RP323

INDEX

ABBIE, Prof A. A. · Australian Aborigines and Genetics, 423
Abd-el-Malek, Prof Y., and others : Chloramphenicol, a Simultaneous Carbon and Nitrogen Source for a *Streptomyces* sp. from Egyptian Soil, 775
Abetti, Giorgio, e Hack, Margherita : Le Nebulose e gli Universi-isole, *review* by J B. Alexander, 867
Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes : Influence of the Charge on a Serum Protein Molecule and its (B. J. Northover), 574
Ablation (Limb) · Effect of, on Neurones in *Xenopus* Larvae (Dr A. F. W. Hughes and Dr P R Lewis), 333
Aborigines (Australian), and Genetics (Prof. R. Ruggles Gates), 423, (Prof. A. A. Abbie), 423
Abplanalp, Prof. Hans : Response of Japanese Quail to Restricted Lighting, 942
Absence of the Glucose Effect on the Frequency of Lysogenization in *Salmonella typhimurium* (Patricia Hoffee, Roger Weinberg and Prof. Ellis Englesberg), 160
Absence (Apparent), of Amines in Cerebrospinal Fluid of Phenylketonurics (Dr. Thomas L. Perry, Kenneth N F Shaw and Dorothy Walker), 926
Absence (Presence or), of ε-N-Methyl-Lysine in *Salmonella* Flagellar Protein : A Gene determining (Dr B. A. D. Stocker, Dr. M. W. McDonough and Dr. R. P Ambler), 556
Absolute Configuration of 4-Methylproline from Perry (Dr. L. F. Burroughs, S. Dalby, Prof G W Kenner and Dr. R. C. Sheppard), 394
Absorbance of Feulgen-stained Bull Sperm (Dr. Simon Iversen), 684
Absorption of Inhaled Radioactive Water Vapour (J. B. West and C. T. Dollery), 588
Absorption (Atomic), in the Flame : Enhancement of, by Organic Solvents (R. Lockyer, J E Scott and Susan Slade), 830
Absorption (Intestinal), of Vitamin B_{12} and of a Vitamin B_{12}-Peptide Complex in Normal Subjects and in Patients with Partial Gastrectomy (Dr. G Milhaud), 31
Absorption (Magnesium), in Sheep (Dr. D. F. Evered), 228
Absorption (Short-term), by Oat Roots : Location of Manganese taken up in (E. R. Page), 597
Absorption and Breakdown of Iron–Ethylenediamine Tetraacetic Acid by Tomato Plants (Dr D G Hill-Cottingham and C. P. Lloyd-Jones), 312
Absorption Spectra in the Ultra-violet and Visible Region (edited by Dr. L. Lang, in collaboration with Dr. J. Szoke, Dr. G. Varsányi and M Vizesy), *review* by Dr. R. F. Barrow, 347
Absorption Spectrum of Haemin : Effect of Polylysine on the (Dr. G. Blauer), 396
Absorption Spectrum (Ultra-Violet), of Water (R. M Golding), 132
Academy of Medical Sciences of the U.S.S R. (New York Academy of Sciences and the) : Conference on Higher Nervous Activity, 282
Academy of Sciences of the U.S.S.R. · International Symposium on Primary and Initial Effects of Ionizing Radiations, 110
Acanthocephala femorata : *Trans*-2-Hexenal in the Scent Gland of the Hemipteran (Prof. Murray S. Blum, Donald D. Crain and Julius B. Chidester), 245
Acceleration of Deuterons in a Synchrotron (H. R. Shaylor and Dr. P. D. Whitaker), 741
Accelerator (Anti-) Action of Methoxamine (Shoichi Imai, Tatsuro Shigei and Prof. Koroku Hashimoto), 493
Acceptors (Electron), in Charge Transfer Compounds : Organic Halides as (T Bjorvatten, Prof. O. Hassel and Chr. Rømming), 137
Accidental Radioactive Labelling of a Migratory Moth (Dr. H. B. D. Kettlewell and M. J. Heard), 676
Accurate Determination of Molecular Weights of Unknown Materials in Solution (R. A Pasternak and Leonard A. Cavanagh), 446
Acetic Acid : Chromatography of the Proteins from Wheat Flour soluble in (Dr. D. H. Simmonds and Dr. D. J. Winzor), 306
Acetoin : Biosynthesis of, by *Leuconostoc citrovorum* (M. Busse and Prof. O. Kandler), 774
Acetylcholine and Cholinesterase in the Heart of White Rats : Distribution of (Dr. J. Vlk, Dr. S. Tuček and Dr. V. Habermann), 923
Acetylcholinesterase (Cockroach) : Activation of, by Water-miscible Organic Solvents (Dr. E. H. Colhoun), 309
Acha, Isabel Garcia, and Villanueva, Dr. Julio R. : A Selective Medium for the Formation of Ascospores by *Aspergillus nidulans*, 328
Achievement in the Glass Industry, *review* by Prof. R. W Douglas, 342
Acids (Organic), in Pacific Ocean Waters (Peter M Williams), 219
Ackerman, Prof. G. Adolph, and others : Effects of Nitrogen Mustard on the Histochemistry of Mouse Lymphocytic Leukaemia *L* 1210, 591
Acquired Porphyria in Man and Rat due to Hexachlorobenzene Intoxication (Robert K. Ockner and Prof. Rudi Schmid), 499
Acquisition of Graft versus Host Tolerance (Dr. J K. Dineen), 680
Acridine-Orange : Effects of Light and Optical Sensitization by, on Living Bull Spermatozoa (C. van Duijn, jun), 76
Acridine Orange (Fluorochrome), as a Vital Stain : Effects of Ultrasonic Radiation in *Escherichia coli B* using (S. S. Ranade, V. G. Tatake and K. S. Korgaonkar), 931
Acriflavin : Elimination of Transmissible Drug-resistance by Treatment with (Prof. S. Mitsuhashi, K. Harada and M. Kameda), 947
Actinomycetes : A Chitin Medium for Isolation, Growth and Maintenance of (Yamuna Lingappa and Prof. John L Lockwood), 158
Actinomycin : Inhibition of Multiplication of Bacteriophage by (Atsuo Nakata, Mutsuo Sekiguchi and Prof Junichi Kawamata), 246
Actinophage (*Streptomyces aureofaciens*) : The Host-Range of a (R. Weindling, H. D. Tresner and Dr. E. J. Backus), 603
Action of an Antheridium-inducing Substance in Ferns : Mode of (Dr. Ulrich Näf), 900
Action of Glutamic Acid and Glutathione Analogues on the *Hydra* Glutathione-Receptor (Howard M. Lenhoff and J. Bovaird), 486
Action of Neurohypophyseal Hormones on the Sodium Fluxes of a Freshwater Teleost (Dr. J. Maetz and M. Julen), 152
Action of Trypsin on Bence-Jones Protein Derivatives (Dr. Umberto Ferrini and Dr Romano Zito), 485
Action of *Vicia faba* on Erythrocytes—Possible Relationship to Favism (Dr. J. E. Bowman and Dr D. G. Walker), 555
Action (Anti-accelerator), of Methoxamine (Shoichi Imai, Tatsuro Shigei and Prof Koroku Hashimoto), 493
Action (Anti-complementary), of Aspirin (Dr. C. J. van Oss, J. C. Friedmann and Dr. M. Fontaine), 147
Action (Drug) · Repression and De-repression of Enzyme Synthesis as a Possible Explanation of some Aspects of (Prof Louis Shuster), 314
Action (Gene) : A Hypothesis concerning the Mechanism of (Dr. Carl C. Lindegren), 959
Action (Protective), of Calcium Gluconate against After-Effects of X-Irradiation on Conidia of *Neurospora crassa* (Prof J. Weijer), 760
Action (Xanthine Oxidase) . Apparent Reversal of, in *Chlorella vulgaris* Starved of Nitrogen (Michael K. Bach), 485
Action Potential with an Artificial *p*H-Muscle (D. H. Walters, Prof. W. Kuhn and Hans J Kuhn), 381
Actions (Some Pharmacological), of ᴅ-Lysergic Acid Methyl Carbinolamide (Dr. A. Glasser), 313
Activation of Cockroach Acetylcholinesterase by Water-miscible Organic Solvents (Dr. E. H. Colhoun), 309
Activation Profiles (Amino-Acid), in Tissue Preparations : A Simple Paper Chromatographic Method for Determination of (Dr. Alexandra von der Decken), 145
Active Alumina as Support for the Liquid Phase : Gas Chromatographic Separation of Low-boiling Hydrocarbons using (Dr. I. Halász and E. E. Wegner), 570
'Active Centre' Studies in Trypsin (Teresa Therattil-Antony, M. Bier and F. F. Nord), 809
Active Ion Transport across Large Canine Blood Vessel Walls : Evidence of (Prof. P. N. Sawyer and I Valmont), 470
Active Sensitization to Tuberculin with Cells from Tuberculin-sensitized Guinea Pigs (Dr. J. L. Turk), 889
Active (Biologically) Cellulose Derivatives of Enzymes : Synthesis of (Dr. Milton A. Mitz and Louis J. Summaria), 576
Activities of the United States National Institutes of Health in the Field of Gerontology—Research Grant and Training Projects Active on January 31, 1960, and Intramural Research Projects carried on during Calendar Year 1959 (United States Department of Health, Education and Welfare—Public Health Service, Publication No. 761), 21
Activities (Fibrinolytic), present in Human Blood Platelets (Dr. Rudolf Holemans and Dr. Rudolf Gross), 238
Activity : Higher Nervous (New York Academy of Sciences and the Academy of Medical Sciences of the U.S.S.R. Conference on), 282
Activity of Corticosteroid 11β-Hydroxylase : Evaluation of the (Dr. Benjamin N. Horwitt, Charles Sobel and Orville J Golub), 1006
Activity (Adipokinetic), of Synthetic Peptides related to Corticotropin (Dr. M. S Raben, Ruth Landolt, F. A. Smith, K. Hofmann and H. Yajima), 681
α-Activity of Drinking Water : Naturally Occurring (R. C. Turner, J. M. Radley and Prof. W. V. Mayneord), 348
α-Activity of Wheat and Flour (Sir Ernest Marsden and E. N. Greer), 326
Activity (Choline Acetylase) : Gradient of (Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres), (Dr. Catherine O. Hebb and Ann Silver), 123
Activity (Choline Acetylase), in Nerve Fibres · Gradient of Cholinesterase Activity and of—Gradient of Cholinesterase Activity (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123
Activity (Cholinesterase) : Gradient of (Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres), (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122
  Gradient of, and of Choline Acetylase Activity in Nerve Fibres—Gradient of Cholinesterase Activity (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123
Activity (Electrical) : Release of Calcium-45 from Frog Nerves during (Prof. K. Koketsu and S. Miyamoto), 402
Activity Glutamic Oxaloacetic Transaminase), in Different Zones of the Ventricular Muscle of the Dog (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr. Enrique Savino and Dr. Manuel René Malinow), 315
Activity (β-Glycosidase), and Cyanogenesis in the Susceptibility of Alfalfa to Winter Crown Rot (Dr. N. Colotelo and Dr. E. W. B. Ward), 242
Activity (Haemolytic) : Fluorescence and, of Tumours and Normal Tissues of the *C3H* Mouse (Dr. Eric Ponder and Ruth V. Ponder), 643
Activity (Haemolytic), of Colloidal Silica (J. D. Harley and Dr. J. Margolis), 1010
Activity (Haemolytic), of *Corynebacterium ovis* (Dr Gordon Fraser), 246
Activity (Increased Dihydrofolate Reductase), as a Possible Basis of Drug Resistance in Leukaemia (Dr. D. K. Misra, Stewart R. Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Activity (Lipolytic), of some Anaerobic Bacteria (C. Gonzalez and G. Sierra), 601
Activity (Melanocyte-stimulating and Corticotropin-releasing) : Synthesis of ʟ-Methionyl-ʟ-Glutamyl-ʟ-Histidyl-ʟ-Phenylalanyl-ʟ-Arginyl-ʟ-Tryptophyl-Glycine and its (Prof. Choh Hao Li, Eugen Schnabel, David Chung and Tung-bin Lo), 143
Activity (Nervous), in relation to the Respiratory Cycle (E. W. Poole), 579
Activity (Neuraminidase) : Determination of the Concentration of Myxoviruses and of some Specific Antisera, based on (Dr. J. Jacobs and Dr. J. N. Walop), 334
Activity (Phenolase and Pectic Enzyme), in the Chocolate Spot Disease of Beans (B. J. Deverall), 311

INDEX

Activity (Reduced Fibrinolytic), of Atherosclerotic Sera caused by an Increase in Low-density Lipoproteins in Blood (Dr. Nirmal Sarkar), 929
Activity (Solar), during the period November 10-15, 1960 : The Cosmic Ray Flare on November 12, 1960, and (Staff of the Ionosphere and Radio-Astronomy Section of the Netherlands Postal and Telecommunications Services), 438
Activity (Steroid-3β-II-Dehydrogenase), in Foetal Leydig's Cells (Dr. Mikko Niemi and Dr M. Ikonen), 592
Activity (Thyroid), in Fish : The Conversion Ratio as a Discriminatory Test for (C. P. Hickman, jun.), 1012
Activity (Total Cytochrome Oxidase), and its relation to Basal and Maximal Metabolism (Dr. Ladislav Jánsky), 921
Adam, A. : Linkage between Deficiency of Glucose-6-phosphate Dehydrogenase and Colour-blindness, 686
Adam, Prof. N. K. A Text-Book of Surface Chemistry, *review*, 521
Adams, F. W. : Elected an Honorary Associate of the City of Liverpool College of Technology, 446
Adams, Dr. J F. : Appointed a reader in mathematics in the University of Manchester, 797
Adams, K. F. : Epidemics of Black (Stem) Rust of Wheat, 285
Adams, Dr. P. J. : The Origin and Evolution of Coal, 712
Adamson, Prof. Arthur W : Physical Chemistry of Surfaces, *review* by Prof N. K. Adam, 521
Adaptation of a Chromatographic Technique for Autoradiography (Dr. R. N. Greenshields), 851
Adenomas (Renal), in the Rat : A Dominant Gene for (Reidar Eker and Jeanne Mossige), 858
Adenosine Tetraphosphate : Enzymatic Dephosphorylation of (Prof. Claude Liébecq, Kazimierz Jaroszewicz and Annette Lallemand), 661
Adipokinetic Activity of Synthetic Peptides related to Corticotropin (Dr. M. S. Raben, Ruth Landolt, F. A. Smith, K. Hofmann and H. Yajima), 681
Adjuvant (Freund's) : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with (Prof. N. Allegretti and B. Vitale), 673
Adlard, E. R. : Gas Chromatography (Apparatus for obtaining Accurate Retention Volume Data), 27
Administration (University), in Britain and the Commonwealth : Freedom and Efficiency—Problems of (Committee on Science and Freedom, Manchester, Bulletin No 16), 517
Administration (University) in Great Britain, 517
Adrian, Rt. Hon. Lord : *Obituary* of Prof D. Cordier, 620
Adsorption : Determination of Heats of, by Transient-Response Techniques (James J. Carberry), 391
Adult Haemoglobin Types (Four), in One Person (Dr. C. Baglioni and Prof. V M. Ingram), 465
Adult Human Haemoglobin : Genetic Control of Foetal and (Dr. C. Baglioni, Prof. V. M. Ingram and Emelie Sullivan), 467
Advances in Fields of Parasitological Research : Recent (Parasitology Group of the Institute of Biology Discussion on), 192
Advances in Inorganic Chemistry, *review* by Dr. D. W. A. Sharp, 521
Advances in Inorganic Chemistry and Radiochemistry (edited by H. J. Emeléus and A. G. Sharpe), Vol. 2, *review* by Dr. D. W. A. Sharp, 521
Advising the Farmer (Advisory Methods Section of the Agricultural Education Association series of papers on), 883
Advisory Council on Research and Development (Ministry of Power) : Appointment of M. A. L. Banks as a member, 188
Advisory Water Committee, Central : Sub-Committee on the Growing Demand for Water, Second Report, 278
Aeronautical Research Laboratories of the Australian Defence Scientific Service : Annual Report for 1958-59, 103
Aetiology of Cirrhosis of the Liver in France : Role of Alcohol in the (Institut National d'Hygiene, Paris), 804
Affinity of Organic Compounds for Free Electrons with Thermal Energy—its Possible Significance in Biology (Dr. J. E. Lovelock), 729
Afforestation in National Parks in Britain, 711
Africa South of the Sahara, Commission for Technical Co-operation in : Symposium on the Quelea, 359
Africa (North) : Science Planning, Development and Co-operation in the Countries of the Middle East and (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
Africa (South-East) : Biogeography of (Symposium at the University of Natal on), 801
Africa (West) : New Stomatopod Crustaceans in, 360
African Game : The Ecology of, *review* by Prof. W. H Pearsall, 783
African Horse-Sickness Virus : Haemagglutination and Haemagglutination-Inhibition with (Khorshed M. Pavri), 249
African Territory : Wild Life in an (Dr. F. Fraser Darling), *review* by Prof W H. Pearsall, 783
African (Portuguese East) : Coronary Artery of the (Joseph Gillman, Christine Gilbert and Manuel D. Prates), 623
After-Effects of X-Irradiation on Conidia of *Neurospora crassa* : Protective Action of Calcium Gluconate against (Prof. J. Weijer), 760
Aftergut, S., and Brown, G. P. : Electronic Properties of Phenazine, 827
AGARD : Calendar of Meetings (NATO), 879
AGARD (Fluid Dynamics Panel) : Technical Sessions at Istanbul (Wind Tunnels and Flow Visualization), 108
Ageing : Problems of, 21
Agent (Eaton's Primary Atypical Pneumonia) : Effect of an Organic Gold Salt on, and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Ager, J. A.•M. (Curran, Prof R. C., and) : Tissue Responses to Filter Membranes of various Porosities, 1023
Agglutinogen (Erythrocyte), in Chickens : Effects of Œstrogen on Somatic Variation of an (S. L. Scheinberg and R. Reckel), 295
Aggregated Chlorophyll : Spectral Characteristics of, and its Possible Role in Photosynthesis (Seymour Steven Brody and Marcia Brody), 547
Aggregated γ-Globulins in Normal Human Sera : Precipitating Factor for (Dr. A. Taranta, Dr. H S. Weiss and E. C. Franklin), 239
Aggregation and Dispersal of Radiation Damage in Graphite (W. N. Reynolds, P. A. Thrower and B. E. Sheldon), 824
Aggregation, Variance and the Mean (L. R. Taylor), 732
Agrell, Dr. S. O., and Gay, Dr. P. : Kilchoanite, a Polymorph of Rankinite, 743
Agricultural Advisory Service (National) : Appointment of E. Ll. Harry as regional director of the South Western Region, 447
Agricultural Aviation, *review* by R J. Courshee, 611
Agricultural Aviation Conference · Report of the First International (Cranfield, 1959), *review* by R. J. Courshee, 611
Agricultural Bureaux (Commonwealth) : Appointment of Sir Thomas Scrivenor as secretary, 714
Agricultural Education Association : Meeting of the Advisory Methods Section, 883
Agricultural History (Agricultural History Society and the Association of Agriculture Conference on), 368
Agricultural History Society : Ninth Annual General Meeting and Conference, 970
Agricultural History Society and the Association of Agriculture : Conference on Agricultural History, 368
Agricultural Meteorology : Fourth Symposium in (Soil Climate with special reference to the British Isles), (University College of Wales, Aberystwyth), 714
Agricultural Research Council : Radiobiology Laboratory, Report No 3, Strontium-90 in Human Diet in the United Kingdom (1959), 191
  Studentships and Fellowships in Agriculture, 796
  Appointment of Prof A. C. Frazer as a member, 880
Agriculture : Radioactive Materials in Food and (Report of an Expert Committee of the Food and Agriculture Organization of the United Nations), 712
  Studentships and Fellowships in (Agricultural Research Council), 796
Agriculture, Association of (Agricultural History Society and the) : Conference on Agricultural History, 368
l'Agriculture, Institut pour l'Encouragement de la Recherche Scientifique dans l'Industrie et : Rapport Annuel (1959), 113
Agriculture, Fisheries and Food, Ministry of : Domestic Food Consumption and Expenditure, 1958—Annual Report of the National Food Survey Committee, 197
Agriculture, Fisheries and Food, Ministry of, and the War Office : Appointment of Brigadier A. H. Dowson as director-general of the Ordnance Survey, with the rank of Major-General, 104
Åhman, Dr. Erik : *Obituary* of Prof. J. G. Andersson, 99
Air (Dissolved) : Effect of, on the Viscosity of Water (W. A. Caw and R. G. Wylie), 995
Air Force, United States (Geophysics Research Directorate) : Handbook of Geophysics, revised edition, *review* by Prof. S. K. Runcorn, 258
Air Force Office of Scientific Research : Decisions, Values and Groups, Vol. 1, Reports from the First Interdisciplinary Conference in the Behavioral Science Division, held at the University of New Mexico (edited by Dorothy Willner), *review* by Prof. Ll. Wynn Jones, 955
Air Ministry (Meteorological Office) : Geophysical Memoirs No. 103, Upper Winds over the World, Parts 1 and 2 (H. Heastie and P. M. Stephenson), 543
Air Pressure : Effect of, on the Fatigue of Lead and Aluminium (Dr. K. U. Snowden), 53
Aircraft (High-Flying) : Some Solar Lines in the Infra-Red Spectrum observed from a (N. D. P. Hughes and Dr. T. S. Moss), 908
Aitcheson, T. : Impact of Man on the Vegetation of the Humid Tropics (Status of the Pig in New Guinea), 25
Akers Research Laboratory of Imperial Chemical Industries, Ltd. · Appointment of Dr. P. W. Brian as associate research manager of the Pharmaceutical Division, and in general charge of the Laboratory, 275
  Appointment of Dr. J. Chatt as group manager of the Heavy Organic Chemicals Division, 275 ; *erratum*, 447
Albumen Proteins (Egg), of the Domestic Fowl : Genetic Polymorphisms in the (I. E. Lush), 981
Alcohol : Role of, in the Aetiology of Cirrhosis of the Liver in France (Institut National d'Hygiene, Paris), 804
Alcohols (Polyhydric) : Effect of, to Frost Hardiness in Plants (Dr. Akira Sakai), 416
Aldrin and Dieldrin : Fate of, in Locusts (A. J. Cohen and Dr. J. N. Smith), 600
Alender, Charles B., and others : Bioassay of Ciguatera Toxin, 229
Alexander, B H , and Baluffi, R. W. : Powder Metallurgy (Sintering of Iron, Copper and Nickel), 366
Alexander, Dr. F. : Elected a Fellow of the Royal Society of Edinburgh, 876
Alexander, J. B. : Nebulae, Galaxies and Cosmology, *review*, 867
Alexander, James V. (Snyder, Dr. William C., and) : Perfect Stages of *Fusarium oxysporum* and of *Fusarium solani* f. *pisi* still Unknown, 596
Alexander, Dr. Peter : Primary and Initial Effects of Ionizing Radiations, 110
Alfalfa : β-Glycosidase Activity and Cyanogenesis in the Susceptibility of, to Winter Crown Rot (Dr. N. Colotelo and Dr. E. W. B. Ward), 242
Algae . Indian Monographs on, *review* by Dr. J. W. G. Lund, 343
Algebraic Curves (Prof J. G. Semple and G. T. Kneebone), *review* by Prof. T. A. A. Broadbent, 175
Algebras (Banach) : General Theory of (Prof Charles E. Rickart), *review* by Dr. R. G. Cooke, 612
Algerian Ivy : Effect of Temperature and Grafting on Vegetative Growth Phases of (Prof. V. T Stoutemyer and O. K. Britt), 854
Algol 60 (Automatic Programming Information Centre of Brighton Technical College Course in), 275
Alikhanian, S. I., and others : Genetic Control of Oxytetracycline Biosynthesis, 939
Alimentary Canal of the Calf : Uptake of Small Resin Particles by the (J. M. Payne and B. F. Sansom), 494
Aliphatic Ethers : Influence of Molecular Structure on the Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and Indium with (Dr. R. R. Brooks and P. J. Lloyd), 375
Alkali Elements : Distillation of, during Formation of Australite Flanges (Dr. S. R. Taylor), 630
Alkaline Phosphatase in Cell Cultures of Human Origin (Dr. Harold M. Nitowsky and Dr. Fritz Herz), 756
Alkaline Phosphatase (Biliary), in the Guinea Pig : Role of (Freda Brown, *née* Bowyer), 755
Alkaloid Chemistry : Progress in, *review* by Dr. E. G. Kellett, 430
Alkaloids : The—Chemistry and Physiology (edited by R. H. F. Manske), Vol. 6 (Supplement to Vols. 1 and 2) ; Vol. 7 (Supplement to Vols. 2-5), *review* by Dr. E. G. Kellett, 430
Alkaloids (Opium) : O-Demethylation as a Biosynthetic Pattern in the Formation of (Frank R. Stermitz and Prof. Henry Rapoport), 310

Alkaloids (Poppy–Fumaria) : Distribution of certain, and a Possible Link with the Incidence of Glaucoma (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
All about Mangoes, *review* by T. A. Russell, 784
Allahabad Botanical Garden : Establishment of the, 358
Allegretti, Prof. N., and Matošić, M. : Experimental Allergic Encephalomyelitis in Irradiated Rats, 500
Allegretti, Prof. N., and Vitale, B. : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant, 673
Allen, J. W., and Cherry, R. J. : Space-Charge Currents in Gallium Arsenide, 297
Allergic Encephalomyelitis : Antibodies against Autologous Brain in Rats with (S. Martin Harwin, Prof Philip Y. Paterson and Norman C. Didakow), 322
Allergic Encephalomyelitis (Experimental), in Irradiated Rats (Prof. N. Allegretti and M. Matošić), 500
Allied Radiations (Nuclear and) The Hazards to Man of—a Second Report (Medical Research Council), 629
Allison, Dr. A C , and Lightbown, J. W. : Inhibition of Cellular Respiration by Co-Carcinogenic Fractions of Croton Oil, 892
Alloploid (Auto-) Nature of *Pennisetum squamulatum* Fresen (B. D. Patil, M W. Hardas and A. B. Joshi), 419
Alloys (Silver–Manganese), at Low Temperatures : Anomalous Conductivity and Lorenz Parameter in Dilute (Dr. M. S. R. Chari), 824
Almeida, J. D., and others : Morphological Characterization of the Virus of the Human Common Wart (*Verruca vulgaris*), 895
α-Activity of Drinking Water : Naturally Occurring (R. C. Turner, J. M. Radley and Prof W. V. Mayneord), 348
α-Activity of Wheat and Flour (Sir Ernest Marsden and E. N. Greer), 326
α-Configuration of Fibrous Proteins (R. D. B. Fraser and T. P. MacRae), 572
α-Kojibiose : Crystalline (Fumio Yamamuchi and Kiyoshi Aso), 753
α- and β-Melanocyte Stimulating Hormones : Effect of, on the Skin Colour of Man (Prof. Aaron B. Lerner and Dr. Joseph S. McGuire), 176
Alston, R , and others : Canavanine in Leguminosae, 360
Alteration of the Growth of Mammalian Cells *in vitro* by Ecdysone Extract (Prof. Walter J. Burdette and Dr. Ralph C. Richards), 666
Altman, K. I. (Gerber, G. B., and) : Method of Collagen Synthesis, 813
Alumina (Active), as Support for the Liquid Phase : Gas Chromatographic Separation of Low-boiling Hydrocarbons using (Dr. I. Halász and E. E Wegner), 570
Aluminium : Effect of Air Pressure on the Fatigue of Lead and (Dr. K. U. Snowden), 53
Aluminium (Soluble), in Plants and Soils (S. A. Harris), 513
Aluminium Monobromide : Dissociation Theory of (Dr. R. F. Barrow), 480
Ambler, Dr. R P., and others : A Gene determining Presence or Absence of ε-N-Methyl-Lysine in *Salmonella* Flagellar Protein, 556
Ambrose, Dr. D. : Gas Chromatography—Definitions and Retention Parameters, 280
Ambrose, E. J. : Appointed reader in physical chemistry at the Institute of Cancer Research, Royal Cancer Hospital, London, 22
America, Inter-Society Color Council of, and others : Conference to celebrate James Clerk Maxwell's demonstration of trichromatic colour reproduction at the Royal Institution in London, 361
America (Latin) : Scientific Institutions and Scientists in, Vol. 4, Part 4, Argentina, N–Z (Unesco Science Co-operation Office, Montevideo), 361
America (South) : New Species of *Chaetocis* from (Arthur M. Chickering), 446
American Academy of Arts and Sciences : Rumford Premium awarded to Prof. C. H. Townes, 797
American Association for the Advancement of Science : Industrial Science Achievement Award awarded to the Bell Telephone Laboratories, Inc., 188
American Geographical Society : To publish *North Atlantic Biogeography*, 358
American Industry : Scientific and Technical Personnel in (United States National Science Foundation), 794
American Institute of Mining and Metallurgical Engineers (Metallurgical Society of the), (Metal Powder Industries Federation and the) : International Conference on Powder Metallurgy, 365
American Institute of Physics, and others : Symposium on Temperature—its Measurement and Control in Science and Industry, 22
American Mathematical Society : 575th Meeting, 22
Amiel, J. L., and others : Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain, 1025
Amine (A New Amino-Acid), from *Ecballium* : *N*-Ethyl-L-Asparagine—(D. O. Gray and Dr. L. Fowden), 401
Amines : Apparent Absence of, in Cerebrospinal Fluid of Phenylketonurics (Dr. Thomas L. Perry, Kenneth N. F. Shaw and Dorothy Walker), 926
Amines (Chromium (II)) : Oxidation of, by Water (Kenneth D. Kopple, George F. Svatos and Prof. Henry Taube), 393
Amines (Tertiary), and Quaternary Ammonium Salts : Specification of Asymmetric Nitrogen Atom—Application of the Cahn–Ingold–Prelog Nomenclature to some (G. Bernáth), 304
6-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride Hydrochloride—a New Drug Active against *Babesia canis* (S. S. Berg and J. M. S Luxas), 64
4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid (Tetrahydroamethopterin) : Toxicity and Anti-leukaemic Effectiveness in Mice of (Dr. J. A. R. Mead, J. M. Venditti, A. W. Schrecker, Dr. A. Goldin and R L. Kisliuk), 937
Amino-Acid Activation Profiles in Tissue Preparations : A Simple Paper Chromatographic Method for Determination of (Dr. Alexandra von der Decken), 145
Amino-Acid Amine (A New), from *Ecballium* : *N*-Ethyl-L-Asparagine—(D. O. Gray and Dr L. Fowden), 401
Amino-Acid Antagonisms : Modifying Factors of, in a Mutant of *Neurospora crassa* (H. E. Brockman and A. Gib DeBusk), 940
Amino-Acid Patterns in Vitamin A-deficient Rats (P. Malathi, P. Seshadri Sastry and Dr. J. Ganguly), 660
Aminoacetonitrile : Inhibition of Experimental Cirrhosis by Carbon Tetrachloride following Treatment with (Dr. L. Fiume and Prof. G. Favilli), 71
p-Aminohippurate : Conjugation of, by the Kidney and Effective Renal Plasma-flow (Dr. B. P. Setchell and E. Blanch), 230
3-Aminomethylindole and 3-Methylaminomethylindole—New Constituents of Barley (Dr. S. Harvey Mudd), 489
Amino-Sugars (Two New), from an Antigenic Polysaccharide of *Pneumococcus* (Dr. S. A. Barker, Dr J. S. Brimacombe, M. J. How, Prof. M. Stacey and Dr. J. M. Williams), 303
Ammal, Dr. E. K. Janaki : Awarded the Indian Botanical Society's Birbal Sahni Medal, 361
  Elected president of the Indian Society of Genetics and Plant Breeding, 796
Ammonia labelled with Nitrogen-15 : Glutamic Acid Metabolism in Brain and Liver during Infusion with (G. Takagaki, S. Berl, D. D. Clarke, D. P. Purpura and Prof. H. Waelsch), 326
Ammonia (Portal Blood) : Rapid Reduction of (O. W. Wendel and E. M. Murphy), 404
Ammonium Salts (Quaternary) : Specification of Asymmetric Nitrogen Atom—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and (G. Bernáth), 304
Amounts (Minute), of Lead in Urine : Use of the Mercury Drop Electrode Method for Direct Evaluation of (Prof. Wiktor Kemula and Zenon Kublik), 57
Amphibian Embryos : Morphogenetic Effects of Lipoic Acid on (Prof. J. Brachet), 156
Amphibians in the British Isles : Distribution of Reptiles and (Lieut.-Col. R. H. R. Taylor), 624
Amphioxus : Presence of Enterochromaffin Cells in the Gut of (Dr. Giuseppe Gerzeli), 237
Amplifying Properties . Electrolytic Junction with (B. Lovreček and B. Kunst), 804
Amylase (Rat Serum) : Electrophoretic Behaviour of (Prof. Robert L. McGeachin and Betty Ann Potter), 751
Anaerobic Bacteria : Lipolytic Activity of some (C. Gonzalez and G. Sierra), 601
Anaerobic Glycolysis versus Structure in Pork Muscle : Rate of (J. Wismer-Pedersen and E. J. Briskey), 318
Anaesthetics (Volatile), in Tissues : Estimation of, by Gas Chromatography (Dr. R. A. Butler and Dr. D. W. Hill), 488
Analogues (Glutathione) : Action of Glutamic Acid and, on the *Hydra* Glutathione-Receptor (Howard M. Lenhoff and J. Bovaird), 486
Analyse Zoogéographique des Mammifères de l'Iran (Dr. Xavier Misonne), 21
Analysis : Elementary Titrimetric (Dr. A. M. G. Macdonald), *review* by Dr. D T. Lewis, 7
Analysis of the Cross-Reaction between Two Strains of Tobacco Mosaic Virus (Prof Irving Rappaport), 986
Analysis of Faecal Sterols : An Evaluation of the Use of Digitonin for the (Prof. W. W. Wells and Patricia A. Mores), 483
Analysis (Chemical), of Resin-based Coating Materials (edited by Dr. C. P. A, Kappelmeier), *review* by Dr. D. T. Lewis, 175
Analysis (Gas Chromatographic), of Permanent Gases using Standard Ionization Detection Equipment (Dr. R. A Landowne and Dr. S. R. Lipsky), 571
Analysis (Short-term Spectrum), in 'Real-Time' : A Versatile Method for (J. S. Gill), 117
Analysis (Spectrographic), of Cobalt in Soil Concentrates : Direct Methods of Estimation in the (Dr. A. B. Calder), 165
Analysis (Subjective), of Saccadic Eye Movements (Dr. J. G. Thomas), 842
Analysis and Control : Automatic and Semi-Automatic Methods in (Medway College of Technology Symposium and Instrument Exhibition on), 447
Analysts (Public), Association of, and others : Labelling Procedure for Compounded Medicinal Preparations, 712
Analytical Chemistry, Society for (Gas Chromatography Discussion Group and the) : International Symposium on Gas Chromatography, 26
Analytical Methods : X-Ray (Research and Control Instruments, Ltd., Conference on), 275
Anatomy at Cardiff, 531
Anatomy of Grasses : An, *review* by Prof. T G. Tutin, 865
Anatomy of the Monocotyledons (Dr. C. R. Metcalfe), Vol. I, Gramineae, *review* by Prof. T. G. Tutin, 865
Anatomy of Seed Plants (Prof. Katherine Esau), *review* by Dr. C. R. Metcalfe, 864
Anatomy (Plant) : Introduction to, *review* by Dr. C. R. Metcalfe, 864
Anatomy and Biology at Western Reserve University, 357
Ancient Glass : A New Method for Dating (Robert H. Brill and Harrison P. Hood), 12
Ande : Fiori delle (Alfonso Vinci), *review* by N. Y. Sandwith, 523
Anderson, J. A R. : Impact of Man on the Vegetation of the Humid Tropics (Effects of Shifting Cultivation—Regeneration of Cleared Areas in Sarawak), 25
Anderson, Dr. J. S. : Rare-Earth Chemistry, *review*, 345
Anderson, Prof. M. L. : Choice of Tree Species, 719
  Elm Disease, 886
Anderson, Robert B., and others : Ethyl Branching in the Fischer–Tropsch Synthesis, 224
Andersson, Prof. J. G. : *Obituary* by Dr. Erik Åhman, 99
Andreenko, G. V., and others : Experimental Pre-Thrombotic State of an Organism resulting from the Dysfunction of the Physiological Anti-coagulating System induced by an Atherogenic Diet, 66
Angele, H. P : Gas Chromatography (Recent Activities of the East German Working Group), 26
Angiospermen : Die Evolution der (Prof. Dr. Armen Takhtajan), *review* by J. Parkin, 519
Angular Measurements of Distant Radio Sources : Cosmological Significance of (Dr. W. Davidson), 991
Anhydrase (Carbonic), and the Inner Ear (Dr. S. D. Erulkar and Prof. T. H. Maren), 459
Aniline Derivatives of the Francis Inhibitor : Inhibition of the Multiplication of Influenza Virus by (Dr. I. Hollós), 553
Animal Behaviour (Prof. J. L. Cloudsley-Thompson), *review* by Dr. A. D. Blest, 522
Animal Body : Opal in the (G. Baker and L. H. P. Jones), 682
Animal Ecology (Tropical) : Nuffield Unit of, 276
Animal Viruses : Use of Potassium Tartrate for Equilibrium Density-gradient Centrifugation of (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220

Animal Welfare, Universities Federation for : Easter Conference, 625
Animals · Socrates and the (Dr. Elena Quarelli), translated from the Italian by Kathleen Speight, *review* by B. J. G. Maitland, 523
Anionic Permeability of the Inhibitory Postsynaptic Membrane of Motoneurones (Dr. T. Araki, M. Ito and O. Oscarsson), 65
Anodic Oxidation in Formic Acid : Micropitting of Titanium during (R. A. Piggott and Dr. L. L Schreir), 216
Anokhin, P. K : Higher Nervous Activity, 282
Anomalous Conductivity and Lorenz Parameter in Dilute Silver–Manganese Alloys at Low Temperatures (Dr M S R. Chari), 824
Anomalous Correspondence · Retinal Correspondency and the Horopter in (Dr. M. C. Flom and Prof F. W. Weymouth), 34
Anomalous Effect : Electron Microscopy of Crystal Lattices—an (Lewis T. Chadderton), 564
Anomaly (Chromosome), in Two Cases of Cerebral Palsy, a Brother and Sister (Dr. J Blumel, Y. Ohnuki and A Awa), 154
Ansell, G. S. (Lenel, F. V, and) : Powder Metallurgy (Yield Stress of Dispersed Particles), 367
Antagonisms (Amino-Acid) : Modifying Factors of, in a Mutant of *Neurospora crassa* (H. E Brockman and A. Gib DeBusk), 940
Antarctic : New British Base in the, 711
Antarctic (Trans-) Expedition, 1955-1958 : Scientific Reports, No. 4, Tides at Shackleton, Weddell Sea (J. G. D. Pratt), *review* by J. R. Rossiter, 346
  Scientific Reports No 2, A Gravity Traverse of Antarctica (J G. D. Pratt) ; Scientific Reports No. 3, Seismic Soundings across Antarctica (J. G. D. Pratt), *review* by G. de Q. Robin, 781
Antarctica : Auroral Observations at Halley Bay, during 1959 (M. A. Sheret and G. M Thomas), 826
  Geological Reconnaissance in Victoria Land (B C. McKelvey and P. N. Webb), 545
  A Gravity Traverse of (J. G. D. Pratt), (Trans-Antarctic Expedition, 1955-1958, Scientific Reports No. 2), *review* by G. de Q. Robin, 781
  Seismic Soundings across (J. G. D Pratt), (Trans-Antarctic Expedition, 1955-1958, Scientific Reports No. 3), *review* by G. de Q. Robin, 781
Anthelmintic (A New), with Unusual Properties (A. W. J. Broome and N. Greenhalgh), 59
Antheridium-Inducing Substance in Ferns : Mode of Action of an (Dr. Ulrich Naf), 900
Antiaccelerator Action of Methoxamine (Shoichi Imai, Tatsuro Shigei and Prof. Koroku Hashimoto), 493
Antibodies against Autologous Brain in Rats with Allergic Encephalomyelitis (S. Martin Harwin, Prof. Philip Y. Paterson and Norman C. Didakow), 322
Antibodies (Phospholipase-A) : Immunity of Bee Keepers to some Constituents of Bee Venom— (A. H. Mohammed and M. M. A. El Karemi), 837
Antibody Formation : Effect of some Metabolic Inhibitors on (Dr. J. Sterzl), 1022
Antibody Properties : Characteristics of γ-Globulin lacking, in New-born Pigs (Dr F. Franek, Dr. I. Riha and Dr. J Sterzl), 1020
Antibody (Rabbit) : Separation of Univalent Fragments of, by Reduction of a Single, Labile Disulphide Bond (Prof. A. Nisonoff, G. Markus and F C. Wissler), 293
Anticoagulating System (Dysfunction of the Physiological), induced by an Atherogenic Diet : Experiemtal Pre-Thrombotic State of an Organism resulting from the (Prof. B. A. Kudrjashov, G. G Bazasian, N. P. Sytina and G. V. Andreenko), 67
Anticomplementary Action of Aspirin (Dr. C J. van Oss, J. C. Friedmann and Dr. M. Fontaine), 147
Antigenic Polysaccharide of *Pneumococcus* : Two New Amino-Sugars from an (Dr. S. A. Barker, Dr. J S. Brimacombe, M. J. Hay, Prof. M. Stacey and Dr. J. M. Williams), 303
Antigenicity of A_2 Haemoglobin (Dr. Paul Heller, Vincent Yakulis and A. M. Josephson), 495
Antigens (Blood), in Fish Mucus: Presence of, and its Possible Parasitological Significance (Prof. Fergus J. O'Rourke), 943
Antigens (Species-characterizing), of 'L' and 'ERK' Cells (Dr R. R. A. Coombs, Mary R. Daniel, B. W Gurner and A. Kelus), 503
Antigens (Transplantation) : Nucleic Acids as (Dr. André Castermans), 504
Anti-leukaemic Effectiveness in Mice : Toxicity and, of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid (Tetrahydroamethopterin), (Dr. J. A. R Mead, J. M. Venditti, A. W. Schrecker, Dr. A. Goldin and R L. Kisliuk), 937
Anti-oxidants in the Rat : Role of Tocopherol, Selenium and (E. E. Edwin, J. Bunyan, A T. Diplock and J Green), 747
Antisera (Specific) : Determination of the Concentration of Myxoviruses and of some, based on Neuraminidase Activity (Dr. J. Jacobs and Dr. J. N Walop), 334
Aorta Lipids of Cockerels in the Initial Stage of Cholesterol- or Stilboestrol-Induced Atherosclerosis : Fatty Acid Pattern in the (Dr Rolf Blomstrand and Dr. Søren Christensen), 376
Aphids and Plant Bugs · Centrosema Mosaic, a Plant Virus Disease transmitted by both (R. J. Van Velsen and Dr. N. C. Crowley), 858
Apocrine Sweat Glands of the Welsh Mountain Sheep : The Synchronous Discharge of (Dr. John Bligh), 582
Apparatus (Scientific Instruments and) : Forty-fifth Annual Exhibition of (Institute of Physics and the Physical Society), 535
Apparent Absence of Amines in Cerebrospinal Fluid of Phenylketonurics (Dr. Thomas L. Perry, Kenneth N. F. Shaw and Dorothy Walker), 926
Apparent Geochemical Association of Bismuth and Thallium (Dr R. R. Brooks), 910
Apparent Migration of N-Methyl Groups in the Pyrimidine Series (Dr. D. J. Brown), 828
Apparent Photosynthesis in Different Populations of *Solidago virgaurea* : Studies of Climatic Ecotypes in Higher Plants—the Temperature Dependence of (O Bjorkman, C. Florell and P. Holmgren), 624
Apparent Reversal of Xanthine Oxidase Action in *Chlorella vulgaris* Starved of Nitrogen (Michael K. Bach), 485
Apparent Steady Component of the Interplanetary Magnetic Field (Prof. V. A. Bailey), 44
Appearance of *Piricularia oryzae* Cav on the Rice Plant : Relations of Intensity of Photosynthesis and (R. Vámos, F. Zsoldos and I. Petrasovits), 407
Apple and Tomato Fruits : Ethylene Production by Cytoplasmic Particles from, in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr C. C. Craft), 243
Appleton, Sir Edward : Awarded the Gunning Victoria Jubilee Prize for 1956-60 of the Royal Society of Edinburgh, 534
Appleton–Hartree Equation : The Quasi-Longitudinal Approximation to the (A. D. M. Walker), 742
Applicability of Hydroxocobalamin as a Long-acting Vitamin B_{12} (Prof. G B. J. Glass, H. R. Skeggs, Dr D. H Lee, Dr. E L. Jones and W. W. Hardy), 138
Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and Quaternary Ammonium Salts : Specification of Asymmetric Nitrogen Atom— (G. Bernáth), 304
Application of Interference Microscopy to Problems of Research (Royal Microscopical Society Symposium on), 714
Application (Clinical), of a Serological Method for the Determination of Human Chorionic Gonadotrophin (Dr. Sam Brody and Dr Gun Carlstrom), 841
Applications : Industrial Fatty Acids and their (edited by E Scott Pattison), *review* by Dr D. T. Lewis, 346
Applications (Therapeutic), of Beams of Negative π-Mesons . The Possibility of (Dr P. H Fowler and Dr. D. H. Perkins), 524
Applied (Directly) Radioactive Reagents · Quantitative Cytochemistry using (Dr E A. Barnard and J. Marbrook), 412
Applied Biologists, Association of : Symposium on Soil Fauna in relation to Soil Formation and Fertility, 367
  General Meeting at the Rothamsted Experimental Station, 714
  Symposium on Physiology of Field Crops, 714
  Symposium on Recent Developments in Plant Nematology, 715
Applied Chemistry (Pure and), International Union of : *Journal* of the, 20
  Symposium on Microchemical Techniques (organized by the Metropolitan Microchemical Society), 188
Applied Chemistry (Pure and), International Union of, and others · Fifth European Congress on Molecular Spectroscopy, 797
Applied Mathematics : General Degree (S. L. Green and J. E. C. Gliddon), *review*, 613
  Surveys in, *review* by Prof. A T. Price, 865
Approximation (The Quasi-Longitudinal), to the Appleton–Hartree Equation (A. D. M. Walker), 742
Aqueous Solutions of the Cyclic Dipeptides : Production of Pyrazine Derivatives in the Radiolysis of (Mathilde Kland-English and Warren M. Garrison), 302
Araki, Dr. T, and others : Anionic Permeability of the Inhibitory Postsynaptic Membrane of Motoneurones, 65
Arboricide : Diquat as an (J S. Gunn and P. B. Tatham), 808
Arc · The Bertele (Prof. D. Gabor and Dr. J. Vithayathil), 821
Archaeology by Geophysical Methods : Prospecting in (Council for British Archaeology Conference on), 534
Archaeology (British), Council for · Conference on Prospecting in Archaeology by Geophysical Methods, 534
Archer, B. L., and others : Incorporation of $[1\text{-}^{14}C]$-*iso*Pentenyl Pyrophosphate into Polyisoprene, 663
Archbishop of York (Dr. Ramsay) · New Universities (Underlying Principles which should guide a New University), 23
Area of Residence of Mental Hospital Patients (Studies on Medical and Population Subjects, No 16), (Registrar General), 716
Area Measurements (Surface) Use of Krypton for (Dr. John M Thomas), 134
Arginase in Rabbit Skin : Localization of (Dr. Simon Rothberg and Dr. Eugene J van Scott), 832
Arid Zone Research, Advisory Committee on, and the World Meteorological Organization : Joint Symposium on Changes of Climate, 361
Arley, Dr. Niels, and Eker, Reidar : Dose-Response Relationship in Radiation Carcinogenesis, 151
Armamentarium of Therapeutics : Modern, *review* by Prof F. Bergel, 699
Armstrong, F. H. : The Strength and Properties of Timber (Forest Products Research Laboratory, Bulletin No. 45), 975
Army, United States (Medical Department) Surgery in World War II—Neurosurgery, Vol. 2 (edited by R. Glen Spurling and Barnes Woodhall), *review* by J. E. A. O'Connell, 344
Arsenide (Gallium) : Space-Charge Currents in (J. W. Allen and R. J. Cherry), 297
Art Gallery (National), and Dominion Museum, Wellington, New Zealand . Report for 1959-60, 623
Arteriosclerosis (Spontaneous), of Old Hens : Inability of Refined Corn Oil to influence (K. F. Gey and Dr A. Pletscher), 491
Artery (Coronary), of the Portuguese East African (Joseph Gillman, Christine Gilbert and Manuel D Prates), 623
Artificial *p*H-Muscle · Action Potential with an (D. H. Walters, Prof. W. Kuhn and Hans J. Kuhn), 381
Artificial Satellite $1958\delta 1$: Rotation Period of the (P. Notni and H. Oleak), 737 ; (C. R. Faulkner), 738
Artin, Prof. Emil . Elected a Member of the Mathematics Section of the Leopoldina German Academy of Sciences, 273
Arts Graduates and Imperial Chemical Industries, Ltd., 969
Arts and Crafts to Technology . From, *review* by Prof. R. J Forbes, 174
Arts and Sciences, American Academy of: Rumford Premium awarded to Prof. C. H. Townes, 797
Ascites Carcinoma Cells (Ehrlich) : Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Ascospores : A Selective Medium for the Formation of, by *Aspergillus nidulans* (Isabel Garcia Acha and Dr Julio R. Villanueva), 328
Ashby, Sir Eric . Australian Universities, 434
Ashida, Prof. Kiyoshi, and others : Prevention of Fatty Liver due to Threonine Deficiency by Moderate Caloric Restriction, 917
Asia (South) · Mathematics in, 273
  Mathematical Education in—Report of the Second Conference on (Tata Institute of Fundamental Research, Bombay, 1960), 273
Asia (South) Science Co-operation Office (Unesco) : Regional Seminar on Scientific Documentation, 534
Asia (South and South-East) : Di^a, Js^a and V Blood Groups in (G. H. Vos and Dr. R. L. Kirk), 321
Aslib (Scottish Branch) : Annual General Meeting, 275
Aslib Cranfield Research Project : Interim Report on the Test Programme of an Investigation into the Comparative Efficiency of Indexing Systems (Cyril W. Cleverdon), 359

Aso, Kiyoshi (Yamamuchi, Fumio, and) : Crystalline α-Kojibiose, 753
Aspects of the Chemistry of Natural Products : Some (Chemical Society Symposium on), 625
Aspects of Drug Action : Repression and De-repression of Enzyme Synthesis as a Possible Explanation of some (Prof. Louis Shuster), 314
Aspects (Engineering), of Lubrication (Postgraduate Course on, at the Imperial College of Science and Technology, London), 624
Aspects (Mathematical), of Subsonic and Transonic Gas Dynamics (Lipman Bers), *review* by Prof. A. T. Price, 865
Aspects (Medical), of the Kariba Dam (Dr. M. H. Webster), 359
Aspergillus nidulans : A Selective Medium for the Formation of Ascospores by (Isabel Garcia Acha and Dr. Julio R. Villanueva), 328
Aspirin : Anticomplementary Action of (Dr. C. J. van Oss, J C Friedmann and Dr. M. Fontaine), 147
Asratyan, E. A. : Higher Nervous Activity (The Question of the Initiation and Localization of various Types of Cortical Inhibition in the Elements of the Conditioned Reflex Arc), 282
Assay of Sensitivity of Micro-organisms : Method of Dissolving Triacetyloleandomycin for the (Dr. J. W. Czekalowski), 752
Assay (Ninhydrin), in the Presence of Thiol Compounds (John R. Whitaker), 662
Assay (Urine) : Assessment of Dietary Strontium-90 through (Dr. Arthur R. Schulert), 933
Assaying some Viruses isolated from Common Colds : A Plaque Method for (Rosemary Parsons and Dr. D. A. J. Tyrrell), 640
Assessment of Dietary Strontium-90 through Urine Assay (Dr. Arthur R. Schulert), 933
Association (Apparent Geochemical), of Bismuth and Thallium (Dr. R. R. Brooks), 910
Astbury, Prof. W T. : Elected the fourth recipient of the T. Duckett Jones Memorial Award by the Helen Hay Whitney Foundation, 447
Astronomical Society (Royal) : Gold Medal awarded to Prof. Herman Zanstra, 188
  Eddington Medal awarded to Prof. Hans A Bethe, 188
  Election of Prof. W. H. McCrea as president, 880
Astronomical Union, International : Transactions of the, Vol. 10, Tenth General Assembly, Moscow, 1958 (edited by D. H. Sadler), *review* by D. McNally, 175
Asymmetric Nitrogen Atom : Specification of—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and Quaternary Ammonium Salts (G. Bernáth), 304
Atal, B. S., and others : Relative Efficiencies of Indian Languages, 614
Atassi, Dr. M. Z : Appointed Research Fellow in the Department of Chemistry in the University of Birmingham, 797
Atherogenic Diet : Experimental Pre-Thrombotic State of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an (Prof. B. A. Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
Atherosclerosis (Cholesterol- or Stilboestrol-Induced) : Fatty Acid Pattern in the Aorta Lipids of Cockerels in the Initial Stage of (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Atherosclerotic Sera . Reduced Fibrinolytic Activity of, caused by an Increase in Low-density Lipoproteins in Blood (Dr. Nirmal Sarkar), 929
Atkinson, Prof. R. J. C. : The Cloud of Unknowing, *review*, 610
Atlantic (North) Biogeography (To be published by the American Geographical Society), 358
Atmospheric Nitrogen : Possibility of Fixation of, by the Rice Plant (Dr M. G R. Hart and Dr E. H. Roberts), 598
Atoll (Jaluit), in the Marshall Islands : A Re-Survey of Typhoon Effects on (Dr. David I. Blumenstock, Dr. F. R. Fosberg and Charles G. Johnson), 618
Atom (Asymmetric Nitrogen) Specification of—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and Quaternary Ammonium Salts (G. Bernáth), 304
Atom Forum (Netherlands) : Establishment of the, 969
Atomic Absorption in the Flame : Enhancement of, by Organic Solvents (R. Lockyer, J. E. Scott and Susan Slade), 830
Atomic Beam Spectrophotometer (G. R Isaak), 373
Atomic Energy : Proceedings of the Second United Nations International Conference on the Peaceful Uses of (Geneva, 1958), Vol. 3, Processing of Raw Materials, *review* by Dr A. R Burkin, 87
Atomic Energy Agency (International) : *Nuclear Fusion* (*Journal of Plasma Physics and Thermonuclear Fusion*), Vol. 1, No. 1, 712
  Research on the Effects of Radioactivity in the Sea, 877
  Appointment of Prof Dragoslav Popovic as director of the Safeguards Division, 970
Atomic Energy Authority (United Kingdom) : Research on the Detection and Identification of Underground Nuclear Explosions, 445
  Re-organization in the, 622
  New Low-power Reactor called *Vera* (Versatile Experimental Reactor Assembly) at the Atomic Weapons Research Establishment, Aldermaston, 711
  Nestor, a New Reactor at Winfrith, 969
Atomic Energy Authority (United Kingdom), and others : To collect and disseminate information concerning Translations of Nuclear Literature, 102
  Establishment in Brussels of a new International Information Office called Transatom, 623
Atomic Energy Commission (Danish), and the Organization for European Economic Co-operation : Symposium on Health Physics in Nuclear Installations, 1959, *review* by W J. Whitehouse, 347
Atomic Energy Commission (United States) : Appointment of Dr. Glenn T Seaborg as chairman, 357
Atomic Energy Commission (United States), and others : To collect and disseminate information concerning Translations of Nuclear Literature, 102
  Establishment in Brussels of a new International Information Office called Transatom, 623
Atomic Energy Community (European), and others : To collect and disseminate information concerning Translations of Nuclear Literature, 102, 623
Atomic Weapons Research Establishment, Aldermaston : New Low-power Reactor called *Vera* (Versatile Experimental Reactor Assembly), 711
Atoms for Peace Award for 1961 awarded to Sir John Cockcroft, 447
Atoms (Nitrogen) : Rates of the Reactions of, with Oxygen and with Nitric Oxide (M. A. A. Clyne and Dr. B. A. Thrush), 56
Atoms (Oxygen) : Reaction of, with Hydrogen (M. A. A. Clyne and Dr. B A. Thrush), 135
Atoms and Molecules, *review* by Dr. G. A. Jones, 172
  Basic Physics of (Dr U. Fano and L. Fano), *review* by Dr. G. A. Jones, 172
Attempt to produce Haemolytic Disease in Lambs (Elizabeth M. Tucker), 847
Attention in Peripheral Vision : An Unexpected Effect of (B. Babington Smith), 776
Attractant (Mosquito) : Lysine as a (Prof. A. W. A. Brown and A. G. Carmichael), 508
Attridge, J : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Atypical Form of β_{2A}-Paraproteinaemia: Identification of So-called Atypical Macroglobulinaemia as an—a New Immunological Entity? (R. E. Ballieux, Dr. J. W. Imhof and G. H. Niehaus), 768
Atypical Macroglobulinaemia (So-called) · Identification of, as an Atypical Form of β_{2A}-Paraproteinaemia—a New Immunological Entity? (R. E. Ballieux, Dr J. W. Imhof and G. H. Niehaus), 768
Atypical Pneumonia Agent (Eaton's Primary) : Effect of an Organic Gold Salt on, and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Auditore, Dr. Joseph V. (Ende, Dr. Norman, and) : Mast Cells and Fibrinolysin, 593
Auerbach, Dr C. : Hazards of Radiation, 629
  Obituary of Prof G. Bonnier, 965
Augmentation of the Pressor Response to Guanethedine by Inhibition of Catechol O-Methyltransferase (Dr. D. W. Wylie), 490
Auricht, C. O., and others : Haptoglobin and Transferrin Types in the Kuru Region of Australian New Guinea, 68
Aurora : Radar Echoes from the, at 1,300 mc./s. (Dr. E. Eastwood, G. A. Isted and J. D. Bell), 115
Auroral Maps : Synoptic (Major F. R Bond and Dr. F. Jacka), 624; (G. Weill and S. Huille), 624 ; (P. Doyen), 624
Auroral Observations at Halley Bay, Antarctica, during 1959 (M. A. Sheret and G. M. Thomas), 826
Australia : Lipofuscin Pigmentation of Sheep Livers in (Dr. Hans Winter), 674
  Scientific Research in, 190
  Student Wastage in, 444
  Utilization of Water in (Victoria Branch of the Royal Australian Chemical Institute Discussion on), 537
Australia (Central) : Rock Carvings at Ewaninga in (C. P. Mountford), 103
Australian Aborigines and Genetics (Prof. R. Ruggles Gates), 423 ; (Prof. A. A. Abbie), 423
Australian Academy of Science (Standing Committee on Spectroscopy of the) : Third Australian Spectroscopy Conference, 714
Australian Chemical Institute, Royal (Victoria Branch) : Discussion on Utilization of Water in Australia, 537
Australian Commonwealth Scientific and Industrial Research Organization : Twelfth Annual Report (1959-60), 190
Australian Defence Scientific Service : Annual Report for 1958-59 of the Aeronautical Research Laboratories, 103
Australian Museum · New Wing of the, 186
Australian New Guinea : Haptoglobin and Transferrin Types in the Kuru Region of (Prof. J. H. Bennett, C O. Auricht, A J. Gray, Dr. R. L. Kirk and L. Y. C Lai), 68
Australian Spectroscopy Conference : Third (Standing Committee on Spectroscopy of the Australian Academy of Science), 714
Australian Universities (Sir Eric Ashby), 434
Australite Flanges : Distillation of Alkali Elements during Formation of (Dr. S. R. Taylor), 630
Auto-Alloploid Nature of *Pennisetum squamulatum* Fresen (B. D. Patil, M. W. Hardas and A. B. Joshi), 419
Autologous Brain : Antibodies against, in Rats with Allergic Encephalomyelitis (S. Martin Harwin, Prof. Philip Y. Paterson and Norman C. Didakow), 322
Automatic Language Translation (Prof. Anthony G. Oettinger), *review* by Dr. A. D. Booth, 784
Automatic Programming Information Centre of Brighton Technical College : Course in Algol 60, 275
Automatic Translation (D. Yu Panov), translated from the Russian by R. Kisch ; edited by A. J. Mitchell, *review* by Dr. A. D. Booth, 784
Automatic and Semi-Automatic Methods in Analysis and Control (Medway College of Technology Symposium and Instrument Exhibition on), 447
Autoradiographic Technique (A 'Dry' Mounting), for the Localization of Water-soluble Compounds (P. J. Fitzgerald, Margery G. Ord and Dr. L. A. Stocken), 55
Autoradiographical Detection of Tritium-labelled Inulin in the Kidney (J. Gayer, E. H Graul and H. Hundeshagen), 500
Autoradiography : Adaptation of a Chromatographic Technique for (Dr. R N. Greenshields), 851
Autoradiography (Electron Microscopic), in a Magnetic Field (Dr. Carl G. Harford and Alice Hamlin), 505
Avery, R J., and others · Brain Glycogen- and Copper-Levels in Normal Sheep and Sheep affected with Scrapie, 410
Aviation : Agricultural, *review* by R. J. Courshee, 611
Aviation, Ministry of : Appointment of Peter Lloyd as director general of engine research and development, 104, 272
  Promotion of F. H. Scrimshaw to Deputy Chief Scientific Officer, 530
Aviation (Agricultural) Conference · Report of the First International (Cranfield, 1959), *review* by R J. Courshee, 611
Avid A2 Influenza Virus Strains : Presence in Horse Serum of Two Inhibitors of (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Avocado Trees : Isolation of D-Glycero-D-galacto-heptitol from the Wound Exudate of (J. K. N. Jones and R. A. Wall), 746
Awa, A., and others : Chromosome Anomaly in Two Cases of Cerebral Palsy, a Brother and Sister, 154
Awareness : Changes in Mode of Respiration as an Indication of Level of (Dr. L. Goldie and J M. Green), 581
Awny, Armed Y., and others : Haemoglobin E in Egypt, 69
Axelrod, Dr. J , and others : Lack of Uptake of Catecholamines after Chronic Denervation of Sympathetic Nerves, 66

Axis (Polar) : X-Ray Correlation of the *A-B* Layer Order of Cadmium Selenide with the Sign of the (R. Zare, W. R. Cook, Jun., and L. R. Shiozawa), 217
Axon, Dr. H. J. : Introducing Meteorites, *review*, 432
Ayrey, G., and others : Incorporation of [1-^{14}C]-*iso*Pentenyl Pyrophosphate into Polyisoprene, 663
6-Azauridine : Control of Fertility by (Margaret A. Sanders, Dr. B. P. Wiesner and Prof. John Yudkin), 1015

BABESIA CANIS : 6-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride Hydrochloride—a New Drug Active against (S. S. Berg and J. M. S. Lucas), 64
Bach, Michael K. : Apparent Reversal of Xanthine Oxidase Action in *Chlorella vulgaris* Starved of Nitrogen, 485
Bach, Michael K., and Fellig, J. : Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by Bean Stems—Heterogeneity of the Ethanol-soluble, Ether-insoluble Products, 763
Bacillus cereus : Changes in Radioresistance of Sporulating Cells of (Dr. Vladimír Vinter), 589
Bacillus cereus NRRL 569 : Isolation and some Properties of the Phages of (Dr. J. Foldes, Katalin Merétey and István Varga), 161
Back Grant of the Royal Geographical Society awarded to Dr. Eric H. Brown, 443
Backhouse, Dr K. M. : Vertebrate Locomotion (Fish-like Lateral Motion of the Hind Feet of the Seal when Swimming in Water), 98
Backroom Boy : A (Arthur Stanley), *review* by Dr. R. L. Smith-Rose, 612
Backus, Dr. E. J., and others The Host-Range of a *Streptomyces aureofaciens* Actinophage, 603
Bacon, Dr. G. E. : Graphite, an Ideally Imperfect Material, *review*, 522
Bacq, Z. M. : Primary and Initial Effects of Ionizing Radiations (Mechanism of Radiation Protective Agents), 111
Bacteria : Chelating Agents for Selective Growth of (G. M. Richardson), 78
Enzymatic Synthesis of Poly-β-Hydroxybutyric Acid in (Dr. J. M. Merrick and Prof. M Doudoroff), 890
Influence of the Charge on a Serum Protein Molecule and its Ability to Stimulate or Inhibit the Phagocytosis of, by Leucocytes (B. J. Northover), 574
Bacteria labelled with Heavy Isotopes for the Isolation of Nucleic Acids : Growth of (Dr. Julius Marmur and Carl L. Schildkraut), 636
Bacteria (Anaerobic) : Lipolytic Activity of some (C. Gonzalez and G. Sierra), 601
Bacteria (Non-dividing) : Replication of Deoxyribonucleic Acid in (Dr. Daisuke Nakada and Dr. Francis J Ryan), 398
Bacteria and Yeast : Nature of the Ribosomes present in—a Re-Appraisal (T J Bowen, Dr. S. Dagley, Dr. J. Sykes and Dr. D G. Wild), 638
Bacterial Cells and their Extracts : Use of Radioactive Nitrogen in Studying Nitrogen Fixation in (Dr. D. J. D Nicholas, Dr. D. J. Silvester and Dr. J. F. Fowler), 634
Bacterial Cellulose : Variation of Elasticity along Single Microfibrils of (J Ross Colvin), 1029
Bacteriology at the London School of Hygiene and Tropical Medicine, 18
Bacteriophage : Inhibition of Multiplication of, by Actinomycin (Atsuo Nakata, Mutsuo Sekiguchi and Prof. Junichi Kawamata), 246
Bacteriophage ΦX 174 · Genetic Recombination in (Dietrich Pfeifer), 422
Baddiley, Prof. J. : Elected a Fellow of the Royal Society, 966
Bader, M. G. (Wilkins, B. J. S., and) : Initiation of Fatigue Cracks in Beta-Brass, 301

Bush, Prof. S. F. : Biogeography of South-East Africa, 801
Buskirk, Dr. E. R. (Moore, Dr. R., and) : Differential Sublimation Rates of Light and Tritium-labelled Water, 149
Busse, M., and Kandler, Prof. O. . Biosynthesis of Acetoin by *Leuconostoc citrovorum*, 774
Bustad, L. K., and others : Fibrosarcoma in a Rabbit following β-Irradiation of the Skin, 770
n-Butane inhibited by Propylene : Nature of the Reactions involved in the Pyrolysis of (J. H. Purnell and C. P. Quinn), 656
Butler, Prof. C. C. : Elected a Fellow of the Royal Society, 966
Butler, Elizabeth A., and others : Two New Haemoglobin Variants in a Very Young Human Embryo, 496
Butler, F. E. : Strontium-90 in Human Teeth, 848
Butler, Prof. J. A. V., and Robins, A. B : Effect of *p*H on the Sensitiveness of Trypsin to Ionizing Radiation, 852
Butler, Dr. R. A., and Hill, Dr. D. W · Estimation of Volatile Anaesthetics in Tissues by Gas Chromatography, 488

CACACE, Fulvio, and others : Labelling of Organic Compounds by Mercury-photosensitized Reaction with Tritium Gas, 54
Cadmium Crystals grown from Vapour · Etch Patterns on (Joy George), 743
Cadmium Selenide : X-Ray Correlation of the *A-B* Layer Order of, with the Sign of the Polar Axis (R. Zare, W. R. Cook, Jun., and L. R. Shiozawa), 217
Caesarian-derived (so-called) Pathogen-free Rats : Spontaneous Cytomegalic Inclusion Body Disease involving Lacrimal Glands of (Dr. Hans Meier), 534
Caesium-137 (Strontium-90 and), in Grass and Milk in Finland during 1959 (J. K. Miettinen, O. Paakkola, R. Näsänen, A. Vuorinen and D. Merten), 324
Cahn–Ingold–Prelog Nomenclature : Application of the, to some Tertiary Amines and Quaternary Ammonium Salts—Specification of Asymmetric Nitrogen Atom (G. Bernáth), 304
Cairns, John M., and others : Induction of Melanotic Tumours in the White ('Partial Albino') Syrian Hamster, 936
Calciferol-induced Metastatic Calcification in the Rat : Inhibiting Effect of 2.4-Dinitrophenol on (R. A. Grant, M. Hathorn and Dr. Theodore Gillman), 317
Calcification (Calciferol-induced Metastatic), in the Rat : Inhibiting Effect of 2:4-Dinitrophenol on (R. A. Grant, M. Hathorn and Dr. Theodore Gillman), 317
Calcium : Influence of, on the Potassium-Contracture of 'Slow' and 'Fast' Skeletal Muscle Fibres of the Frog (P. Pauschinger and Prof. K. Brecht), 583
Calcium-45: Release of, from Frog Nerves during Electrical Activity (Prof. K. Koketsu and S. Miyamoto), 402
Calcium (Membrane), in Calcium-free and Potassium-rich Media: Significance of (Prof. K. Koketsu and S. Miyamoto), 403
Calcium-free and Potassium-rich Media : Significance of Membrane Calcium in (Prof. K. Koketsu and S. Miyamoto), 403
Calcium Fluoride Structure : Microhardness and other Properties of Magnesium Compounds with the (E. R. Petty), 132
Calcium Gluconate : Protective Action of, against After-Effects of X-Irradiation on Conidia of *Neurospora crassa* (Prof. J. Weijer), 760
Calcium Pantothenate (Pantothenic Acid) : Effects of, and of Thyroxine on the Development of Chicken Embryos (Prof. C. Vacca, G. V. Pelagalli and A. Schiavo), 66
Calcium Phosphates . Rehardening of Softened Enamel Surfaces of Human Teeth by Solutions of (Theodore Koulourides, Prof. Heriberto Cueto and Dr. Ward Pigman), 226
Calcium and Phosphorus Excretion in the Laying Hen : Partition of (S. Hurwitz and Prof. P Griminger), 759
Calculation of $N(h)$ Profiles from Ionospheric $h'(f)$ Curves : A New Method for the (H. Hojo), 562
Calculus : Operational (Prof. Jan Mikusiński), *review* by Prof. T. A. A. Broadbent, 700
Calcutta School of Tropical Medicine, and the Carmichael Hospital for Tropical Diseases : Joint Annual Report for 1958-59, 359
Calder, Dr. A. B. : Direct Methods of Estimation in the Spectrographic Analysis of Cobalt in Soil Concentrates, 165
Calder, Prof. Ritchie : Awarded the Kalinga Prize by Unesco, 880
Calendar for 1961 : International Geophysical (Prof A. H. Shapley), 9
Calendar of Centenaries 1961, 8
Calf : Uptake of Small Resin Particles by the Alimentary Canal of the (J. M. Payne and B. F. Sansom), 494
California Institute of Technology · 1961 James Watt International Medal of the Institution of Mechanical Engineers awarded to Prof. Theodore von Kármán, 361
California Institute of Technology and Research Corporation : 1960 Research Corporation Award awarded to Dr. Rudolf L. Mössbauer, 275
Callear, Dr. A. B. : Vistas in Free-Radical Chemistry, *review*, 433
Caloric Restriction (Moderate) : Prevention of Fatty Liver due to Threonine Deficiency by (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A. E. Harper), 917
Calorie Balance in Man (Nutrition Society Symposium on), 536
Calorific Value of Gaseous Fuels, *review* by R. J. H. Banks, 255
Calorimetric and Thermodynamic Data : Publication of, 454
Calorimetry : Gas (Major C. G. Hyde and M. W. Jones), second edition, *review* by R. J. H. Banks, 255
Calves (Murrah Buffalo) · Effect of Exposure to Sun and Exercise on Heat Tolerance Coefficient in (D. S. Bhatnagar and N. C. Chaudhary), 844
Cameron, Prof. J. M. : New Universities (Full Participation of all the Academic Staff in the Governing of the Institution), 24
Cameron, Thomas W. M. (edited by) : Evolution, its Science and Doctrine —Symposium presented to the Royal Society of Canada, 1959, *review* by Dr. P. G. Fothergill, 340
Campbell, M. : Elected a Fellow of the Royal Society of Edinburgh, 876
Campbell, Dr. P. N., and Whelan, Dr. W. J. : Golden Jubilee of the Biochemical Society, 701
Canada, National Research Council of . Appointment of Dr. D. C. Rose as director of the Division of Pure Physics, 444, *erratum*, 797
  Symposium on Self-Regulation in Living Systems, 799
Canada, Royal Society of : Symposium on Evolution—its Science and Doctrine, 1959 (edited by Thomas W. M. Cameron), *review* by Dr. P. G. Fothergill, 340
Canary Islands : Potato Root Eelworm in the (R. Chamberlain), 773
Canavanine in Leguminosae (B. A Birdsong, R. Alston and B. L. Turner), 360
Cancer (Mammary), induced by a Single Feeding of Polynuclear Hydrocarbons, and its Suppression (Prof. Charles Huggins, Lorraine C. Grand and Filomena P. Brillantes), 204
Cancer Chemotherapy National Service Center (Biochemistry Committee), and others : International Conference on the Biochemistry of Human Tumours, 627
Cancer Hospital (Royal), London : Title of professor of biophysics as applied to medicine in the University of London (at the Institute of Cancer Research) conferred on Dr. L. F. Lamerton, 22
  Appointment of E. J. Ambrose as reader in physical chemistry at the Institute of Cancer Research, 22
  Appointment of Dr. G. M. Timmis as reader in chemistry at the Institute of Cancer Research, 22
Cancer Institute (National), and others : International Conference on the Biochemistry of Human Tumours, 627
Cancer Research : Immunology and (The Collected Papers of Paul Ehrlich, Vol. 2), *review* by Prof. C. H Browning, 254
Candida albicans : A Simple Medium for the Demonstration of Chlamydospores of (R. Dutt-Choudhuri and Prof. Robin Dutt), 418
Canine Blood Vessel Walls : Evidence of Active Ion Transport across Large (Prof. P. N. Sawyer and I Valmont), 470
Capillary Columns : An Enrichment Trap for Use with (R. Self), 223
Caputo, Prof Antonio : Molecular Properties of Conjugated Proteins isolated from Exudates, 395
Carberry, James J. · Determination of Heats of Adsorption by Transient-Response Techniques, 391
Carbon-14 · Formation of Hippuric Acid from Phenylalanine labelled with, in Phenylketonuric Subjects (Dr. H.-D. Grümer), 63
Carbon (Graphitic), and Non-Graphitic Carbon : Surface Orientation and Friction of Graphite, (Dr. J. W. Midgley and D. G. Teer), 735
Carbon (Non-Graphitic) : Surface Orientation and Friction of Graphite, Graphitic Carbon and (Dr. J W. Midgley and D. G. Teer), 735
Carbon Monoxide—the System $e^3\Sigma^-$–$a^3\Pi$. Triplet Bands of (Dr. R. F. Barrow), 480
Carbon Monoxide from Flavonoids : Microbial Production of (D. W. S. Westlake, J. M. Roxburgh and G. Talbot), 510
[1-^{14}C]-*iso*Pentenyl Pyrophosphate : Incorporation of, into Polyisoprene (B. L. Archer, G. Ayrey, E. G. Cockbain and G. P. McSweeney), 663
2-^{14}C-Mevalonic Acid · Biosynthesis of ^{14}C-Sclareol and β-Sitosterol from (Prof. Harold J. Nicholas), 143
^{14}C-Sclareol and β-Sitosterol from 2-^{14}C-Mevalonic Acid : Biosynthesis of (Prof. Harold J. Nicholas), 143
Carbon Tetrachloride : Inhibition of Experimental Cirrhosis by, following Treatment with Aminoacetonitrile (Dr. L. Fiume and Prof. G. Favilli), 71

Carbon and Nitrogen Source (A Simultaneous), for a *Streptomyces* sp. from Egyptian Soil : Chloramphenicol, a (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775
Carbonic Anhydrase and the Inner Ear (Dr. S. D. Erulkar and Prof. T. H. Maren), 459
Carboniferous Peat Bogs : Palaeoecology of (A. H. V. Smith), 744
Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid : Metabolism of, by Bean Stems—Heterogeneity of the Ethanol-soluble, Ether-insoluble Products (Michael K. Bach and J. Fellig), 763
N-*o*-Carboxyphenylribosylamine . Lability of, as a Factor in the Study of Tryptophan Biosynthesis (Dr. Colin H. Doy), 461
Carcinogenesis (Radiation) : Dose-Response Relationship in (Dr. Niels Arley and Reidar Eker), 151
Carcinoma Cells (Ehrlich Ascites) : Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Cardiac Effects of Streptolysin O in Rabbits (Prof. S. P. Halbert, R. Bircher and E. Dahle), 232
Cardiac Muscle (Sheep) : Relationship of the Sarcoplasmic Reticulum to Sarcolemma in (F. O. Simpson and S. J. Oertelis), 758
Carey, Dr. I. Y. : Impact of Man on the Vegetation of the Humid Tropics (Effects of Shifting Cultivation—Methods of the Temiar People), 25
Carlstrom, Dr. Gun (Brody, Dr. Sam, and) : Clinical Application of a Serological Method for the Determination of Human Chorionic Gonadotrophin, 841
Carmichael, A. G. (Brown, Prof. A. W. A., and) : Lysine as a Mosquito Attractant, 508
Carmichael Hospital for Tropical Diseases (Calcutta School of Tropical Medicine and the) : Joint Annual Report for 1958-59, 359
Carnation Plant (Young) : Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a Seed Dressing, in the Tissues of the (June Robson and P. Fenn), 501
Carnegie Institution of Washington : Report of the President for 1959-1960 (Dr. Caryl Haskins), 695, 972
  Year Book No. 59 (1959-60), 972
Carozzi, Prof. Albert V. : Microscopic Sedimentary Petrography, *review* by Dr. F. S. Wallis, 257
Carpenter, Prof. Anna-Mary (Stock, Prof. Aaron H., and) : *Obituary* of Prof. Maud Menten, 965
Carru, H., and others : A Transatlantic Communication Experiment via *Echo* I Satellite, 268
Carruthers, Dr. W. : Tobacco Smoke Research, 453
Carson, R. B., and others : Brain Glycogen- and Copper-Levels in Normal Sheep and Sheep affected with Scrapie, 410
Carter, Dr. G. S. . Evolution, *review*, 89
Cartilage . Effect of Cortisone and related Compounds on the Biogenesis of (Dr. M. W. Whitehouse and Dr. J. W. Lash), 37
Cartilage (Embryonic Mammalian) : Growth of, after Freezing (Dr. Susan Heyner), 1027
Carvalho, Dr A. : Linkage in *Coffea arabica*, 685
Carvings (Rock), at Ewaninga in Central Australia (C. P. Mountford), 103
Casida, Prof John E., and Sanderson, D M. : Toxic Hazard from Formulating the Insecticide Dimethoate in Methyl 'Cellosolve', 507
Cassiopeia A (Radio Source) : Secular Variation of the Flux Density of the (Dr. J. A. Hogbom and Dr. J. R Shakeshaft), 561
Castermans, Dr. André · Nucleic Acids as Transplantation Antigens, 504
Catalase Synthesis and Destruction *in vivo* : Methods for Determining the Rates of (Dr. V. E. Price, M. Rechcigl, jun , and R. W. Hartley, jun.), 62
Catalysis (edited by Paul H Emmett), Vol. 7, Oxidation, Hydration, De-hydration and Cracking Catalysts, *review* by Dr. E. B. Maxted, 88
Catalysts : Oxidation, Hydration, Dehydration and Cracking (edited by Paul H Emmett), (Catalysis, Vol. 7), *review* by Dr. E B. Maxted, 88
Catechol O-Methyltransferase · Augmentation of the Pressor Response to Guanethedine by Inhibition of (Dr D. W. Wylie), 490
Catecholamines : Lack of Uptake of, after Chronic Denervation of Sympathetic Nerves (Dr. G. Hertting, Dr. J. Axelrod, I. J. Kopin and L. G. Whitby), 66
Cats : Plastic Changes of Spinal Monosynaptic Responses from Tenotomized Muscles in (Dr. W. Kozak and Dr. R. A Westerman), 753
Cattell, Jaques : *Obituary*, 184
Cattle : Relationships between Blood Groups and the Fat Percentage of the Milk in (Jan Rendel), 408
Cattle (Indian Zebu) : Rate of Evaporation from Different Regions of the Skin of (Dr. D. Roy Chowdhury and Dr. D. P. Sadhu), 491
Causes of Death : Shortening of Life and, in Mice exposed to a Single Whole-Body Dose of Radiation (Dr. Patricia J. Lindop and Prof. J. Rotblat), 645
Cavalieri, Prof. Liebe F., and others : Multi-stranded Deoxyribonucleic Acid as determined by X-Irradiation, 833
Cavanagh, Leonard A. (Pasternak, R. A , and) : Accurate Determination of Molecular Weights of Unknown Materials in Solution, 446
Cave (Niah), Sarawak : An Extinct Giant Pangolin and associated Mammals from (Tom Harrisson, D. A. Hooijer and Lord Medway), 166
Cavonius, C. R., and others : Photographic Cumulation of Recurrent Response Potentials, 383
Caw, W. A., and Wylie, R G. : Effect of Dissolved Air on the Viscosity of Water, 995
Cell of *Escherichia coli* : Localization of a Protease in the (Dr. J. Chaloupka), 512
Cell (Dog Mast) Tumour : Histochemical Evidence of Hydroxytryptamine in a (Prof. W. G. Rice and Dr. James Mitchener), 767
Cell (*Salmonella typhimurium*) : Phenomic Delay in Transduction of (Dr. J. Hubáček), 679
Cell Cultures of Human Origin : Alkaline Phosphatase in (Dr. Harold M. Nitowsky and Dr. Fritz Herz), 756
Cell Fractions (Rat Liver) : Distribution of Coenzyme Q in (P. Seshadri Sastry, J. Jayaraman and Dr. T. Ramasarma), 577
Cell Nucleus : Uptake of Deoxyribonucleic Acid (DNA)—a Special Property of the (Dr. M. Hill), 916
Cell Proliferation : Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of Data on (Eugene P. Cronkite, Samuel W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Cell Response (Horizontal), to Retinal Illumination : Location of the Non-Linearity in (Dr. Richard Fatehchand, Dr. Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Cell Shape (Red) : Deformation of, induced by *Vipera palestinae* Venom *in vivo* (Dr. D. Danon, S. Gitter and M. Rosen), 320
Cell Walls of *Escherichia coli* : Isolation of Lysozyme-soluble Mucoproteins from the (Dr. L. Mandelstam), 855
'Cellosolve' (Methyl) : Toxic Hazard from Formulating the Insecticide Dimethoate in (Prof. John E. Casida and D. M. Sanderson), 507
Cells of Origin of the Ventral Spino-Cerebellar Tract : Localization of the (J. I Hubbard and O. Oscarsson), 157
Cells which Synthesize Protein : Cytology of (M. S. C. Birbeck and Dr. E. H. Mercer), 558
Cells from Tuberculin-sensitized Guinea Pigs : Active Sensitization to Tuberculin with (Dr. J. L. Turk), 889
Cells (Bacterial), and their Extracts : Use of Radioactive Nitrogen in Studying Nitrogen Fixation in (Dr. D. J. D. Nicholas, Dr. D. J. Silvester and Dr. J. F. Fowler), 634
Cells (Ehrlich Ascites Carcinoma) : Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and (Rose M. Johnstone and Dr. Stephen I Vas), 70
Cells (Enterochromaffin) . Presence of, in the Gut of Amphioxus (Dr. Giuseppe Gerzeli), 237
Cells (Foetal Leydig's) : Steroid-3β-ol-Dehydrogenase Activity in (Dr. Mikko Niemi and Dr. M. Ikonen), 592
Cells ('L' and 'ERK') : Species-characterizing Antigens of (Dr. R. R. A. Coombs, Mary R. Daniel, B. W. Gurner and A. Kelus), 503
Cells (Mammalian), *in vitro* : Alteration of the Growth of, by Ecdysone Extract (Prof. Walter J Burdette and Dr. Ralph C Richards), 666
Cells (Mast), in Peripheral Nerve Trunks (H. J. Gamble and Prof. Stephen Goldby), 766
Cells (Mast), and Fibrinolysin (Dr. Norman Ende and Dr. Joseph V. Auditore), 593
Cells (Myeloid and Lymphoid), from a Parental Strain : Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with (V Schwarzmann, Prof. G. Mathe and J L. Amiel), 1025
Cells (Normal) : *In vitro* Transformation of, by Polyoma Virus (Dr. Leo Sachs and Dan Medina), 457
Cells (Novikoff Hepatoma), of the Rat : Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Cells (Salk 'Altered' Monkey Heart), and Ehrlich Ascites Carcinoma Cells : Immunological Cross-Reactions between (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Cells (Sporulating), of *Bacillus cereus* : Changes in Radioresistance of (Dr. Vladimir Vinter), 589
Cellular Respiration : Inhibition of, by Co-Carcinogenic Fractions of Croton Oil (Dr. A. C. Allison and J. W. Lightbown), 892
Cellulose · Crystals of (R. St. John Manley), 390
Cellulose (Bacterial) : Variation of Elasticity along Single Microfibrils of (J. Ross Colvin), 1029
Cellulose Derivatives of Enzymes : Synthesis of Biologically Active (Dr. Milton A. Mitz and Louis J. Summaria), 576
Centenaries (Joan M Eyles), 182
Centenaries 1961 : Calendar of, 8
Central Advisory Water Committee : Sub-Committee on the Growing Demand for Water, Second Report, 278
Central Australia : Rock Carvings at Ewaninga in (C. P Mountford), 103
Central Nervous System (Elementary) : Pharmacological Specificities of Neurones in an (Dr. H. Gerschenfeld and Dr. L. Tauc), 924
Centrifugation (Equilibrium Density-gradient), of Animal Viruses : Use of Potassium Tartrate for (Prof J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Centrosema Mosaic, a Plant Virus Disease transmitted by both Aphids and Plant Bugs (R J Van Velsen and Dr. N. C. Crowley), 858
Cerebral Palsy : Chromosome Anomaly in Two Cases of, a Brother and Sister (Dr. J. Blumel, Y. Ohnuki and A. Awa), 154
Cerebrospinal Fluid of Phenylketonurics : Apparent Absence of Amines in (Dr. Thomas L. Perry, Kenneth N. F. Shaw and Dorothy Walker), 926
Cerebrospinal Fluid (Normal) · Transferrin in (Dr Jørgen Clausen and Troels Munkner), 60
Certificate (Post-School), and Higher Education in Nigeria : The Report of the Commission on—Investment in Education, 169
Certificates (Endorsed), in Biology, 20
Cessation of Nuclear Tests : Observations of Fall-out in India during the Period of (K. G. Vohra and V S. Bhatnagar), 286
Cetaceans Hearing in (F. C. Fraser and P. E. Purves), 187
Chadderton, Lewis T. : Electron Microscopy of Crystal Lattices—an Anomalous Effect, 564
Chaetacis . New Species of, from South America (Arthur M. Chickering), 446
Chains (Polypeptide), of Haemoglobin A_2 (Dr. E. R. Huehns and Dr. E. M. Shooter), 918
Chakrabarty, Dr. M. M. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Chaldecott, J. A · Appointed keeper of the Science Museum Library, 188, 530 , work of, 530
Challoner, Dr. David, and others : Fatty Acid and Glucose Metabolism in the Perfused Heart, 1018
Chalmers, Dr. T. M. : Calorie Balance in Man (Metabolism of Adipose Tissue), 537
Chaloupka, Dr. J. : Localization of a Protease in the Cell of *Escherichia coli*, 512
Chamberlain, R. : Potato Root Eelworm in the Canary Islands, 773
Chance, Prof Britton : Energy-linked Cytochrome Oxidation in Mitochondria, 719
Chandler, Dr. R. L : Greater Susceptibility to *Mycobacterium johnei* of *C.* 57 Black Mice, when compared with *CBA* and Swiss White Mice, 602
Change in the Earth's Radius : Palaeomagnetic Evidence relevant to a (Allan Cox and Richard R. Doell), 45
Changes of Climate (Advisory Committee on Arid Zone Research and the World Meterological Organization Joint Symposium on), 361
Changes in Mode of Respiration as an Indication of Level of Awareness (Dr. L. Goldie and J. M. Green), 581

Changes in Radioresistance of Sporulating Cells of *Bacillus cereus* (Dr. Vladimir Vinter), 589
Changes in Sea-level recorded in New Zealand (J. C. Schofield), 533
Changes (Microbiological), in Freshly Moistened Soil (Dr. E. Griffiths and H. F. Birch), 424
Changes (Myocardial Tissue), associated with Rigor Mortis (Piero Gallo), 114
Changes (Phase), in Zirconia from Thermal Etching : Evidence of (P. E. Evans and G. Wildsmith), 569
Changes (Plastic), of Spinal Monosynaptic Responses from Tenotomized Muscles in Cats (Dr. W. Kozak and Dr. R. A. Westerman), 753
Changing Industrial Environment (T. H. Hawkins), 283
Channel (Bristol) : Geology of the Floor of the (Dr. D. T. Donovan, Dr. R. J. G Savage, A. H. Stride and A. R. Stubbs), 51
Characteristics of γ-Globulin, lacking Antibody Properties, in New-born Pigs (Dr. F. Franek, Dr. I. Říha and Dr. J. Sterzl), 1020
Characteristics (Spectral), of Aggregated Chlorophyll and its Possible Role in Photosynthesis (Seymour Steven Brody and Marcia Brody), 547
Characterization (Morphological), of the Virus of the Human Common Wart (*Verruca vulgaris*), (M. G. Williams, A. F. Howatson and J. D. Almeida), 895
Charge on a Serum Protein Molecule : Influence of the, and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes (B. J. Northover), 574
Charge (Space-) Currents in Gallium Arsenide (J. W. Allen and R. J. Cherry), 297
Charge Transfer Compounds : Organic Halides as Electron Acceptors in (T. Bjorvatten, Prof. O Hassel and Chr. Rømming), 137
Charges (Free), from Motor-Car Exhaust Gases : Detection of (Dr. T. Westermark), 910
Chari, Dr. M S R. : Anomalous Conductivity and Lorenz Parameter in Dilute Silver–Manganese Alloys at Low Temperatures, 824
Charing Cross Hospital Medical School, London . Appointment of Dr. H. I. Winner as reader in bacteriology, 22
Charles, Sir John · The Health of the School Child—Report of the Chief Medical Officer of the Ministry of Education for 1958 and 1959, 974
Charlson, Dr A. J : Appointed I.C I. Research Fellow in the University of Edinburgh, 22
Chatt, Dr. J. : Appointed group manager of the Heavy Organic Chemicals Division of the Akers Research Laboratory of Imperial Chemical Industries, Ltd., 275 ; *erratum*, 447
  Elected a Fellow of the Royal Society, 966
Chatt, Dr. J., and Watson, H. R. : Complexes of Zerovalent Vanadium, Chromium, Molybdenum and Tungsten with a Ditertiary Phosphine, 1003
Chatterjee, G C. (Mitra, Sankar, and): Lecithin-splitting Enzyme of *Vibrio* El Tor, 837
Chaudhary, N. C (Bhatnagar, D. S , and) : Effect of Exposure to Sun and Exercise on Heat Tolerance Coefficient in Murrah Buffalo Calves, 844
Chaudhri, Prof. Rafi Mohammed, and Kyan, Mustaf Yar : Emission of Soft Electromagnetic Radiation from Metals by the Impact of High-Energy Protons and Positive Ions, 996
Chelating Agents for Selective Growth of Bacteria (G. M. Richardson), 78
Chemical Analysis of Resin-based Coating Materials (edited by Dr. C. P. A. Kappelmeier), *review* by Dr. D. T. Lewis, 175
Chemical Bond . The Nature of the, and the Structure of Molecules and Crystals (Prof Linus Pauling), third edition, *review* by Prof. C. A. Coulson, 3
  Pauling's, *review* by Prof. C. A. Coulson, 3
Chemical Engineer : Computers for the (Graduate Section of the Birmingham University Chemical Engineering Society and the Graduates and Students Section of the Midlands Centre of the Institution of Chemical Engineers Symposium on), 534
Chemical Engineering : Course in (University College of Swansea), 447
Chemical Engineering Society (Graduate Section of Birmingham University), and the Graduates and Students Section of the Midlands Centre of the Institution of Chemical Engineers : Symposium on Computers for Chemical Engineers, 534
Chemical Engineers, Institution of : Symposium at the University of Birmingham, 880
Chemical Engineers, Institution of (Graduates and Students Section of the Midlands Centre), (Graduate Section of the Birmingham University Chemical Engineering Society and the) : Symposium on Computers for Chemical Engineers, 534
Chemical Industries (Engineering and), in Britain : Technicians in, 973
Chemical Industry, Society of : Medal for 1961 awarded to Sir Cyril Hinshelwood, 22
  Essay Competition on Corrosion Science, 274
Chemical Institute, Royal Australian (Victoria Branch) : Discussion on Utilization of Water in Australia, 537
Chemical Isomerism : Influence of, on the Szilard–Chalmers Processes in Solids (T. Costea and I. Dema), 478
Chemical Oxidation of Uridine Diphosphate-Glucose to Uridine Diphosphate-Glucuronic Acid (Dr. Bernard Jacobson and Dr. Eugene A. Davidson), 663
Chemical Society : Anniversary Meeting, 625
  Symposium on Developments in the Chemistry of Boron Compounds, 625
  Symposium on Some Aspects of the Chemistry of Natural Products, 625
Chemical and Metallurgical Plant Criticality Control in (European Nuclear Energy Agency of the Organization for European Economic Co-operation in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H. International Symposium on), 797
Chemicals (Toxic), and Wild Life, 878
Chemische Vereniging (Koninklijke Nederlandse), and others . Fifth European Congress on Molecular Spectroscopy, 797
Chemistry . Food (Prof. Lillian Hoagland Meyer), *review* by A. M. Copping, 259
  Medicinal (edited by Prof Alfred Burger), second edition, *review* by Prof. F. Bergel, 699
  Ramsay Memorial Fellowship for advanced students of (Ramsay Memorial Fellowships Trust), 534
  Rare-Earth, *review* by Dr. J. S. Anderson, 345
Chemistry of Boron Compounds . Developments in the (Chemical Society Symposium on), 625
Chemistry of Natural Products : Some Aspects of the (Chemical Society Symposium on), 625
Chemistry of Yttrium and Scandium (Dr. R. C. Vickery), *review* by Dr. J. S. Anderson, 345
Chemistry (Alkaloid) : Progress in, *review* by Dr. E. G. Kellett, 430
Chemistry (Analytical), Society for (Gas Chromatography Discussion Group and the) : International Symposium on Gas Chromatography, 26
Chemistry (Free-Radical) : Vistas in (edited by Dr. W. A. Waters), *review* by Dr. A. B. Callear, 433
Chemistry (Inorganic) : Advances in, *review* by Dr. D. W. A Sharp, 521
Chemistry (Inorganic), and Radiochemistry : Advances in (edited by H. J. Emeléus and A. G. Sharpe), Vol. 2, *review* by Dr. D. W. A. Sharp, 521
Chemistry (Organic) : Physical Methods of (edited by Arnold Weissberger), Vol. I, Parts I and 2, third edition, *review* by Dr. W. A. Waters, 954
Chemistry (Physical), of Surfaces (Prof. Arthur W. Adamson), *review* by Prof. N. K. Adam, 521
Chemistry (Pure and Applied), International Union of : *Journal* of the, 20
  Symposium on Microchemical Techniques (organized by the Metropolitan Microchemical Society), 188
Chemistry (Pure and Applied), International Union of, and others : Fifth European Congress on Molecular Spectroscopy, 797
Chemistry (Radio-) : Advances in Inorganic Chemistry and (edited by H. J Emeléus and A. G. Sharpe), Vol. 2, *review* by Dr. D. W. A. Sharp, 521
Chemistry (Surface) : A Text-Book of, *review* by Prof. N. K. Adam, 521
Chemotherapy (The Collected Papers of Paul Ehrlich, Vol. 3), *review* by Prof. C. H. Browning, 254
Chemotherapy (Cancer) National Service Center (Biochemistry Committee), and others : International Conference on the Biochemistry of Human Tumours, 627
Chen, Dr. William Y. : Medicine and Public Health in Modern China, 795
Chenopodium amaranticolor (Short-Day Plant) : Promotion of Leaf Growth by Short Days in the (Roderick G. Thomas), 771
Cherns, A B. · Priorities for Research in the Social Sciences in Industry, 541

Chest (Treasure), for Teachers (National Union of Teachers), 20
Chesterfield Tube Co., Ltd.: Fabrication of Beryllium Tubes and Sections—a New Structural Metal with Unique Properties, 976
Chiari, Prof. Hermann : Elected a Member of the Pathology and Anatomy Section of the Leopoldina German Academy of Sciences, 273
Chibata, Dr. Ichiro, and others : Utilization of the Stereoisomers of *Iso*Leucine by *Lactobacillus arabinosus* 17-5, 144
Chicago Natural History Museum · *Fieldiana*, Zoology, Vol. 35, No. 7, Birds of the Philippine Islands (A. L. Rand and D. S. Rabor), 446
Chick Tibiotarsi (Embryonic), *in vitro* : L-Glutamine and the Growth of (Dr. J. D. Biggers), 1016
Chicken Embryos : Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the Development of (Prof. C. Vacca, G. V. Pelagalli and A. Schiavo), 66
Chickens : Effects of Œstrogen on Somatic Variation of an Erythrocyte Agglutinogen in (S. L. Scheinberg and R. Reckel), 295
Chickering, Arthur M. . New Species of *Chaetacis* from South America, 446
Chidester, Julius B., and others : *Trans*-2-Hexenal in the Scent Gland of the Hemipteran *Acanthocephala femorata*, 245
Child (School) : The Health of the—Report of the Chief Medical Officer of the Ministry of Education for 1958 and 1959, 974
Chiloé : South from (Colour Film for hire from the Royal Society), 188
China, Dr. W. E : Retirement as keeper of the Department of Entomology in the British Museum (Natural History), 272 ; work of, 272
China (Modern) : Medicine and Public Health in (Dr. William Y. Chen), 795
Chiplunkar, V. N., and others : Relative Efficiencies of Indian Languages, 614
Chirnside, R. C. : Gas Chromatography, 28
Chitin Medium for Isolation, Growth and Maintenance of Actinomycetes (Yamuna Lingappa and Prof. John L. Lockwood), 158
Chlamydospores of *Candida albicans* : A Simple Medium for the Demonstration of (R. Dutt-Choudhuri and Prof. Robin Dutt), 418
Chloramphenicol, a Simultaneous Carbon and Nitrogen Source for a *Streptomyces* sp. from Egyptian Soil (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775
Chlorella vulgaris Starved of Nitrogen : Apparent Reversal of Xanthine Oxidase in (Michael K. Bach), 485
Chloride (Nitrosyl) : Vibrationally Excited Nitric Oxide produced in the Flash Pyrolysis of (Dr. N. Basco and Prof. R. G. W. Norrish), 455
Chloride (Phenyl Mercuric), labelled with Mercury-203 ; Distribution of, applied as a Seed Dressing, in the Tissues of the Young Carnation Plant (June Robson and P. Fenn), 501
Chloride (Sodium) Whiskers : Visible Twist on (B. Jeszenszky and E. Hartmann), 213
Chloride Hydrochloride (6-(m-Amidinophenyldiazoamino)-4-amino-1,2 dimethylquinazolinium)—a New Drug Active against *Babesia canis* (S. S. Berg and J. M. S. Lucas), 64
Chlorides (Dialkylphosphinous) · A New Synthetic Route to (J. L. Ferron), 916
Chloro-Complexes of Gallium and Indium : Influence of Molecular Structure on the Liquid/Liquid Extraction of the, with Aliphatic Ethers (Dr. R R. Brooks and P. J. Lloyd), 375
Chlorophyll (Aggregated) : Spectral Characteristics of, and its Possible Role in Photosynthesis (Seymour Steven Brody and Marcia Brody), 547
Chocolate Spot Disease of Beans : Phenolase and Pectic Enzyme Activity in the (B. J. Deverall), 311
Choice of Tree Species (Food and Agriculture Organization of the United Nations, Forest Development Paper No. 13), 719
Cholesterol : Fatty Acid Specificity for the Esterification of Vitamin A and, by Intestinal and Pancreatic Enzymes in Rats (S. K. Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Cholesterol Metabolism : Function of the Hypophysis–Thyroid System in the Rabbit Foetus with regard to (J. G. Bearn, H. B. Koerselman and T. R. E. Pilkington), 318
Cholesterol- or Stilboestrol-induced Atherosclerosis : Fatty Acid Pattern in the Aorta Lipids of Cockerels in the Initial Stage of (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Choline Acetylase Activity : Gradient of (Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres), (Dr. Catherine O. Hebb and Ann Silver), 123
Choline Acetylase Activity in Nerve Fibres : Gradient of Cholinesterase Activity and of—Gradient of Cholinesterase Activity (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123

Cholinergic Nervous Pathways in the Forebrain (Dr. C. C. D. Shute and Dr. P. R. Lewis), 332
Cholinesterase in the Heart of White Rats : Distribution of Acetylcholine and (Dr. J. Vlk, Dr. S. Tuček and Dr. V. Habermann), 923
Cholinesterase within the Kidney of the Domestic Fowl : Distribution of (A. B. Gilbert), 1009
Cholinesterase Activity . Gradient of (Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres), (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122
  Gradient of, and of Choline Acetylase Activity in Nerve Fibres—Gradient of Cholinesterase Activity (Dr. L. Lubińska, S. Niemierko and B Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123
Chorionic Gonadotrophin (Human) : Clinical Application of a Serological Method for the Determination of (Dr. Sam Brody and Dr. Gun Carlstrom), 841
Chovin, Prof. P. : Gas Chromatography—Definitions and Retention Parameters, 281
Chowdhury, Dr. D. Roy, and Sadhu, Dr D. P. : Rate of Evaporation from Different Regions of the Skin of Indian Zebu Cattle, 491
Christensen, Dr. Søren (Blomstrand, Dr. Rolf, and) : Fatty Acid Pattern in the Aorta Lipids of Cockerels in the Initial Stage of Cholesterol- or Stilboestrol-induced Atherosclerosis, 376
Christian : Science, Technology and the (Prof. C. A. Coulson), (Beckly Social Service Lecture, 1960), *review* by R. Brightman, 173
Christianity and Scientific Progress, *review* by R. Brightman, 173
Christie, Prof. G. S., and others : Pyridine Nucleotide Metabolism in Heliotrine Poisoning, 593
Chromatograph (Gas–Liquid) : Rapid Identification of High Polymers using a Simple Pyrolysis Unit with a (C. E. Roland Jones and A. F. Moyles), 222
Chromatographic Method (A Simple Paper), for Determination of Amino-Acid Activation Profiles in Tissue Preparations (Dr. Alexandra von der Decken), 145
Chromatographic Technique for Autoradiography : Adaptation of a (Dr. R. N. Greenshields), 851
Chromatographic (Gas) Analysis of Permanent Gases using Standard Ionization Detector Equipment (Dr. R. A. Landowne and Dr. S. R. Lipsky), 571
Chromatographic (Gas) Separation of Low-boiling Hydrocarbons using Active Alumina as Support for the Liquid Phase (Dr. I. Halász and E. E. Wegner), 570
Chromatographically Pure Rutin : Isolation of, from Flowers of Elder (Jiří Davidek), 487
Chromatography : Gas (Gas Chromatography Discussion Group and the Society for Analytical Chemistry International Symposium on), 26
  Gas—Definitions and Retention Parameters (Gas Chromatography Discussion Group of the Hydrocarbon Research Group of the Institute of Petroleum Symposium on), 280
  Porous Glass (Herbert L. MacDonell), 302
Chromatography of the Proteins from Wheat Flour soluble in Acetic Acid (Dr. D. H. Simmonds and Dr. D. J. Winzor), 306
Chromatography (Gas) : Estimation of Volatile Anaesthetics in Tissues by (Dr. R. A. Butler and Dr. D. W. Hill), 488
Chromatography (Gas) Discussion Group and the Society for Analytical Chemistry : International Symposium on Gas Chromatography, 26
Chromium-51 : Site of Binding of, to Haemoglobin (Dr. Howard A. Pearson and Dr. Kenneth M. Vertrees), 1019
Chromium (II) Amines : Oxidation of, by Water (Kenneth D. Kopple, George F. Svatos and Prof. Henry Taube), 393
Chromium–Dipyridyl Complexes : Polarographic Behaviour of (Dr. A. A. Vlček), 393
Chromium, Molybdenum and Tungsten (Zerovalent Vanadium,), with a Ditertiary Phosphine : Complexes of (Dr. J. Chatt and H. R. Watson), 1003
Chromosome Anomaly in Two Cases of Cerebral Palsy, a Brother and Sister (Dr. J. Blumel, Y. Ohnuki and A. Awa), 154
Chromosome Structure and Replication : Implication of, on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation (Eugene P. Cronkite, Samuel. W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Chromosomes in Man : A Simplified Method for the Study of (Dr. M. A. Kinlough, Prof. H. N. Robson and Dr. D L. Hayman), 420
Chromosomes (Human) : Nomenclature of, 796
Chronic Denervation of Sympathetic Nerves : Lack of Uptake of Catecholamines after (Dr. G. Hertting, Dr. J Axelrod, I. J. Kopin and L. G. Whitby), 66
Chung, David, and others : Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and its Melanocyte-stimulating and Corticotropin-releasing Activity, 143
Chytrids versus *Hyphochytrium* : Lysine Synthesis and Phylogeny of Lower Fungi—some (Prof. Henry J. Vogel), 1026
Ciguatera Toxin : Bioassay of (Albert H. Banner, Satoshi Sasaki, Philip Helfrich, Charles B. Alender and Prof. Paul J. Scheuer), 229
Circulating Blood : Detection of Liver Proteins in (Dr. A. H. Gordon), 727
Circulation (Meridional) : Southern Hemisphere Fall-out and the (A. R. Dyer), 905
Cirrhosis of the Liver in France : Role of Alcohol in the Aetiology of (Institut National d'Hygiene, Paris), 804
Cirrhosis (Experimental) · Inhibition of, by Carbon Tetrachloride following Treatment with Aminoacetonitrile (Dr. L. Fiume and Prof. G. Favilli), 71
Clark, J. Desmond : Sites yielding Hominid Remains in Bed I Olduval Gorge, 903
Clarke, D. D , and others . Glutamic Acid Metabolism in Brain and Liver during Infusion with Ammonia labelled with Nitrogen-15, 326
Clarke, Dr. Louis : *Obituary* by M. C. Burkitt, 99
Clarke, S. H. : Fire Research, 352
Class (A New), of the Complex Hydrides (Dr. J. Kollonitsch), 1005
Classical Physics and Modern Technology, *review* by Dr. W. A. Waters, 954
Classification (Biochemical), of Yeasts (J. A Barnett), 76
Clausen, Dr. Jørgen, and Munkner, Troels : Transferrin in Normal Cerebrospinal Fluid, 60
Clegg, Samuel, 1781-1861 (Joan M. Eyles), 182
Cleverdon, Cyril W. : Interim Report on the Test Programme of an Investigation into the Comparative Efficiency of Indexing Systems (Aslib Cranfield Research Project), 359
Climate Changes of (Advisory Committee on Arid Zone Research and the World Meteorological Organization Joint Symposium on), 361
Climate (Soil), with special reference to the British Isles (Fourth Symposium in Agricultural Meteorology), (University College of Wales, Aberystwyth), 714
Climatic Ecotypes in Higher Plants . Studies of—the Temperature Dependence of Apparent Photosynthesis in Different Populations of *Solidago virgaurea* (O Bjorkman, C. Florell and P. Holmgren), 624
Clinical Application of a Serological Method for the Determination of Human Chorionic Gonadotrophin (Dr. Sam Brody and Dr. Gun Carlstrom), 841
Clitherow, J. W., and others : Muscarinic Receptors, 671
Clotting of Fish Plasma : Occurrence of Heparin in the Blood of Fish and its Prevention of the (Dr S. Z. Qasim and R. Hasan), 764
Cloud of Unknowing, *review* by Prof. R J. C Atkinson, 610
Cloud (The Dust), about the Earth (Dr. Fred L. Whipple), 127
Cloudsley-Thompson, Prof. J. L. : Animal Behaviour, *review* by Dr. A. D Blest, 522
Clyde Sea Area : The Northern Rockling in the (T B Bagenal), 1028
Clyne, M. A A., and Thrush, Dr. B. A. : Rates of the Reactions of Nitrogen Atoms with Oxygen and with Nitric Oxide, 56
  Reaction of Oxygen Atoms with Hydrogen, 135
Co-Carcinogenic Fractions of Croton Oil : Inhibition of Cellular Respiration by (Dr. A C. Allison and J. W. Lightbown), 892
Coal : The Origin and Evolution of (Dr P. J Adams), 712
Coal Tar Components : Origin of some Primary (Dr. M. Vahrman), 136
Coates, Sir Eric : At a meeting of the sponsors of the Delhi Engineering College Trust, 371
Coating Materials : Chemical Analysis of Resin-based (edited by Dr. C. P. A. Kappelmeier), *review* by Dr. D. T Lewis, 175
Cobalt in Soil Concentrates : Direct Methods of Estimation in the Spectrographic Analysis of (Dr. A. B Calder), 165
Cobalt-58 : Excretion and Hepatic Storage of 5,6–Dimethylbenziminazolyl Cobamide Coenzyme labelled with (Wolmar Nyberg, Matti Saarni and Dr. Ralph Gräsbeck), 764
Cockayne, Dr. B. : Appointed lecturer in the Department of Physical Metallurgy in the University of Birmingham, 797
Cockbain, E. G , and others : Incorporation of [1-^{14}C]-*iso*Pentenyl Pyrophosphate into Polyisoprene, 663
Cockcroft, Sir John : Awarded the 1961 Atoms for Peace Award, 447
Cockcroft, R. (Smith, D. N. R , and) : A Method of Obtaining Uniform Distribution of Wood Preservatives in Toxicity Test Blocks, 163
Cockcroft, Dr. W. H : Appointed to the chair of pure mathematics in the University of Hull, 968 ; work of, 968
Cockerels in the Initial Stage of Cholesterol- or Stilboestrol-induced Atherosclerosis : Fatty Acid Pattern in the Aorta Lipids of (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Cockroach Acetylcholinesterase : Activation of, by Water-miscible Organic Solvents (Dr. E. H. Colhoun), 309
Coconut Milk : A New Green-Leaf Growth-stimulating Factor, Phyllococosine, from (Dr. Susumu Kuraishi and Dr. F. Shigeo Okumura), 148
Coefficient (Fresnel Drag) : The Relativistic Theory of the (Prof. P. T. Landsberg), 654
Coefficient (Heat Tolerance), in Murrah Buffalo Calves · Effect of Exposure to Sun and Exercise on (D. S. Bhatnagar and N. C. Chaudhary), 844
Coefficient (Temperature), of Endodiurnal Leaf Movements in *Phaseolus* (Franz-Josef Leinweber), 1028
Coenzyme *Q* : Distribution of, in Rat Liver Cell Fractions (P. Seshadri Sastry, J. Jayaraman and Dr. T. Ramasarma), 577
  Reduction of, by Succinic Acid Dehydrogenase (Prof Józef Heller, Dr. Ludmila Szarkowska and Czeslawa Petryszyn), 578
Coenzyme (5,6-Dimethylbenziminazolyl Cobamide), labelled with Cobalt-58 : Excretion and Hepatic Storage of (Wolmar Nyberg, Matti Saarni and Dr. Ralph Grasbeck), 764
Coetzee, Prof. J. N. : Lysogenic Conversion in the Genus *Proteus*, 946
Coffea arabica : Linkage in (Dr A. Carvalho), 685
Cohen, A. J , and Smith, Dr. J. N. : Fate of Aldrin and Dieldrin in Locusts, 600
Cohen, Dr. Carl, and others : Effects of Nitrogen Mustard on the Histochemistry of Mouse Lymphocytic Leukaemia *L* 1210, 591
Cohen, Prof. M. H., and Turnbull, D. : Composition Requirements for Glass Formation in Metallic and Ionic Systems, 131
Cohn, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Coke Research Association (British) · Sixteenth Annual Report (1959), 112
Cold Deep Water : Overflow of, across the Iceland–Greenland Ridge (J G. Harvey), 911
Colds (Common) : A Plaque Method for Assaying some Viruses isolated from (Rosemary Parsons and Dr. D. A. J. Tyrrell), 640
Cole, K. D. : Hydromagnetics and Stellar Structure, 31
Colebatch, H. J. H (Halmagyi, Dr. D. F. J., and) : Prevention of Vagotomy of Erythrocytosis induced by Hypoxaemia, 757
Coleman, B. L. : The Special Theory of Electromagnetism, 476
Colhoun, Dr. E. H. : Activation of Cockroach Acetylcholinesterase by Water-miscible Organic Solvents, 309
Colhoun, Prof John : An Introduction to Industrial Mycology, *review*, 347
Collagen Synthesis : Method of (G. B. Gerber and K. I. Altman), 813
Collins, C., and Jelly, D. H. · Ionospheric Disturbance at the Time of Cosmic Ray Increases, 128
Collisions (Electron–Electron) : Recombination through (Prof. D. R. Bates and A E. Kingston), 652
Colloidal Silica : Haemolytic Activity of (J. D Harley and Dr. J. Margolis), 1010
Colonial Office : Service with Overseas Governments, 29
  Report of the Public Services Conference, London, 1960 (Colonial No. 347), 29
Colonial and the Commonwealth Relations Offices : Future of the, 277
Color Council of America (Inter-Society), and others : Conference to celebrate James Clerk Maxwell's demonstration of trichromatic colour reproduction at the Royal Institution in London, 361

Colotelo, Dr. N., and Ward, Dr. E. W. B. : β-Glycosidase Activity and Cyanogenesis in the Susceptibility of Alfalfa to Winter Crown Rot, 242
Colour-Blindness : Linkage between Deficiency of Glucose-6-phosphate Dehydrogenase and (A. Adam), 686
Colour Group, and others : Conference to celebrate James Clerk Maxwell's demonstration of trichromatic colour reproduction at the Royal Institution in London, 361
Colour Mutant (Histocompatible), from *CBA/Lab* Strain of Mice (Annie M. Brown and Margaret J. Cook), 1031
Colour Projections (Land's Two-) : The Eye, the Brain and (Dr. W. A. H. Rushton), 440
Colour (Skin), of Man : Effect of Alpha- and Beta-Melanocyte Stimulating Hormones on the (Prof. Aaron B. Lerner and Dr. Joseph S. McGuire), 176
Columns (Capillary) : An Enrichment Trap for Use with (R. Self), 223
Colvin, J. Ross : Variation of Elasticity along Single Microfibrils of Bacterial Cellulose, 1029
Commerce and Industry, Federal Ministry of (Lagos) : *Industrial Abstract*, No. 47, 361
Commercial and Industrial Education, British Association for : Policy in Perspective—Report of the Annual Conference (Cambridge, 1960), 863
Common Colds : A Plaque Method for Assaying some Viruses isolated from (Rosemary Parsons and Dr. D. A. J. Tyrrell), 640
Commons, House of : Adjournment Debate on State Scholarships, 19
  Adjournment Debate on a British Communications Satellite Programme, 276
  Second reading of the White Fish and Herring Industries Bill, 532
  Adjournment Debate on the National Reference Library for Science and Technology, 968
Commonwealth : Freedom and Efficiency—Problems of University Administration in Britain and the (Committee on Science and Freedom, Manchester, Bulletin No. 16), 517
  History and Philosophy of Science in the (Dr. W. Mays), 971
Commonwealth Agricultural Bureaux : Appointment of Sir Thomas Scrivenor as secretary, 714
Commonwealth Bursaries (Royal Society and Nuffield Foundation) : Awards, 100
Commonwealth Forestry Bureau : A Synopsis of the Work and Growth of the Commonwealth Forestry Bureau, Oxford, 1939-1959, 795
Commonwealth Relations Office : Future of the Colonial and the, 277
Commonwealth Scientific and Industrial Research Organization (Australian) : Twelfth Annual Report (1959-60), 190
Commonwealth (British) : Cultural Contacts in the, 794
Commonwealth (British), Association of Universities of the : Report for 1959-60, 795
Communication : Science and Industry—the Problem of (Department of Scientific and Industrial Research National Conference on), 275
Communication Experiment (A Transatlantic), via *Echo I* Satellite (H. Carru, R. Gendrin and M. Reyssat), 268
Communication (Honeybee), when the Sun is close to the Zenith (Dr. D. A. T. New, F. R. Burrowes and A. J. Edgar), 155
Communications (British) Satellite Programme (House of Commons Adjournment Debate on), 276
Community Mental Health Services (Political and Economic Planning, Broadsheet No. 447), 717
Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the Novikoff Hepatoma Cells of the Rat (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Comparative Efficiency of Indexing Systems : Interim Report on the Test Programme of an Investigation into the (Cyril W. Cleverdon), (Aslib Cranfield Research Project), 359
Competition (Essay), on Corrosion Science (Society of Chemical Industry), 274
Complementary (Anti-) Action of Aspirin (Dr. C. J. van Oss, J. C. Friedmann and Dr. M. Fontaine), 147
Complex (A Fatty Acid/Protein), in Human Hair (A. W. Holmes), 923
Complex (Vitamin B_{12}-Peptide) : Intestinal Absorption of Vitamin B_{12} and of a, in Normal Subjects and in Patients with Partial Gastrectomy (Dr. G. Milhaud), 31
Complex Hydrides : A New Class of the (Dr. J. Kollonitsch), 1005
Complexes : Pyrazine–Metal Halide—New Types of Metal–Ligand Polymers (Dr. A. B. P. Lever, Dr. J. Lewis and Prof. R. S. Nyholm), 58
Complexes of Zerovalent Vanadium, Chromium, Molybdenum and Tungsten with a Ditertiary Phosphine (Dr. J. Chatt and H. R. Watson), 1003
Complexes (Chloro-) of Gallium and Indium : Influence of Molecular Structure on the Liquid/Liquid Extraction of the, with Aliphatic Ethers (Dr. R. R. Brooks and P. J. Lloyd), 375
Complexes (Chromium–Dipyridyl) : Polarographic Behaviour of (Dr. A. A. Vlček), 393
Component (Apparent Steady), of the Interplanetary Magnetic Field (Prof. V. A. Bailey), 44
Component (A Pyroninophilic), in Pathological Serum Proteins and Urinary Proteins (R. E. Ballieux, G. N. Niehaus and Prof. M. T. Jansen), 60
Components (Coal Tar) : Origin of some Primary (Dr. M. Vahrman), 136
Composition of Dental Plaque : Nature and (D. J. Millin and M. H. Smith), 664
Composition of various Ribonucleic Acid Fractions from Micro-organisms of Different Deoxyribonucleic Acid Composition (Carl R. Woese), 920
Composition (Deoxyribonucleic Acid) : Composition of various Ribonucleic Acid Fractions from Micro-organisms of Different (Carl R. Woese), 920
Composition Requirements for Glass Formation in Metallic and Ionic Systems (Prof. M. H. Cohen and D. Turnbull), 131
Composition (Lipoprotein), of the Film lining the Lung (R. E. Pattle and L. C. Thomas), 844
Compound found during Separation of Purines in Human Urine : Identification of a (Dr. Herbert Singer, Arax Gulbenkian, Sigmund E. Lasker and Charles L. Fox, jun.), 671
Compound (A Polyglycerophosphate), from *Mycoplasma mycoides* (Glycerol in *Mycoplasma mycoides*), (P. Plackett), 125
Compounded Medicinal Preparations : Labelling Procedure for (Association of British Pharmaceutical Industry, the Proprietary Association of Great Britain and the Association of Public Analysts), 712
Compounds : Effect of Cortisone and related, on the Biogenesis of Cartilage (Dr. M. W. Whitehouse and Dr. J. W. Lash), 37
  Mechanisms of the Gas-Phase Reactions of the Halogens and their (Faraday Society Informal Discussion on), 275, 447
Compounds (Boron) : Developments in the Chemistry of (Chemical Society Symposium on), 625
Compounds (Charge Transfer) : Organic Halides as Electron Acceptors in (T. Bjorvatten, Prof. O. Hassel and Chr. Rømming), 137
Compounds (Crystal) : Graphite and its (Prof. A. R. Ubbelohde and F. A. Lewis), *review* by Dr. G. E. Bacon, 522
Compounds (Intermetallic) of Thorium of the Type Th_7X_3 . Some New (J. R. Thomson), 217
Compounds (Magnesium), with the Calcium Fluoride Structure : Microhardness and other Properties of (E. R. Petty), 132
Compounds (Organic) : Affinity of, for Free Electrons with Thermal Energy—its Possible Significance in Biology (Dr. J. E. Lovelock), 729
  Crystal Structures of (X-Ray Analysis Group of the Institute of Physics and the Physical Society Spring Conference on), 275, 797
  Labelling of, by Mercury-photosensitized Reaction with Tritium Gas (Fulvio Cacace, Angelo Guarino and Gabriella Montefinale), 54
Compounds (Radioactive Sulphydryl) : Effect of, on the Oxygen Tension in the Spleen of Mice (Dr. C. van der Meer, P. W. Valkenburg and M. Remmelts), 588
Compounds (Thiol) : Ninhydrin Assay in the Presence of (John R. Whitaker), 662
Compounds (Water-soluble) : A 'Dry' Mounting Autoradiographic Technique for the Localization of (P. J. Fitzgerald, Margery G. Ord and Dr. L. A. Stocken), 55
Computers for the Chemical Engineer (Graduate Section of the Birmingham University Chemical Engineering Society and the Graduates and Students Section of the Midlands Centre of the Institution of Chemical Engineers Symposium on), 534
Conant, Dr. J. B. : Higher Education in the United States, 803
Concentrates (Soil) : Direct Methods of Estimation in the Spectrographic Analysis of Cobalt in (Dr. A. B. Calder), 165
Concentration of Myxoviruses and of some Specific Antisera : Determination of the, based on Neuraminidase Activity (Dr. J. Jacobs and Dr. J. N. Walop), 334
Condition of Outer Space (Sir Bernard Lovell), 625
Conditioning and Electro-Physiology (Prof. H. J. Eysenck), 282
Conditions (Soil Physical), affecting Plant Growth (National Vegetable Research Station Association Members' Day programme), 625
Condon, R. C. : Gas Chromatography (Hydrogen Flame and Argon Ionization Detectors), 26 ; (Determination of Response Factors for Compounds of Different Type), 26
Conduction (Water-), in the Stems of certain Conifers (J. Maddern Harris), 678
Conductivity (Anomalous), and Lorenz Parameter in Dilute Silver–Manganese Alloys at Low Temperatures (Dr. M. S. R. Chari), 824
Conductivity (Direct-Current), of Textiles, Proteins and other Polymers (Dr. C. P. S. Taylor), 388
Conferences : Forthcoming International Scientific and Technical (Department of Scientific and Industrial Research, List No. 28), 104
Configuration (Absolute), of 4-Methylproline from Perry (Dr. L. F. Burroughs, S. Dalby, Prof. G. W. Kenner and Dr. R. C. Sheppard), 394
α-Configuration of Fibrous Proteins (R. D. B. Fraser and T. P. MacRae), 572
Conflicting Hypotheses on the Growth of World Population (Dr. Max Pettersson), 1032
Congestion in Telephone Systems, *review* by Prof. L. S. Goddard, 6
Congestion Theory in Telephone Systems : Introduction to (R. Syski), *review* by Prof. L. S. Goddard, 6
Congo Reptiles : Five Less-Common *Salmonella* Serotypes from (Prof. MacDonald Fulton, Philomena Szafran and Matthew M. Lesko), 240
Conidia of *Neurospora crassa* : Protective Action of Calcium Gluconate against After-Effects of X-Irradiation on (Prof. J. Weijer), 760
Conifers : Water-Conduction in the Stems of certain (J. Maddern Harris), 678
Conjugated Proteins isolated from Exudates : Molecular Properties of (Prof. Antonio Caputo), 395
Conjugation of *p*-Aminohippurate by the Kidney and Effective Renal Plasma-flow (Dr. B. P. Setchell and E. Blanch), 230
Connexion between Thyroid Function and Mucopolysaccharide (Hexosamine)-Level : Experimental Data concerning the (Prof. St. Krompecher, Cs. Hadházy, G. Berencsi, E. H. Oláh and M. B. László), 670
Connolly, John H., and others : Blood Nucleases and Infectious Viral Nucleic Acids, 817
Connolly, R., and others : Size of Particles ingested by *Simulium* Larvae, 78
Conrad, M. A., and Levy, S. : Photo-Emission from Metal Surfaces measured with Geiger Counters, 887
Conroy, W. L. : Impact of Man on the Vegetation of the Humid Tropics (Effects of Indigenous Agriculture on Soil-erosion and Soil-deterioration), 24
Conservation : Forage, *review* by Dr. William Davies, 4
Conservation of Grass and Forage Crops (Prof. Stephen J. Watson and Dr. Michael J. Nash), second edition, *review* by Dr. William Davies, 4
Conservation of Natural Resources, 779
Conservation of Nature, International Youth Federation for the Study and : Report for 1959, 623
Considerations (Theoretical), in the Ultra-violet Irradiation of Micro-organisms (Dr. C. W. Hiatt), 678
Constituent (An Unidentified Ubichromenol-like Lipid), of Bakers' Yeast (E. E. Edwin, J. Green, A. T. Diplock and J. Bunyan), 750
Constituents of Bee Venom : Immunity of Bee Keepers to some—Phospholipase-A Antibodies (A. H. Mohammed and M. M. A. El Karemi), 837
Constituents of Tobacco Smoke, an Annotated Bibliography, First Supplement (edited by H. R. Bentley and E. G. N. Berry), (Tobacco Manufacturers' Standing Committee, Research Papers No. 3), 453
Constituents (New), of Barley : 3-Aminomethylindole and 3-Methylaminomethylindole— (Dr. S. Harvey Mudd), 489
Consumption and Expenditure, 1958 : Domestic Food—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 197
Contacts (Cultural), in the British Commonwealth, 794

Continuous Regeneration of the Dentinal Nerve-Endings (Prof. D. Hattyasy), 72
Contracting : Methods used by Universities of, and of Recording and Controlling Expenditure (University Grants Committee), 427
Contracts (Building), for Universities, 444
Contracture (Potassium-) of 'Slow' and 'Fast' Skeletal Muscle Fibres of the Frog : Influence of Calcium on the (P. Pauschinger and Prof. K. Brecht), 583
Control : Automatic and Semi-Automatic Methods in Analysis and (Medway College of Technology Symposium and Instrument Exhibition on), 447
Control of Fertility by 6-Azauridine (Margaret A Sanders, Dr. B. P. Wiesner and Prof. John Yudkin), 1015
Control of Irradiation Embrittlement in Molybdenum (D. N. Sethna, A. A. Johnson, K. J. Proud and S. S. Sheinin), 568
Control in Science and Industry : Temperature—its Measurement and (American Institute of Physics, the Instrument Society of America and the United States National Bureau of Standards Symposium on), 22
Control of University Building Development, 427
Control (Criticality), in Chemical and Metallurgical Plant (European Nuclear Energy Agency of the Organization for European Economic Co-operation in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H. International Symposium on), 797
Control (Genetic), of Foetal and Adult Human Haemoglobin (Dr. C. Baglioni, Prof. V. M. Ingram and Emelie Sullivan), 467
Control (Genetic), of Oxytetracycline Biosynthesis (S I Alikhanian, N. V. Orlova, S. Z. Mindlin and Z. M. Zaitzeva), 939
Control (International), of Investigations of Rare Meteorites, 967
Controlling Expenditure : Methods used by Universities of Contracting and of Recording and (University Grants Committee), 427
Conversion of DL-*m*-Tyrosine to Dopamine in the Rat (Prof. T. L. Sourkes, G. F. Murphy and A. Rabinovitch), 577
Conversion (Lysogenic), in the Genus *Proteus* (Prof. J. N. Coetzee), 946
Conversion (Thrombin-induced), of Fibrinogen to Fibrin Monomer : Optical Rotatory Dispersion of the (Prof. C. M. Kay and M. M. Marsh), 307
Conversion Ratio as a Discriminatory Test for Thyroid Activity in Fish (C. P. Hickman, Jun.), 1012
Convolution Transform, *review* by Prof. T. A. A. Broadbent, 700
Convulsion : Levels of Serotonin during, and the Effect of Reserpine (Prof. E. M. Gal and P. A. Drewes), 234
Conway, Prof. B. E., and Dziecıuch, M. : Delayed Gas Evolution from Passive Films formed in the Kolbe Reaction, 914
Cook, Margaret J. (Brown, Annie M., and) : Histocompatible Colour Mutant from *CBA/Lab* Strain of Mice, 1031
Cook, jun., W. R., and others : X-Ray Correlation of the *A-B* Layer Order of Cadmium Selenide with the Sign of the Polar Axis, 217
Cooke, Dr. R. G. : Theory of Banach Algebras, *review*, 612
Cooley, R. A. : Powder Metallurgy (Use of an Explosion to drive the ram of a Mould Pressing Powders—Improved Properties of Products), 366
Coombs, Dr. R. R. A., and others : Species-characterizing Antigens of 'L' and 'ERK' Cells, 503
Cooper, R. B. : Utilization of Water in Australia (Reducing the Salt Content of Water), 538
Co-operation : Science Planning, Development and, in the Countries of the Middle East and North Africa (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
Co-operation (European), in Space Research, 19
Co-operation (Technical), in Africa South of the Sahara, Commission for : Symposium on the Quelea, 359
Co-operative Nuclear Research, 878
Co-operative Space Research Programme, 531
Co-ordinated Structures (Functionally) : Plasma Membranes and Mitochondrial Equivalents as (Prof Stuart Mudd, Dr. Tomio Kawata, John I. Payne, Dr. Theodore Sall and Prof. Atsushi Takagi), 79
Co-ordination (Octahedral), of Nickel in Nickel (II) Bisacetylacetone (Dr. G. J. Bullen, Dr. R. Mason and Dr. Peter Pauling), 291
Copepod (A Biennial), from Lake Hazen, Ellesmere Island (Dr. I. A. McLaren), 774
Copernican Revolution : Origins of the (Dr. J. R. Ravetz), 859
Copper-Levels (Brain Glycogen- and), in Normal Sheep and Sheep affected with Scrapie (C. le Q. Darcel, R. J. Avery and R. B. Carson), 410
Copper Protein (A New Leaf), 'Plastocyanin', a Natural Hill Oxidant (Dr. Sakae Katoh and Dr Atusi Takamiya), 665
Copper Whisker : Fatigue Straining of (Dr Edward Eisner), 534
Copping, A. M. : Food Chemistry, *review*, 259
  Dictionary of Nutrition and Food Technology, *review*, 433
  Fundamentals of Nutrition, *review*, 523
Cordier, Prof. D : *Obituary* by the Rt Hon. Lord Adrian, 620
Corixidae and Notonectidae : Degeneration of Flight-musculature in the (E. C. Young), 328
Corn (Sweet), *Zea mays* var. *saccharata* Bailey : Effect of 6-Methoxybenzoxazolinone on the Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson and its Presence in (N. J. Whitney and C G. Mortimore), 596
Corn Oil (Refined) : Inability of, to influence Spontaneous Arteriosclerosis of Old Hens (K. F. Gey and Dr. A. Pletscher), 491
Corner, Dr. E. J. H. : Impact of Man on the Vegetation of the Humid Tropics, 24
Corona Discharges : Effect of, on Polyethylene (L. R. Hougen), 274
Coronary Artery of the Portuguese East African (Joseph Gillman, Christine Gilbert and Manuel D. Prates), 623
Correlation (X-Ray), of the *A-B* Layer Order of Cadmium Selenide with the Sign of the Polar Axis (R. Zare, W. R. Cook, jun., and L. R Shiawoza), 217
Correspondence of Isaac Newton (edited by Prof. H. W. Turnbull), Vol. 2, 1676-1687, *review* by Prof L. Rosenfeld, 171
Correspondence (Anomalous) : Retinal Correspondency and the Horopter in (Dr M. C Flom and Prof. F W Weymouth), 34
Correspondency (Retinal), and the Horopter in Anomalous Correspondence (Dr M. C. Flom and Prof. F. W. Weymouth), 34
Corrosion Science : Essay Competition on (Society of Chemical Industry), 274
Corrosion (Metallic) : International Congress on (Imperial College of Science and Technology, London), 713
Corry, Prof. J. E. : New Universities (Independence of the New Institution), 24
Corticosteroid 11β-Hydroxylase : Evaluation of the Activity of (Dr. Benjamin N. Horwitt, Charles Sobel and Orville J. Golub), 1006
Corticotropin : Adipokinetic Activity of Synthetic Peptides related to (Dr. M. S. Raben, Ruth Landolt, F. A. Smith, K. Hofmann and H Yajima), 681
Corticotropin-releasing Activity : Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and its Melanocyte-stimulating and (Prof. Choh Hao Li, Eugen Schnabel, David Chung and Tung-bin Lo), 143
Cortisone and related Compounds : Effect of, on the Biogenesis of Cartilage (Dr. M. W. Whitehouse and Dr. J W. Lash), 37
Corynebacterium ovis : Haemolytic Activity of (Dr Gordon Fraser), 246
Cosmic Ray Flare on November 12, 1960, and Solar Activity during the period November 10-15, 1960 (Staff of the Ionosphere and Radio-Astronomy Section of the Netherlands Postal and Telecommunications Services), 438
Cosmic Ray Increases : Ionospheric Disturbance at the Time of (C. Collins and D H. Jelly), 128
Cosmological Significance of Angular Measurements of Distant Radio Sources (Dr. W. Davidson), 991
Cosmology : The Interpretation of (B Balázs and Gy. Paál), 992
  Nebulae, Galaxies and, *review* by J. B. Alexander, 867
  Rival Theories of—a Symposium and Discussion of Modern Theories of the Structure of the Universe (Prof H. Bondi, Dr. W. B. Bonnor, Dr R. A. Lyttleton and Dr G. J. Whitrow), *review* by J. B. Alexander, 867
Costea, T., and Dema, I : Influence of Chemical Isomerism on the Szilard–Chalmers Processes in Solids, 478
Cotton in India (B. L. Sethi, S. M. Sikka, R. H. Dastur, P. D. Gadkari, R. Balasubrahmanyan, P Maheshwari, N. S. Ranga Swamy and A. B. Joshi), *review* by Prof S C. Harland, 86
Cotton Industry Research Association (British), and the British Rayon Research Association : Merger of the, to be called the Cotton, Silk and Man-made Fibres Research Association, 531
Cotton, Silk and Man-made Fibres Research Association : Merger of the British Cotton Industry Research Association and the British Rayon Research Association to be called the, 531
Cotton Rats : Inherited Haemoglobin Ionographic Properties in (Prof. Charles W. Foreman), 585
Coulomb, Prof. J. : Science Planning and Administration in France, 362
Coulson, Prof C. A. : Pauling's Chemical Bond, *review*, 3
  Science, Technology and the Christian (Beckly Social Service Lecture, 1960), *review* by R Brightman, 173
Counters (Geiger) : Photo-Emission from Metal Surfaces measured with (M. A Conrad and S Levy), 887
Countries of the Middle East and North Africa : Science Planning, Development and Co-operation in the (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
Course : Meterological Field (Royal Meteorological Society and the Field Studies Council), 797
Course in Chemical Engineering (University College of Swansea), 447
Course in Elementary Plasticity (Imperial College of Science and Technology, London), 447
Course (Postgraduate), on Engineering Aspects of Lubrication (Imperial College of Science and Technology, London), 624
Courses (Field Studies Council), 445
Courses (Scottish Field Studies Association Programme of), 713
Courshee, R. J. : Agricultural Aviation, *review*, 611
Court, M. N. (Larsen, S., and) : Soil Phosphate Solubility, 164
Couteaux, Prof R. : Appointed Royal Society visiting professor for 1961-62, 796
Cow's Milk : Some Factors Influencing the Food-Chain Transport of Radioactive Materials into (D. Merten and O. Suschny), 806
Cowley, J. M., and Moodie, A F. : Out-of-Focus Electron Microscope Images of Edges of Crystal Lattices, 477
Cows : Effects of Pulped Soybean Silage on the Milk-yield of (Dr. E. Kurnik, D Gábos and B. Pozsár), 492
Cox, Allan, and Doell, Richard R. : Palaeomagnetic Evidence relevant to a Change in the Earth's Radius, 45
Cox, Dr. D R : Appointed to the University of London chair of statistics at Birkbeck College, 188, 443 ; work of, 443
Cracking Catalysts : Oxidation, Hydration, Dehydration and (edited by Paul H. Emmett), (Catalysis, Vol. 7), *review* by Dr. E. B. Maxted, 88
Cracks (Fatigue), in Beta-Brass : Initiation of (B. J. S. Wilkins and M. G. Bader), 301
Craft, Dr. C C. (Lieberman, Dr M., and) : Ethylene Production by Cytoplasmic Particles from Apple and Tomato Fruits in the Presence of Thiomalic and Thioglycolic Acid, 243
Crafts : From Arts and, to Technology, *review* by Prof R. J. Forbes, 174
Craik (Kenneth) Research Award of St John's College, Cambridge, 188
Crain, Ronald D , and others : *Trans*-2-Hexenal in the Scent Gland of the Hemipteran *Acanthocephala femorata*, 245
Crampton, E. W., and Lloyd, L. E : Fundamentals of Nutrition, *review* by A M. Copping, 423
Cranfield Research Project (Aslib) : Interim Report on the Test Programme of an Investigation into the Comparative Efficiency of Indexing Systems (Cyril W Cleverdon), 359
Crass, R. S. : Biogeography of South-East Africa, 801
Crawford, Elizabeth J , and others : Increased Dihydrofolate Reductase Activity as a Possible Basis for Drug Resistance in Leukaemia, 39
Crawford, R. M. M : Effect of Temperature Fluctuations on Flowering in *Salvia splendens*, 75
Creasey, R. F., and Emslie, K. : Wind Tunnels and Flow Visualization (Industrial Uses of Wind-Tunnels with particular reference to Wind Machines), 109
Creese, Dr. R. : Appointed reader in physiology at St. Mary's Hospital Medical School, London, 22
Criticality Control in Chemical and Metallurgical Plant (European Nuclear Energy Agency of the Organization for European Economic Co-operation in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H. International Symposium on), 797

Cronkite, Eugene P., and others : Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation, 153
Crop (Pioneer), on Culm Measure Soil with Impeded Drainage : Phosphate Requirement of Lupins grown as a (S. Larsen and D. Gunary), 691
Crop Growth-Rate : Relationship of Radiation, Leaf Area Index and (W. R. Stern and Prof. C. M. Donald), 597
Crops (Field) : Physiology of (Association of Applied Biologists Symposium on), 714
Crops (Forage) : The Conservation of Grass and (Prof. Stephen J. Watson and Dr. Michael J. Nash), second edition, *review* by Dr. William Davies, 4
Cross-Reaction between Two Strains of Tobacco Mosaic Virus : Analysis of the (Prof. Irving Rappaport), 986
Cross-Reactions (Immunological), between Salk 'Altered' Monkey Heart Cells and Ehrlich Ascites Carcinoma Cells (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Croton Oil : Inhibition of Cellular Respiration by Co-Carcinogenic Fractions of (Dr. A. C. Allison and J. W. Lightbown), 892
Crowley, Dr. N. C. (Van Velsen, R. J., and) : Centrosema Mosaic, a Plant Virus Disease transmitted by both Aphids and Plant Bugs, 858
Crown Rot (Winter) : β-Glycosidase Activity and Cyanogenesis in the Susceptibility of Alfalfa to (Dr. N. Colotelo and Dr. E. W. B. Ward), 242
Crowther, J. G. : Founders of British Science—John Wilkins, Robert Boyle, John Ray, Christopher Wren, Robert Hooke, Isaac Newton, *review* by Dr. W. P. D. Wightman, 259
Crude Oils : Proton Relaxation in (R. J. S. Brown), 387
Cruickshank, Dr. A. J. O. : Elected a Fellow of the Royal Society of Edinburgh, 876
Crustaceans (New Stomatopod), in West Africa, 360
Crystal Compounds : Graphite and its (Prof. A. R. Ubbelohde and F. A. Lewis), *review* by Dr. G. E. Bacon, 522
Crystal Lattices : Electron Microscopy of—an Anomalous Effect (Lewis T. Chadderton), 564
  Out-of-Focus Electron Microscope Images of Edges of (J. M. Cowley and A. F. Moodie), 477
Crystal Structures of Organic Compounds (X-Ray Analysis Group of the Institute of Physics and the Physical Society Spring Conference on), 275, 797
Crystalline α-Kojibiose (Fumio Yamamuchi and Kiyoshi Aso), 753
Crystallization (High-Yield), or Urease from Jack Bean (Dr. Kiyomichi Hanabusa), 551
Crystals : The Nature of the Chemical Bond and the Structure of Molecules and (Prof. Linus Pauling), third edition, *review* by Prof. C. A. Coulson, 3
Crystals of Cellulose (R. St. John Manley), 390
Crystals (Cadmium), grown from Vapour : Etch Patterns on (Joy George), 743
Cubic Transition Metals (Body-centred) : Theory of the Deformation and Fracture of (A. A. Johnson), 826
Cucumber Hypocotyl Growth : Promotion of, by Two New Gibberellins (Dr. P. W. Brian and H. G. Hemming), 74
Cueto, Prof. Heriberto, and others : Rehardening of Softened Enamel Surfaces of Human Teeth by Solutions of Calcium Phosphates, 226
Culicine Mosquitoes : A New Virus isolated from (B. M. McIntosh, R. H. Kokernot and H. E. Paterson), 274
Cullwick, Prof. E. G. : Magnetic Energy, 565
Culm Measure Soil with Impeded Drainage : Phosphate Requirement of Lupins grown as a Pioneer Crop on (S. Larsen and D. Gunary), 691
Cultural Contacts in the British Commonwealth, 794
Cultures (Cell), of Human Origin : Alkaline Phosphatase in (Dr. Harold M. Nitowsky and Dr. Fritz Herz), 756
Cultures (Enriched) : Growth of Lake Victoria Phytoplankton in (Dr. John H. Evans), 417
Cultures (Sodium-deficient Water) : Growth of a Nematode in Tomato Plants grown on (A. F. Bird and P. F. Brownell), 418
Cumulation (Photographic), of Recurrent Response Potentials (Prof. Lorrin A. Riggs, C. R. Cavonius and Dr. E. Parker Johnson), 383
Curran, Prof. R. C., and Ager, J. A. M. : Tissue Responses to Filter Membranes of various Porosities, 1023
Current Research and Development in Scientific Documentation, No. 7 (United States National Science Foundation), 185
Current (Direct-) Conductivity of Textiles, Proteins and other Polymers (Dr. C. P. S. Taylor), 388
Currents (Space-Charge), in Gallium Arsenide (J. W. Allen and R. J. Cherry), 297
Curreri, A. R. : Biochemistry of Human Tumours (The Surgeon's Role in the Collection of Surgical Specimens), 627
Curves : Algebraic (Prof. J. G. Semple and G. T. Kneebone), *review* by Prof. T. A. A. Broadbent, 175
Curves (Ionospheric $h'(f)$) : A New Method for the Calculation of N (h) Profiles from (H. Hojo), 562
Cutaneous Homografts : Survival of, after Transplantation of Lymph Nodes immunized against the Host (Dr. J. Vrubel), 853
Cyanogenesis in the Susceptibility of Alfalfa to Winter Crown Rot : β-Glycosidase Activity and (Dr. N. Colotelo and Dr. E. W. B. Ward), 242
Cyanophyta (Dr. T. V. Desikachary), *review* by Dr. J. W. G. Lund, 343
Cybernetics . Problems in, No. 1, 795
Cyclic Dipeptides : Production of Pyrazine Derivatives in the Radiolysis of Aqueous Solutions of the (Mathilde Kland-English and Warren M. Garrison), 302
Cytochemistry (Quantitative), using Directly Applied Radioactive Reagents (Dr. E. A. Barnard and J. Marbrook), 412
Cytochrome Oxidase Activity (Total), and its relation to Basal and Maximal Metabolism (Dr. Ladislav Jánsky), 921
Cytochrome Oxidation (Energy-linked), in Mitochondria (Prof. Britton Chance), 719
Cytogenetics of the Genus *Rubus* : Life-History and (Dr. Gordon Haskell), 713
Cytological Races in *Ranunculus ficaria* L. : Morphological Separation of (Dr. V. H. Heywood and Dr. S. Walker), 604
Cytological Studies : Use of Induced Rooting in (D. N. Singh), 420
Cytology of Cells which Synthesize Protein (M. S. C. Birbeck and Dr. E. H. Mercer), 558
Cytomegalic Inclusion Body Disease involving Lacrimal Glands of Caesarian-derived (so-called) Pathogen-free Rats : Spontaneous (Dr. Hans Meier), 534
Cytoplasmic Inheritance : Mechanics of (Dr. G. H. Beale), 713
Cytoplasmic Particles : Ethylene Production by, from Apple and Tomato Fruits in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr. C. C. Craft), 243
Czechoslovak Academy of Sciences : Election of Prof. J. D. Bernal as a member, 714
Czekalowski, Dr. J. W. : Method of Dissolving Triacetyl-oleandomycin for the Assay of Sensitivity of Micro-organisms, 752

DAGLEY, Dr. S., and others : Nature of the Ribosomes present in Bacteria and Yeast—a Re-Appraisal, 638
Dahl, Prof. Dr. Friedrich (begründet von ; weitergeführt von Maria Dahl und Prof. Dr. Hans Bischoff) : Die Tierwelt Deutschlands und der Angrenzenden Meeresteile nach ihren Merkmalen und nach ihrer Lebensweise, Teil 47, Spinnentiere oder Arachnoidea (Araneae), 11, Micryphantidae—Zwergspinnen (Dr. Hermann Wiehle), *review* by Dr. Eric Duffey, 344
Dahle, E., and others : Cardiac Effects of Streptolysin O in Rabbits, 232
Dalby, S., and others : Absolute Configuration of 4-Methylproline from Perry, 394
Dale, Sir Henry (under the editorial direction of) : The Collected Papers of Paul Ehrlich (compiled and edited by Dr. F. Himmelweit, with the assistance of the late Martha Marquardt), Vol. 2, Immunology and Cancer Research ; Vol. 3, Chemotherapy, *review* by Prof. C. H. Browning, 254
Dale, Dr. W. M., and others : 'Nitric Oxide—and Oxygen Effect' in X-irradiated *Shigella flexneri*, 851
Dalgarno, Dr. A. : Space Science, *review*, 5
Dam (Kariba) : Medical Aspects of the (Dr. M. H. Webster), 359
Damage (Radiation), in Graphite : Aggregation and Dispersal of (W. N. Reynolds, P. A. Thrower and B. E. Sheldon), 824
Damage (Radiation), in Seeds : Modification of, by Post Treatment (Dr. W. Klingmüller), 413
Daniel, Mary R., and others : Species-characterizing Antigens of 'L' and 'ERK' Cells, 503
Danielli, James : Biochemistry of Human Tumours (No Single Variable has been found in Tumours to serve as a Basis to Design New Drugs), 628
Danish Atomic Energy Commission and the Organization for European Economic Co-operation : Symposium on Health Physics in Nuclear Installations, 1959, *review* by W. J. Whitehouse, 347
Danon, Dr. D., and others : Deformation of Red Cell Shape induced by *Vipera palestinae* Venon *in vivo*, 320
Darcel, C. le Q., and others : Brain Glycogen- and Copper-Levels in Normal Sheep and Sheep affected with Scrapie, 410
Darling, A. I., and others : Molecular Sieve Behaviour of Dental Enamel, 998
Darling, Dr. F. Fraser : Wild Life in an African Territory, *review* by Prof. W. H. Pearsall, 783
Darwin : Evolution after (edited by Prof. Sol Tax), Vol. 1, The Evolution of Life—its Origin, History and Future ; Vol. 2, The Evolution of Man—Man, Culture and Society, *review* by Dr. P. G. Fothergill, 340
Darwin, Erasmus : Letter from, to Jonas Dryander (Dr. John Ramsbottom), 424
Darwin, W. E., and Buddery, Dr. J. H. : Beryllium, *review* by Prof. A. G. Quarrell, 345
Dastur, R. H., and others : Cotton in India, *review* by Prof. S. C. Harland, 86
Data on Cell Proliferation : Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of (Eugene P. Cronkite, Samuel W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Data (Calorimetric and Thermodynamic) . Publication of, 454
Data (Experimental), concerning the Connexion between Thyroid Function and Mucopolysaccharide (Hexosamine)-Level (Prof. St. Krompecher, Cs. Hadházy, G. Berencsi, E. H. Oláh and M. B. László), 670
Dating Ancient Glass : A New Method for (Robert H. Brill and Harrison P. Hood), 12
Davídek, Jiří : Isolation of Chromatographically Pure Rutin from Flowers of Elder, 487
Davidson, Prof. C. F. : Russian Geology in Translation, *review*, 610
Davidson, Dr. Eugene A. (Jacobson, Dr. Bernard, and) : Chemical Oxidation of Uridine Diphosphate-Glucose to Uridine Diphosphate-Glucuronic Acid, 663
Davidson, Dr. W. : Cosmological Significance of Angular Measurements of Distant Radio Sources, 991
Davies, D. E. N. : Appointed Associated Television Fellow in the Department of Electrical Engineering in the University of Birmingham, 22, 714
Davies, J. V., and others : 'Nitric Oxide—and Oxygen Effect' in X-irradiated *Shigella flexneri*, 851
Davies, Dr. R. O. : Title of reader in physics in the University of London (at Queen Mary College) conferred on, 797
Davies, Dr. William : Forage Conservation, *review*, 4
Davis, B. N. K. : Soil Fauna in relation to Soil Formation and Fertility, 367
Davis, D. H. S. : Biogeography of South-East Africa, 802
Dawson, J. B. : Basutoland Kimberlites, 475
Day, Prof. J. H. O. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Daykin, P. N. (Wright, R. H., and) : A Spectrometer for the Far Infra-red, 212
Days (Short), in the Short-Day Plant *Chenopodium amaranticolor* : Promotion of Leaf Growth by (Roderick G. Thomas), 771
de Barr, A. E. : Appointed first director of the Machine Tool Industry Research Association, 621 ; work of, 621
DeBusk, A. Gib (Brockman, H. E., and) : Modifying Factors of Amino-Acid Antagonisms in a Mutant of *Neurospora crassa*, 940
DeCarvalho, Dr. S., and Rand, Dr. H. J. : Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the Novikoff Hepatoma Cells of the Rat, 815
de Castro, Sisinio, and others : Serum Iron and its Transport Mechanism in the Fowl, 668

de Duve, C. : *Biochemistry of Human Tumours (A Strategic Approach to Chemotherapy by classifying the various Enzymes that affect or are affected by a given Drug)*, 628
de Vaucouleurs, Dr. Gérard : *l'Exploration des Galaxies Voisines par les Méthodes Optiques et Radio-électriques*, *review* by J. B. Alexander, 867
Deadmore, D. L. (Machin, J. S., and) . Thermal Stability of $TiOF_2$, 223
Dean, Dr. W. T. : Awarded a moiety of the Lyell Fund for 1961 of the *Geological Society of London*, 100
Death : Shortening of Life and Causes of, in Mice exposed to a Single Whole-Body Dose of Radiation (Dr. Patricia J. Lindop and Prof. J. Rotblat), 645
Decarboxylase (Mammalian) : *In vitro* Decarboxylation of Tryptophans by (Dr. V. Erspamer, Dr. A. Glässer, C. Pasini and G. Stoppani), 483
Decarboxylation (*In vitro*), of Tryptophans by *Mammalian Decarboxylase* (Dr. V. Erspamer, Dr. A. Glässer, C. Pasini and G Stoppani), 483
Decarboxylation (Non-Enzymic), of Methionine by Ferrous Ion (Mendel Mazelis), 305
Decisions, Values and Groups : *Vol I, Reports from* the First Interdisciplinary Conference in the Behavioral Science Division of the Air Force Office of Scientific Research, held at the University of New Mexico (edited by Dorothy Willner), *review* by Prof. Ll. Wynn Jones, 955
Deep Water (Cold) : Overflow of, across the Iceland–Greenland Ridge (J. G. Harvey), 911
Deer, Prof. W. A. : Appointed professor of mineralogy and petrology in *the University of* Cambridge, 793 ; work of, 794
Deer Forests : British, *review* by R. S. R Fitter, 431
Deer Stalking Grounds of Great Britain and Ireland (compiled by Col. G. Kenneth Whitehead), *review by* R. S. R. *Fitter*, 431
Defects (Lattice) : Electrical, Optical and Mechanical Properties of (Summer School at the University of Ghent on the), (sponsored by NATO), 104
Defects (Point), in Titanium and Zirconium : Production and Mobility of (E. Smith and M. S. Stagg), 300
Defence Scientific Service (Australian) : Annual Report for 1958-59 of the *Aeronautical Research Laboratories*, 103
Deficiency of Glucose-6-phosphate Dehydrogenase and Colour-blindness : Linkage between (A. Adam), 686
Deficiency (Glycerol) : *Unbalanced Growth of Mycoplasma mycoides* caused by (Glycerol in *Mycoplasma mycoides*), (A. W. Rodwell), 125
Deficiency (Tartronate), in Man : Possible Sources of (Laurence G. Wesson), 147
Deficiency (Threonine) : Prevention of Fatty Liver due to, by Moderate Caloric Restriction (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A. E. Harper), 917
Deflexion of Light in the Gravitational Field of the Sun (Dr N. S. Japolsky), 651
Deformation of Red Cell Shape induced by *Vipera palestinae* Venom *in vivo* *(Dr. D. Danon, S. Gitter and M. Rosen)*, 320
Deformation and Fracture of Body-centred Cubic Transition Metals : Theory of the (A. A. Johnson), 826
Degeneration of Flight-musculature in the *Corixidae* and *Notonectidae* (E. C. Young), 328
Degradative Pathway of L-Leucine in *Proteus vulgaris* (Shoji Sasaki), 400
Degree nearer Industry · A (Kenneth Harris), 969
Degree (*General*) : *Future of* the (Home Universities Conference Discussion on), 106
Degree (General) Applied Mathematics (S. L. Green and J. E. C. Gliddon), *review*, 613
Dehydration and Cracking Catalysts : Oxidation, Hydration, (edited by Paul H. Emmett), (Catalysis, Vol. 7), *review* by Dr E. B. Maxted, 88
Dehydrogenase (Glucose-6-phosphate), and *Colour-blindness* : *Linkage* between Deficiency of (A. Adam), 686
Dehydrogenase (Succinic Acid) : Reduction of Coenzyme Q by (Prof. Józef Heller, Dr. Ludmila Szarkowska and Czeslawa Petryszyn), 578
Dehydrogenase Activity (Steroid-3β-ol-), in Foetal Leydig's Cells (Dr. Mikko Niemi and Dr. M. Ikonen), 592
Dehydrogenase *System* (*Succinic*) *Stereochemistry of the* (Prof. O. Gawron, A. J. Glaid, T. P. Fondy and M. M. Bechtold), 1004
Delay (Phenomic), in Transduction of *Salmonella typhimurium* Cell (Dr. J. Hubáček), 679
Delayed Gas Evolution from Passive Films formed in the Kolbe Reaction (Prof. B. E. Conway and M. Dzieciuch), 914
Delayed Hypersensitivity to Homologous γ-Globulin in the Guinea Pig (*Dr. B. Benacerraf* and Dr. P. G H. Gell), 586
Delhi Engineering College Trust, 371
Dema, I. (Costea, T., and) : Influence of Chemical Isomerism on the Szilard–Chalmers *Processes in Solids*, 478
Demand (Growing), for Water : Second Report of the Sub-Committee on the (Central Advisory Water Committee), 278
O-Demethylation as a *Biosynthetic Pattern in the Formation of Opium* Alkaloids (Frank R. Stermitz and Prof. Henry Rapoport), 310
Demildt, A. : Excitation Functions of (d,α)- and $(d,\alpha n)$- Reactions on Natural Tungsten, 51
Demineralization by Electrodialysis (edited by J. R. Wilson), *review* by D. K. Hale, 258
Demonstration of Chlamydospores of *Candida albicans* : A Simple Medium *for the (R. Dutt-Choudhuri and Prof. Robin Dutt)*, 418
Demonstration (Optical), of Bragg's Law (Prof. W. G. Burgers), 741
Denervation (Chronic), of Sympathetic Nerves : Lack of Uptake of Catecholamines after (*Dr. G. Hertting, Dr. J. Axelrod, I. J. Kopin* and L. G. Whitby), 66
Dennis, Dr. R. W. G. : The Lichen Flora of the United States, *review*, 7
Dennis, Dr. S. C. R. . Appointed senior lecturer in applied *mathematics* at *the University* of Sheffield, 714
Density (Flux), of the Radio Source Cassiopeia A : Secular Variation of the (Dr. J. A. Hogbom and Dr. J. R. Shakeshaft), 561
Density-gradient (Equilibrium) Centrifugation of Animal Viruses : Use of Potassium Tartrate for (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Dental Enamel · *Molecular Sieve Behaviour of* (D. F. G. Poole, K. V. Mortimer, A. I. Darling and Dr. W. D. Ollis), 998
Dental Plaque : Nature and Composition of (D. J. Millin and M. H. Smith), 664
Dentinal Nerve-Endings : Continuous Regeneration of the (Prof. D. Hattyasy), 72
Deoxyribonucleic Acid Interference in the Diphenylamine Procedure for estimating (Dr. T F. Slater), 834
  Replication of, in Non-dividing Bacteria (*Dr. Daisuke Nakada and Dr. Francis J. Ryan*), 398
  Uptake of—a Special Property of the Cell Nucleus (Dr. M. Hill), 916
Deoxyribonucleic Acid in Thymus Nucleoprotein : Labilization of, after *Whole-body Irradiation* (Dr. Ulrich Hagen), 361
Deoxyribonucleic Acid Composition : Composition of various Ribonucleic Acid Fractions from Micro-organisms of Different (Carl R. Woese), 920
Deoxyribonucleic Acid (Multi-stranded), as determined by X-Irradiation (Prof. Liebe F. Cavalieri, Roland Finston and Barbara Hatch Rosenberg), 833
Dependence (Temperature), of Apparent Photosynthesis in Different Populations of *Solidago virgaurea* : Studies of Climatic Ecotypes in Higher Plants—the (O. Bjorkman, C. Florell and P. Holmgren), 624
Dependence (*Western*), *on Oil* (*Prof* R. J. *Sarjant*), 626
Dephosphorylation (Enzymatic), of Adenosine Tetraphosphate (Prof. Claude Liébecq, Kazimierz Jaroszewicz and Annette Lallemand), 661
Deposition of *Fission* Product *Nuclides* after Two *Sahara* Nuclear Test Explosions (Dr. V. Havlovic), 977
Depot Fatty Acids (Liver and), in Kwashiorkor (Dr R. W. R. Baker and Dr. I. Macdonald), 406
De-repression (*Repression* and), of Enzyme Synthesis as a Possible Explanation of some Aspects of Drug Action (Prof. Louis Shuster), 314
Derivatives (Aniline), of the Francis Inhibitor : Inhibition of the Multiplication of *Influenza Virus by* (*Dr. I. Hollós*), 553
Derivatives (Bence-Jones Protein) : Action of Trypsin on (Dr. Umberto Ferrini and Dr. Romano Zito), 485
Derivatives (Cellulose), of Enzymes : *Synthesis of Biologically Active* (Dr. Milton A. Mitz and Louis J. Summaria), 576
Derivatives (Pyrazine) : Production of, in the Radiolysis of Aqueous Solutions of the Cyclic Dipeptides (Mathilde Kland-English *and Warren* M. Garrison), 302
Derry, L. W. (Johnston, R. D., and) : An Unusual Feature of the Fusion Welding of Niobium to Vanadium, 52
Derry, T. K., and *Williams*, Dr. *Trevor I.* : *A Short History of* Technology from the Earliest Times to A.D. 1900, *review* by Prof. R. J. Forbes, 174
Desert (Sahara) : Radioactive Fall-out in Israel resulting from the Nuclear Tests in the (Y. Feige, E. Shalmon, J. Vardi, J. R. Gat (*Gutmann*), and Y. L. Tokatly), 90
Desikachary, Dr. T. V. : Cyanophyta, *review* by Dr. J. W. G. Lund, 343
Destruction of the Pineal Body : A Technique for, using Yttrium-90 *Spheres* (Dr. Uno Holmgren and Dr. Gustaf Notter), 773
Destruction (Catalase Synthesis and), *in vivo*: Methods for Determining the Rates of (Dr. V. E. Price, M. Rechcigl, jun., and R. W. Hartley, jun.), 62
Desty, D. H. : Gas Chromatography (Determination of Response Factors for Compounds of Different Type), 26
Desty, D. H. (Onkiehong, L., and) : *Gas Chromatography* (Hydrogen Flame and Argon Ionization Detectors), 26
Detection by Fluorescence of Oxytetracycline bound to Bone (Dr. Erminio Muzii), 934
Detection of Free Charges *from* Motor-Car Exhaust Gases (Dr. T. Westermark), 910
Detection of Liver Proteins in Circulating Blood (Dr. A. H. Gordon), 727
Detection of a Metabolic *Product* : *Experimental Transmission* of Sanguinarine in Milk— (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 201
Detection (Autoradiographical), of *Tritium-labelled Inulin in the Kidney* (J. Gayer, E. H. Graul and H. Hundeshagen), 500
Detection and Identification of Underground Nuclear Explosions . Research on the (United Kingdom Atomic Energy Authority), 445
Detector Equipment (*Standard* Ionization) : Gas Chromatographic Analysis of Permanent Gases using (Dr. R A. Landowne and Dr S. R. Lipsky), 571
Determination of *Amino-Acid Activation Profiles in Tissue Preparations* : A Simple Paper Chromatographic Method for (Dr. Alexandra von der Decken), 145
Determination of the Concentration of Myxoviruses and of *some Specific* Antisera, based on Neuraminidase Activity (Dr. J. Jacobs and Dr. J. N. Walop), 334
Determination of Heats of Adsorption by Transient-Response Techniques (*James J. Carberry*), 391
Determination of Human Chorionic Gonadotrophin : Clinical Application of a Serological Method for the (Dr. Sam Brody and Dr. Gun Carlstrom), 841
Determination of Tetramethyl Lead and Tetraethyl Lead in Petrol : A Rapid Method for the (Dr. J. Van Rysselberge and R. Leysen), 478
Determination (Accurate), of *Molecular Weights of Unknown Materials in* Solution (R. A. Pasternak and Leonard A. Cavanagh), 446
Determination (Sex Ratio), in the Parasitic Hymenopteran *Nasonia vitripennis* · A Possible Method of (Dr. P. E. King), 330
Determined by X-Irradiation · Multi-stranded Deoxyribonucleic Acid as (Prof. Liebe F. Cavalieri, Roland Finston and Barbara Hatch Rosenberg), 833
Determining *Embryonic* Orientation *in the* Hen's Egg : A Method of (I. S. Robertson), 854
Determining the Rates of Catalase Synthesis and Destruction *in vivo* : Methods for (*Dr. V. E. Price, M. Rechcigl, jun., and R W. Hartley, jun.*), 62
Detre, L. : Bericht uber Optische Beobachtungen anlasslich der Landung der *Sowjetischen* Mondrakete *Lunik II*, 186
Deuterium Oxide Solution : Nucleic Acids in (Y. Kyogoku, M Tsuboi, T. Shimanouchi and I. Watanabe)—An Infra-red Criterion of the Base Pairing in Nucleic Acid Structure, 120; Parallelism of the *Hypochromicity* at 260 $m\mu$ and the Hyperchromicity at 1,685 cm.$^{-1}$ of Nucleic Acids in Deuterium Oxide Solution, 121
Deuterium Peroxide–Heavy Water : Glass Formation in Solutions of *Hydrogen Peroxide–Water and* (*Robert C. Smith* and *S. J. Wyard*), 211
Deuterons in a Synchrotron: Acceleration of (H R. Shaylor and Dr. P. D. Whitaker), 741
Deutsch, Dr. E. R , and Watkins, N. D. · Direction of the Geomagnetic Field during the Triassic Period in Siberia, 543
Deutsche Kunststoff-Industrie : Ninth German Plastics Convention, 625

Deutscher Akademie der Naturforscher Leopoldina : Election of new Members, 273
Deutschlands (Die Tierwelt), und der Angrenzenden Meeresteile nach ihren Merkmalen und nach ihrer Lebenweise (begrundet von Prof. Dr. Friedrich Dahl ; weitergefuhrt von Maria Dahl und Prof. Dr. Hans Bischoff), Teil 47, Spinnentiere oder Arachnoidea (Araneae), 11, Micryphantidae–Zwergspinnen (Dr. Hermann Wiehle), *review* by Dr. Eric Duffey, 344
Development, Advisory Council on Research and (Ministry of Power) : Appointment of M. A L. Banks as a member, 188
Development of Chicken Embryos : Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the (Prof. C. Vacca, G. V. Pelagalli and A Schiavo), 66
Development of Electrical Engineering in the Royal Navy (Sir Hamish Maclaren), 364
Development of Elm Disease in Britain : The Status and (T. R Peace), (Forestry Commission, Bulletin No. 33), 886
Development (Current Research and), in Scientific Documentation, No. 7 (United States National Science Foundation), 185
Development (Soil Profile) : Glaciation in Wales as related to (Welsh Soils Discussion Group Meeting on), 275
Development (University Building) . Control of, 427
Development and Co-operation (Science Planning,), in the Countries of the Middle East and North Africa (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
Developmental Barriers in a Selection Experiment (K. C. Sondhi), 249
Developments in the Chemistry of Boron Compounds (Chemical Society Symposium on), 625
Developments in Plant Nematology : Recent (Association of Applied Biologists Symposium on), 715
Deverall, B. J. : Phenolase and Pectic Enzyme Activity in the Chocolate Spot Disease of Beans, 311
Devon : Involutions and Ice-Wedges in (Ronald S. Waters), 389
Diagnosis (Differential), of Yaws (Dr. C J. Hackett and Dr. L. J. A. Loewenthal), (World Health Organization, Monograph Series No. 45), 187
Dialkylphosphinous Chlorides : A New Synthetic Route to (J L. Ferron), 916
Diamond, A. L. (Porteus, Prof. S. D., and) : Measurement of Psychomotor Perseverative Tendencies, 691
Diamond : The 'Ballas' Form of (Roland Barton Fischer), 50
2,4-Dichlorophenoxyacetic Acid (Carboxyl-^{14}C-labelled) . Metabolism of, by Bean Stems—Heterogeneity of the Ethanol-soluble, Ether-insoluble Products (Michael K. Bach and J. Fellig), 763
Dick, Dr Stanley, and Raper, Dr. John R.: Origin of Expressed Mutations in *Schizophyllum commune*, 81
Dictionary of Nutrition and Food Technology (Dr. Arnold E. Bender), *review* by A. M. Copping, 433
Didakow, Norman C , and others : Antibodies against Autologous Brain in Rats with Allergic Encephalomyelitis, 322
Dieldrin : Fate of Aldrin and, in Locusts (A. J. Cohen and Dr. J. N. Smith), 600
Dielectric and Dipolar Interaction Theories of Solvent-induced Infra-Red Frequency Shifts (Dr. H. E. Hallam and T. C. Ray), 915
Diener, Dr. T. O. : Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus, 687
Diet (Atherogenic) : Experimental Pre-Thrombotic State of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an (Prof. B A. Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
Diet (Human) · Strontium-90 in, in the United Kingdom, 1959 (Agricultural Research Council, Radiobiology Laboratory Report No. 3), 191
Dietary Strontium-90 : Assessment of, through Urine Assay (Dr. Arthur R. Schulert), 933
Different Deoxyribonucleic Acid Composition : Composition of various Ribonucleic Acid Fractions from Micro-organisms of (Carl R. Woese). 920
Different Zones of the Ventricular Muscle of the Dog : Glutamic Oxaloacetic Transaminase Activity in (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr. Enrique Savino and Dr. Manuel René Malinow), 315
Differential Diagnosis of Yaws (Dr. C. J. Hackett and Dr L. J. A. Loewenthal), (World Health Organization, Monograph Series No. 45), 187
Differential Geometry : An Introduction to (Dr. T. J. Willmore), *review*, 613
Differential Radiosensitivity in Rice (*Oryza sativa* Linn.) at the Genotypic Level (H. K. Shama Rao and K. C. Bora), 762
Differential Sublimation Rates of Light and Tritium-labelled Water (Dr. R. Moore and Dr. E. R. Buskirk), 149
Difficulty (Reading), in English : Spelling Irregularities and (Dr. W. R. Lee), 273
Diffusion through Porous Materials (J. R. Bell and Dr. P. Grosberg), 980
Diffusion of Small Molecules (Prof. C. Rossi and E. Bianchi), 822
Diffusion (Gel) : Examination of *Leptospira pomona* by (P. G. Pande, P. C. Sekariah and R. R. Shukla), 511
Digitonin for the Analysis of Faecal Sterols : An Evaluation of the Use of (Prof. W. W. Wells and Patricia A. Mores), 483
Diglyceride Kinase and Phosphatidic Acid Phosphatase in Erythrocyte Membranes (Prof. Lowell E. Hokin and Mabel R. Hokin), 836
Dihydrofolate Reductase Activity (Increased), as a Possible Basis of Drug Resistance in Leukaemia (Dr. D. K. Misra, Stewart R. Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Diisopropylfluorophosphonate : Protective Effects of, against the Lethal Effects of X-Rays before or after Irradiation (D. A. Willoughby), 761
Dilute Silver–Manganese Alloys at Low Temperatures : Anomalous Conductivity and Lorenz Parameter in (Dr. M S. R. Chari), 824
Dimethoate (Insecticide), in Methyl 'Cellosolve' : Toxic Hazard from Formulating the (Prof. John E. Casida and D. M Sanderson), 507
5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58 : Excretion and Hepatic Storage of (Wolmar Nyberg, Matti Saarni and Dr. Ralph Gräsbeck), 764
Dineen, Dr. J. K. : Acquisition of Graft versus Host Tolerance, 680
Dingle, Prof. R. B. : Elected a Fellow of the Royal Society of Edinburgh, 876
2:4-Dinitrophenol · Inhibiting Effect of, on Calciferol-Induced Metastatic Calcification in the Rat (R. A. Grant, M. Hathorn and Dr. Theodore Gillman), 317
Diodes (Gallium Phosphide Point-Contact) : Radiative Recombination in (Dr. H. C. Gorton, Dr. J. M. Swartz and Dr. C. S Peet), 361
Dionne, Leo O (Spicer, Pauline B., and) : Use of Gibberellin to hasten Germination of *Solanum* Seed, 327
Dioxide (Titanium) : Thermal Stability of (J. S. Machin and D. L. Deadmore), 223, *erratum*, 275
Dipeptides (Cyclic) : Production of Pyrazine Derivatives in the Radiolysis of Aqueous Solutions of the (Mathilde Kland-English and Warren M Garrison), 302
Diphenylamine Procedure for estimating Deoxyribonucleic Acid : Interference in the (Dr. T. F. Slater), 834
Diphosphate-Glucose (Uridine) : Chemical Oxidation of, to Uridine Diphosphate-Glucuronic Acid (Dr. Bernard Jacobson and Dr Eugene A. Davidson), 663
Diphosphate-Glucuronic Acid (Uridine) : Chemical Oxidation of Uridine Diphosphate-Glucose to (Dr. Bernard Jacobson and Dr. Eugene A. Davidson), 663
Diphosphopyridine Nucleotide : Inhibiting Effect of Nicotinamide and, on the Methylcholanthrene Sarcoma in Rats (M. Matsuyama, A. Maekawa and T. Nagayo), 673
Diplock, A. T., and others : Role of Tocopherol, Selenium and Antioxidants in the Rat, 747
  Role of Selenium in relation to Ubiquinone in the Rat, 748
  Tocopherol, Ubiquinones and Ubichromenols in Yeasts and Mushrooms, 749
  An Unidentified Ubichromenol-like Lipid Constituent of Bakers' Yeast, 750
Dipolar Interaction Theories : Dielectric and, of Solvent-Induced Infra-Red Frequency Shifts (Dr. H E. Hallam and T. C Ray), 915
Dipyridyl (Chromium–) Complexes : Polarographic Behaviour of (Dr. A. A. Vlček), 393
Diquat as an Arboricide (J. S. Gunn and P. B Tatham), 808
Dirac, Prof. P. A M. : *Obituary* of Prof. Erwin Schrödinger, 355
Direct-Current Conductivity of Textiles, Proteins and other Polymers (Dr. C. P. S Taylor), 388
Direct Evaluation of Minute Amounts of Lead in Urine : Use of the Mercury Drop Electrode Method for (Prof Wiktor Kemula and Zenon Kublik), 57
Direct Methods of Estimation in the Spectrographic Analysis of Cobalt in Soil Concentrates (Dr. A. B. Calder), 165
Direction of the Geomagnetic Field during the Triassic Period in Siberia (Dr. E. R. Deutsch and N. D Watkins), 543
Directly Applied Radioactive Reagents : Quantitative Cytochemistry using (Dr. E. A Barnard and J Marbrook), 412
Discaria toumatou : Fixation of Nitrogen-15 by Excised Nodules of (Dr. T. M. Morrison), 945
Discharge (Glow), in an Induction-heated Vacuum Furnace : Elimination of a (John E. Fagel), 212
Discharge (The Synchronous), of Apocrine Sweat Glands of the Welsh Mountain Sheep (Dr. John Bligh), 582
Discharges (Corona) · Effect of, on Polyethylene (L. R. Hougen), 274
Discriminatory Test for Thyroid Activity in Fish : The Conversion Ratio as a (C. P. Hickman, jun.), 1012
Disease : Elm (Prof M. L. Anderson), 886
Disease (Chocolate Spot), of Beans : Phenolase and Pectic Enzyme Activity in the (B. J. Deverall), 311
Disease (Elm), in Britain : The Status and Development of (T. R. Peace), (Forestry Commission, Bulletin No. 33), 886
Disease (Foot-and-Mouth), in Madras, 274
Disease (Haemolytic), in Lambs : An Attempt to produce (Elizabeth M. Tucker), 847
Disease (Plant Virus), transmitted by both Aphids and Plant Bugs : Centrosema Mosaic, a (R. J. Van Velsen and Dr. N. C. Crowley), 858
Disease (Spontaneous Cytomegalic Inclusion Body), involving Lacrimal Glands of Caesarian-derived (so-called) Pathogen-free Rats (Dr. Hans Meier), 534
Diseases of the Blood : Research on (Lady Tata Memorial Trust Grants, Scholarships and Fellowships for), 361
Diseases and Pests of Ornamental Plants (Pascal P. Pirone, Bernard O. Dodge and Harold W. Rickett), third edition, *review* by Derek A. Reid, 956
Diseases (Plant) : Viruses and (Dr. L. O Kunkel), 630 ; (Dr. Karl Maramorosch), 630
Diseases (Tropical), Carmichael Hospital for (Calcutta School of Tropical Medicine and the) : Joint Annual Report for 1958-59, 359
Dispersal of Radiation Damage in Graphite : Aggregation and (W. N. Reynolds, P. A. Thrower and B. E. Sheldon), 824
Dispersion (Optical Rotatory), of the Thrombin-induced Conversion of Fibrinogen to Fibrin Monomer (Prof. C. M. Kay and M M. Marsh), 307
Displacements (Radial Particle), in Poiseuille Flow of Suspensions (Dr. G. Segré and Dr. A. Silberberg), 209
Dissimilatory Nitrate Reductase in *Neurospora crassa* : An Iron Requirement for a (G. S Walker and Dr D. J. D. Nicholas), 141
Dissociation (Ionic), at the Peptide Linkage · Possibility of (P. F. Browne), 658
Dissociation Theory of Aluminium Monobromide (Dr. R. F. Barrow), 480
Dissolved Air : Effect of, on the Viscosity of Water (W. A. Caw and R. G. Wylie), 995
Dissolving the Protective Spittle Masses of Frog Hopper Nymphs : A Method of (Dr. G. F. Howden and A. T. Marshall), 509
Dissolving Triacetyl-oleandomycin for the Assay of Sensitivity of Micro-organisms : Method of (Dr. J. W. Czekalowski), 752
Distant Radio Sources : Cosmological Significance of Angular Measurements of (Dr. W. Davidson), 991
Distillation of Alkali Elements during Formation of Australite Flanges (Dr. S. R Taylor), 630
Distribution of Acetylcholine and Cholinesterase in the Heart of White Rats (Dr. J. Vík, Dr. S. Tuček and Dr V. Habermann), 923
Distribution of Cholinesterase within the Kidney of the Domestic Fowl (A. B. Gilbert), 1009
Distribution of Coenzyme Q in Rat Liver Cell Fractions (P. Seshadri Sastry, J. Jayaraman and Dr. T. Ramasarma), 577

Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a Seed Dressing, in the Tissues of the Young Carnation Plant (June Robson and P. Fenn), 501
Distribution of certain Poppy–Fumaria Alkaloids and a Possible Link with the Incidence of Glaucoma (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
Distribution of Reptiles and Amphibians in the British Isles (Lieut.-Col. R. H. R. Taylor), 624
Distribution and Fate of Rose Bengal (Dr. V. Bocci), 584
Distribution (Uniform), of Wood Preservatives in Toxicity Test Blocks : A Method of Obtaining (D. N. R. Smith and R. Cockcroft), 163
Distributions (Molecular Weight), from Rheological Measurements · Polymers and the Theory of Numbers— (E. Menefee and W. L. Peticolas), 745
Disturbance (Ionospheric), at the Time of Cosmic Ray Increases (C. Collins and D. H. Jelly), 128
Disturbance (Magnetic), of November 12-13, 1960 : The Total Electron Content of the Ionosphere during the (G. N. Taylor), 740
Disulphide Bond (Single, Labile) : Separation of Univalent Fragments of Rabbit Antibody by Reduction of a (Prof. A. Nisonoff, G. Markus and F. C Wissler), 293
Ditertiary Phosphine : Complexes of Zerovalent Vanadium, Chromium, Molybdenum and Tungsten with a (Dr. J. Chatt and H. R. Watson), 1003
Diuresis Relationship between Urinary Hyaluronidase and (Prof. A. G. Ginetzinsky), 235 ; (Dr. G. M. Berlyne), 236
Diurnal Temperature Fluctuation and Genetic Variance in *Drosophila* Populations (J. A. Beardmore), 162
Dobzhansky, Prof. Th. : Elected a Member of the General Biology Section of the Leopoldina German Academy of Sciences, 273
Documentation Scientific (Unesco South Asia Science Co-operation Office Regional Seminar on), 534
Documentation (Scientific) . Current Research and Development in, No. 7 (United States National Science Foundation), 185
Dodds, Sir Charles . Calorie Balance in Man, 536
Dodds, Sir Edward : Elected to honorary life-membership of the New York Academy of Sciences, 19
Dodge, Bernard O , and others Diseases and Pests of Ornamental Plants, third edition, *review* by Derek A. Reid, 956
Dodge, Harold F , and Romig, Harry G. · Sampling Inspection Tables, second edition, *review* by Prof. M. G. Kendall, 259
Dodgson, K. S. (edited by) : The Organization and Financing of Research in Biochemistry and Allied Sciences in Great Britain (Biochemical Society), 794
Doell, Richard R. (Cox, Allan, and) : Palaeomagnetic Evidence relevant to a Change in the Earth's Radius, 45
Doemin, N. N · Primary and Initial Effects of Ionizing Radiations (Effect of Radiation on the Lipids and Lipoproteins in Different Sub-cellular Fractions), 110
Doetsch, Raymond N. (edited by) : Microbiology—Historical Contributions from 1776 to 1908 by Spallanzani, Schwann, Pasteur, Cohn, Tyndall, Koch, Lister, Schloesing, Burrill, Ehrlich, Vinogradsky, Warington, Beijerinck, Smith, Orla-Jensen, *review* by W. H Dowdeswell, 175
Dog : Glutamic Oxaloacetic Transaminase Activity in Different Zones of the Ventricular Muscle of the (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr Enrique Savino and Dr. Manuel René Malinow), 315
  Identification of 3,4,5-Trimethoxyphenylacetic Acid as the Major Metabolite of Mescaline in the (Prof. Elliot Spector), 751
Dog Mast Cell Tumour : Histochemical Evidence of 5-Hydroxytryptamine in a (Prof W. G. Rice and Dr. James Mitchener), 767
Dollery, C. T. (West, J. B., and) Absorption of Inhaled Radioactive Water Vapour, 588
Domestic Food Consumption and Expenditure, 1958—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 197
Domestic Fowl : Distribution of Cholinesterase within the Kidney of the (A. B. Gilbert), 1009
  Genetic Polymorphisms in the Egg Albumen Proteins of the (I. E. Lush), 981
Dominant Gene for Renal Adenomas in the Rat (Reidar Eker and Jeanne Mossige), 858
Dominion Museum (National Art Gallery and), Wellington, New Zealand : Report for 1959-60, 623
Donald, Prof. C. M. (Stern, W. R , and) : Relationship of Radiation, Leaf Area Index and Crop Growth-Rate, 597
Doncaster, C. C. : Recent Developments in Plant Nematology (Film of Some Nematode Feeding Mechanisms), 715
Donovan, Dr. D T., and others : Geology of the Floor of the Bristol Channel, 51
Dopamine Conversion of DL-*m*-Tyrosine to, in the Rat (Prof. T. L. Sourkes, G. F. Murphy and A. Rabinovitch), 577
Dose-Response Relationship in Radiation Carcinogenesis (Dr. Niels Arley and Reidar Eker), 151
Doses (Large), of X-Radiation : Influence of Hypothermia on the Survival of Mice after (L. Mráz and Dr. M. Praslička), 677
Doudoroff, Prof. M. (Merrick, Dr. J. M., and) : Enzymatic Synthesis of Poly-β-Hydroxybutyric Acid in Bacteria, 890
Doughty, Joyce · Domestic Food Consumption and Expenditure in Britain, 197
Douglas, Prof R. W. : Achievement in the Glass Industry, *review*, 342
Dounreay Fast Reactor . Work of the, 794
Dowdeswell, W. H. : Microbiology, *review*, 175
Dowson, Brigadier A. H. : Appointed director general of the Ordnance Survey, with the rank of Major-General, 104
Doy, Dr. Colin H. : Lability of N-o-Carboxyphenylribosylamine as a Factor in the Study of Tryptophan Biosynthesis, 461
Doyen, P. : Synoptic Auroral Maps, 624
Drag Coefficient (Fresnel) : The Relativistic Theory of the (Prof. P. T. Landsberg), 654
Drainage of Wales · The Relief and (Dr. Eric H. Brown), *review* by Prof. W G. V. Balchin, 432
Drainage (Impeded) : Phosphate Requirement of Lupins grown as a Pioneer Crop on Culm Measure Soil with (S. Larsen and D. Gunary), 691
Drewes, P. A (Gal, Prof E. M., and): Levels of Serotonin during Convulsion and the Effect of Reserpine, 234
Dreyer, Prof. C. J. : Properties of Stressed Bone, 594
Drinking Water : Naturally Occurring Alpha-Activity of (R. C. Turner, J M. Radley and Prof. W. V. Mayneord), 348
Drop Forging Research Association : Appointment of P. H. R. Lane as director of research, 625, 793
Drosophila : Enzymatic Reduction of the Yellow Pigment of (Toshifumi Taira), 231
Drosophila Populations : Diurnal Temperature Fluctuation and Genetic Variance in (J. A. Beardmore), 162
Drug Action . Repression and De-repression of Enzyme Synthesis as a Possible Explanation of some Aspects of (Prof. Louis Shuster), 314
Drug Resistance in Leukaemia : Increased Dihydrofolate Reductase Activity as a Possible Basis of (Dr. D. K. Misra, Stewart R. Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Drug Resistance (Transmissible) . Elimination of, by Treatment with Acriflavin (Prof. S. Mitsuhashi, K. Harada and M. Kameda), 947
Drug (New) Active against *Babesia canis* : 6-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride Hydrochloride —a (S. S Berg and J. M. S. Lucas), 64
'Dry' Mounting Autoradiographic Technique for the Localization of Water-soluble Compounds (P. J. Fitzgerald, Margery G. Ord and Dr L. A. Stocken), 55
Dry Rot and Redbrick (Dr. A. P. Rowe), 360

Edwin, E. E., and others Role of Tocopherol, Selenium and Anti-oxidants in the Rat, 747

  Role of Selenium in relation to Ubiquinone in the Rat, 748

  Tocopherol, Ubiquinones and Ubichromenols in Yeasts and Mushrooms, 749

  An Unidentified Ubichromenol-like Lipid Constituent of Bakers' Yeast, 750

Eelworm (Potato Root), in the Canary Islands (R. Chamberlain), 773

Effect of Air Pressure on the Fatigue of Lead and Aluminium (Dr. K. U. Snowden), 53

Effect of Alpha- and Beta-Melanocyte Stimulating Hormones on the Skin Colour of Man (Prof. Aaron B. Lerner and Dr. Joseph S. McGuire), 176

Effect of Corona Discharges on Polyethylene (L. R. Hougen), 274

Effect of Cortisone and related Compounds on the Biogenesis of Cartilage (Dr M W. Whitehouse and Dr. J. W. Lash), 37

Effect of Dissolved Air on the Viscosity of Water (W. A. Caw and R. G. Wylie), 995

Effect of Exposure to Sun and Exercise on Heat Tolerance Coefficient in Murrah Buffalo Calves (D. S. Bhatnagar and N. C. Chaudhary), 844

Effect of High-Temperature and Pre-Treatment on the Germination of Oil Palm Seed (A. R. Rees), 74

Effect of Light, Gibberellic Acid and Kinetin on Growth and Morphogenesis of *Striga* Seedlings (Growth and Morphogenesis of *Striga* Seedlings), (Colin N. Williams), 378

Effect of Limb Ablation on Neurones in *Xenopus* Larvae (Dr. A. F. W. Hughes and Dr. P. R. Lewis), 333

Effect of some Metabolic Inhibitors on Antibody Formation (Dr. J. Sterzl), 1022

Effect of 6-Methoxybenzoxazolinone on the Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson and its Presence in Sweet Corn (*Zea mays* var *saccharata* Bailey), (N. J. Whitney and C. G. Mortimore), 596

Effect of an Organic Gold Salt on Eaton's Primary Atypical Pneumonia Agent and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247

Effect of *p*H on the Sensitiveness of Trypsin to Ionizing Radiation (Prof. J A. V. Butler and A. B. Robins), 852

Effect of Phentolamine on Body Fat (Dr. C. R. Boshart, T. C. Smith, L. Will, J. Perrine and I. Ringler), 405

Effect of Polyhydric Alcohols to Frost Hardiness in Plants (Dr. Akira Sakai), 416

Effect of Polylysine on the Absorption Spectrum of Haemin (Dr. G Blauer), 396

Effect of Radioactive Sulphydryl Compounds on the Oxygen Tension in the Spleen of Mice (Dr. C. van der Meer, P. W. Valkenburg and M. Remmelts), 588

Effect of Reserpine : Levels of Serotonin during Convulsion and the (Prof. E. M. Gal and P. A. Drewes), 234

Effect of Temperature Fluctuations on Flowering in *Salvia splendens* (R. M. M. Crawford), 75

Effect of Temperature and Grafting on Vegetative Growth Phases of Algerian Ivy (Prof. V. T. Stoutemyer and O. K. Britt), 854

Effect of Urinary *p*H on 5-Hydroxytryptamine Excretion in the Rat (M. Sandler and R. G. Spector), 838

Effect (Anomalous) : Electron Microscopy of Crystal Lattices—an (Lewis T, Chadderton), 564

Effect (Glucose) : Absence of the, on the Frequency of Lysogenization in *Salmonella typhimurium* (Patricia Hoffee, Roger Weinberg and Prof. Ellis Englesberg), 160

Effect (Inhibiting), of 2:4-Dinitrophenol on Calciferol-induced Metastatic Calcification in the Rat (R. A. Grant, M. Hathorn and Dr Theodore Gillman), 317

Effect (Inhibiting), of Nicotinamide and Diphosphopyridine Nucleotide on the Methylcholanthrene Sarcoma in Rats (M. Matsuyama, A. Maekawa and T. Nagayo), 673

Effect (Memory), in the Thermal Initiation of Explosives (Dr. Werner R. Hess and Dr Rufus C. Ling), 288

Effect (A New), of Ionizing Radiation on Nucleoprotein (Dr. G. Hems), 849

Effect (An Unexpected), of Attention in Peripheral Vision (B. Babington Smith), 776

Effect (Weissenberg), in the Thick White of the Hen's Egg (Dr. H. G. Muller), 213

Effective Renal Plasma-flow : Conjugation of *p*-Aminohippurate by the Kidney and (Dr. B. P. Setchell and E. Blanch), 230

Effectiveness of Western Science : Increasing the (Fondation Universitaire, Brussels), 339

Effectiveness (Anti-leukaemic), in Mice : Toxicity and, of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroyl-glutamic Acid (Tetrahydroamethopterin), (Dr. J. A. R Mead, J. M. Venditti, A. W. Schrecker, Dr. A Goldin and R. L. Kisliuk), 937

Effects of Light and Optical Sensitization by Acridine-Orange on Living Bull Spermatozoa (C van Duijn, jun.), 76

Effects of Maleic Hydrazide on the Growth of Leaf and Stem Rusts of Wheat (D. J. Samborski *et al.*), 187

Effects of Nitrogen Mustard on the Histochemistry of Mouse Lymphocytic Leukaemia *L* 1210 (Dr. George J Furman, Prof. G. Adolph Ackerman and Dr. Carl Cohen), 591

Effects of Œstrogen on Somatic Variation of an Erythrocyte Agglutinogen in Chickens (S. L. Scheinberg and, R Reckel), 295

Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the Development of Chicken Embryos (Prof. C. Vacca, G. V. Pelagalli and A. Schiavo), 66

Effects of Pulped Soybean Silage on the Milk-yield of Cows (Dr. E. Kurnik, D. Gábos and B. Pozsár), 492

Effects of Radioactivity in the Sea : Research on the (International Atomic Energy Agency), 877

Effects of Ultrasonic Radiation in *Escherichia coli* B using Fluorochrome Acridine Orange as a Vital Stain (S. S. Ranade, V. G. Tatake and K. S. Korgaonkar), 931

Effects (After-) of X-Irradiation on Conidia of *Neurospora crassa* · Protective Action of Calcium Gluconate against (Prof. J. Weijer), 760

Effects (Cardiac), of Streptolysin O in Rabbits (Prof. S. P. Halbert, R. Bircher and E. Dahle), 232

Effects (Comparative), of Liver and Tumour Ribonucleic Acids on the Normal Liver and the Novikoff Hepatoma Cells of the Rat (Dr. S. DeCarvalho and Dr. H. J. Rand), 815

Effects (Lethal), of X-Rays : Protective Effects of Diisopropylfluorophosphonate against the, before or after Irradiation (D. A. Willoughby), 761

Effects (Morphogenetic), of Lipoic Acid on Amphibian Embryos (Prof. J. Brachet), 156

Effects (Possible Biological), of Electrically Charged Particles in Tobacco Smoke (Dr. K. H. Kingdon), 180

Effects (Primary and Initial), of Ionizing Radiations (Academy of Sciences of the U.S.S R. International Symposium on), 110

Effects (Protective), of Diisopropylfluorophosphonate against the Lethal Effects of X-Rays before or after Irradiation (D A. Willoughby), 761

Effects (Radiation), in Inorganic Solids (Faraday Society General Discussion on), 447

Effects (Typhoon), on Jaluit Atoll in the Marshall Islands : A Re-Survey of (Dr. David I. Blumenstock, Dr. F. R. Fosberg and Charles G. Johnson), 618

Efficiencies (Relative), of Indian Languages (Dr. B. S. Ramakrishna, K. K. Nair, V N. Chiplunkar, B. S. Atal, V. Ramachandran and R Subramanian), 614

Efficiency : Freedom and—Problems of University Administration in Britain and the Commonwealth (Committee on Science and Freedom, Manchester, Bulletin No 16), 517

Efficiency in Universities : The Problem of Freedom and (Dr. A. P. Rowe), 360

Efficiency (Comparative), of Indexing Systems : Interim Report on the Test Programme of an Investigation into the (Cyril W. Cleverdon), (Aslib Cranfield Research Project), 359

Effort (Physical) : Excretion of Tryptophan Metabolites after (Dr. L. Schmid), 64

Egg (Hen's) : A Method of determining Embryonic Orientation in the (I. S. Robertson), 854

  Weissenberg Effect in the Thick White of the (Dr. H. G. Muller), 213

Egg Albumen Proteins of the Domestic Fowl : Genetic Polymorphisms in the (I. E. Lush), 981

Egg-String in *Enoplus communis* Bastian, 1865 (Nematoda : Enoplidae) : Occurrence of an (Bruce E Hopper), 331

Egypt : Haemoglobin E in (Comdr. Kirk C. Hoerman, Karim Kamel and Armed Y. Awny), 69

Egyptian Soil : Chloramphenicol, a Simultaneous Carbon and Nitrogen Source for a *Streptomyces* sp. from (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775

Ehrich, Prof. Wilhelm E : Elected a Member of the Pathology and Anatomy Section of the Leopoldina German Academy of Sciences, 273

Ehrlich, Paul : The Collected Papers of (compiled and edited by Dr. F. Himmelweit, with the assistance of the late Martha Marquardt ; under the editorial direction of Sir Henry Dale), Vol. 2, Immunology and Cancer Research ; Vol. 3, Chemotherapy, *review* by Prof. C. H. Browning, 254

Ehrlich, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175

Ehrlich Ascites Carcinoma Cells . Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and (Rose M. Johnstone and Dr. Stephen I. Vas), 70

Eisenkolb, F. : Powder Metallurgy (Effect of Nickel on the Sintering of Tungsten), 366

Eker, Reider, and Mossige, Jeanne . A Dominant Gene for Renal Adenomas in the Rat, 858
Eker, Reidar (Arley, Dr Niels, and) : Dose-Response Relationship in Radiation Carcinogenesis, 151
El Karemi, M. M A (Mohammed, A. H., and) : Immunity of Bee Keepers to some Constituents of Bee Venom—Phospholipase-A Antibodies, 837
Elasticity along Single Microfibrils of Bacterial Cellulose . Variation of (J. Ross Colvin), 1029
Elasticity and Plasticity (Prof. J. N. Goodier and Prof. P. G. Hodge), *review* by Prof. A. T. Price, 865
Elder Isolation of Chromatographically Pure Rutin from Flowers of (Jiří Davídek), 487
Electric Breakdown : A Phenomenon in *n*-Hexane prior to its (Dr. S. S. Hakim and Dr. J. B. Higham), 996
Electric Charges on Stars : Existence of Net (Dr. Ludwig Oster and Kenelm W Philip), 43 ; (Prof. V. A. Bailey), 43, 995 ; (Prof. Lloyd Motz), 994
Electric Field : Influence of an, upon the Heat Transfer from a Hot Wire to an Insulating Liquid (Dr. P. Keith Watson), 563
Electrical Activity · Release of Calcium-45 from Frog Nerves during (Prof. K. Koketsu and S. Miyamoto), 402
Electrical Engineering in the Royal Navy : Development of (Sir Hamish Maclaren), 364
Electrical Engineering Industry : The Training of Graduates—a Report of the Joint Committee on Practical Training in the, revised re-issue (Institution of Electrical Engineers), 542
Electrical Engineers, Institution of : Presidential Address, Development of Electrical Engineering in the Royal Navy (Sir Hamish Maclaren), 364
  The Training of Graduates—a Report of the Joint Committee on Practical Training in the Electrical Engineering Industry, revised re-issue, 542
  Election of Lord Nelson of Stafford as an honorary member, 797
  Faraday Medal awarded to Julius A. Stratton, 797
Electrical Research Association : Appointment of Dr. R. H. Golde as head of the Surges and Transformer Department, 101
  Appointment of M. Waters as deputy head of the Surges and Transformer Department, 101
  Appointment of L. Gosland as deputy director of the Association, 101
  Appointment of C. G. Garton and E. W. Golding as assistant directors of the Association, 101
Electrical, Optical and Mechanical Properties of Lattice Defects (Summer School at the University of Ghent on the), (sponsored by NATO), 104
Electrically Charged Particles in Tobacco Smoke : Possible Biological Effects of (Dr. K. H. Kingdon), 180
Electrode (Mercury Drop) Method : Use of the, for Direct Evaluation of Minute Amounts of Lead in Urine (Prof. Wiktor Kemula and Zenon Kublik), 57
Electrodialysis : Demineralisation by (edited by J. R. Wilson), *review* by D. K. Hale, 258
Electrolytic Junction with Amplifying Properties (B. Lovreček and B. Kunst), 804
Electromagnetic Fields (Strong) : Standardization of (J. A. Lane and J. E. Pearson), 49
Electromagnetic Radiation (Soft), from Metals · Emission of, by the Impact of High-Energy Protons and Positive Ions (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Électromagnétique (Théorie), et de la Relativité · Les Principes de la (Prof. Marie-Antoinette Tonnelat), *review* by Prof. J. Hamilton, 87
Electromagnetism : The Special Theory of (B. L. Coleman), 476
Electromagnetism and Relativity, *review* by Prof. J. Hamilton, 87
Electron Acceptors in Charge Transfer Compounds : Organic Halides as (T. Bjorvatten, Prof. O. Hassel and Chr. Romming), 137
Electron Content (Total), of the Ionosphere during the Magnetic Disturbance of November 12-13, 1960 (G. N. Taylor), 740
Electron–Electron Collisions : Recombination through (Prof. D. R. Bates and A. E. Kingston), 652
Electron Microscope : Simple Methods for preparing Pointed Filaments for the (Dr. D. E. Bradley), 298
Electron Microscope Images (Out-of-Focus), of Edges of Crystal Lattices (J. M. Cowley and A. F. Moodie), 477
Electron Microscopic Autoradiography in a Magnetic Field (Dr. Carl G. Harford and Alice Hamlin), 505
Electron Microscopy : Sampling of Sub-micron Particles for (C. E. Billings, W. J. Megaw and R. D. Wiffen), 336
Electron Microscopy of Crystal Lattices—an Anomalous Effect (Lewis T. Chadderton), 564
Electron Spin Resonance Studies : Tritium as a Source of Radiation in (Jerzy Kroh, Basil C. Green and Dr. John W. T. Spinks), 655
Electronic Properties of Phenazine (S. Aftergut and G P. Brown), 827
Electrons (Free), with Thermal Energy : Affinity of Organic Compounds for—its Possible Significance in Biology (Dr. J. E. Lovelock), 729
Electrophoresis (Zone) : Lipoprotein Staining Method for (Dr. J. Kohn), 312
Electrophoretic Behaviour of Rat Serum Amylase (Prof. Robert L. McGeachin and Betty Ann Potter), 751
Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025
Electro-Physiology : Conditioning and (Prof. H. J. Eysenck), 282
Elementary Central Nervous System : Pharmacological Specificities of Neurones in an (Dr. H. Gerschenfeld and Dr. L. Tauc), 924
Elementary Plasticity (Imperial College of Science and Technology, London, Course on), 447
Elementary Titrimetric Analysis (Dr. A. M. G. Macdonald), *review* by Dr. D. T. Lewis, 7
Elements of the Kinetic Theory of Gases (Prof. E. A. Guggenheim), *review* by Dr. D. J. Millen, 783
Elements (Alkali) : Distillation of, during Formation of Australite Flanges (Dr. S. R. Taylor), 630
Elements (Ionized), in Stellar Spectra : Oscillation Broadening of Lines from (Gunnar Eriksen), 651
Elimination of a Glow Discharge in an Induction-heated Vacuum Furnace (John E. Fagel), 212
Elimination of Transmissible Drug-resistance by Treatment with Acriflavin (Prof. S. Mitsuhashi, K. Harada and M. Kameda), 947
Ellenby, Dr. C. : Recent Advances in Fields of Parasitological Research (Plant Nematology), 192
Ellesmere Island : A Biennial Copepod from Lake Hazen (Dr I. A. McLaren), 774
Elliott, Dr. W. H. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Elm Disease (Prof. M. L. Anderson), 886
Elm Disease in Britain : The Status and Development of (T. R. Peace), (Forestry Commission, Bulletin No. 33), 886
Elton, Dr. L. R. B. : *Obituary* of Dr. Sidney Smith, 356
Embassy (British), Paris : Appointment of R. V. Melville as scientific attaché, 877
Embrittlement (Irradiation), in Molybdenum : Control of (D. N. Sethna, A. A. Johnson, K. J. Proud and S. S. Sheinin), 568
Embryo (Human) . Two New Haemoglobin Variants in a Very Young (Dr. E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496
Embryonic Chick Tibiotarsi *in vitro* : L-Glutamine and the Growth of (Dr. J. D. Biggers), 1016
Embryonic Mammalian Cartilage : Growth of, after Freezing (Dr. Susan Heyner), 1027
Embryonic Orientation in the Hen's Egg · A Method of determining (I. S. Robertson), 854
Embryos (Amphibian) : Morphogenetic Effects of Lipoic Acid on (Prof. J. Brachet), 156
Embryos (Chicken) : Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the Development of (Prof. C. Vacca, G. V. Pelagalli and A. Schiavo), 66

Engineering (Electrical) Industry : The Training of Graduates—a Report of the Joint Committee on Practical Training in the, revised re-issue (Institution of Electrical Engineers), 542
Engineers (Chemical), Institution of : Symposium at the University of Birmingham, 880
Engineers (Chemical), Institution of (Graduates and Students Section of the Midlands Centre), (Graduate Section of Birmingham University Chemical Engineering Society and the) : Symposium on Computers for Chemical Engineers, 534
Engineers (Electrical), Institution of : Presidential Address, Development of Electrical Engineering in the Royal Navy (Sir Hamish Maclaren), 364
  The Training of Graduates—a Report of the Joint Committee on Practical Training in the Electrical Engineering Industry, revised re-issue, 542
  Election of Lord Nelson of Stafford as an honorary member, 797
  Faraday Medal awarded to Julius A. Stratton, 797

Engineers (Mechanical), Institution of · Symposium on User Experience of Large-Scale Industrial Vacuum Plant, 275
  1961 James Watt International Medal awarded to Prof. Theodore von Kármán, 361
  Retirement of Brian G. Robbins as secretary, 534
  Appointment of Kenneth H. Platt as secretary, 534
Engineers (Mining and Metallurgical), American Institute of (Metallurgical Society of the), (Metal Powder Industries Federation and the): International Conference on Powder Metallurgy, 365
Engineers (Telecommunication), of India, Institution of: 1960 Prize awarded to S N. Mitra, 447
Engineers (Women Scientists and) · Employment of, 253
England and Wales: Statistical Review of, for 1958 (Registrar General), 101
England and Wales, National Foundation for Educational Research in: Occasional Publication No. 2, Spelling Irregularities and Reading Difficulty in English (Dr. W. R. Lee), 273
Englesberg, Prof. Ellis, and others: Absence of the Glucose Effect on the Frequency of Lysogenization in *Salmonella typhimurium*, 160
English: Spelling Irregularities and Reading Difficulty in (Dr. W. R. Lee), 273
Enhancement of Atomic Absorption in the Flame by Organic Solvents (R. Lockyer, J. E. Scott and Susan Slade), 830
Enhancement of Ionization in the *E*-Layer due to Solar Flares during the International Geophysical Year (G H Bazzard), 47
Enoplus communis Bastian, 1865 (Nematoda . Enoplidae): Occurrence of an Egg-String in (Bruce E Hopper), 331
Enriched Cultures: Growth of Lake Victoria Phytoplankton in (Dr. John H. Evans), 417
Enrichment Trap for Use with Capillary Columns (R. Self), 223
Enterochromaffin Cells · Presence of, in the Gut of Amphioxus (Dr. Giuseppe Gerzeli), 237
Entomology at the British Museum (Natural History), 272
Environment: The Changing Industrial (T. H Hawkins), 283
Environment and Reproduction in Freshwater Triclads (Dr. T. B. Reynoldson), 329
Enzymatic Dephosphorylation of Adenosine Tetraphosphate (Prof Claude Liébecq, Kazimierz Jaroszewicz and Annette Lallemand), 661
Enzymatic Reduction of the Yellow Pigment of *Drosophila* (Toshifumi Taira), 231
Enzymatic Synthesis of Poly-β-Hydroxybutyric Acid in Bacteria (Dr. J. M. Merrick and Prof M. Doudoroff), 890
Enzyme (Lecithin-splitting), of *Vibrio* El Tor (Sankar Mitra and G. C. Chatterjee), 837
Enzyme (Pectic) Activity in the Chocolate Spot Disease of Beans: Phenolase and (B. J. Deverall), 311
Enzyme Synthesis: Repression and De-repression of, as a Possible Explanation of some Aspects of Drug Action (Prof. Louis Shuster), 314
Enzymes: Synthesis of Biologically Active Cellulose Derivatives of (Dr. Milton A. Mitz and Louis J Summaria), 576
Enzymes (Intestinal and Pancreatic), in Rats · Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by (S. K. Murthy, S. Mahadevan, P Seshadri Sastry and Dr. J. Ganguly), 482
Enzymic Glucoside Synthesis in Locusts (Dr. J. N. Smith and Helen B. Turbert), 600
Enzymic Release of Sialic Acid and Inactivation of Human Menopausal Gonadotropin (Dr. René Got and Dr. Roland Bourrillon), 234
Enzymic Synthesis of 3-*O*-α-D-Glucopyranosyl D-Xylose (Dr. S. A. Barker, Prof. M. Stacey and D. B. E Stroud), 138
Enzymic (Non-) Decarboxylation of Methionine by Ferrous Ion (Mendel Mazelis), 305
Epidemics of Black (Stem) Rust of Wheat (British Mycological Society Symposium on), 285
ε-N-Methyl-Lysine in *Salmonella* Flagellar Protein: A Gene determining Presence or Absence of (Dr. B. A. D. Stocker, Dr. M. W. McDonough and Dr. R. P. Ambler), 556
Epstein, Richard S., and others: Use of Potassium Tartrate for Equilibrium Density-gradient Centrifugation of Animal Viruses, 220
Equation (Appleton–Hartree): The Quasi-Longitudinal Approximation to the (A. D. M. Walker), 742
Equator (Geomagnetic): Lunar Tide in the F_2 Layer of the Ionosphere near the (R. G. Rastogi), 214
Equatorial Stratospheric Winds: Fluctuations in (R. A. Ebdon and R. G. Veryard), 791
Equilibrium Density-gradient Centrifugation of Animal Viruses: Use of Potassium Tartrate for (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Equivalents (Mitochondrial) · Plasma Membranes and, as Functionally Co-ordinated Structures (Prof. Stuart Mudd, Dr. Tomio Kawata, John I. Payne, Dr. Theodore Sall and Prof Atsushi Takagi), 79
Eragrostis curvula (Schrad) Nees: Low-Temperature Injury in Lovegrass (J. H. Leigh), 415
Ergonomics (International Ergonomics Association First International Congress on), 104
Ergonomics Association (International): First International Congress on Ergonomics, 104
Eriksen, Gunnar: Oscillation Broadening of Lines from Ionized Elements in Stellar Spectra, 651
Errera, M.: Primary and Initial Effects of Ionizing Radiations (Immediate Effect of X-Rays on the Metabolism of the Nuclei of Rat Thymocytes), 110
Erspamer, Dr. V, and others: *In vitro* Decarboxylation of Tryptophans by Mammalian Decarboxylase, 483
Erulkar, Dr. S. D., and Maren, Prof. T. H.: Carbonic Anhydrase and the Inner Ear, 459
Erythrocruorins: Haemoglobins, Myoglobins and—a Proposal for Modifying the Present Terminology (Dr. Malcolm H. Smith), 225
Erythrocyte: Transport of Phosphate into the (Dr. A. Zipursky and Dr. L. G. Israels), 1013
Erythrocyte Agglutinogen in Chickens: Effects of Œstrogen on Somatic Variation of an (S L. Scheinberg and R. Reckel), 295
Erythrocyte Membranes: Diglyceride Kinase and Phosphatidic Acid Phosphatase in (Prof. Lowell E Hokin and Mabel R. Hokin), 836
Erythrocytes: Action of *Vicia faba* on—Possible Relationship to Favism (Dr J. E. Bowman and Dr. D G. Walker), 555
Erythrocytes (Human): A New Haemoprotein with a Unique Iron Porphyrin Prosthetic Group isolated from (Dr. Martin Morrison), 765
Erythrocytosis induced by Hypoxaemia: Prevention of Vagotomy of (Dr. D. F. J Halmagyi and H. J. H. Colebatch), 757
Esau, Prof. Katherine: Anatomy of Seed Plants, *review* by Dr. C. R. Metcalfe, 864
Escherichia coli: Isolation of Lysozyme-soluble Mucopeptides from the Cell Walls of (Dr. L. Mandelstam), 855
  Localization of a Protease in the Cell of (Dr. J. Chaloupka), 512
Escherichia coli B. Effects of Ultrasonic Radiation in, using Fluorochrome Acridine Orange as a Vital Stain (S. S. Ranade, V. G. Tatake and K. S Korgaonkar), 931
Escherichia coli (2-Thiouracil-grown): A Requirement for 2-Thiouracil of, under Conditions of Ornithine Transcarbamylase Repression (Ada Zamir and Dr. Ruth Ben-Ishai), 922
Essay Competition: Teyler, 714
Essay Competition on Corrosion Science (Society of Chemical Industry), 274
Essen, Dr L., and others · Hyperfine Splitting of Rubidium-87, 298
Essentials of Logistics, *review* by F. I. G. Rawlins, 88
ESSO Magazine, Vol 9, No. 4, 185
Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in Rats · Fatty Acid Specificity for the (S K Murthy, S Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Estimating Deoxyribonucleic Acid: Interference in the Diphenylamine Procedure for (Dr. T. F Slater), 834
Estimation: Direct Methods of, in the Spectrographic Analysis of Cobalt in Soil Concentrates (Dr A. B. Calder), 165
Estimation of Oil in Safflower Seed (S. H. Pawlowski), 772
Estimation of Volatile Anaesthetics in Tissues by Gas Chromatography (Dr. R. A. Butler and Dr. D W Hill), 488
Etch Patterns on Cadmium Crystals grown from Vapour (Joy George), 743
Etching (Thermal) · Evidence of Phase Changes in Zirconia from (P. E. Evans and G Wildsmith), 569
Ethanol-soluble, Ether-insoluble Products · Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by Bean Stems—Heterogeneity of the (Michael K. Bach and J. Fellig), 763
Ether-insoluble Products: Metabolism of Carboxy-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by Bean Stems—Heterogeneity of the Ethanol-soluble, (Michael K. Bach and J. Fellig), 763
Ethers (Aliphatic): Influence of Molecular Structure on the Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and Indium with (Dr R. R Brooks and P J Lloyd), 375
Ethnography: Saharan, *review* by G. I. Jones, 782
Ethyl Branching in the Fischer–Tropsch Synthesis (Bernard D. Blaustein, Irving Wender and Robert B. Anderson), 224
Ethyl Iodide Solutions: Photolysis of (Michael C. L. Gerry and Prof. Gerald B. Porter), 655
N-Ethyl-L-Asparagine, a New Amino-Acid Amine from *Ecballium* (D. O. Gray and Dr. L Fowden), 401
Ethylene Production by Cytoplasmic Particles from Apple and Tomato Fruits in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr. C C. Craft), 243
Ethylenediamine Tetraacetic Acid (Iron–): Absorption and Breakdown of, by Tomato Plants (Dr. D. G. Hill-Cottingham and C. P. Lloyd-Jones), 312
Eudier, M.: Powder Metallurgy (Controlled Oxidation of Nickel before Sintering raised the Density Achieved), 367
Euratom, and others · Establishment in Brussels of an office ('Transatom') to collect and disseminate information concerning Translations of Nuclear Literature, 102, 623
European Atomic Energy Community, and others: Establishment in Brussels of an office ('Transatom') to collect and disseminate inofrmation concerning Translations of Nuclear Literature, 102, 623
European Congress on Molecular Spectroscopy: Fifth (International Union of Pure and Applied Chemistry, the Koninklijke Nederlandse Chemische Vereniging and the Nederlandse Natuurkundige Vereniging), 797
European Co-operation in Space Research, 19
European Economic Co-operation, Organization for (Danish Atomic Energy Commission and the): Health Physics in Nuclear Installations, 1959, *review* by W. J Whitehouse, 347
European Economic Co-operation, Organization for (European Nuclear Energy Agency): Text of the Convention on Third Party Liability in the Field of Nuclear Energy, 444
European Economic Co-operation, Organization for (European Nuclear Energy Agency), in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m b H: International Symposium on Criticality Control in Chemical and Metallurgical Plant, 797
European Nuclear Energy Agency (Organization for European Economic Co-operation). Text of the Convention on Third Party Liability in the Field of Nuclear Energy, 444
European Nuclear Energy Agency (Organization for European Economic Co-operation), in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H.. International Symposium on Criticality Control in Chemical and Metallurgical Plant, 797
European Spiders, *review* by Dr. Eric Duffey, 344
Evaluation of the Activity of Corticosteroid 11β-Hydroxylase (Dr. Benjamin N. Horwitt, Charles Sobel and Orville J. Golub), 1006
Evaluation of the Use of Digitonin for the Analysis of Faecal Sterols (Prof. W. W. Wells and Patricia A. Mores), 483
Evaluation (Direct), of Minute Amounts of Lead in Urine: Use of the Mercury Drop Electrode Method for (Prof. Wiktor Kemula and Zenon Kublik), 57
Evans, Prof D. G.: Appointed to the University of London chair of bacteriology at the London School of Hygiene and Tropical Medicine, 18; work of, 18
Evans, Dr. John H.: Growth of Lake Victoria Phytoplankton in Enriched Cultures, 417
Evans, P. E, and Wildsmith, G.: Evidence of Phase Changes in Zirconia from Thermal Etching, 569
Evaporation from Different Regions of the Skin of Indian Zebu Cattle: Rate of (Dr. D Roy Chowdhury and Dr. D P. Sadhu), 491
Evered, Dr D. F.: Magnesium Absorption in Sheep, 228
Evidence of Active Ion Transport across Large Canine Blood Vessel Walls (Prof. P. N. Sawyer and I. Valmont), 470
Evidence for the Granular Localization of Posterior Pituitary Hormones (Shawn Schapiro and Lennart Stjarne), 669

Evidence of Phase Changes in Zirconia from Thermal Etching (P. E. Evans and G. Wildsmith), 569
Evidence (Histochemical), of 5-Hydroxytryptamine in a Dog Mast Cell Tumour (Prof. W. G. Rice and Dr. James Mitchener), 767
Evidence (Palaeomagnetic), relevant to a Change in the Earth's Radius (Allan Cox and Richard R. Doell), 45
Evolution, *review* by Dr. G S. Carter, 89 ; *review* by Dr. P. G. Fothergill, 340
  Implications of (Dr. G A. Kerkut), *review* by Dr. G. S Carter, 89
Evolution, its Science and Doctrine—Symposium presented to the Royal Society of Canada in 1959 (edited by Thomas W. M Cameron), *review* by Dr P. G. Fothergill, 340
Evolution der Angiospermen (Prof. Dr. Armen Takhtajan), *review* by J. Parkin, 519
Evolution of Coal : The Origin and (Dr. P. J. Adams), 712
Evolution after Darwin (edited by Prof. Sol Tax), Vol 1, The Evolution of Life—its Origin, History and Future ; Vol. 2, The Evolution of Man—Man, Culture and Society, *review* by Dr. P. G. Fothergill, 340
Evolution of the Flower, *review* by J. Parkin, 519
Evolution of Life—its Origin, History and Future (edited by Prof. Sol Tax), (Evolution after Darwin, Vol 1), *review* by Dr. P. G Fothergill, 340
Evolution of Man—Man, Culture and Society (edited by Prof. Sol Tax), (Evolution after Darwin, Vol. 2), *review* by Dr. P. G. Fothergill, 340
Evolution (Delayed Gas), from Passive Films formed in the Kolbe Reaction (Prof B E. Conway and M. Dzieciuch), 914
Evolution (Gene), and the Haemoglobins (Prof. Vernon M. Ingram), 704
Ewes . Relationship between High Temperature and Vitamin A Metabolism and the Fertility of (Margaret Ryle), 104
Examination of *Leptospira pomona* by Gel Diffusion (P G. Pande, P. C. Sekariah and R. R Shukla), 511
Exchange' · 'Ligand—a Novel Separation Technique (Dr. F. Helfferich), 1001
Excised Nodules of *Discaria toumatou* : Fixation of Nitrogen-15 by (Dr. T. M. Morrison), 945
Excitation Functions of (d,α)- and $(d,\alpha n)$- Reactions on Natural Tungsten (A. Demildt), 51
Excited (Vibrationally) Nitric Oxide produced in the Flash Photolysis of Nitrosyl Chloride (Dr. N Basco and Prof. R G. W Norrish), 455
Excretion of Tryptophan Metabolites after Physical Effort (Dr. L. Schmid), 64
Excretion (Calcium and Phosphorus), in the Laying Hen : Partition of (S. Hurwitz and Prof. P. Griminger), 759
Excretion (5-Hydroxytryptamine), in the Rat Effect of Urinary *p*H on (M. Sandler and R. G. Spector), 838
Excretion and Hepatic Storage of 5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58 (Wolmar Nyberg, Matti Saarni and Dr. Ralph Gräsbeck), 764
Exercise : Effect of Exposure to Sun and, on Heat Tolerance Coefficient in Murrah Buffalo Calves (D. S. Bhatnagar and N. C. Chaudhary), 844
Exhaust Gases (Motor-Car) : Detection of Free Charges from (Dr T. Westermark), 910
Exhibition (The 1961) of the Institute of Physics and the Physical Society (G R Noakes), 535
Exhibition (Symposium and Instrument), on Automatic and Semi-Automatic Methods in Analysis and Control (Medway College of Technology), 447
Existence of Net Electric Charges on Stars (Dr. Ludwig Oster and Kenelm W. Philip), 43 ; (Prof V. A. Bailey), 43, 995 ; (Prof Lloyd Motz), 994
Expedition : Trans-Antarctic, 1955-1958, Scientific Reports, No. 4, Tides at Shackleton, Weddell Sea (J. G. D. Pratt), *review* by J. R. Rossiter, 346
Expeditions : Photography on (Royal Photographic Society Symposium on), 880
Expenditure : Domestic Food Consumption and, 1958—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 197
  Methods used by Universities of Contracting and of Recording and Controlling (University Grants Committee), 427
Expenditure (Research), on Fisheries, 532
Experience (User), of Large-Scale Industrial Vacuum Plant (Institution of Mechanical Engineers Symposium on), 275
Experiment (Selection) : Developmental Barriers in a (K. C. Sondhi), 249
Experiment (A Transatlantic Communication), via *Echo* I Satellite (H. Carru, R Gendrin and M. Reyssat), 268
Experimental Allergic Encephalomyelitis in Irradiated Rats (Prof. N. Allegretti and M. Matošić), 500
Experimental Biology, Worcester Foundation for : Fellowships in Reproductive Physiology, 970
Experimental Burns : Local Treatment of, with a Monoamine Oxidase Inhibitor (W. G. Spector and D. A. Willoughby), 489
Experimental Cirrhosis : Inhibition of, by Carbon Tetrachloride following Treatment with Aminoacetonitrile (Dr. L. Fiume and Prof. G. Favilli), 71
Experimental Data concerning the Connexion between Thyroid Function and Mucopolysaccharide(Hexosamine)-Level (Prof. St. Krompecher, Cs Hadházy, G. Berencsi, E H Oláh and M B László), 670
Experimental Pre-Thrombotic State of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet (Prof. B A Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
Experimental Transmission of Sanguinarine in Milk—Detection of a Metabolic Product (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr James Walker), 201
Explanation (Possible), of some Aspects of Drug Action : Repression and De-repression of Enzyme Synthesis as a (Prof. Louis Shuster), 314
l'Exploration des Galaxies Voisines par les Méthodes Optiques et Radioélectriques (Dr. Gérard de Vaucouleurs), *review* by J. B. Alexander, 867
Exploration of the Sea, International Council for the : Symposium on Zooplankton Production, 360
Explosions (Sahara Nuclear Test) : Deposition of Fission Product Nuclides after Two (Dr. V. Havlovic), 977
Explosions (Underground Nuclear) : Research on the Detection and Identification of (United Kingdom Atomic Energy Authority), 445
Explosives : Memory Effect in the Thermal Initiation of (Dr. Werner R. Hess and Dr. Rufus C. Ling), 288
Exposure to Sun and Exercise : Effect of, on Heat Tolerance Coefficient in Murrah Buffalo Calves (D. S. Bhatnagar and N. C. Chaudhary), 844
Expressed Mutations in *Schizophyllum commune* : Origin of (Dr. Stanley Dick and Dr. John R. Raper), 81
Extinct Giant Pangolin and associated Mammals from Niah Cave, Sarawak (Tom Harrisson, D. A. Hooijer and Lord Medway), 166
Extract (Ecdysone) · Alteration of the Growth of Mammalian Cells *in vitro* by (Prof. Walter J Burdette and Dr. Ralph C. Richards), 666
Extraction (Liquid/Liquid), of the Chloro-Complexes of Gallium and Indium with Aliphatic Ethers · Influence of Molecular Structure on the (Dr. R. R. Brooks and P. J. Lloyd), 375
Extracts : Use of Radioactive Nitrogen in Studying Nitrogen Fixation in Bacterial Cells and their (Dr. D. J. D. Nicholas, Dr. D. J. Silvester and Dr. J. F. Fowler), 634
Exudate (Wound), of Avocado Trees Isolation of D-Glycero-D-galacto-heptitol from the (J. K. N. Jones and R. A. Wall), 746
Exudates : Molecular Properties of Conjugated Proteins isolated from (Prof. Antonio Caputo), 395
Eye, the Brain and Land's Two-Colour Projections (Dr W. A. H. Rushton), 440
Eye Movements (Saccadic) : Subjective Analysis of (Dr. J. G. Thomas), 842
Eyes of *Polyphemus pediculus* (L.) (Crustacea, Cladocera) : Biliverdin in the (J. Green), 227
Eyles, Joan M. . Centenaries (Samuel Clegg, 1781-1861) ; Sir James Hall (1761-1832), 182
Eyles, Dr. V. A. To deliver the Bruce-Preller Lecture (1961) of the Royal Society of Edinburgh, 876
Eysenck, Prof. H. J. : Conditioning and Electro-Physiology, 282

F(SPREAD-), and the Latitude Variation of Occurrence of Whistlers (D. G. Singleton), 215
F_2 Layer of the Ionosphere near the Geomagnetic Equator : Lunar Tide in the (R. G. Rastogi), 214
Fabrication of Beryllium Tubes and Sections—a New Structural Metal with Unique Properties (Chesterfield Tube Co., Ltd), 976
Factor in the Study of Tryptophan Biosynthesis Lability of N-*o*-Carboxyphenylribosylamine as a (Dr. Colin H Doy), 461
Factor (A New Green-Leaf Growth-stimulating), Phyllococosine, from Coconut Milk (Dr. Susumu Kuraishi and Dr. F. Shigeo Okumura), 148
Factor (Precipitating), for Aggregated γ-Globulins in Normal Human Sera (Dr. A. Taranta, Dr. H. S. Weiss and E. C. Franklin), 239
Factories (British) : Health at Work—a Description of Medical Services in Fourteen (Ministry of Labour and National Service), 886
Factors Influencing the Food-Chain Transport of Radioactive Materials into Cow's Milk . Some (D. Merten and O. Suschny), 806
Factors (Modifying), of Amino-acid Antagonisms in a Mutant of *Neurospora crassa* (H. E Brockman and A. Gib DeBusk), 940
Fading (Irregular), of Satellite Transmissions (Dr. W. C. Bain), 129
Faecal Sterols : An Evaluation of the Use of Digitonin for the Analysis of (Prof. W. W. Wells and Patricia A. Mores), 483
Fagel, John E. : Elimination of a Glow Discharge in an Induction-heated Vacuum Furnace, 212
Fall-out in India : Observations of, during the Period of Cessation of Nuclear Tests (K. G. Vohra and V. S. Bhatnagar), 286
Fall-out (Radioactive), in Israel resulting from the Nuclear Tests in the Sahara Desert (Y. Feige, E. Shalmon, J. Vardi, J. R. Gat (Gutmann), and Y. L. Tokatly), 90
Fall-out (Southern Hemisphere), and the Meridional Circulation (A. R. Dyer), 905
Fano, L. (Fano, Dr. U., and) · Basic Physics of Atoms and Molecules, *review* by Dr. G. A Jones, 172
Fano, Dr. U., and Fano, L. : Basic Physics of Atoms and Molecules, *review* by Dr. G. A. Jones, 172
Far Infra-red : A Spectrometer for the (R. H. Wright and P. N. Daykin), 212
Faraday Medal of the Institution of Electrical Engineers awarded to Julius A. Stratton, 797
Faraday Society : Informal Discussion on Mechanisms of the Gas-Phase Reactions of the Halogens and their Compounds, 275, 447
  General Discussion on Radiation Effects in Inorganic Solids, 447
Farago, Dr. P S. : Elected a Fellow of the Royal Society of Edinburgh, 876
Farmer : Advising the (Advisory Methods Section of the Agricultural Education Association series of papers on), 883
Farrago of Earth History, *review* by Prof. Arthur Holmes, 341
'Fast' ('Slow' and) Skeletal Muscle Fibres of the Frog : Influence of Calcium on the Potassium-Contracture of (P. Pauschinger and Prof. K. Brecht), 583
Fat Percentage of the Milk in Cattle . Relationships between Blood Groups and the (Jan Rendel), 408
Fat (Body) Effect of Phentolamine on (Dr. C. R. Boshart, T. C. Smith, L. Will, J. Perrine and I Ringler), 405
Fate of Aldrin and Dieldrin in Locusts (A J. Cohen and Dr. J. N. Smith), 600
Fate of Rose Bengal · Distribution and (Dr V Bocci), 584
Fatehchand, Dr. Richard, and others : Location of the Non-Linearity in Horizontal Cell Response to Retinal Illumination, 463
Fatigue of Lead and Aluminium : Effect of Air Pressure on the (Dr. K. U. Snowden), 53
Fatigue Cracks in Beta-Brass : Initiation of (B J. S. Wilkins and M. G. Bader), 301
Fatigue Straining of Copper Whisker (Dr. Edward Eisner), 534
Fatty Acid Pattern in the Aorta Lipids of Cockerels in the Initial Stage of Cholesterol- or Stilboestrol-induced Atherosclerosis (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in Rats (S. K. Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Fatty Acid and Glucose Metabolism in the Perfused Heart (Dr Joseph C. Shipp, Dr. Lionel H. Opie and Dr. David Challoner), 1018
Fatty Acid/Protein Complex in Human Hair (A. W. Holmes), 923
Fatty Acids (Depot), in Kwashiorkor : Liver and (Dr. R. W. R. Baker and Dr. I. Macdonald), 406
Fatty Acids (Industrial), and their Applications (edited by E. Scott Pattison), *review* by Dr. D. T. Lewis, 346
Fatty Liver due to Threonine Deficiency · Prevention of, by Moderate Caloric Restriction (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A. E. Harper), 917
Faulkner, C. R. . Rotation Period of the Artificial Satellite 1958δ1, 738

Fauna (Soil), in relation to Soil Formation and Fertility (Association of Applied Biologists Symposium on), 367
Favilli, Prof. G. (Fiume, Dr L , and) : Inhibition of Experimental Cirrhosis by Carbon Tetrachloride following Treatment with Aminoacetonitrile, 71
Favism : Action of *Vicia faba* on Erythrocytes—Possible Relationship to (Dr. J. E. Bowman and Dr. D. G Walker), 555
Feature (An Unusual), of the Fusion Welding of Niobium to Vanadium (R. D. Johnston and L. W. Derry), 52
Fecundity of the Nile Mormyrid, *Hyperopisus bebe* (Lacepede), (G. Nawar), 274
Federation of Malaya, Government of the (Rubber Research Institute of Malaya and the) : Conference on Natural Rubber Research, 193
Feeding (Single), of Polynuclear Hydrocarbons : Mammary Cancer induced by a, and its Suppression (Prof Charles Huggins, Lorraine C. Grand and Filomena P Brillantes), 204
Feige, Y , and others : Radioactive Fall-out in Israel resulting from the Nuclear Tests in the Sahara Desert, 90
Felss, N : Wind Tunnels and Flow Visualization, 109
Fellgett, Dr. P. B. : Elected a Fellow of the Royal Society of Edinburgh, 876
Fellig, J. (Bach, Michael K., and) : Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by Bean Stems—Heterogeneity of the Ethanol-soluble, Ether-insoluble Products, 763
Fellowship (Ramsay Memorial), for advanced students of Chemistry (Ramsay Memorial Fellowships Trust), 534
Fellowships : Grants, Scholarships and, for Research on Diseases of the Blood (Lady Tata Memorial Trust), 361
Fellowships in Reproductive Physiology (Worcester Foundation for Experimental Biology, Mass.), 970
Fellowships (Ford Foundation Research) of the Zoological Society of London awarded to Dr. Peter A. Jewell, Dr. Lorna M. Kellas and D. R. S. Kirby, 711
Fellowships (Studentships and), in Agriculture (Agricultural Research Council), 796
Fellowships and Research Grants 1961 : Studentships, (Department of Scientific and Industrial Research), 361
Female Reproductive Tract : Breakdown of Seminal Glycerylphosphorylcholine by Secretions of the (Prof. I. G. White and J. C. Wallace), 843
Fenn, P. (Robson, June, and) : Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a Seed Dressing, in the Tissues of the Young Carnation Plant, 501
Fermi (Enrico) International School of Physics (Societá Italiana di Fisica), 880
Fern Gametophytes : Protein and Ribonucleic Acid in the Growth of (Y. Hotta), 455
Fernández de Gimeno, Dr. Martha A., and others : Glutamic Oxaloacetic Transaminase Activity in Different Zones of the Ventricular Muscle of the Dog, 315
Ferns : Mode of Action of an Antheridium-inducing Substance in (Dr. Ulrich Naf), 900
Ferraro, Prof V. C. A. : Magnetic Energy, 566
Ferrini, Dr. Umberto, and Zito, Dr. Romano : Action of Trypsin on Bence-Jones Protein Derivatives, 485
Ferritin : Formation of Haemosiderin and its relation to (Dr. Arne Shoden and Dr. Philip Sturgeon), 846
Ferron, J L. : A New Synthetic Route to Dialkylphosphinous Chlorides, 916
Ferrous Hydroxide System : The Sodium Silicate— (Dr. G. Kakabadse and P. Whinfrey), 829
Ferrous Ion : Non-Enzymic Decarboxylation of Methionine by (Mendel Mazelis), 305
Fertility : Control of, by 6-Azauridine (Margaret A. Sanders, Dr. B. P. Wiesner and Prof. John Yudkin), 1015
Fertility of Ewes : Relationship between High Temperature and Vitamin A Metabolism and the (Margaret Ryle), 104
Fertility (Soil Formation and) : Soil Fauna in relation to (Association of Applied Biologists Symposium on), 367
Feulgen-stained Bull Sperm : Absorbance of (Dr. Simon Iversen), 684
Fibres (Nerve) : Gradient of Cholinesterase Activity and of Choline Acetylase Activity in—Gradient of Cholinesterase Activity (Dr. L Lubińska, S. Niemierko and B. Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123
Fibres (Skeletal Muscle), of the Frog : Influence of Calcium on the Potassium-Contracture of 'Slow' and 'Fast' (P. Pauschinger and Prof. K. Brecht), 583
Fibrin Monomer : Optical Rotatory Dispersion of the Thrombin-induced Conversion of Fibrinogen to (Prof. C. M. Kay and M. M. Marsh), 307
Fibrinogen to Fibrin Monomer : Optical Rotatory Dispersion of the Thrombin-induced Conversion of (Prof. C. M. Kay and M. M. Marsh), 307
Fibrinolysin : Mast Cells and (Dr. Norman Ende and Dr. Joseph V. Auditore), 593
Fibrinolytic Activities present in Human Blood Platelets (Dr. Rudolf Holemans and Dr. Rudolf Gross), 238
Fibrinolytic Activity (Reduced), of Atherosclerotic Sera caused by an Increase in Low-density Lipoproteins in Blood (Dr. Nirmal Sarkar), 929
Fibrosarcoma in a Rabbit following β-Irradiation of the Skin (L A. George, S. Marks and L. K. Bustad), 770
Fibrous Materials (Drying) . Technology of, with particular reference to Leather (Society of Leather Trades' Chemists Symposium on), 188
Fibrous Proteins : α-Configuration of (R. D. B. Fraser and T. P. MacRae), 572
Field Crops : Physiology of (Association of Applied Biologists Symposium on), 714
Field Studies Association (Scottish) : Programme of Courses, 713
Field Studies Council : Courses, 445
  Annual Report for 1959-60, 970
Field Studies Council (Royal Meteorological Society and the) : Meteorological Field Course, 797
Field-Aligned Ionospheric Irregularities and the Scintillation of Satellite Radio Transmissions (D. G. Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Fields of Parasitological Research : Recent Advances in (Parasitology Group of the Institute of Biology Discussion on), 192
Freller, E. C. : *Obituary* by E D. van Rest, 271
Filaments (Pointed), for the Electron Microscope : Simple Methods for preparing (Dr. D. E. Bradley), 298
Film lining the Lung : Lipoprotein Composition of the (R. E. Pattle and L. C. Thomas), 844
Film in Scientific Research : Use of (Working Party of the Department of Scientific and Industrial Research to consider the), 102
Film Council (British Universities) . Catalogue of Films for Teaching Purposes, 102
Films for Teaching Purposes : Catalogue of (British Universities Film Council), 102
Films (Passive), formed in the Kolbe Reaction : Delayed Gas Evolution from (Prof. B. E. Conway and M. Dzieciuch), 914
Films (Thin) : Structure and Properties of—Proceedings of an International Conference, New York, 1959 (edited by A. Neugebauer, J. B. Newkirk and D. A. Vermilyea), *review* by Dr. J. Ring, 613
Filter Membranes of various Porosities : Tissue Responses to (Prof. R. C. Curran and J. A. M Ager), 1023
Financing of Research in Biochemistry and Allied Sciences in Great Britain : The Organization and (edited by K. S. Dodgson), (Biochemical Society), 794
Finch, Dr. L. R. . Utilization of Water in Australia (Movement of Water-solute through Cell Walls), 538
Finds (New), at Olduvai Gorge (Dr. L. S. B Leakey), 649
Fink, Bruce : The Lichen Flora of the United States, second printing, *review* by Dr R. W. G. Dennis, 7
Finland : Strontium-90 and Caesium-137 in Grass and Milk in, during 1959 (J. K. Miettinen, O. Paakkola, R. Nasanen, A. Vuorinen and D. Merten), 324
Finn, David : Public Relations and Management, *review* by T. H. Hawkins, 433
Finniston, H. M., and Howe, J P. (edited by) : Metallurgy and Fuels, Vol. 2 (Progress in Nuclear Energy, Series 5), *review* by Dr. G. A. Geach ,5
Finston, Roland, and others : Multi-stranded Deoxyribonucleic Acid as determined by X-Irradiation, 833
Fiori delle Ande (Alfonso Vinci), *review* by N. Y. Sandwith, 523
Fire : References to Scientific Literature on (E. M. Shakeshaft and B. F. W. Rogowski), (Fire Offices' Committee, Joint Fire Research Organization, Library Bibliography No 5, Part 10), 358
Fire Offices' Committee, Joint Fire Research Organization : Library Bibliography No. 5, Part 10, References to Scientific Literature on Fire (E. M Shakeshaft and B. F. W. Rogowski), 358
Fire Research (S H. Clarke), 352
Fire Research Station : New Buildings at the (D I Lawson); 105
Fischer, Roland Barton : The 'Ballas' Form of Diamond, 50
Fischer–Tropsch Synthesis : Ethyl Branching in the (Bernard D. Blaustein, Irving Wender and Robert B Anderson), 224
Fish : The Conversion Ratio as a Discriminatory Test for Thyroid Activity in (C. P. Hickman, jun.), 1012
  Occurrence of Heparin in the Blood of, and its Prevention of the Clotting of Fish Plasma (Dr. S. Z. Qasim and R. Hasan), 764
Fish (White) and Herring Industries Bill (Second reading in the House of Commons), 532
Fish Mucus : Presence of Blood Antigens in, and its Possible Parasitological Significance (Prof. Fergus J. O'Rourke), 943
Fish Plasma : Occurrence of Heparin in the Blood of Fish and its Prevention of the Clotting of (Dr S. Z. Qasim and R Hasan), 764
Fisheries : Research Expenditure on, 532
Fisica, Società Italiana di : Enrico Fermi International School of Physics, 880
Fission Product Nuclides : Deposition of, after Two Sahara Nuclear Test Explosions (Dr. V. Havlovic), 977
Fitness (Physical) : Nutrition and (Dr. L. Jean Bogert), seventh edition, *review*, 613
Fitter, R. S. R. : British Deer Forests, *review*, 431
  Status of the Grey Seal, 506
Fitzgerald, P. J., and others : A 'Dry' Mounting Autoradiographic Technique for the Localization of Water-soluble Compounds, 55
Fiume, Dr. L., and Favilli, Prof. G. : Inhibition of Experimental Cirrhosis by Carbon Tetrachloride following Treatment with Aminoacetonitrile, 71
Fixation of Atmospheric Nitrogen by the Rice Plant : Possibility of (Dr. M. G. R. Hart and Dr. E. H. Roberts), 598
Fixation of Nitrogen-15 by Excised Nodules of *Discaria toumatou* (Dr. T. M. Morrison), 945
Fixation (Nitrogen), in Bacterial Cells and their Extracts : Use of Radioactive Nitrogen in studying (Dr. D J. D. Nicholas, Dr. D. J. Silvester and Dr. J. F Fowler), 634
Flagella (Trypanosome) : Organization of Function in (Dr. P. J. Walker), 1017
Flagellar Protein (*Salmonella*) : A Gene determining Presence or Absence of ε-N-Methyl-Lysine in (Dr. B. A. D. Stocker, Dr. M. W. McDonough and Dr. R. P. Ambler), 556
Flame : Enhancement of Atomic Absorption in the, by Organic Solvents (R. Lockyer, J. E. Scott and Susan Slade), 830
Flanges (Australite) : Distillation of Alkali Elements during Formation of (Dr. S. R. Taylor), 630
Flare (Cosmic Ray), on November 12, 1960, and Solar Activity during the period November 10-15, 1960 (Staff of the Ionosphere and Radio-Astronomy Section of the Netherlands Postal and Telecommunications Services), 438
Flares (Solar), during the International Geophysical Year : Enhancement of Ionization in the *E*-Layer due to (G. H. Bazzard), 47
Flash Pyrolysis of Nitrosyl Chloride : Vibrationally Excited Nitric Oxide produced in the (Dr. N. Basco and Prof R. G. W Norrish), 455
Flavell, J. S. : Mathematics in the Junior School, 20
Flavonoids : Microbial Production of Carbon Monoxide from (D. W. S Westlake, J M. Roxburgh and G. Talbot), 505
Fleck, Sir Alexander : At a meeting of the sponsors of the Delhi Engineering College Trust, 372
Flight-musculature : Degeneration of, in the Corixidae and Notonectidae (E. C. Young), 328
Flom, Dr. M. C., and Weymouth, Prof. F W. : Retinal Correspondency and the Horopter in Anomalous Correspondence, 34
Floor of the Bristol Channel : Geology of the (Dr. D. T. Donovan, Dr. R. J G Savage, A. H. Stride and A. R. Stubbs), 51
Flora (British) : A Bibliographical Index of the (compiled by N. Douglas Simpson), *review* by Dr. G. Taylor, 259
Flora (The Lichen), of the United States (Bruce Fink), second printing, *review* by Dr. R. W. G. Dennis, 7

Florell, C., and others . Studies of Climatic Ecotypes in Higher Plants—the Temperature Dependence of Apparent *Photosynthesis in Different* Populations of *Solidago virgaurea*, 624
Flour : Alpha-Activity of Wheat and (Sir Ernest Marsden and E. N. Greer), 326
Flour (Wheat), soluble in Acetic Acid : Chromatography of the Proteins from (Dr. D. H. Simmonds and Dr. D. J. Winzor), 306
Flow (Minimum Rates of), in *Therapy with Sulphonamides (Prof. Elno* Nelson), 928
Flow Birefringence in Macromolecular Solutions : A New Type of Phenomenon of (*Shoei Fujishige*), 653
Flow Folding in Rocks (Dr. Emyr Williams), 474
Flow Patterns in Particle Beds (N. J. Hassett), 997
Flow Visualization : *Wind Tunnels and (Fluid Dynamics Panel of* AGARD Technical Sessions at Istanbul), 108
Flow (Poiseuille), of Suspensions : Radial Particle Displacements in (Dr. G. *Segré and Dr. A. Silberberg*), 209
Flow (Renal Plasma-) : Conjugation of *p*-Aminohippurate by the Kidney and Effective (Dr. B. P. Setchell and E. Blanch), 230
Flower : Evolution of the, review by J. Parkin, 519
Flowering in *Salvia splendens* : Effect of Temperature Fluctuations on (R. M. M. Crawford), 74
Flowers, Prof. B. H. : Granted the title of Langworthy *professor of physics* in the University of Manchester, 797
  Elected a Fellow of the Royal Society, 966
Flowers *of* Elder : Isolation of Chromatographically Pure Rutin from (Jiří Davídek), 487
Fluctuation (Diurnal Temperature), and Genetic Variance in *Drosophila* Populations (J. A. Beardmore), 162
Fluctuations in Equatorial Stratospheric Winds (R. A. Ebdon and R. G. Veryard), 791
Fluctuations (Random), in a Nuclear Fission Reactor (L. G. Kemeny and Samaun), 130
Fluctuations (Temperature) : Effect of, on Flowering in *Salvia splendens* (R. M. M. Crawford), 75
Fluid (Cerebrospinal), of Phenylketonurics : Apparent Absence of Amines in (Dr. Thomas L. Perry, Kenneth N. F. Shaw and Dorothy Walker), 926
Fluid (Normal Cerebrospinal) : Transferrin in (Dr. Jørgen Clausen and Troels Munkner), 60
Fluid Sealing (British Hydromechanics Research Association International Conference on), 970
Fluorescence : *Detection by, of Oxytetracycline bound to Bone* (Dr. Erminio Muzii), 934
Fluorescence and Haemolytic Activity of Tumours and Normal Tissues of the *C3H* Mouse (*Dr. Eric Ponder and Ruth V. Ponder*), 643
Fluoride (Calcium) Structure : Microhardness and other Properties of Magnesium Compounds with the (E. R. Petty), 132
Fluorochrome Acridine Orange as a Vital Stain : Effects of Ultrasonic Radiation in *Escherichia coli B* using (S. S. Ranade, V. G. Tatake and K. S. Korgaonkar), 931
Flux Density of the Radio Source Cassiopeia A · Secular Variation of the (Dr. J. A Hogbom and Dr. J. R. Shakeshaft), 561
Fluxes (Sodium), of a Freshwater Teleost : Action of Neurohypophyseal *Hormones on the (Dr. J. Maetz and M. Juien)*, 152
Flynn, Dr. F. V., and others Two New Haemoglobin Variants in a Very Young Human Embryo, 496
Focusing (Ray-) in the Ionosphere · Skip-Distance (E. Golton), 48
Foetal Leydig's Cells : Steroid-3β-ol-Dehydrogenase Activity in (Dr. Mikko Niemi and Dr. M. Ikonen), 592
Foetal *CBA* Mice : *Haemoglobins of* (J. Barrowman and Dr. K. B. Roberts), 409
Foetal Resorption (Ovine), caused by *Toxoplasma gondii* Infection (I. D. *Smith*), 939
Foetal and Adult Human Haemoglobin : Genetic Control of (Dr. C. Baglioni, Prof. V. M. Ingram and Emelie Sullivan), 467
Foetus (Rabbit) : Function of the Hypophysis–Thyroid System in the, with regard to Cholesterol Metabolism (J. G. Bearn, H. B. Koerselman and T. R. E. Pilkington), 318
Földes, Dr. J., and others : Isolation and some Properties of the Phages of *B. cereus* NRRL 569, 161
Folding (Flow), in Rocks (Dr. Emyr Williams), 474
Fondation Universitaire, Brussels : Increasing the Effectiveness of Western Science, 339
Fondy, T. P., and others : Stereochemistry of the *Succinic* Dehydrogenase System, 1004
Fontaine, Dr. M., and others : Anticomplementary Action of Aspirin, 147
Food-Chain Transport of Radioactive *Materials* into Cow's *Milk . Some* Factors Influencing the (D. Merten and O. Suschny), 806
Food Chemistry (Prof. Lillian Hoagland Meyer), *review* by A. M. Copping, 259
Food Consumption and Expenditure, 1958 : Domestic—Annual Report of the National Food Survey Committee (Ministry of Agriculture, *Fisheries and Food*), 197
Food Survey Committee (National) : Annual Report of the (Domestic Food Consumption and Expenditure, 1958), (Ministry of Agriculture, *Fisheries and Food*), 197
Food Technology : Dictionary of Nutrition and (Dr. Arnold E. Bender), *review* by A. M. Copping, 433
Food and Agriculture : Radioactive Materials in (Report of an Expert Committee of the Food and Agriculture Organization of the United Nations), 712
Food and Agriculture Organization (United Nations) : Report of an Expert Committee on Radioactive Materials in Food and Agriculture, 712
  Forest Development Paper No. 13, Choice of Tree Species, 719
Foot-and-Mouth Disease in Madras, 274
Forage Conservation, *review* by Dr. William Davies, 4
Forage Crops : The Conservation of Grass and (Prof. Stephen J. Watson and Dr. Michael J. Nash), second edition, *review* by Dr. William Davies, 4
Forbes, *Prof.* R. J. : From Arts and Crafts to Technology, *review*, 174
Ford Foundation : Grant of 440,000 dollars to the University of Birmingham, to support a programme of research in the Department of Anatomy *into the reproductive physiology of monkeys*, 533
  Research Fellowships of the Zoological Society of London awarded to Dr. Peter A. Jewell, Dr. Lorna M. Kellas and D. R. S. Kirby, 711
Ford (Henry) Hospital, Detroit : International Symposium on Host Tumour *Interactions*, 534
Forebrain : Cholinergic Nervous Pathways in the (Dr. C. C. D. Shute and Dr. P. R. Lewis), 332
Foreman, Prof. Charles W.· *Inherited Haemoglobin Ionographic Properties* in Cotton Rats, 585
Forest Products Research Laboratory : Forest Products Research Bulletin *No. 45, The Strength and Properties of Timber* (F. H. Armstrong), 975
Forest Trees of Ghana : Vegetation and, *review* by Dr. E. W. Jones, 700
Forestomach (Mouse) : Tumour-Promotion by Lime Oil in the (Winifred E. H. Peirce), 497
Forestry Bureau (Commonwealth) : A Synopsis of the Work and Growth of the Commonwealth Forestry Bureau, Oxford, 1939-1959, 795
Forestry Commission : Bulletin No. 33, The Status and Development of Elm Disease in Britain (T. R. Peace), 886
Forests : British Deer, *review* by R. S. R. Fitter, 431
Forging (Drop) Research Association : Appointment of P. H. R. Lane as director of research, 625, 793
Form of New Universities in Britain, 23
Form (Atypical), of β-$_{1A}$Paraproteinaemia : Identification of So-called Atypical Macroglobulinaemia as an—a New Immunological Entity ? (R. E. Ballieux, Dr. J. W. Imhof and G. H. Niehaus), 768
Form (The 'Ballas'), of Diamond (Roland Barton Fischer), 50
Formation of Ascospores by *Aspergillus nidulans* · A Selective Medium for the (Isabel Garcia Acha and Dr. Julio R. Villanueva), 328
Formation of Australite Flanges : Distillation of Alkali Elements during (Dr. S. R. Taylor), 630
Formation of Haemosiderin and its relation to Ferritin (Dr. Arne Shoden and Dr. Phillip Sturgeon), 846
Formation of Hippuric Acid from Phenylalanine *labelled* with Carbon-14 in Phenylketonuric Subjects (Dr. H. -D. Grümer), 63
Formation of Opium Alkaloids : O-Demethylation as a Biosynthetic Pattern *in the* (Frank R. Stermitz and *Prof. Henry Rapoport*), *310*
Formation (Antibody) : Effect of some Metabolic Inhibitors on (Dr. J. Sterzl), 1022
Formation (Glass), in Metallic and Ionic Systems : Composition Requirements for (Prof. M. H. Cohen and D. Turnbull), 131
Formation (Glass), in Solutions of Hydrogen Peroxide–Water and Deu*terium Peroxide–Heavy Water (Robert C. Smith and S J. Wyard)*, 211
Formation (Glutamic Acid), by Transoximase–Oximase Reaction (Prof. K. Yamafuji, S Hatano and A. Ida), 397
Formation and Fertility (Soil) : Soil Fauna in relation to (Association of Applied Biologists Symposium on), 367
Formic Acid : Micropitting of Titanium during Anodic Oxidation in (R. A. *Piggott and Dr. L. L. Schreir*), 216
Formulating the Insecticide Dimethoate in Methyl 'Cellosolve' : Toxic Hazard from (Prof. John E. Casida and D. M. Sanderson), 507
Fornet, B., and others : Mucopolysaccharides and Thyroid Function, 670
Forrest, W. W. : Measurement of Pressure in Vacuum Physics, 476
Fortey, J. W. : Appointed lecturer in civil engineering at the University of Birmingham, 22, 714
Forthcoming International Scientific and Technical Conferences (Department of Scientific and Industrial Research, List No. 28), 104
Fortune, Dr. R. F. : Mambu, a Melanesian Millennium, *review*, 523
Forward, Dr. Robert L., and others : Upper Limit for Interstellar Millicycle Gravitational Radiation, 473
Fosberg, Dr. F. R. : Impact of Man on the Vegetation of the Humid Tropics (Physical and Human Backgrounds of the Humid Tropics—Aspects of Soils and Substrata), 24 ; (Origin of the Coconut as a Cultigen), 24 ; (Nature of the Secondary Plant-Communities arising from the Activity of Early Man), 25
Fosberg, Dr F. R., and others : A Re-Survey of Typhoon Effects on Jaluit Atoll in the Marshall Islands, 618
Fothergill, Dr P. G. : Evolution, *review*, 340
Founder's Medal for 1961 of the *Royal Geographical Society* awarded to John Bartholomew, 443
Founders of British Science—John Wilkins, Robert Boyle, John Ray, Christopher Wren, Robert Hooke, Isaac Newton (*J. G. Crowther*), *review* by Dr. W. P. D. Wightman, 259
Four Adult Haemoglobin Types in One Person (Dr. C Baglioni and Prof. V. M. Ingram), 465
Fowden, Dr. L (Gray, D. O , and) · N-Ethyl-L-Asparagine, a new Amino-Acid Amine from *Ecballium*, 401
Fowl : Serum Iron and its Transport Mechanism in the (Prof. Jose Planas, Sisinio de Castro and Jose Maria Recio), 668
Fowl (Domestic) : Distribution of Cholinesterase within the Kidney of the (A. B. *Gilbert*), *1009*
  Genetic Polymorphisms in the Egg Albumen Proteins of the (I. E Lush), 981
Fowler, Dr. J. F., and others : Use of Radioactive Nitrogen in Studying Nitrogen Fixation in Bacterial Cells and their Extracts, 634
Fowler, Dr. P H , and Perkins, Dr. D. H. : The Possibility of Therapeutic *Applications of Beams of Negative* π*-Mesons*, 524
Fox, Jun., Charles L., and others : Identification of a Compound found during Separation of Purines in Human Urine, 671
Fox, Dr. Thomas G. : Appointed a research director in the Mellon Institute, *794*
Fractions (Co-Carcinogenic), of Croton Oil · Inhibition of Cellular Respiration by (Dr. A. C. Allison and J .W. Lightbown), 892
Fractions (Rat Liver Cell) : Distribution of Coenzyme Q in (P. Seshadri Sastry, J Jayaraman and Dr. T. Ramasarma), 577
Fractions (Ribonucleic Acid) : Composition of various, from Micro-organisms of Different Deoxyribonucleic Acid Composition (Carl R. Woese), 920
Fracture of Body-centred Cubic Transition Metals : Theory of the Deformation and (A. A. Johnson), 826
Fragments (*Univalent*), of Rabbit *Antibody : Separation of, by Reduction* of a Single, Labile Disulphide Bond (Prof. A. Nisonoff, G. Markus and F. C. Wissler), 293
France : *Role of Alcohol in the Aetiology of Cirrhosis of the Liver in* (Institut National d'Hygiene, Paris), 804
Francis Inhibitor : Inhibition of the Multiplication of Influenza Virus by *Aniline Derivatives of the (Dr. I. Hollós)*, 553
Franek, Dr. F., and others : Characteristics of γ-Globulin, lacking Antibody Properties, in New-born Pigs, 1020

Frank, Prof. F. C. : Future of the General Degree in British Universities, 106
Frank, Prof. G. M. · Primary and Initial Effects of Ionizing Radiations, 110
Franklin, Alicelia H. (Fried, Dr. Maurice, and) : Rapid Preparation of Fresh Frozen Sections of Barley Roots, 414
Franklin, E. C., and others . Precipitating Factor for Aggregated γ-Globulins in Normal Human Sera, 239
Fraser, Dean (Mahler, Prof. H. R., and) : Structural Mutations, 948
Fraser, F. C., and Purves, P. E. · Hearing in Cetaceans, 187
Fraser, Dr. Gordon : Haemolytic Activity of *Corynebacterium ovis*, 246
Fraser, Dr. J. H. : Use of Polyethylene Glycol in Biology, 241
Fraser, K. B. · Elected a Fellow of the Royal Society of Edinburgh, 876
Fraser, R. D. B., and MacRae, T. P. : α-Configuration of Fibrous Proteins, 572
Frazer, Prof. A. C. : Appointed a member of the Agricultural Research Council, 880
Free Charges from Motor-Car Exhaust Gases : Detection of (Dr. T. Westermark), 910
Free Electrons with Thermal Energy : Affinity of Organic Compounds for—its Possible Significance in Biology (Dr. J. E. Lovelock), 729
Free-Radical Chemistry . Vistas in (edited by Dr. W. A Waters), *review* by Dr. A. B Callear, 433
Freedom and Efficiency—Problems of University Administration in Britain and the Commonwealth (Committee on Science and Freedom, Manchester, Bulletin No. 16), 517
Freedom and Efficiency in Universities : The Problem of (Dr A. P. Rowe), 360
Freedom (Science and), Committee on (Manchester) : Bulletin No. 16, Freedom and Efficiency—Problems of University Administration in Britain and the Commonwealth, 517
Freeth, Denzil : Appointed Parliamentary Secretary to the Minister for Science, 534
Freezing · Growth of Embryonic Mammalian Cartilage after (Dr. Susan Heyner), 1027
Freire-Maia, A., and others : Lethal Mutations in Brazilian Human Populations, 80
Freire-Maia, Prof N (Marçallo, F. A., and) : New Recurrent Series in Inbreeding Phenomena, 421
Freire-Maia, Prof. N , and others : Lethal Mutations in Brazilian Human Populations, 80
Freiser, G : Gas Chromatography (General Applications—Gas Chromatography of Inorganic Compounds), 28
French Government : Scholarships for further study of research in France, 534
Frequency of Lysogenization in *Salmonella typhimurium* : Absence of the Glucose Effect on the (Patricia Hoffee, Roger Weinberg and Prof. Ellis Englesberg), 160
Frequency (Vibration), and Ionization Potential—Halide Molecules (S. S. Mitra), 914
Frequency Shifts (Solvent-induced Infra-Red) : Dielectric and Dipolar Interaction Theories of (Dr H. E. Hallam and T. C. Ray), 915
Fresh Frozen Sections of Barley Roots : Rapid Preparation of (Dr. Maurice Fried and Alicelia H Franklin), 414
Freshly Moistened Soil : Microbiological Changes in (Dr. E. Griffiths and H. F. Birch), 424
Freshwater Teleost : Action of Neurohypophyseal Hormones on the Sodium Fluxes of a (Dr. J. Maetz and M. Juien), 152
Freshwater Triclads : Environment and Reproduction in (Dr. T. B. Reynoldson), 329
Fresnel Drag Coefficient : The Relativistic Theory of the (Prof. P. T. Landsberg), 654
Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with (Prof. N. Allegretti and B. Vitale), 673
Friction : Surface Orientation and, of Graphite, Graphitic Carbon and Non-Graphitic Carbon (Dr. J. W. Midgley and D. G. Teer), 735
Frictional Oscillations (R. T. Spurr), 50
Fried, Dr. Maurice, and Franklin, Alicelia H : Rapid Preparation of Fresh Frozen Sections of Barley Roots, 414
Friedkin, Prof. Morris, and others . Increased Dihydrofolate Reductase Activity as a Possible Basis of Drug Resistance in Leukaemia, 39
Friedmann, J. C., and others . Anticomplementary Action of Aspirin, 147
Frog : Influence of Calcium on the Potassium-Contracture of 'Slow' and 'Fast' Skeletal Muscle Fibres of the (P. Pauschinger and Prof. K. Brecht), 583
Frog (A New), *Hyla bokermanni*, n. sp., from Brazil (Coleman J. Goin), 274
Frog Hopper Nymphs : A Method of Dissolving the Protective Spittle Masses of (Dr. G F Howden and A. T. Marshall), 509
Frog Nerves during Electrical Activity : Release of Calcium-45 from (Prof. K. Koketsu and S Miyamoto), 402
Front (Sea-Breeze) : A Radar Observation of a (Dr. E. Eastwood and G. C. Rider), 978
Frost Hardiness in Plants : Effect of Polyhydric Alcohols to (Dr. Akira Sakai), 416
Frozen Sections (Fresh), of Barley Roots : Rapid Preparation of (Dr. Maurice Fried and Alicelia H. Franklin), 414
Fruits (Apple and Tomato) · Ethylene Production by Cytoplasmic Particles from, in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr. C. C. Craft), 243
Fuel and Power Policy · A National—a Policy Statement (Association of Scientific Workers), 626
Fuels : Metallurgy and (edited by H. M. Finniston and J P. Howe), Vol. 2 (Progress in Nuclear Energy, Series 5), *review* by Dr. G. A. Geach, 5
Fuels (Gaseous) : Calorific Value of, *review* by R. J H. Banks, 255
Fujishige, Shoei : A New Type of Phenomenon of Flow Birefringence in Macromolecular Solutions, 653
Fulton, J. S : New Universities (Problems of Siting, Staffing, Curricula and Policy), 23
Fulton, Prof. MacDonald, and others · Five Less-Common *Salmonella* Serotypes from Congo Reptiles, 240
Fumaria Alkaloids (Poppy–) Distribution of certain, and a Possible Link with the Incidence of Glaucoma (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr James Walker), 198
Function of the Hypophysis–Thyroid System in the Rabbit Foetus with regard to Cholesterol Metabolism (J. G. Bearn, H. B. Koerselman and T R. E. Pilkington), 318
Function in Trypanosome Flagella : Organization of (Dr. P. J. Walker), 1017
Function (Thyroid) : Mucopolysaccharides and (Prof. St. Krompecher, B. Fornet, G. Balogh, E. H. Oláh and M. B. László), 670
Function (Thyroid), and Mucopolysaccharide(Hexosamine)-Level : Experimental Data concerning the Connexion between (Prof. St. Krompecher, Cs. Hadházy, G. Berencsi, E. H. Oláh and M. B. László), 670
Functionally Co-ordinated Structures · Plasma Membranes and Mitochondrial Equivalents as (Prof. Stuart Mudd, Dr. Tomio Kawata, John I. Payne, Dr. Theodore Sall and Prof Atsushi Takagi), 79
Functions (Excitation), of (d,α)- and $(d,\alpha n)$- Reactions on Natural Tungsten (A. Demildt), 51
Functions (Line-Spread), of Photographic Emulsions (Dr. N. W. Lewis), 909
Fundamentals of Nutrition (E. W. Crampton and L. E. Lloyd), *review* by A. M. Copping, 523
Fungi (Lower) : Lysine Synthesis and Phylogeny of—some Chytrids versus *Hyphochytrium* (Prof Henry J. Vogel), 1026
Fungi (Rust) : Effects of Maleic Hydrazide on, 187
Furman, Dr. George J., and others : Effects of Nitrogen Mustard on the Histochemistry of Mouse Lymphocytic Leukaemia *L* 1210, 591
Furnace (Vacuum) : Elimination of a Glow Discharge in an Induction-heated (John E. Fagel), 212
Fusarium oxysporum . Perfect Stages of, and of *Fusarium solani* f. *pisi* still Unknown (Dr. William C Snyder and James V. Alexander), 596
Fusarium solani f. *pisi* : Perfect Stages of *Fusarium oxysporum* and of, still Unknown (Dr. William C. Snyder and James V. Alexander), 596
Fusion : Nuclear (*Journal of Plasma Physics and Thermonuclear Fusion*), Vol. 1, No 1 (International Atomic Energy Agency), 712
Fusion Welding of Niobium to Vanadium : An Unusual Feature of the (R. D. Johnston and L. W. Derry), 52
Future of the Colonial and the Commonwealth Relations Offices, 277
Future of the General Degree (Home Universities Conference Discussion on), 106

GABOR, Prof. D. : A New Thermionic Generator, 868
Gabor, Prof. D., and Vithayathil, Dr. J. : The Bertele Arc, 821
Gábos, D., and others : Effects of Pulped Soybean Silage on the Milk-yield of Cows, 492
Gaddum, Prof. J. H. : Polypeptides acting on Smooth Muscles, *review*, 257
Gadkari, P D., and others : Cotton in India, *review* by Prof. S. C. Harland, 86
Gal, Prof. E. M., and Drewes, P. A. : Levels of Serotonin during Convulsion and the Effect of Reserpine, 234
Galactic Motions in a Large-Scale Magnetic Field (Donat G. Wentzel), 907
L-Galactose-6-sulphate : Isolation of, from a Seaweed Polysaccharide (J. R. Turvey and Dr. D. A. Rees), 831
Galaxies and Cosmology : Nebulae, *review* by J. B. Alexander, 867
Galaxies Voisines : l'Exploration des, par les Méthodes Optiques et Radioélectriques (Dr. Gérard de Vaucouleurs), *review* by J. B. Alexander, 867
Gale, R. S., and others : Natural Rubber Research, 193
Galleries (Whispering) : Normal Mode Interpretation of the Sound Propagation in (Yasuo Satô), 475
Gallium and Indium : Influence of Molecular Structure on the Liquid/Liquid Extraction of the Chloro-Complexes of, with Aliphatic Ethers (Dr. R. R. Brooks and P. J. Lloyd), 375
Gallium Arsenide · Space-Charge Currents in (J. W. Allen and R. J. Cherry), 297
Gallium Phosphide Point-Contact Diodes : Radiative Recombination in (Dr. H. C. Gorton, Dr. J. M. Swartz and Dr. C. S. Peet), 361
Gallo, Piero . Myocardial Tissue Changes associated with Rigor Mortis, 114
Gamble, H. J., and Goldby, Prof. Stephen : Mast Cells in Peripheral Nerve Trunks, 766
Game (African) · The Ecology of, *review* by Prof. W. H. Pearsall, 783
Gametophytes (Fern) : Protein and Ribonucleic Acid in the Growth o (Y. Hotta), 455
γ-Globulin, lacking Antibody Properties : Characteristics of, in New-born Pigs (Dr. F. Franek, Dr. I. Riha and Dr J Sterzl), 1020
γ-Globulin (Homologous), in the Guinea Pig : Delayed Hypersensitivity to (Dr B. Benacerraf and Dr. P. G H. Gell), 586
γ-Globulins (Aggregated), in Normal Human Sera · Precipitating Factor for (Dr. A. Taranta, Dr. H. S. Weiss and E. C. Franklin), 239
Gamow, Prof George : Biography of the Earth, revised edition, *review* by Prof. Arthur Holmes, 341
Ganguly, Dr. J., and others : Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in Rats, 482
  Amino-Acid Patterns in Vitamin A-deficient Rats, 660
Garrison, Warren M (Kland-English, Mathilde, and) : Production of Pyrazine Derivatives in the Radiolysis of Aqueous Solutions of the Cyclic Dipeptides, 302
Garstang, Dr. R. H. . Title of reader of astronomy in the University of London (at University College) conferred on, 22
Garton, C. G · Appointed an assistant director of the Electrical Research Association, 101
Gas (Tritium) : Labelling of Organic Compounds by Mercury-photosensitized Reaction with (Fulvio Cacace, Angelo Guarino and Gabriella Montefinale), 54
Gas Calorimetry (Major C. G. Hyde and M. W Jones), second edition, *review* by R J H. Banks, 255
Gas Chromatographic Analysis of Permanent Gases using Standard Ionization Detector Equipment (Dr. R. A. Landowne and Dr. S. R. Lipsky), 571
Gas Chromatographic Separation of Low-boiling Hydrocarbons using Active Alumina as Support for the Liquid Phase (Dr. I. Halász and E. E. Wegner), 570
Gas Chromatography (Gas Chromatography Discussion Group and the Society for Analytical Chemistry International Symposium on), 26
  Estimation of Volatile Anaesthetics in Tissues by (Dr. R. A. Butler and Dr. D. W. Hill), 488
  Definitions and Retention Parameters (Gas Chromatography Discussion Group of the Hydrocarbon Research Group of the Institute of Petroleum Symposium on), 280
Gas Chromatography Discussion Group and the Society for Analytical Chemistry : International Symposium on Gas Chromatography 26

Gas Dynamics : Mathematical Aspects of Subsonic and Transonic (Lipman Bers), *review* by Prof. A. T. Price, 865
Gas Evolution (Delayed), from Passive Films formed in the Kolbe Reaction (Prof B. E. Conway and M. Dzeiciuch), 914
Gas–Liquid Chromatograph : Rapid Identification of High Polymers using a Simple Pyrolysis Unit with a (C. E. Roland Jones and A F. Moyles), 222
Gas-Phase Reactions of the Halogens and their Compounds : Mechanisms of the (Faraday Society Informal Discussion on), 275, 447
Gaseous Fuels : Calorific Value of, *review* by R. J. H. Banks, 255
Gases : Elements of the Kinetic Theory of (Prof. E. A. Guggenheim), *review* by Dr. D. J. Millen, 783
  Kinetic Theory of, *review* by Dr. D. J. Millen, 783
Gases (Motor-Car Exhaust) : Detection of Free Charges from (Dr. T. Westermark), 910
Gases (Permanent) . Gas Chromatographic Analysis of, using Standard Ionization Detector Equipment (Dr. R. A. Landowne and Dr. S. R. Lipsky), 571
Gastrectomy (Partial) : Intestinal Absorption of Vitamin B_{12} and of a Vitamin B_{12}–Peptide Complex in Normal Subjects and in Patients with (Dr. G. Milhaud), 31
Gat (Gutmann), J. R., and others : Radioactive Fall-out in Israel resulting from the Nuclear Tests in the Sahara Desert, 90
Gates, Prof. R. Ruggles : Australian Aborigines and Genetics, 423
Gawron, Prof. O., and others : Stereochemistry of the Succinic Dehydrogenase System, 1004
Gay, Dr. P. (Agrell, Dr. S. O., and) : Kilchoanite, a Polymorph of Rankinite, 743
Gayer, J., and others : Autoradiographical Detection of Tritium-labelled Inulin in the Kidney, 500
Geach, Dr. G. A. : The Real Matter of Nuclear Energy, *review*, 5
  Powder Metallurgy, 365
Geach, Dr G. A , and Woolf, A. A. : Powder Metallurgy (Pure Crystalline Organic Materials of widely differing Molecular Shapes which do not Sinter at 0.8 of the Absolute Melting Points), 366
Geddes, Prof W. R : Impact of Man on the Vegetation of the Humid Tropics (The Human Background), 24
Gee, Prof. G · Future of the General Degree, 107
  Natural Rubber Research (New Methods of Elastomer Synthesis and their Impact on Natural Rubber), 194
Gegenschein : Solar Wind and the (E. R Harrison), 993
Geiger Counters : Photo-Emission from Metal Surfaces measured with (M A. Conrad and S. Levy), 887
Gel Diffusion : Examination of *Leptospira pomona* by (P. G. Pande, P. C. Sekariah and R. R. Shukla), 511
Gell, Dr. P G. H. (Benacerraf, Dr. B., and) : Delayed Hypersensitivity to Homologous γ-Globulin in the Guinea Pig, 586
Gendrin, R , and others : A Transatlantic Communication Experiment via *Echo* I Satellite, 268
Gene determining Presence or Absence of ϵ-N-Methyl-Lysine in *Salmonella* Flagellar Protein (Dr. B. A D. Stocker, Dr. M. W. McDonough and Dr. R P. Ambler), 556
Gene (A Dominant), for Renal Adenomas in the Rat (Reidar Eker and Jeanne Mossige), 858
Gene Action : A Hypothesis concerning the Mechanism of (Dr. Carl C. Lindegren), 959
Gene Evolution and the Haemoglobins (Prof. Vernon M. Ingram), 704
General Degree · Future of the (Home Universities Conference Discussion on), 106
General Degree Applied Mathematics (S L. Green and J. E. C. Gliddon), *review*, 613
General Electric Co. of America : Sea-Water Purification Unit based on New Principles, 969
General Hypothesis : Biochemistry of Heredity—a (Dr. Ian Leslie), 260
General Practitioners : Postgraduate Education for, 103
General Theory of Banach Algebras (Prof Charles E. Rickart), *review* by Dr. R. G. Cooke, 612
Generator : New Pulsed X-Ray (Zenith Radio Corporation), 879
  A New Thermionic (Prof. D. Gabor), 868
Genetic Control of Foetal and Adult Human Haemoglobin (Dr. C. Baglioni, Prof. V. M Ingram and Emelie Sullivan), 467
Genetic Control of Oxytetracycline Biosynthesis (S I. Alikhanian, N. V. Orlova, S. Z. Mindlin and Z. M. Zaitzeva), 939
Genetic Polymorphisms in the Egg Albumen Proteins of the Domestic Fowl (I. E Lush), 981
Genetic Recombination in Bacteriophage ΦX 174 (Dietrich Pfeifer), 422
Genetic Recombination in *Vibrio cholerae* (Dr. K. Bhaskaran and S. S Iyer), 1030
Genetic Variance in *Drosophila* Populations · Diurnal Temperature Fluctuation and (J. A. Beardmore), 162
Genetics : Australian Aborigines and (Prof. R. Ruggles Gates), 423 ; (Prof. A. A. Abbie), 423
Genetics and Plant Breeding, Indian Society of : Election of Officers, 796
Genotypic Level : Differential Radiosensitivity in Rice (*Oryza sativa* Linn.) at the (H. K. Shama Rao and K. C. Bora), 762
Gentile, Zora (Blumberg, Dr. B S., and) · Haptoglobins and Transferrins of Two Tropical Populations, 897
Geochemical Association (Apparent), of Bismuth and Thallium (Dr R. R. Brooks), 910
Geochemical Laboratories, Ltd., Teddington : Hitherto carried on in partnership by H. B. Milner and A H Clarke to be continued by A. H. Clarke under the same name, 714
Geographical Society (American) · To publish *North Atlantic Biogeography*, 358
Geographical Society (Royal) : Patron's Medal for 1961 awarded to Mikhail M. Somov, 443
  Founder's Medal for 1961 awarded to John Bartholomew, 443
  Victoria Medal awarded to Prof. W William-Olsson, 443
  Murchison Grant awarded to Prof. K. M. Buchanan, 443
  Back Grant awarded to Dr. Eric H Brown, 443
  Cuthbert Peek Grant awarded to Martin W. Holdgate, 443
  Gill Memorial awarded to Cuchlaine A. M. King, 443
  Mrs. Patrick Ness Award awarded to R. M. L. Mason and A. R. Hanbury-Tenison, 443
Geography at the London School of Economics, 710
Geological Reconnaissance in Victoria Land, Antarctica (B. C. McKelvey and P. N Webb), 545
Geological Society of London : Wollaston Medal for 1961 awarded to Prof. Roman Kozlowski, 100
  Murchison Medal for 1961 awarded to W. N. Edwards, 100
  Lyell Medal for 1961 awarded to Dr. J. V. Harrison, 100
  Bigsby Medal for 1961 awarded to Prof. Alwyn Williams, 100
  Wollaston Fund for 1961 awarded to Dr. E. A. Vincent, 100
  Murchison Fund for 1961 awarded to Dr. J. Ineson, 100
  Lyell Fund (a moiety of the) for 1961 awarded to Dr. R. G West, and one to Dr. W. T. Dean, 100
Geological Survey and Museum : The Origin and Evolution of Coal (Dr. P. J. Adams), (Department of Scientific and Industrial Research), 712
Geology of Ben Nevis and Glen Coe (Sir Edward Bailey), second edition, 879
Geology of the Floor of the Bristol Channel (Dr D. T. Donovan, Dr. R. J. G. Savage, A. H. Stride and A R. Stubbs), 51
Geology of the U.S.S.R. (Academician D. V. Nalivkin), translated from the Russian by Dr. S. I. Tomkeieff, *review* by Prof. C. F. Davidson, 610
Geology (Russian), in Translation, *review* by Prof. C. F. Davidson, 610
Geomagnetic Equator : Lunar Tide in the F_2 Layer of the Ionosphere near the (R. G. Rastogi), 214
Geomagnetic Field : Direction of the, during the Triassic Period in Siberia (Dr. E. R. Deutsch and N. D. Watkins), 543
Geometry (Differential) : An Introduction to (Dr. T. J. Willmore), *review*, 613
Geomorphology of Wales, *review* by Prof. W. G. V. Balchin, 432
Geophysical Calendar (International), for 1961 (Prof. A. H. Shapley), 9
Geophysical Methods · Prospecting in Archaeology by (Council for British Archaeology Conference on), 534
Geophysical Year (International) : Enhancement of Ionization in the E-Layer due to Solar Flares during the (G. H. Bazzard), 47
Geophysics : Handbook of (United States Air Force Geophysics Research Directorate), revised edition, *review* by Prof. S. K. Runcorn, 258
George, Joy : Etch Patterns on Cadmium Crystals grown from Vapour, 743
George, L. A., and others : Fibrosarcoma in a Rabbit following β-Irradiation of the Skin, 770
Gerber, G. B., and Altman, K. I. · Method of Collagen Synthesis, 813
German, R. J., and others : Polysaccharides of *Mycobacterium phlei*, 1008
German Plastics Convention : Ninth (Deutsche Kunststoff-Industrie), 625
German (West) Starch Research Station, Detmold : International Conference on Starch, 625
Germination of Oil Palm Seed : Effect of High-Temperature and Pre-Treatment on the (A. R. Rees), 74
Germination of *Solanum* Seed : Use of Gibberellin to hasten (Pauline B. Spicer and Leo O. Dionne), 327
Germination (Pollen), in some Gramineae (Dr. P O. Wiehe), 328
Gerontology : Activities of the United States National Institutes of Health in the Field of—Research Grant and Training Projects Active on January 31, 1960, and Intramural Research Projects carried on during Calendar Year 1959 (United States Department of Health, Education and Welfare—Public Health Service, Publication No. 761), 21
Gerry, Michael C. L., and Porter, Prof. Gerald B : Photolysis of Ethyl Iodide Solutions, 655
Gerschenfeld, Dr. H., and Tauc, Dr. L. · Pharmacological Specificities of Neurones in an Elementary Central Nervous System, 924
Gerzeli, Dr. Giuseppe : Presence of Enterochromaffin Cells in the Gut of Amphioxus, 237
Gey, K F , and Pletscher, Dr. A. : Inability of Refined Corn Oil to influence Spontaneous Arteriosclerosis of Old Hens, 491
Ghana : Synecology and Silviculture in (Dr Charles J. Taylor), *review* by Dr. E. W. Jones, 700
  Vegetation and Forest Trees of, *review* by Dr. E. W. Jones, 700
Giant Nuclei in the Earthworm *Lumbricus* (Dr. R L. Hancock), 685
Giant Pangolin (An Extinct), and associated Mammals from Niah Cave, Sarawak (Tom Harrisson, D. A. Hooijer and Lord Medway), 166
Gibberellic Acid and Kinetin (Light,) : Effect of, on Growth and Morphogenesis of *Striga* Seedlings (Growth and Morphogenesis of *Striga* Seedlings), (Colin N. Williams), 378
Gibberellin : Use of, to hasten Germination of *Solanum* Seed (Pauline B. Spicer and Leo O. Dionne), 327
Gibberellins : A Review of the (Dr. P. W. Brian), 713
Gibberellins (New) : Promotion of Cucumber Hypocotyl Growth by Two (Dr. P. W Brian and H. G. Hemming), 74
Gilbert, A. B. : Distribution of Cholinesterase within the Kidney of the Domestic Fowl, 1009
Gilbert, Christine, and others : Coronary Artery of the Portuguese East African, 623
Gill, J. S. : A Versatile Method for Short-term Spectrum Analysis in 'Real-Time', 117
Gill Memorial of the Royal Geographical Society awarded to Cuchlaine A. M. King, 443
Gillman, Joseph, and others : Coronary Artery of the Portuguese East African, 623
Gillman, Dr. Theodore, and others · Inhibiting Effect of 2.4-Dinotrophenol on Calciferol-induced Metastatic Calcification in the Rat, 317
Gilman, Dr. J. J. : Solid-State Physics (Crystals exhibit a Plastic Resistance to Dislocation Motion), 113
Gimeno, Dr. Alvaro L , and others : Glutamic Oxaloacetic Transaminase Activity in Different Zones of the Ventricular Muscle of the Dog, 315
Ginetzinsky, Prof. A. G. : Relationship between Urinary Hyaluronidase and Diuresis, 235
Gitter, S., and others Deformation of Red Cell Shape induced by *Vipera palestinae* Venom *in vivo*, 320
Glaciation in Wales as related to Soil Profile Development (Welsh Soils Discussion Group Meeting on), 275
Glaid, A. J., and others : Stereochemistry of the Succinic Dehydrogenase System, 1004
Gland (Scent), of the Hemipteran *Acanthocephala femorata* : *Trans*-2-Hexenal in the (Prof. Murray S. Blum, Donald D. Crain and Julius B. Chidester), 245
Glands (Apocrine Sweat), of the Welsh Mountain Sheep : The Synchronous Discharge of (Dr. John Bligh), 582
Glands (Human Sublingual) : Histochemistry of (Dr. G Quintarelli and Dr. L Robinson), 935

Glands (Lacrimal), of Caesarian-derived (so-called) Pathogen-free Rats : Spontaneous Cytomegalic Inclusion Body Disease involving (Dr. Hans Meier), 534
Glass, Prof. G. B. J., and others : Applicability of Hydrocobalamin as a Long-acting Vitamin B_{12}, 138
Glass : High Strength (Dr. D. G. Holloway and P. A. P. Hastilow), 385
Glass Formation in Metallic and Ionic Systems : Composition Requirements for (Prof. M. H. Cohen and D. Turnbull), 131
Glass Formation in Solutions of Hydrogen Peroxide–Water and Deuterium Peroxide–Heavy Water (Robert C. Smith and S. J. Wyard), 211
Glass Industry : Achievement in the, *review* by Prof. R. W. Douglas, 342
  Pilkington Brothers and the (T. C. Barker), *review* by Prof. R. W. Douglas, 342
Glass (Ancient) : A New Method for Dating (Robert H. Brill and Harrison P. Hood), 12
Glass (Porous) Chromatography (Herbert L. MacDonell), 302
Glässer, Dr. A. : Some Pharmacological Actions of L-Lysergic Acid Methyl Carbinolamide, 313
Glässer, Dr. A., and others : *In vitro* Decarboxylation of Tryptophans by Mammalian Decarboxylase, 483
Glasshouse, Samuel W., and others : Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation, 153
Glaucoma : Distribution of certain Poppy–Fumaria Alkaloids and a Possible Link with the Incidence of (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
Glen Coe : The Geology of Ben Nevis and (Sir Edward Bailey), second edition, 879
Glick, David : Biochemistry of Human Tumours (Techniques for the Quantitative Assay of Enzymes extracted from Samples the size of Common Histological Sections and by Micro-dissection), 627
Gliddon, J. E. C. (Green, S. L., and) : General Degree Applied Mathematics, *review*, 613
Globulin (Thyroxine-binding), in Human Serum : Nature of (Dr. J. R. Tata), 573
γ-Globulin, lacking Antibody Properties : Characteristics of, in New-born Pigs (Dr. F. Franek, Dr. I. Riha and Dr. J. Sterzl), 1020
γ-Globulin (Homologous), in the Guinea Pig : Delayed Hypersensitivity to (Dr. B. Benacerraf and Dr. P. F. H. Gell), 586
γ-Globulins (Aggregated), in Normal Human Sera : Precipitating Factor for (Dr. A. Taranta, Dr. H. S. Weiss and E. C. Franklin), 239
Glossina palpalis (Wild) : Isolation of *Trypanosoma rhodesiense* from (H. A. W. Southon and D. H. H. Robertson), 411
Glow Discharge in an Induction-heated Vacuum Furnace : Elimination of a (John E. Fagel), 212
Gluconate (Calcium) : Protective Action of, against After-Effects of X-Irradiation on Conidia of *Neurospora crassa* (Prof. J. Weijer), 760
3-O-α-D-Glucopyranosyl D-Xylose : Enzymic Synthesis of (Dr. S. A. Barker, Prof M. Stacey and D. B. E. Stroud), 138
Glucose (Uridine Diphosphate-) : Chemical Oxidation of, to Uridine Diphosphate-Glucoronic Acid (Dr. Bernard Jacobson and Dr. Eugene A. Davidson), 663
Glucose Effect : Absence of the, on the Frequency of Lysogenization in *Salmonella typhimurium* (Patricia Hoffee, Roger Weinberg and Prof. Ellis Englesberg), 160
Glucose Metabolism in the Perfused Heart : Fatty Acid and (Dr. Joseph C. Shipp, Dr. Lionel H Opie and Dr. David Challoner), 1018
Glucose-6-phosphate Dehydrogenase and Colour-blindness : Linkage between Deficiency of (A. Adam), 686
Glucoside Synthesis (Enzymic), in Locusts (Dr. J. N. Smith and Helen B. Turbert), 600
Glucuronic Acid (Uridine Diphosphate-) : Chemical Oxidation of Uridine Diphosphate-Glucose to (Dr. Bernard Jacobson and Dr. Eugene A. Davidson), 663
Glutamic Acid and Glutathione Analogues : Action of, on the *Hydra* Glutathione-Receptor (Howard M. Lenhoff and J. Bovaird), 486
Glutamic Acid Formation by Transoximase–Oximase Reaction (Prof. K. Yamafuji, S. Hatano and A. Ida), 397
Glutamic Acid Metabolism in Brain and Liver during Infusion with Ammonia labelled with Nitrogen-15 (G. Takagaki, S. Berl, D. D. Clarke, D. P. Purpura and Prof. H. Waelsch), 326
Glutamic Oxaloacetic Transaminase Activity in Different Zones of the Ventricular Muscle of the Dog (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr. Enrique Savino and Dr. Manuel René Malinow), 315
L-Glutamine and the Growth of Embryonic Chick Tibiotarsi *in vitro* (Dr. J. D. Biggers), 1016
Glutathione Analogues : Action of Glutamic Acid and, on the *Hydra* Glutathione-Receptor (Howard M. Lenhoff and J. Bovaird), 486
Glutathione-Receptor (*Hydra*) : Action of Glutamic Acid and Glutathione Analogues on the (Howard M. Lenhoff and J. Bovaird), 486
D-Glycero-D-galacto-heptitol : Isolation of, from the Wound Exudate of Avocado Trees (J. K N. Jones and R. A. Wall), 746
Glycerol in *Mycoplasma mycoides*—Unbalanced Growth of *Mycoplasma mycoides* caused by Glycerol Deficiency (A. W. Rodwell), 125 ; A Polyglycerophosphate Compound from *Mycoplasma mycoides* (P. Plackett), 125
Glycerol Deficiency : Unbalanced Growth of *Mycoplasma mycoides* caused by (Glycerol in *Mycoplasma mycoides*), (A. W. Rodwell), 125
Glycerylphosphorylcholine (Seminal) Breakdown of, by Secretions of the Female Reproductive Tract (Prof. I. G. White and J. C. Wallace), 843
Glycogen- and Copper-Levels (Brain), in Normal Sheep and Sheep affected with Scrapie (C. le Q. Darcel, R. J. Avery and R. B. Carson), 410
Glycol (Polyethylene) : Use of, in Biology (Dr. J. H. Fraser), 241
Glycolysis (Anaerobic), versus Structure in Pork Muscle : Rate of (J. Wismer-Pedersen and E. J. Briskey), 318
β-Glycosidase Activity and Cyanogenesis in the Susceptibility of Alfalfa to Winter Crown Rot (Dr. N. Colotelo and Dr. E. W. B. Ward), 242
Gm Groups : A Notation for the (Prof. R. Grubb), 845
Goddard, Prof. L. S. : Congestion in Telephone Systems, *review*, 6
Gods of Prehistoric Man (Prof. Johannes Maringer), translated from the German by Mary Ilford, *review* by Prof. R. J. C. Atkinson, 610
Godson, G. N. (Hunter, Dr. G. D., and) : Later Stages of Protein Synthesis and the Role of Phospholipids in the Process, 140
Goin, Coleman J. : A New Frog, *Hyla bokermanni*, n. sp., from Brazil, 274
Golay, M. J. E. : Gas Chromatography (Theory and Application), 27
Gold Medal of the Royal Astronomical Society awarded to Prof. Herman Zanstra, 188
Gold Salt (Organic) : Effect of an, on Eaton's Primary Atypical Pneumonia Agent and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Goldby, Prof. Stephen (Gamble, H. J., and) : Mast Cells in Peripheral Nerve Trunks, 766
Golde, Dr. R. H. : Appointed head of the Surges and Transformer Department of the Electrical Research Association, 101 ; work of, 101
Golden Jubilee of the Biochemical Society (Dr. P. N. Campbell and Dr. W. J. Whelan), 702
Goldie, Dr. L., and Green, J. M. : Changes in Mode of Respiration as an Indication of Level of Awareness, 581
Goldin, Dr. Abraham, and others : Increased Dihydrofolate Reductase Activity as a Possible Basis of Drug Resistance in Leukaemia, 39
  Toxicity and Anti-leukaemic Effectiveness in Mice of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid (Tetrahydroamethopterin), 937
Golding, E. W. : Appointed an assistant director of the Electrical Research Association, 101
Golding, R. M. : Ultra-Violet Absorption Spectrum of Water, 132
Goldsworthy, Dr. F. A. : Appointed reader in applied mathematics at Queen Mary College, London, 22 ; unable to accept the appointment, 188
Goldup, Dr. A. : Gas Chromatography, 26
Goldup, Dr. A. (read by) : Gas Chromatography—Definitions and Retention Parameters (paper by R. L. Martin), 281
Golton, E. : Skip-Distance Ray-focusing in the Ionosphere, 48
Golub, Orville J., and others : Evaluation of the Activity of Corticosteroid 11β-Hydroxylase, 1006
Gonadotrophin (Human Chorionic) : Clinical Application of a Serological Method for the Determination of (Dr. Sam Brody and Dr. Gun Carlstrom), 841
Gonadotropin (Human Menopausal) : Enzymic Release of Sialic Acid and Inactivation of (Dr. René Got and Dr. Roland Bourrillon), 234
Gonzalez, C., and Sierra, G. : Lipolytic Activity of some Anaerobic Bacteria, 601
Goodey, Dr. J. B. : Recent Developments in Plant Nematology, 715
Goodburn, Gillian M. (Marmion, Dr. B. P., and) : Effect of an Organic Gold Salt on Eaton's Primary Atypical Pneumonia Agent and other Observations, 247
Goodier, Prof. J. N., and Hodge, Prof. P. G. : Elasticity and Plasticity, *review* by Prof. A. T. Price, 865
Goodman, N. J. : New Research Laboratories of Hilger and Watts, Ltd., 189
Gordon, Dr. A. H. : Detection of Liver Proteins in Circulating Blood, 727
Gordon-Gray, K. D. : Biogeography of South-East Africa, 801
Gorer, Dr. P. A., and others : Proposed Revisions of 'Transplantese', 1024
Gorge (Olduvai) : New Finds at (Dr. L. S. B. Leakey), 649
Gorge (Bed I Olduvai) : Sites yielding Hominid Remains in (J. Desmond Clark), 903
Gorton, Dr. H. C., and others : Radiative Recombination in Gallium Phosphide Point-Contact Diodes, 361
Gosland, L. : Appointed deputy director of the Electrical Research Association, 101
Got, Dr. René, and Bourrillon, Dr. Roland : Enzymic Release of Sialic Acid and Inactivation of Human Menopausal Gonadotropin, 234
Gough, Dr. H. C. : Recent Developments in Plant Nematology (The Importance of Plant Parasitic Nematodes in Britain), 715
Government (French) : Scholarships for further study of research in France, 534
Government of the Federation of Malaya (Rubber Research Institute of Malaya and the) : Conference on Natural Rubber Research, 193
Government Analyst, Madras (King Institute of Preventive Medicine, Guindy, and the) : Report for 1957-58, 274
Governments (Overseas) : Service with (Colonial Office), 29
Gradient of Choline Acetylase Activity (Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres), (Dr. Catherine O. Hebb and Ann Silver), 123
Gradient of Cholinesterase Activity (Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres), (Dr. L. Lubińska, S. Niemierko and B. Oberfeld,) 122
Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres—Gradient of Cholinesterase Activity (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123
Graduates : The Training of—a Report of the Joint Committee on Practical Training in the Electrical Engineering Industry, revised re-issue (Institution of Electrical Engineers), 542
Graduates (Arts), and Imperial Chemical Industries, Ltd., 969
Graduates (Engineering) Training, 542
Grafstein, Dr. Bernice : Self-Regulation in Living Systems (Reception of Peripheral Information), 799
Graft versus Host Tolerance : Acquisition of (Dr. J. K. Dineen), 680
Grafting : Effect of Temperature and, on Vegetative Growth Phases of Algerian Ivy (Prof. V. T. Stoutemyer and O. K. Britt), 854
Grafts (Skin) : Transfer of Tolerance to, in F_1 C57Bl Inbred Mice (Anna Skowron-Cendrzak), 595
Gramineae (Dr. C. R. Metcalfe), (Anatomy of the Monocotyledons, Vol. I), *review* by Prof T. G. Tutin, 865
  Pollen Germination in some (Dr. P. O. Wiehe), 328
Grand, Lorraine C., and others : Mammary Cancer induced by a Single Feeding of Polynuclear Hydrocarbons, and its Suppression, 204
Grant, R. A , and others : Inhibiting Effect of 2:4-Dinitrophenol on Calciferol-induced Metastatic Calcification in the Rat, 317
Grants (Research), 1961 : Studentships, Fellowships and (Department of Scientific and Industrial Research), 361
Grants (Student), in Great Britain, 19
Grants, Scholarships and Fellowships for Research on Diseases of the Blood (Lady Tata Memorial Trust), 361
Granular Localization of Posterior Pituitary Hormones : Evidence for the (Shawn Schapiro and Lennart Stjarne), 669
Graphite, an Ideally Imperfect Material, *review* by Dr. G. E. Bacon, 522
Graphite : Aggregation and Dispersal of Radiation Damage in (W. N. Reynolds, P. A. Thrower and B. E. Sheldon), 824
Graphite and its Crystal Compounds (Prof. A. R. Ubbelohde and F. A. Lewis), *review* by Dr. G. E. Bacon, 522

Graphite, Graphitic Carbon and Non-Graphitic Carbon : Surface Orientation and Friction of (Dr. J. W. Midgley and D. G. Teer), 735
Graphitic Carbon and Non-Graphitic Carbon : Surface Orientation and Friction of Graphite, (Dr. J. W. Midgley and D. G. Teer), 735
Gräsbeck, Dr. Ralph, and others Excretion and Hepatic Storage of 5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58, 764
Grass (Love-), *Eragrostis curvula* (Schrad) Nees : Low-Temperature Injury in (J. H. Leigh), 415
Grass and Forage Crops : The Conservation of (Prof. Stephen J. Watson and Dr. Michael J. Nash), second edition, *review* by Dr. William Davies, 4
Grass and Milk in Finland : Strontium-90 and Caesium-137 in, during 1959 (J. K. Miettinen, O. Paakkola, R. Nasanen, A. Vuorinen and D. Merten), 324
Grasses · An Anatomy of, *review* by Prof. T. G. Tutin, 865
Graul, E. H., and others : Autoradiographical Detection of Tritium-labelled Inulin in the Kidney, 500
Gravitational Field of the Sun : Deflexion of Light in the (Dr. N. S. Japolsky), 651
Gravitational Radiation (Interstellar Millicycle) Upper Limit for (Dr. Robert L. Forward, David Zipoy, Prof. J. Weber, Stewart Smith and Prof. Hugo Benioff), 473
Gravity Traverse of Antarctica (J. G. D. Pratt), (Trans-Antarctic Expedition, 1955-1958, Scientific Reports No. 2), *review* by G. de Q. Robin, 781
Gray, A. J., and others: Haptoglobin and Transferrin Types in the Kuru Region of Australian New Guinea, 68
Gray, D. O., and Fowden, Dr. L.: *N*-Ethyl-L-Asparagine, a New Amino-Acid Amine from *Ecballium*, 401
Gray, E. C. G : Impact of Man on the Vegetation of the Humid Tropics (Nature of Secondary Plant-Communities arising from the Activity of Early Man—Sylviculture of Mangrove-Forest developed by the Natives in the Gulf of Papua), 25
Gray, Sir James : Vertebrate Locomotion (Mechanics of Vertebrate Movement), 97
Gray, Dr. L. H. : Primary and Initial Effects of Ionizing Radiations (Radiosensitizing Action of Oxygen cannot be attributed to Early Post-Irradiation Metabolic Processes), 111 ; (Protection of Cell Suspensions *in vitro* by Aliphatic Alcohols), 111 ; (Death of a Bacterial Cell as a Single-hit Target Event), 111
  Elected a Fellow of the Royal Society, 966
Grayevsky, E. Y. : Primary and Initial Effects of Ionizing Radiations (Mechanism of Radiation Protective Agents), 111
Great Britain : Hydrology in (Prof. W. G. V. Balchin), 278
  The Organization and Financing of Research in Biochemistry and Allied Sciences in (edited by K. S. Dodgson), (Biochemical Society), 794
  Student Grants in, 19
  University Administration in, 517
  See also under Britain
Great Britain and Ireland : The Deer Stalking Grounds of (compiled by Col. G. Kenneth Whitehead), *review* by R. S. R. Fitter, 431
Great Grey Kangaroo : Reproduction in the (Phyllis E. Pilton), 984
Great Ouse Basin (River)—Hydrological Survey (Hydrometric Area No. 33), (Ministry of Housing and Local Government), 278
Greater Susceptibility to *Mycobacterium johnei* of C.57 Black Mice, when compared with *CBA* and Swiss White Mice (Dr. R. L. Chandler), 602

Greig, Prof. J. : *Obituary* of Prof. G. W. O. Howe, 183
  Electrical Engineering in the Royal Navy, 364
Grey Kangaroo (Great) : Reproduction in the (Phyllis E. Pilton), 984
Grey Seal : Status of the (R. S. R. Fitter), 506
Griffiths, Dr. E., and Birch, H. F. : Microbiological Changes in Freshly Moistened Soil, 424
Griffiths, S. T. : Gas Chromatography (Information on Gasolines obtained by a combination of Liquid–Solid and Gas–Liquid Chromatography), 28
Grimbleby, Dr. F. H., and Ntailianas, H. A. : Binding of Trichloroacetic Acid by Protein, 835
Griminger, Prof. P. (Hurwitz, S., and) : Partition of Calcium and Phosphorus Excretion in the Laying Hen, 759
Grosberg, Dr. P. (Bell, J. R., and) : Diffusion through Porous Materials, 980
Gross, Dr. Rudolf (Holemans, Dr. Rudolf, and) : Fibrinolytic Activities present in Human Blood Platelets, 238
Groups : Decisions, Values and, Vol. 1, Reports from the First Interdisciplinary Conference in the Behavioral Science Division of the Air Force Office of Scientific Research, held at the University of New Mexico (edited by Dorothy Willner), *review* by Prof. Ll. Wynn Jones, 955
Growing Demand for Water : Second Report of the Sub-Committee on the (Central Advisory Water Committee), 278
Growth : Human (edited by J. M. Tanner), *review*, 955
Growth of Bacteria labelled with Heavy Isotopes for the Isolation of Nucleic Acids (Dr. Julius Marmur and Carl L. Schildkraut), 636
Growth of the Commonwealth Forestry Bureau, Oxford : A Synopsis of the Work and (1939-1959), 795
Growth of Embryonic Chick Tibiotarsi *in vitro* : L-Glutamine and the (Dr. J. D. Biggers), 1016
Growth of Embryonic Mammalian Cartilage after Freezing (Dr. Susan Heyner), 1027
Growth of Fern Gametophytes : Protein and Ribonucleic Acid in the (Y. Hotta), 455
Growth of Lake Victoria Phytoplankton in Enriched Cultures (Dr. John H. Evans), 417
Growth of Leaf and Stem Rusts of Wheat : Effects of Maleic Hydrazide on the (D. J. Samborski *et al.*), 187
Growth of Mammalian Cells *in vitro* : Alteration of the, by Ecdysone Extract (Prof. Walter J. Burdette and Dr. Ralph C. Richards), 666
Growth of a Nematode in Tomato Plants grown on Sodium-deficient Water Cultures (A. F. Bird and P. F. Brownell), 418
Growth of World Population : Conflicting Hypotheses on the (Dr. Max Pettersson), 1032
Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson · Effect of 6-Methoxybenzoxazolinone on the, and its Presence in Sweet Corn (*Zea mays* var. *saccharata* Bailey), (N. J. Whitney and C. G. Mortimore), 596
Growth (Cucumber Hypocotyl) : Promotion of, by Two New Gibberellins (Dr. P. W. Brian and H. G. Hemming), 74
Growth (Leaf) : Promotion of, by Short Days in the Short-Day Plant *Chenopodium amaranticolor* (Roderick G. Thomas), 771
Growth (Plant) : Soil Physical Conditions affecting (National Vegetable Research Station Association Members' Day programme), 625
Growth (Selective), of Bacteria : Chelating Agents for (G. M. Richardson), 78
Growth (Unbalanced) of *Mycoplasma mycoides* caused by Glycerol Deficiency (Glycerol in *Mycoplasma mycoides*), (A. W. Rodwell), 125
Growth (Whisker), from Quartz (R. J. Jaccodine and R. K. Kline), 298
Growth Phases (Vegetative), of Algerian Ivy : Effect of Temperature and Grafting on (Prof. V. T. Stoutemyer and O. K. Britt), 854
Growth-Rate (Crop) : Relationship of Radiation, Leaf Area Index and (W. R. Stern and Prof. C. M. Donald), 597
Growth-stimulating Factor (A New Green-Leaf), Phyllococosine, from Coconut Milk (Dr. Susumu Kuraishi and Dr. F. Shigeo Okumura), 148
Growth and Maintenance of Actinomycetes · A Chitin Medium for Isolation, (Yamuna Lingappa and Prof. John L. Lockwood), 158
Growth and Morphogenesis of *Striga* Seedlings (Colin N. Williams)—Effect of Light, Gibberellic Acid and Kinetin on Growth and Morphogenesis of *Striga* Seedlings, 378 ; Influence of the Host Rhizosphere on the Morphogenesis of *Striga* Seedlings, 380
Grubb, Prof. R. : A Notation for the Gm Groups, 845
Gruber, Prof. Jacob W. : Request for biographical material relating to Richard Owen, 796
Grümer, Dr. H. -D. : Formation of Hippuric Acid from Phenylalanine labelled with Carbon-14 in Phenylketonuric Subjects, 63
Guanethedine : Augmentation of the Pressor Response to, by Inhibition of Catechol O-Methyltransferase (Dr. D. W. Wylie), 490
Guarino, Angelo, and others : Labelling of Organic Compounds by Mercury-photosensitized Reaction with Tritium Gas, 54
Guénault, Dr. A. M. : Self-Regulation in Living Systems, 799
Guggenheim, Prof. E. A. : Elements of the Kinetic Theory of Gases, *review* by Dr. D. J. Millen, 783
Guinea Pig : Delayed Hypersensitivity to Homologous γ-Globulin in the (Dr. B. Benacerraf and Dr. P. G. H. Gell), 586
  Role of Biliary Alkaline Phosphatase in the (Freda Brown, *née* Bowyer), 755
Guinea Pigs (Tuberculin-sensitized) : Active Sensitization to Tuberculin with Cells from (Dr. J. L. Turk), 889
Gulbenkian, Arax, and others : Identification of a Compound found during Separation of Purines in Human Urine, 671
Gunary, D. (Larsen, S., and) : Phosphate Requirement of Lupins grown as a Pioneer Crop on Culm Measure Soil with Impeded Drainage, 691
Gunn, J. S., and Tatham, P. B. · Diquat as an Arboricide, 808
Gunning, B. E. S. : Appointed lecturer in botany at the Queen's University, Belfast, 714
Gunning Victoria Jubilee Prize for 1956-60 of the Royal Society of Edinburgh awarded to Sir Edward Appleton, 534
Gunther, Dr. J. T. : Impact of Man on the Vegetation of the Humid Tropics, 24
Gupta, Shanta, and others : Blood Nucleases and Infectious Viral Nucleic Acids, 817
Gurner, B. W., and others : Species-characterizing Antigens of 'L' and 'ERK' Cells, 503
Gurney, T. R. : Appointed in charge of fatigue researches at the British Welding Research Association, 625
Gustafsson, Prof. Ake : Elected a Member of the General Biology Section of the Leopoldina German Academy of Sciences, 273
Gut of Amphioxus : Presence of Enterochromaffin Cells in the (Dr. Giuseppe Gerzeli), 237

HABERMANN, Dr. S., and others : Distribution of Acetylcholine and Cholinesterase in the Heart of White Rats, 923
Hack, Margherita (Abetti, Giorgio, e) : Le Nebulose e gli Universi-Isole, *review* by J. B. Alexander, 867
Hackett, Dr. C. J., and Loewenthal, Dr. L. J. A. : Differential Diagnosis of Yaws (World Health Organization, Monograph Series No. 45), 187
Haddow, Prof. A. : Elected a Fellow of the Royal Society of Edinburgh, 876

Hadházy, Cs., and others : Experimental Data concerning the Connexion between Thyroid Function and Mucopolysaccharide- (Hexosamine)-Level, 670
Haemagglutination and Haemagglutination-Inhibition with African Horse-Sickness Virus (Khorshed M. Pavri), 249
Haemagglutination-Inhibition · Haemagglutination and, with African Horse-Sickness Virus (Khorshed M. Pavri), 249
Haemin : Effect of Polylysine on the Absorption Spectrum of (Dr. G. Blauer), 396
Haemoglobin . Site of Binding of Chromium-51 to (Dr. Howard A. Pearson and Dr. Kenneth M Vertrees), 1019
Haemoglobin A_2 : Antigenicity of (Dr. Paul Heller, Vincent Yakulis and A M. Josephson), 495
  Polypeptide Chains of (Dr. E. R. Huehns and Dr. E. M. Shooter), 918
Haemoglobin E in Egypt (Comdr. Kirk C. Hoerman, Karim Kamel and Armed Y. Awny), 69
Haemoglobin Ionographic Properties in Cotton Rats : Inherited (Prof. Charles W. Foreman), 585
Haemoglobin (Human) : Genetic Control of Foetal and Adult (Dr. C. Baglioni, Prof. V. M. Ingram and Emelie Sullivan), 467
Haemoglobin Types (Four Adult), in One Person (Dr C Baglioni and Prof. V. M. Ingram), 465
Haemoglobin Variants (Two New), in a Very Young Human Embryo (Dr. E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496
Haemoglobins : Gene Evolution and the (Prof. Vernon M. Ingram), 704
Haemoglobins of Foetal *CBA* Mice (J. Barrowman and Dr K. B. Roberts), 409
Haemoglobins, Myoglobins and Erythrocruorins—a Proposal for Modifying the Present Terminology (Dr. Malcolm H. Smith), 225
Haemolytic Activity of Colloidal Silica (J D. Harley and Dr. J. Margolis), 1010
Haemolytic Activity of *Corynebacterium ovis* (Dr. Gordon Fraser), 246
Haemolytic Activity (Fluorescence and), of Tumours and Normal Tissues of the *C3H* Mouse (Dr Eric Ponder and Ruth V. Ponder), 643
Haemolytic Disease in Lambs . An Attempt to produce (Elizabeth M. Tucker), 847
Haemoprotein (A New), with a Unique Iron Porphyrin Prosthetic Group isolated from Human Erythrocytes (Dr. Martin Morrison), 765
Haemosiderin : Formation of, and its relation to Ferritin (Dr Arne Shoden and Dr. Phillip Sturgeon), 846
Hagen, Dr. Ulrich : Labilization of Deoxyribonucleic Acid in Thymus Nucleoprotein after Whole-body Irradiation, 361
Haguenau, Francoise . Biochemistry of Human Tumours (Electron Microscopy of Human Tumours), 627
Hair, J. B., and Beuzenberg, E J. : High Polyploidy in a New Zealand *Poa*, 160
Hair (Human) : A Fatty Acid Protein Complex in (A W. Holmes), 923
Hakim, Dr. Sohrab A E, and others · Distribution of certain Poppy-Fumaria Alkaloids and a Possible Link with the Incidence of Glaucoma, 198
  Experimental Transmission of Sanguinarine in Milk—Detection of a Metabolic Product, 201
Hakim, Dr. S. S., and Higham, Dr. J B. : A Phenomenon in *n*-Hexane prior to its Electric Breakdown, 996
Halammohydra on the Isles of Scilly : Occurrence of a Species of (Prof. L. A. Harvey and J. B. J. Wells), 944
Halasz, Dr. I : Gas Chromatography (Developments in Apparatus and Technique), 27

Heat Tolerance Coefficient in Murrah Buffalo Calves : Effect of Exposure to Sun and Exercise on (D. S. Bhatnagar and N. C. Chaudhary), 844
Heat Transfer from a Hot Wire to an Insulating Liquid : Influence of an Electric Field upon the (Dr. P. Keith Watson), 563
Heats of Adsorption : Determination of, by Transient-Response Techniques (James J. Carberry), 391
Heavy Isotopes : Growth of Bacteria labelled with, for the Isolation of Nucleic Acids (Dr. Julius Marmur and Carl L. Schildkraut), 636
Heavy Water (Deuterium Peroxide–) · Glass Formation in Solutions of Hydrogen Peroxide–Water and (Robert C. Smith and S. J. Wyard), 211
Hebb, Dr. Catherine O., and Silver, Ann · Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres—Gradient of Choline Acetylase Activity, 123
Hegel : Western Intellectual Tradition from Leonardo to (Dr. J. Bronowski and Dr. Bruce Mazlish), *review* by Dr. D. Thomson, 520
Heidelberger, Dr. Charles : Biochemistry of Human Tumours, 627
Helfferich, Dr. F. : 'Ligand Exchange', a Novel Separation Technique, 1001
Helfrich, Philip, and others : Bioassay of Ciguatera Toxin, 229
Heliotrine Poisoning : Pyridine Nucleotide Metabolism in (Prof. G. S. Christie, R. N. LePage and Margot J. Bailie), 593
Heller, Prof Józef, and others : Reduction of Coenzyme Q by Succinic Acid Dehydrogenase, 578
Heller, Dr. Paul, and others : Antigenicity of A$_2$ Haemoglobin, 495
Hemipteran *Acanthocephala femorata* : *Trans*-2-Hexenal in the Scent Gland of the (Prof. Murray S. Blum, Donald D. Crain and Julius B. Chidester), 245
Hemisphere (Southern) Fall-out and the Meridional Circulation (A. R. Dyer), 905
Hemming, H. G (Brian, Dr. P. W., and) : Promotion of Cucumber Hypocotyl Growth by Two New Gibberellins, 74
Hems, Dr. G : A New Effect of Ionizing Radiation on Nucleoprotein, 849
Hen (Laying) Partition of Calcium and Phosphorus Excretion in the (S. Hurwitz and Prof. P. Griminger), 759
Hen's Egg : A Method of determining Embryonic Orientation in the (I. S. Robertson), 854
  Weissenberg Effect in the Thick White of the (Dr. H. G. Muller), 213
Henderson, B. . Appointed William Gibbins Research Fellow in the Department of Physical Metallurgy in the University of Birmingham, 22, 714
Hendry, Prof. A. W. : Elected a Fellow of the Royal Society of Edinburgh, 876
Hens (Old) : Inability of Refined Corn Oil to influence Spontaneous Arteriosclerosis of (K. F. Gey and Dr. A. Pletscher), 491
Heparin in the Blood of Fish : Occurrence of, and its Prevention of the Clotting of Fish Plasma (Dr. S. Z. Qasim and R. Hasan), 764
Hepatic Storage of 5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58 : Excretion and (Wolmar Nyberg, Matti Saarni and Dr. Ralph Gräsbeck), 764
Hepatoencephalomyelitis Virus and Reoviruses : Relationship of (Prof. N. F. Stanley), 687
Hepatoma Cells (Novikoff), of the Rat : Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Herbert, E. Le Q. : Elected an Honorary Associate of the City of Liverpool College of Technology, 446
Herbert, L. S. : Utilization of Water in Australia (Reducing the Salt Content of Water), 538
Herčik, F. : Primary and Initial Effects of Ionizing Radiations (Modification of Radiation Damage), 111
Heredity : Biochemistry of—a General Hypothesis (Dr. Ian Leslie), 260
Herring Industries Bill : White Fish and (Second reading in the House of Commons), 532
Herriott, Roger M., and others : Blood Nucleases and Infectious Viral Nucleic Acids, 817
Hertting, Dr. G., and others : Lack of Uptake of Catecholamines after Chronic Denervation of Sympathetic Nerves, 66
Herz, Dr. Fritz (Nitowsky, Dr. Harold M., and) : Alkaline Phosphatase in Cell Cultures of Human Origin, 756
Hess, Dr. Werner R., and Ling, Dr Rufus C. : Memory Effect in the Thermal Initiation of Explosives, 288
Heterogeneity of the Ethanol-soluble, Ether-insoluble Products : Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by Bean Stems— (Michael K. Bach and J. Fellig), 763
Hevea brasiliensis : Thread-like Reticulum in Latex from, and its relation to Latex Particles (W. A. Southorn), 1000
Hewson-Brown, Dr. R. C. : Appointed lecturer in applied mathematics at the University of Sheffield, 714
Hexachlorobenzene Intoxication · Acquired Porphyria in Man and Rat due to (Robert K. Ockner and Prof. Rudi Schmid), 499
n-Hexane : A Phenomenon in, prior to its Electric Breakdown (Dr. S. S. Hakim and Dr. J. B. Higham), 996
Trans-2-Hexenal in the Scent Gland of the Hemipteran *Acanthocephala femorata* (Prof. Murray S. Blum, Ronald D. Crain and Julius B. Chidester), 245
Heymann, Dr. F. F. : Appointed to the University of London readership in physics at University College, 714
Heyner, Dr. Susan : Growth of Embryonic Mammalian Cartilage after Freezing, 1027
Heywood, Dr. V. H., and Walker, Dr. S. : Morphological Separation of Cytological Races in *Ranunculus ficaria* L., 604
Hiatt, Dr. C. W. : Theoretical Considerations in the Ultra-violet Irradiation of Micro-organisms, 678
Hickman, jun., C. P. : The Conversion Ratio as a Discriminatory Test for Thyroid Activity in Fish, 1012
High-Energy Protons and Positive Ions : Emission of Soft Electromagnetic Radiation from Metals by the Impact of (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
High-Flying Aircraft : Some Solar Lines in the Infra-Red Spectrum observed from a (N. D. P. Hughes and Dr. T. S. Moss), 908
High Metal Content : *HD* 101065—a *G0* Star with (Dr. Antoni Przybylski), 739
High Polymers : Rapid Identification of, using a Simple Pyrolysis Unit with a Gas–Liquid Chromatograph (C. E. Roland Jones and A. F. Moyles), 222
High Polyploidy in a New Zealand *Poa* (J. B Hair and E. J. Beuzenberg), 160
High Strength Glass (Dr. D. G. Holloway and P. A. P. Hastilow), 385
High-Temperature and Pre-Treatment : Effect of, on the Germination of Oil Palm Seed (A R. Rees), 74
High Temperature and Vitamin A Metabolism : Relationship between, and the Fertility of Ewes (Margaret Ryle), 104
High Temperatures : Reactions on Metal Surfaces at (F. T. Barcroft and J. R. Hayden), 133
High-Yield Crystallization of Urease from Jack Bean (Dr. Kiyomichi Hanabusa), 551
Higham, Dr. J. B. (Hakim, Dr. S. S , and) : A Phenomenon in *n*-Hexane prior to its Electric Breakdown, 996
Higher Education in Britain, Committee on, 531
Higher Education in Nigeria : The Report of the Commission on Post-School Certificate and—Investment in Education, 169
Higher Education in the United States (Dr. J. B. Conant), 803
Higher Education (Post-Secondary and), in Nigeria (Dr. C. T. Mortimer), 95
Higher Nervous Activity (New York Academy of Sciences and the Academy of Medical Sciences of the U.S.S.R. Conference on), 282
Higher Plants : Studies of Climatic Ecotypes in—the Temperature Dependence of Apparent Photosynthesis in Different Populations of *Solidago virgaurea* (O. Bjorkman, C. Florell and P. Holmgren), 624
Hilger and Watts, Ltd. : New Research Laboratories of (N. J. Goodman), 189
Hill, Dr. D. W. : Gas Chromatography (Application of Gas Chromatography to Anaesthetic Research), 28
Hill, Dr. D. W. (Butler, Dr. R. A., and) · Estimation of Volatile Anaesthetics in Tissues by Gas Chromatography, 488
Hill, Dr. M. : Uptake of Deoxyribonucleic Acid (DNA)—a Special Property of the Cell Nucleus, 916
Hill, Prof. Rodney : Elected a Fellow of the Royal Society, 966
Hill Oxidant : A New Leaf Copper Protein 'Plastocyanin', a Natural (Dr. Sakae Katoh and Dr. Atusi Takamiya), 665
Hill-Cottingham, Dr. D. G , and Lloyd-Jones, C. P. : Absorption and Breakdown of Iron–Ethylenediamine Tetraacetic Acid by Tomato Plants, 312
Hilton, Prof. P. J. : New Universities (Priority of Teaching over Research), 23
Himmelweit, Dr. F., with the assistance of the late Martha Marquardt (compiled and edited by ; under the editorial direction of Sir Henry Dale) : The Collected Papers of Paul Ehrlich, Vol. 2, Immunology and Cancer Research ; Vol. 3, Chemotherapy, *review* by Prof. C. H. Browning, 254
Hindle, Dr Edward : Zoological Literature for 1957, *review*, 89
Hinshelwood, Sir Cyril : Awarded the Medal for 1961 of the Society of Chemical Industry, 22
Hinton, Dr. H. E. : Elected a Fellow of the Royal Society, 966
Hippuric Acid : Formation of, from Phenylalamine labelled with Carbon-14 in Phenylketonuric Subjects (Dr. H.-D. Grumer), 63

Hirsch, H. H., and van Buren, C. E. : Powder Metallurgy (Hydrostatic Pressing of Powder), 366
Hirsch, Dr. P. B. : Awarded the Rosenhain Medal for 1961 of the Institute of Metals, 533
Hirst, Prof. E. L. : Gas Chromatography (Impact of Chromatography on Research in Recent Years), 26
Hirst, Dr. J. M. : Epidemics of Black (Stem) Rust of Wheat (Liberation, Transport and Deposition of Rust Uredospores), 285
Histochemical Evidence of 5-Hydroxytryptamine in a Dog Mast Cell Tumour (Prof. W G. Rice and Dr. James Mitchener), 767
Histochemistry of Human Sublingual Glands (Dr. G. Quintarelli and Dr. L. Robinson), 935
Histochemistry of Mouse Lymphocytic Leukaemia *L* 1210 : Effects of Nitrogen Mustard on the (Dr. George J. Furman, Prof. G. Adolph Ackerman and Dr. Carl Cohen), 591
Histocompatible Colour Mutant from *CBA/Lab* Strain of Mice (Annie M. Brown and Margaret J. Cook), 1031
History : Agricultural (Agricultural History Society and the Association of Agriculture Conference on), 368
History of Science in Poland, 103
History of Western Ideas, *review* by Dr. D. Thomson, 520
History (Earth) : A Farrago of, *review* by Prof. Arthur Holmes, 341
History (A Short), of Technology from the Earliest Times to A.D. 1900 (T. K. Derry and Dr. Trevor I. Williams), *review* by Prof. R. J. Forbes, 174
History and Philosophy of Science in the Commonwealth (Dr. W. Mays), 971
Hoare, Dr. D. E. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Hobart, J. : Soil Fauna in relation to Soil Formation and Fertility (Distributing Patterns of Soil Mites in Pure and Mixed Stands of Conifers), 367
Hodge, Prof. P. G. (Goodier, Prof. J. N., and) : Elasticity and Plasticity, *review* by Prof. A. T. Price, 865
Hoenig, Dr. J. : Appointed reader in psychiatry in the University of Manchester, 797
Hoerman, Comdr. Kirk C., and others : Haemoglobin E in Egypt, 69
Hoffee, Patricia, and others : Absence of the Glucose Effect on the Frequency of Lysogenization in *Salmonella typhimurium*, 160
Hofmann, K., and others : Adipokinetic Activity of Synthetic Peptides related to Corticotropin, 681
Högbom, Dr. J. A., and Shakeshaft, Dr. J. R. : Secular Variation of the Flux Density of the Radio Source Cassiopeia A, 561
Hogg, W. H. : Epidemics of Black (Stem) Rust of Wheat, 285
Hojo, H. : A New Method for the Calculation of *N*(*h*) Profiles from Ionospheric *h*'(*f*) Curves, 562
Hokin, Prof Lowell E., and Hokin, Mabel R. : Diglyceride Kinase and Phosphatidic Acid Phosphatase in Erythrocyte Membranes, 836
Hokin, Mabel R. (Hokin, Prof. Lowell E , and) : Diglyceride Kinase and Phosphatidic Acid Phosphatase in Erythrocyte Membranes, 836
Holder, Dr. D. W. : Appointed to the chair of engineering science at the University of Oxford, 185 ; work of, 185
Holdgate, Martin W. : Awarded the Cuthbert Peek Grant of the Royal Geographical Society, 443
Holemans, Dr. Rudolf, and Gross, Dr Rudolf : Fibrinolytic Activities present in Human Blood Platelets, 238
Hollaender, A : Primary and Initial Effects of Ionizing Radiations (Modification of Radiation Damage), 111 ; (Protection against the Mutagenic Action of X-Rays is independent of Protection against Death of the Cells), 111
Holland, James F. : Biochemistry of Human Tumours (Major Deficiencies in Knowledge about Human Cancer), 627
Hollier, R. H. : Appointed Tube Investments Senior Research Fellow in the Department of Engineering Production in the University of Birmingham, 22
Hollom, P. O D : The Popular Handbook of Rarer British Birds, *review* by Sir Landsborough Thomson, 7
Hollós, Dr. I. : Inhibition of the Multiplication of Influenza Virus by Aniline Derivatives of the Francis Inhibitor, 553
Holloway, Dr. D. G., and Hastilow, P. A. P. : High Strength Glass, 385
Holmes, Prof. Arthur : A Farrago of Earth History, *review*, 341
Holmes, A. W. . A Fatty Acid/Protein Complex in Human Hair, 923
Holmes, B. : Primary and Initial Effects of Ionizing Radiations (Radiosensitivity of Biological Macromolecules), 112
Holmes, Dr. J. L. : Appointed I.C.I. Research Fellow in the University of Edinburgh, 22
Holmgren, P , and others : Studies of Climatic Ecotypes in Higher Plants—the Temperature Dependence of Apparent Photosynthesis in Different Populations of *Solidago virgaurea*, 624
Holmgren, Dr. Uno, and Notter, Dr Gustaf : A Technique for Destruction of the Pineal Body using Yttrium-90 Spheres, 773
Home Universities Conference : Discussion on the Future of the General Degree, 106
Hominid Remains in Bed I Olduvai Gorge : Sites yielding (J. Desmond Clark), 903
Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats Injected with (Prof. N. Allegretti and B. Vitale), 673
Homografts (Cutaneous) : Survival of, after Transplantation of Lymph Nodes Immunized against the Host (Dr. J Vrubel), 853
Homologous γ-Globulin in the Guinea Pig : Delayed Hypersensitivity to (Dr B. Benacerraf and Dr. P. G. H Gell), 586
Homologous Lung Tissue (Homogenized), mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats Injected with (Prof N. Allegretti and B. Vitale), 673
Homotopy Theory (Sze-Tsen Hu), *review* by Prof. T. A. A. Broadbent, 433
Honeybee Communication when the Sun is close to the Zenith (Dr. D. A. T. New, F. R. Burrowes and A. J. Edgar), 155
Honours : New Year, 18
Hood, Harrison P. (Brill, Robert H., and) : A New Method for Dating Ancient Glass, 12
Hooijer, D A., and others : An Extinct Giant Pangolin and associated Mammals from Niah Cave, Sarawak, 166
Hooke, Robert, and others (Founders of British Science), (J. G. Crowther), *review* by Dr. W. P. D. Wightman, 259
Hope, E. G., and others : Hyperfine Splitting of Rubidium-87, 298
Hopkins Memorial Lecture of the Biochemical Society (Sir Hans Krebs), 446
Hopper, Bruce E. : Occurrence of an Egg-String in *Enoplus communis* Bastian, 1865 (Nematoda : Enoplidae), 331
C Horizon of the Soil Profile (D. F. Ball), 688 ; (Dr. S. G. Willimott and D. W. Gilchrist Shirlaw), 689
Horizontal Cell Response to Retinal Illumination : Location of the Non-Linearity in (Dr. Richard Fatehchand, Dr. Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Hormones (α- and β-Melanocyte Stimulating) : Effect of, on the Skin Colour of Man (Prof. Aaron B. Lerner and Dr. Joseph S. McGuire), 176
Hormones (Neurohypophyseal) : Action of, on the Sodium Fluxes of a Freshwater Teleost (Dr. J. Maetz and M. Juien), 152
Hormones (Posterior Pituitary) : Evidence for the Granular Localization of (Shawn Schapiro and Lennart Stjarne), 669
Horopter in Anomalous Correspondence : Retinal Correspondency and the (Dr. M. C. Flom and Prof. F. W. Weymouth), 34
Horrell, C. R. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Horse Serum : Presence in, of Two Inhibitors of Avid *A2* Influenza Virus Strains (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Medecky and F. Sokol), 513
Horse-Sickness Virus (African) : Haemogglutination and Haemagglutination-Inhibition with (Khorshed M. Pavri), 249
Horsfield, A., and others : Identification of the Radical $\cdot CH_2(CO_2H)$, 481
Horticultural Society (Royal) : Jones–Bateman Cup awarded to A. Gavin Brown, 104
Horton-Smith, Dr. C. : Recent Advances in Fields of Parasitological Research (Poultry Parasites and their Control), 193
Horwitt, Dr. Benjamin N., and others : Evaluation of the Activity of Corticosteroid 11β-Hydroxylase, 1006
Hospital Patients (Mental) : Area of Residence of (Studies on Medical and Population Subjects, No. 16), (Registrar General), 716
Host : Survival of Cutaneous Homografts after Transplantation of Lymph Nodes Immunized against the (Dr. J. Vrubel), 853
Host-Range of *Streptomyces aureofaciens* Actinophage (R. Weindling, H. D. Tresner and Dr. E. J. Backus), 603
Host Rhizosphere : Influence of the, on the Morphogenesis of *Striga* Seedlings (Growth and Morphogenesis of *Striga* Seedlings), (Colin N. Williams), 380
Host Tolerance : Acquisition of Graft versus (Dr. J. K. Dineen), 680
Host Tumour Interactions (Henry Ford Hospital, Detroit, International Symposium on), 534
Hot Wire : Influence of an Electric Field upon the Heat Transfer from a, to an Insulating Liquid (Dr. P. Keith Watson), 563
Hotta, Y. : Protein and Ribonucleic Acid in the Growth of Fern Gametophytes, 455
Hougen, L R : Effect of Corona Discharges on Polyethylene, 274
House of Commons : Adjournment Debate on State Scholarships, 19
  Adjournment Debate on a British Communications Satellite Programme, 276
  Second reading of the White Fish and Herring Industries Bill, 532
  Adjournment Debate on the National Reference Library for Science and Technology, 968
House of Lords : Debate on the Post Office Telephone Service, 532
Housing and Local Government, Ministry of : River Great Ouse Basin—Hydrological Survey (Hydrometric Area No. 33), 278
  River Severn Basin—Hydrological Survey (Hydrometric Area No. 54), 278
Housing and Local Government, Ministry of, and Scottish Office : The Surface Water Year-Book of Great Britain, 1958-59—Hydrometric Statistics for British Rivers, together with related Rainfalls, for the Year ended 30th September 1959, 278
How, M. J., and others : Two New Amino-Sugars from an Antigenic Polysaccharide of *Pneumococcus*, 303
Howatson, A. F., and others : Morphological Characterization of the Virus of the Human Common Wart (*Verruca vulgaris*), 895
Howden, Dr G. F , and Marshall, A. T. : A Method of Dissolving the Protective Spittle Masses of Frog Hopper Nymphs, 509
Howe, Prof G. W. O. : *Obituary* by Prof. J. Greig, 183
Howe, J. P. (edited by H. M. Finniston and) : Metallurgy and Fuels, Vol. 2 (Progress in Nuclear Energy, Series 5), *review* by Dr. G. A. Geach, 5
Hu, Sze-Tsen : Homotopy Theory, *review* by Prof. T. A. A. Broadbent, 433
Hubáček, Dr. J. : Phenomic Delay in Transduction of *Salmonella typhimurium* Cell, 679
Hubbard, J. I., and Oscarsson, O. : Localization of the Cells of Origin of the Ventral Spino-Cerebellar Tract, 157
Hudson, Dr. R. G. S. : Elected a Fellow of the Royal Society, 966
Huehns, Dr E. R , and others : Two New Haemoglobin Variants in a Very Young Human Embryo, 496
Huehns, Dr. E R., and Shooter, Dr. E. M. : Polypeptide Chains of Haemoglobin A_2, 918
Hug, O. : Primary and Initial Effects of Ionizing Radiations (Radiosensitivity of Smooth Muscle), 110
Huggins, Prof. Charles, and others : Mammary Cancer Induced by a Single Feeding of Polynuclear Hydrocarbons, and its Suppression, 204
Hughes, Dr. A. F. W., and Lewis, Dr. P. R. : Effect of Limb Ablation on Neurones in *Xenopus* Larvae, 333
Hughes, N. D. P., and Moss, Dr. T. S. : Some Solar Lines in the Infra-Red Spectrum observed from a High-Flying Aircraft, 908
Huille, S. (Weill, G., and) : Synoptic Auroral Maps, 624
Human Biology, Society for the Study of : Symposia of the, Vol. 3, Human Growth (edited by J. M. Tanner), *review*, 955
Human Blood Platelets : Fibrinolytic Activities present in (Dr. Rudolf Holemans and Dr. Rudolf Gross), 238
Human Chorionic Gonadotrophin : Clinical Application of a Serological Method for the Determination of (Dr. Sam Brody and Dr. Gun Carlström), 841
Human Chromosomes : Nomenclature of, 796
Human Common Wart (*Verruca vulgaris*) : Morphological Characterization of the Virus of the (M. G. Williams, A. F. Howatson and J. D. Almeida), 895
Human Diet : Strontium-90 in, in the United Kingdom, 1959 (Agricultural Research Council, Radiobiology Laboratory Report No. 3), 191
Human Embryo : Two New Haemoglobin Variants in a Very Young (Dr. E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496

Human Erythrocytes : A New Haemoprotein with a Unique Iron Porphyrin Prosthetic Group isolated from (Dr. Martin Morrison), 765
Human Growth (edited by J. M. Tanner), *review*, 955
Human Haemoglobin: Genetic Control of Foetal and Adult (Dr. C. Baglioni, Prof. V. M. Ingram and Emelie Sullivan), 467
Human Hair : A Fatty Acid/Protein Complex in (A. W. Holmes), 923
Human Menopausal Gonadotropin : Enzymic Release of Sialic Acid and Inactivation of (Dr. René Got and Dr. Roland Bourrillon), 234
Human Origin : Alkaline Phosphatase in Cell Cultures of (Dr. Harold M. Nitowsky and Dr. Fritz Herz), 756
Human Plasma : Strontium-90 in (Dr. G. E. Harrison, Alice Sutton and Dr. W. D'A. Maycock), 324
Human Populations (Brazilian) : Lethal Mutations in (Prof. N. Friere-Maia, A. Friere-Maia and A. Quelce-Salgado), 80
Human Sera : A New Inheritable Property of—the InV Factor (Dr. C. Ropartz, Dr. J. Lenoir and Dr. L. Rivat), 586
  Precipitating Factor for Aggregated γ-Globulins in Normal (Dr. A. Taranta, Dr. H. S. Weiss and E. C. Franklin), 239
Human Serum : Nature of Thyroxine-binding Globulin in (Dr. J. R. Tata), 573
Human Subjects : Tyrosyluria in (R. Robinson and Air-Commodore P. Smith), 323
Human Sublingual Glands Histochemistry of (Dr. G. Quintarelli and Dr. L. Robinson), 935
Human Teeth : Rehardening of Softened Enamel Surfaces of, by Solutions of Calcium Phosphates (Theodore Koulourides, Prof. Heriberto Cueto and Dr. Ward Pigman), 226
  Strontium-90 in (F. E. Butler), 848
Human Tumours : Biochemistry of (Biochemistry Committee of the Cancer Chemotherapy National Service Center, National Cancer Institute and the United States Public Health Service International Conference on), 627
Human Urine : Identification of a Compound found during Separation of Purines in (Dr. Herbert Singer, Arax Gulbenkian, Sigmund E. Lasker and Charles L. Fox, Jun.), 671
Humanities : Science and the, 695
Humid Tropics : Impact of Man on the Vegetation of the (Unesco South East Asia Science Co-operation Office Symposium on), 24
Humphreys, Stewart R., and others : Increased Dihydrofolate Reductase Activity as a Possible Basis of Drug Resistance in Leukaemia, 39
Hundeshagen, H., and others : Autoradiographical Detection of Tritium-labelled Inulin in the Kidney, 500
Hunter, Dr. C. G. : Appointed director of the Tunstall Laboratory of 'Shell' Research, 625
Hunter, Dr. G. D., and Godson, G. N. : Later Stages of Protein Synthesis and the Role of Phospholipids in the Process, 140
Hurcomb, Lord : Appointed chairman of the Nature Conservancy, 880
Hurst, Dr. C. A. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 100
Hurwitz, S., and Griminger, Prof. P. : Partition of Calcium and Phosphorus Excretion in the Laying Hen, 759
Huytens, F. H. : Gas Chromatography (Progress on Large-scale Preparative Columns), 27
Hyaluronidase (Urinary), and Diuresis : Relationship between (Prof. A. G. Ginetzinsky), 235 ; (Dr. G. M. Berlyne), 236
Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain : Electrophoretic Patterns of Lymph Node Proteins in (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025
Hyde, Major C. G., and Jones, M. W. : Gas Calorimetry, second edition, *review* by R. J. H. Banks, 255
Hyde, H. A. : Epidemics of Black (Stem) Rust of Wheat, 285
Hydra Glutathione-Receptor : Action of Glutamic Acid and Glutathione Analogues on the (Howard M. Lenhoff and J. Bovaird), 486
Hydration, Dehydration and Cracking Catalysts : Oxidation, (edited by Paul H. Emmett), (Catalysis, Vol. 7), *review* by Dr. E. B. Maxted, 88
Hydrazide (Maleic) : Effects of, on the Growth of Leaf and Stem Rusts of Wheat (D. J. Samborski et *al.*), 187
Hydrides (Complex) : A New Class of the (Dr. J. Kollonitsch), 1005
Hydrocarbons (Low-boiling) : Gas Chromatographic Separation of, using Active Alumina as Support for the Liquid Phase (Dr. I. Halász and E. E. Wegner), 570
Hydrocarbons (Polynuclear) : Mammary Cancer Induced by a Single Feeding of, and its Suppression (Prof. Charles Huggins, Lorraine C. Grand and Filomena P. Brillantes), 204
Hydrocharitaceae in New Zealand (R. Mason), 718
Hydrochloride (16-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride)—a New Drug active against *Babesia canis* (S. S. Berg and J. M. S. Lucas), 64
Hydrogen : Reaction of Oxygen Atoms with (M. A. A. Clyne and Dr. B. A. Thrush), 135
Hydrogen (Interstellar), in the Vicinity of the Sun : Streaming of (Dr. R. X. McGee, Dr. J. D. Murray and Dr. J. L. Pawsey), 957
Hydrogen Peroxide–Water and Deuterium Peroxide–Heavy Water : Glass Formation in Solutions of (Robert C. Smith and S. J. Wyard), 211
Hydrology in Great Britain (Prof. W. G. V. Balchin), 278
Hydromagnetics and Stellar Structure (K. D. Cole), 31
Hydromechanics Research Association (British) : International Conference on Fluid Sealing, 970
Hydroxide (Ferrous) System : The Sodium Silicate— (Dr. G. Kakabadse and P. Whinfrey), 829
Hydroxocobalamin : Applicability of, as a Long-acting Vitamin B_{12} (Prof. G. B. J. Glass, H. R. Skeggs, Dr. D. H. Lee, Dr. E. L. Jones and W. W. Hardy), 138
11β-Hydroxylase (Corticosteroid) : Evaluation of the Activity of (Dr. Benjamin N. Horwitt, Charles Sobel and Orville J. Golub), 1006
5-Hydroxytryptamine in a Dog Mast Cell Tumour : Histochemical Evidence of (Prof. W. G. Rice and Dr. James Mitchener), 767
5-Hydroxytryptamine Excretion in the Rat : Effect of Urinary *p*H on (M. Sandler and R. G. Spector), 838
d'Hygiene, Institut National (Paris) : Role of Alcohol in the Aetiology of Cirrhosis of the Liver in France, 804
Hygiene and Plant Protection (L. I. Medved), 279
Hyla bokermanni, n. sp., from Brazil : A New Frog (Coleman J. Goin), 274
Hymenopteran *Nasonia vitripennis* : A Possible Method of Sex Ratio Determination in the Parasitic (Dr. P. E. King), 330
Hynes, H. B. N., and others : Size of Particles Ingested by *Simulium* Larvae, 78
Hyperfine Splitting of Rubidium-87 (Dr. L. Essen, E. G. Hope and D. Sutcliffe), 298
Hyperopisus bebe (Lacepede) : Fecundity of the Nile Mormyrid (G. Nawar), 274
Hypersensitivity (Delayed), to Homologous γ-Globulin in the Guinea Pig (Dr. B. Benacerraf and Dr. P. G. H. Gell), 586
Hyphochytrium : Lysine Synthesis and Phylogeny of Lower Fungi—some Chytrids versus (Prof. Henry J. Vogel), 1026
Hypocotyl Growth (Cucumber) : Promotion of, by Two New Gibberellins (Dr. P. W. Brian and H. G. Hemming), 74
Hypophysis–Thyroid System in the Rabbit Foetus : Function of the, with regard to Cholesterol Metabolism (J. G. Bearn, H. B. Koerselman and T. R. E. Pilkington), 318
Hypothermia : Influence of, on the Survival of Mice after Large Doses of X-Radiation (L. Mráz and Dr. M. Praslička), 677
Hypotheses (Conflicting), on the Growth of World Population (Dr. Max Pettersson), 1032
Hypothesis : Biochemistry of Heredity—a General (Dr. Ian Leslie), 260
Hypothesis concerning the Mechanism of Gene Action (Dr. Carl C. Lindegren), 959
Hypoxaemia : Prevention of Vagotomy of Erythrocytosis induced by (Dr. D. F. J. Halmagyi and H. J. H. Colebatch), 757
Hytten, Dr. F. (Thomson, Dr. A. M., and) : Calorie Balance in Man (Calorie Requirements in Pregnancy), 537

Ice-Wedges in Devon : Involutions and (Ronald S. Waters), 389
Iceland–Greenland Ridge : Overflow of Cold Deep Water across the (J. G. Harvey), 911
Ida, A., and others : Glutamic Acid Formation by Transoximase–Oximase Reaction, 397
Ideally Imperfect Material : Graphite, an, *review* by Dr. G. E. Bacon, 522
Ideas (Western) : History of, *review* by Dr. D. Thomson, 520
Identification of a Compound found during Separation of Purines in Human Urine (Dr. Herbert Singer, Arax Gulbenkian, Sigmund E. Lasker and Charles L. Fox, jun.), 671
Identification of the Radical $\cdot CH_2(CO_2H)$ (A. Horsfield, Dr. J. R. Morton and Dr. D. H. Wiffen), 481
Identification of So-called Atypical Macroglobulinaemia as an Atypical Form of β_{2A}-Paraproteinaemia—a New Immunological Entity ? (R. E. Ballieux, Dr. J. W. Imhof and G. H. Niehaus), 768
Identification of 3,4,5-Trimethoxyphenylacetic Acid as the Major Metabolite of Mescaline in the Dog (Prof. Elliot Spector), 751
Identification (Detection and), of Underground Nuclear Explosions : Research on the (United Kingdom Atomic Energy Authority), 445
Identification (Rapid), of High Polymers using a Simple Pyrolysis Unit with a Gas–Liquid Chromatograph (C. E. Roland Jones and A. F. Moyles), 222
Ikonen, Dr. M. (Niemi, Dr. Mikko, and) : Steroid-3β-ol-Dehydrogenase Activity in Foetal Leydig's Cells, 592
Ilfracombe and District : Map of (Ordnance Survey, Sheet 856), 713
Illumination (Retinal) : Location of the Non-Linearity in Horizontal Cell Response to (Dr. Richard Fatehchand, Dr. Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Images (Out-of-Focus Electron Microscope), of Edges of Crystal Lattices (J. M. Cowley and A. F. Moodie), 477
Imai, Shoichi, and others : Antiaccelerator Action of Methoxamine, 493
IMEKO (International Measurement Conference), 1961, to be held in Budapest, 104
Imhof, Dr. J. W., and others : Identification of So-called Atypical Macroglobulinaemia as an Atypical Form of β_{2A}-Paraproteinaemia—a New Immunological Entity ?, 768
Immunity of Bee Keepers to some Constituents of Bee Venom—Phospholipase-A Antibodies (A. M. Mohammed and M. M. A. El Karemi), 837
Immunization in India, 197
Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and Ehrlich Ascites Carcinoma Cells (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Immunological Entity ? : Identification of So-called Atypical Macroglobulinaemia as an Atypical Form of β_{2A}-Paraproteinaemia—a New (R. E. Ballieux, Dr. J. W. Imhof and G. H. Niehaus), 768
Immunological Tolerance (Prof. P. B. Medawar), 12
Immunology and Cancer Research (The Collected Papers of Paul Ehrlich, Vol. 2), *review* by Prof. C. H. Browning, 254
Impact of High-Energy Protons and Positive Ions : Emission of Soft Electromagnetic Radiation from Metals by the (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Impact of *Lunik* 2 on the Moon, 186
Impact of Man on the Vegetation of the Humid Tropics (Unesco South East Asia Science Co-operation Office Symposium on), 24
Impeded Drainage : Phosphate Requirement of Lupins grown as a Pioneer Crop on Culm Measure Soil with (S. Larsen and D. Gunary), 691
Imperfect Material : Graphite, an Ideally, *review* by Dr. G. E. Bacon, 522
Imperial Chemicals Industries, Ltd. : Appointment of Dr. P. W. Brian as associate research manager of the Pharmaceutical Division of the Akers Research Laboratory, and to be in general charge of the Laboratory, 275
  Appointment of Dr. J. Chatt as group manager of the Heavy Organic Chemicals Division of the Akers Research Labotatory, 275 ; *erratum*, 447
  Agricultural History (Film, The Harvest Shall Come), 368
  Arts Graduates and, 969
  A Degree nearer Industry (Kenneth Harris), 969
Imperial College of Science and Technology, London : Appointment of Dr. L. Miles Jackman as reader in organic chemistry, 22
  Appointment of M. J. Way as reader in applied entomology, 22
  Appointment of Dr. Donald Rogers to the University of London readership in chemical crystallography, 188
  Title of reader in mathematics in the University of London conferred on Dr. S. Raimes, 188
  Postgraduate Course on Engineering Aspects of Lubrication, 624
  International Congress on Metallic Corrosion, 713

Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation (Eugene P. Cronkite, Samuel W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Implications of Evolution (Dr. G. A Kerkut), *review* by Dr. G. S. Carter, 89
Importance of Plant Phenolics in Industry (Plant Phenolics Group Meeting on), 625
Inability of Refined Corn Oil to Influence Spontaneous Arteriosclerosis of Old Hens (K. F. Gey and Dr. A Pletscher), 491
Inactivation of Human Menopausal Gonadotropin : Enzymic Release of Sialic Acid and (Dr. René Got and Dr. Roland Bourrillon), 234
Inbred Mice (F_1 C57Bl) : Transfer of Tolerance to Skin Grafts in (Anna Skowron-Cendrzak), 595
Inbreeding Phenomena : New Recurrent Series in (F. A. Marçallo and Prof. N. Freire-Maia, 421
Incidence of Glaucoma : Distribution of certain Poppy–Fumaria Alkaloids and a Possible Link with the (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
Incorporation of [1-^{14}C]-*iso*Pentenyl Pyrophosphate into Polyisoprene (B. L. Archer, G. Ayrey, E. G. Cockbain and G. P. McSweeney), 663
Increase in Low-density Lipoproteins in Blood · Reduced Fibrinolytic Activity of Atherosclerotic Sera caused by an (Dr. Nirmal Sarkar), 929
Increased Dihydrofolate Reductase Activity as a Possible Basis of Drug Resistance in Leukaemia (Dr. D. K. Misra, Stewart R. Humphreys, Prof Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Increases (Cosmic Ray) : Ionospheric Disturbance at the Time of (C. Collins and D. H. Jelly), 128
Increasing the Effectiveness of Western Science (Fondation Universitaire, Brussels), 339
Index (A Bibliographical), of the British Flora (compiled by N. Douglas Simpson), *review* by Dr. G Taylor, 259
Index (Leaf Area), and Crop Growth-Rate : Relationship of Radiation, (W. R. Stern and Prof. C M. Donald), 597
Indexing Systems : Interim Report on the Test Programme of an Investigation into the Comparative Efficiency of (Cyril W. Cleverdon), (Aslib Cranfield Research Project), 359
India: Cotton in (B. L Sethi, S. M. Sikka, R. H. Dastur, P. D. Gadkari, R. Balasubrahmanyan, P. Maheshwari, N S Ranga Swamy and A. B. Joshi), *review* by Prof. S. C. Harland, 86
  Health Programme in, 622
  Immunization in, 197
  Observations of Fall-out in, during the Period of Cessation of Nuclear Tests (K G. Vohra and V. S Bhatnagar), 286
  Secondary Education in, 451
India, Botanical Survey of : Establishment of a Botanical Garden at the Central Botanical Laboratory, Allahabad, 358
Indian Botanical Society : Birbal Sahni Medal awarded to Dr. E. K. Janaki Ammal, 361
Indian Days on the Western Prairies (Marius Barbeau), 187
Indian Institute of Science : Golden Jubilee Volume, 273
Indian Languages : Relative Efficiencies of (Dr. B. S. Ramakrishna, K. K. Nair, V. N Chiplunkar, B. S. Atal, V. Ramachandran and R. Subramanian), 614
Indian Monographs on Algae, *review* by Dr. J. W. G. Lund, 343
Indian Society of Genetics and Plant Breeding : Election of Officers, 796
Indian Zebu Cattle : Rate of Evaporation from Different Regions of the Skin of (Dr. D. Roy Chowdhury and Dr. D P. Sadhu), 491
Indication of Level of Awareness : Changes in Mode of Respiration as an (Dr. L. Goldie and J. M Green), 581
Indium : Influence of Molecular Structure on the Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and, with Aliphatic Ethers (Dr. R R. Brooks and P. J. Lloyd), 375
Individual : Psychology and the (G. W H. Leytham), 435
Induced Protein Synthesis (Prof. Sam M. Beiser and Prof. Stuart W. Tanenbaum), 659
Induced Rooting : Use of, in Cytological Studies (D. N. Singh), 420
Induction of Melanotic Tumours in the White ('Partial Albino') Syrian Hamster (Walter C. Quevedo, jun., John M. Cairns, Jean A. Smith, Fred G. Bock and Robert J. Burns), 936
Induction-heated Vacuum Furnace : Elimination of a Glow Discharge in an (John E. Fagel), 212
Industrial Abstract (Federal Ministry of Commerce and Industry, Lagos), No. 47, 361
Industrial Education (Commercial and), British Association for : Policy in Perspective—Report of the Annual Conference (Cambridge, 1960), 863
Industrial Environment : The Changing (T. H. Hawkins), 283
Industrial Fatty Acids and their Applications (edited by E. Scott Pattison), *review* by Dr. D. T Lewis, 346
Industrial Mycology : An Introduction to (George Smith), fifth edition, *review* by Prof. John Colhoun, 347
Industrial Science Achievement Award of the American Association for the Advancement of Science awarded to the Bell Telephone Laboratories, Inc , 188
Industrial Vacuum Plant : User Experience of Large-Scale (Institution of Mechanical Engineers Symposium on), 275
l'Industrie et l'Agriculture, Institut pour l'Encouragement de la Recherche Scientifique dans : Rapport Annuel (1959), 113
Industries (Engineering and Chemical), in Britain : Technicians in, 973
Industries (Nationalized) : Report from the Select Committee on, together with the Proceedings of the Committee, Minutes of Evidence and Appendices—British Railways, 607
Industry . A Degree nearer (Kenneth Harris), 969
  Education and (Sir Hugh Beaver), 185
  Health in, 886
  The Importance of Plant Phenolics in (Plant Phenolics Group Meeting on), 625
  Priorities for Research in the Social Sciences in (A B. Cherns), 541
  Science and—the Problem of Communication (Department of Scientific and Industrial Research National Conference on), 275
  Temperature—its Measurement and Control in Science and (American Institute of Physics, the Instrument Society of America and the United States Bureau of Standards Symposium on), 22
Industry (American) : Scientific and Technical Personnel in (United States National Science Foundation), 794
Industry (Commerce and), Federal Ministry of (Lagos) : *Industrial Abstract*, No. 47, 361
Industry (Electrical Engineering) · The Training of Graduates—a Report of the Joint Committee on Practical Training in the, revised re-issue (Institution of Electrical Engineers), 542
Industry (Glass) : Achievement in the, *review* by Prof. R. W. Douglas, 342
  Pilkington Brothers and the (T. C. Barker), *review* by Prof. R. W. Douglas, 342
Infection (*Toxoplasma gondii*) : Ovine Foetal Resorption caused by (I. D. Smith), 939
Infectious Viral Nucleic Acids : Blood Nucleases and (Roger M. Herriott, John H. Connolly and Shanta Gupta), 817
Influence of Calcium on the Potassium-Contracture of 'Slow' and 'Fast' Skeletal Muscle Fibres of the Frog (P. Pauschinger and Prof. K. Brecht), 583
Influence of the Charge on a Serum Protein Molecule and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes (B. J. Northover), 574
Influence of Chemical Isomerism on the Szilard–Chalmers Processes in Solids (T. Costea and I. Dema), 478
Influence of an Electric Field upon the Heat Transfer from a Hot Wire to an Insulating Liquid (Dr. P. Keith Watson), 563
Influence of the Host Rhizosphere on the Morphogenesis of *Striga* Seedlings (Growth and Morphogenesis of *Striga* Seedlings), (Colin N Williams), 380
Influence of Hypothermia on the Survival of Mice after Large Doses of X-Radiation (L. Mráz and Dr. M. Praslička), 677
Influence of Molecular Structure on the Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and Indium with Aliphatic Esters (Dr R. R. Brooks and P. J. Lloyd), 375
Influence of Sodium on the Transport of Magnesium across the Intestinal Wall of the Rat *in vitro* (D. B Ross), 840
Influenza Virus . Inhibition of the Multiplication of, by Aniline Derivatives of the Francis Inhibitor (Dr I. Hollos), 553
Influenza Virus Strains (Avid A2) : Presence in Horse Serum of Two Inhibitors of (Ol'ga Krizanová-Laučíková, J Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Information on Translations, 623
Infra-Red (Far) : A Spectrometer for the (R. H. Wright and P. N. Daykin), 212
Infra-Red Frequency Shifts (Solvent-induced) : Dielectric and Dipolar Interaction Theories of (Dr H. E. Hallam and T. C. Ray), 915
Infra-Red Spectrum . Some Solar Lines in the, observed from a High-Flying Aircraft (N. D. P Hughes and Dr. T. S. Moss), 908
Infusion with Ammonia labelled with Nitrogen-15 : Glutamic Acid Metabolism in Brain and Liver during (G. Takagaki, S. Berl, D. D. Clarke, D. P. Purpura and Prof. H Waelsch), 326
Ingle, W. R. : *Squilla labadiensis*, 360
Inglis, Prof J. S S · Elected a Fellow of the Royal Society of Edinburgh, 876
Ingram, Prof V. M : Gene Evolution and the Haemoglobins, 704
Ingram, Prof V. M. (Baglioni, Dr. C , and) . Four Adult Haemoglobin Types in One Person, 465
Ingram, Prof. V M , and others . Genetic Control of Foetal and Adult Human Haemoglobin, 467
Inhaled Radioactive Water Vapour Absorption of (J. B West and C T. Dollery), 588
Inheritable Property (A New), of Human Sera—the InV Factor (Dr. C. Ropartz, Dr. J. Lenoir and Dr. L. Rivat), 586
Inheritance (Cytoplasmic) : Mechanics of (Dr G. H. Beale), 713
Inherited Haemoglobin Ionographic Properties in Cotton Rats (Prof Charles W. Foreman), 585
Inhibit the Phagocytosis of Bacteria by Leucocytes: Influence of the Charge on a Serum Protein Molecule and its Ability to Stimulate or (B. J. Northover), 574
Inhibiting Effect of 2 4-Dinitrophenol on Calciferol-induced Metastatic Calcification in the Rat (R A. Grant, M. Hathorn and Dr. Theodore Gillman), 317
Inhibiting Effect of Nicotinamide and Diphosphopyridine Nucleotide on the Methylcholanthrene Sarcoma in Rats (M. Matsuyama, A. Maekawa and T. Nagayo), 673
Inhibition of Catechol O-Methyltransferase : Augmentation of the Pressor Response to Guanethedine by (Dr D. W. Wylie), 490
Inhibition of Cellular Respiration by Co-Carcinogenic Fractions of Croton Oil (Dr. A. C. Allison and J W. Lightbown), 892
Inhibition of Experimental Cirrhosis by Carbon Tetrachloride following Treatment with Aminoacetonitrile (Dr. L. Fiume and Prof. G. Favilli), 71
Inhibition of Multiplication of Bacteriophage by Actinomycin (Atsuo Nakata, Mutsuo Sekiguchi and Prof. Junichi Kawamata), 246
Inhibition of the Multiplication of Influenza Virus by Aniline Derivatives of the Francis Inhibitor (Dr. I. Hollós), 553
Inhibition (Haemagglutination-) : Haemagglutination and, with African Horse-Sickness Virus (Khorshed M. Pavri), 249
Inhibitor (Francis) : Inhibition of the Multiplication of Influenza Virus by Aniline Derivatives of the (Dr. I Hollós), 553
Inhibitor (Monoamine Oxidase) : Local Treatment of Experimental Burns with a (W. G. Spector and D A. Willoughby), 489
Inhibitors (Metabolic): Effect of some, on Antibody Formation (Dr. J. Sterzl), 1022
Inhibitors (Two), of Avid A2 Influenza Virus Strains : Presence in Horse Serum of (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F Sokol), 513
Inhibitory Postsynaptic Membrane of Motoneurones : Anionic Permeability of the (Dr. T. Araki, M. Ito and O. Oscarsson), 65
Initial Effects (Primary and), of Ionizing Radiations (Academy of Sciences of the U.S.S.R. International Symposium on), 110
Initial Stage of Cholesterol- or Stilboestrol-induced Atherosclerosis : Fatty Acid Pattern in the Aorta Lipids of Cockerels in the (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Initiation of Fatigue Cracks in Beta-Brass (B. J. S. Wilkins and M. G. Bader), 301
Initiation (Thermal), of Explosives : Memory Effect in the (Dr. Werner R. Hess and Dr. Rufus C. Ling), 288
Injury by Soaking of *Populus alba* Seeds (Dr. L. Pólya), 159

Injury (Low-Temperature), in Lovegrass (*Eragrostis curvula* (Schrad) Nees), (J. H. Leigh), 415
Ineson, Dr. J.: Awarded the Murchison Fund for 1961 of the Geological Society of London, 100
Inner Ear: Carbonic Anhydrase and the (Dr. S. D. Erulkar and Prof. T. H. Maren), 459
Inorganic Chemistry: Advances in, *review* by Dr. D. W. A. Sharp, 521
Inorganic Chemistry and Radiochemistry: Advances in (edited by H. J. Emeléus and A. G. Sharpe), Vol. 2, *review* by Dr. D. W. A. Sharp, 521
Inorganic Solids: Radiation Effects in (Faraday Society General Discussion on), 447
Insect: Ribonucleic Acids in the Moult Cycle of an (A. Krishnakumaran), 243
Insect Migration: A Turning Point in the Study of (Dr. J S. Kennedy), 785
Insecticide Dimethoate in Methyl 'Cellosolve': Toxic Hazard from Formulating the (Prof. John E. Casida and D. M. Sanderson), 507
Inspection Tables · Sampling (Harold F. Dodge and Harry G. Romig), second edition, *review* by Prof M. G Kendall, 259
Installations (Nuclear) · Health Physics in—Symposium organized by the Danish Atomic Energy Commission and the Organization for European Economic Co-operation, 1959, *review* by W J. Whitehouse, 347
Institut National d'Hygiene, Paris: Role of Alcohol in the Aetiology of Cirrhosis of the Liver in France, 804
Institut Royal des Sciences Naturelles de Belgique: Mémoires, Deuxième Série, Fasc 59, Analyse Zoogéographique des Mammifères de l'Iran (Dr. Xavier Misonne), 21
Institutions (Scientific) and Scientists in Latin America, Vol. 4, Part 4, Argentina, N–Z (Unesco Science Co-operation Office, Montevideo), 361
Institutions (Technical), Association of Teachers in, and others: Discussion Conference on Science and Education, 534
Instrument Exhibition (Symposium and), on Automatic and Semi-Automatic Methods in Analysis and Control (Medway College of Technology), 447
Instrument Society of America, and others: Symposium on Temperature—its Measurement and Control in Science and Industry, 22
Instruments and Apparatus (Scientific): Forty-fifth Annual Exhibition of (Institute of Physics and the Physical Society), 535
Insulating Liquid: Influence of an Electric Field upon the Heat Transfer from a Hot Wire to an (Dr. P. Keith Watson), 563
Intellectual Tradition (Western), from Leonardo to Hegel (Dr. J. Bronowski and Dr. Bruce Mazlish), *review* by Dr. D. Thomson, 520
Intensity of Photosynthesis and Appearance of *Piricularia oryzae* Cav. on the Rice Plant: Relations of (R. Vámos, F. Zsoldos and I. Petrasovits), 407
Inter-Society Color Council of America, and others · Conference to celebrate James Clerk Maxwell's demonstration of trichromatic colour reproduction at the Royal Institution in London, 361
Interaction Theories · Dielectric and Dipolar, of Solvent-induced Infra-Red Frequency Shifts (Dr H. E. Hallam and T. C. Ray), 915
Interactions: Host Tumour (Henry Ford Hospital, Detroit, International Symposium on), 534
Interactions of NO_2–N_2O_4 and Niobium Dioxide (NbO_2), (Dr. Frederick Vratny), 479
Interference in the Diphenylamine Procedure for estimating Deoxyribonucleic Acid (Dr. T. F. Slater), 834
Interference Microscopy: Application of, to Problems of Research (Royal Microscopical Society Symposium on), 714
Intermetallic Compounds of Thorium of the Type Th_7X_3: Some New (J. R. Thomson), 217
International Agricultural Aviation Conference: Report of the First (Cranfield, 1959), *review* by R. J. Courshee, 611
International Astronomical Union: Transactions of the, Vol. 10, Tenth General Assembly, Moscow, 1958 (edited by D. H. Sadler), *review* by D. McNally, 175
International Atomic Energy Agency: *Nuclear Fusion* (*Journal of Plasma Physics and Thermonuclear Fusion*), Vol. 1, No. 1, 712
  Research on the Effects of Radioactivity in the Sea, 877
  Appointment of Prof. Dragoslav Popovic as director of the Safeguards Division, 970
International Conference on the Biochemistry of Human Tumours (Biochemistry Committee of the Cancer Chemotherapy National Service Center, National Cancer Institute and the United States Public Health Service), 627
International Conference on Fluid Sealing (British Hydromechanics Research Association), 970
International Conference on the Peaceful Uses of Atomic Energy: Proceedings of the Second United Nations (Geneva, 1958), Vol. 3, Processing of Raw Materials, *review* by Dr. A. R. Burkin, 87
International Conference on Powder Metallurgy (Metal Powder Industries Federation and the Metallurgical Society of the American Institute of Mining and Metallurgical Engineers), 365
International Conference on Starch (West German Starch Research Station, Detmold), 625
International Conference on the Structure and Properties of Thin Films: Proceedings of an, New York, 1959 (edited by A. Neugebauer, J. B. Newkirk and D. A. Vermilyea), *review* by Dr. J. Ring, 613
International Congress of Biochemistry: Proceedings of the Fourth (Vienna, 1958), Vols. 1-15, *review* by Prof D. C. Harrison, 430
International Congress on Ergonomics: First (International Ergonomics Association), 104
International Congress on Metallic Corrosion (Imperial College of Science and Technology, London), 713
International Control of Investigations of Rare Meteorites, 967
International Council for the Exploration of the Sea: Symposium on Zooplankton Production, 360
International Ergonomics Association: First International Congress on Ergonomics, 104
International Geophysical Calendar for 1961 (Prof. A. H. Shapley), 9
International Geophysical Year: Enhancement of Ionization in the *E*-Layer due to Solar Flares during the (G. H. Bazzard), 47
International Laws on Nuclear Incidents, 444
International Measurement Conference (IMEKO), 1961, to be held in Budapest, 104
International Natural History Research, 623
International School of Physics: Enrico Fermi (Società Italiana di Fisica), 880
International Scientific and Technical Conferences: Forthcoming (Department of Scientific and Industrial Research, List No. 28), 104
International Society for Tropical Ecology: *Bulletin* of the, 285
International Space Science Symposium: Proceedings of the First (Nice, 1960)—Space Research (edited by Dr. Hilde Kallmann Bijl), *review* by Dr. R. L. F. Boyd, 346
International Symposium on Criticality Control in Chemical and Metallurgical Plant (European Nuclear Energy Agency of the Organization for European Economic Co-operation in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H.), 797
International Symposium on Gas Chromatography (Gas Chromatography Discussion Group and the Society for Analytical Chemistry), 26
International Symposium on Host Tumour Interactions (Henry Ford Hospital, Detroit), 534
International Symposium on Primary and Initial Effects of Ionizing Radiations (Academy of Sciences of the U.S.S.R.), 110
International Understanding, British Society for: Annual Report for 1960, 103
International Union of Pure and Applied Chemistry · *Journal* of the, 20
  Symposium of Microchemical Techniques (organized by the Metropolitan Microchemical Society), 188
International Union of Pure and Applied Chemistry, and others: Fifth European Congress on Molecular Spectroscopy, 797
International Youth Federation for the Study and Conservation of Nature: Report for 1959, 623
Interplanetary Magnetic Field: Apparent Steady Component of the (Prof. V. A. Bailey), 44
Interpretation of Cosmology (B. Balázs and Gy. Paál), 992
Interpretation of Data on Cell Proliferation: Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the (Eugene P. Cronkite, Samuel W Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Interpretation (Normal Mode), of the Sound Propagation in Whispering Galleries (Yasuo Satô), 475
Interstellar Hydrogen in the Vicinity of the Sun: Streaming of (Dr. R. X. McGee, Dr. J. D. Murray and Dr. J. L. Pawsey), 957
Interstellar Millicycle Gravitational Radiation: Upper Limit for (Dr. Robert L. Forward, David Zipoy, Prof. J. Weber, Stewart Smith and Prof Hugo Benioff), 473
Intestinal Absorption of Vitamin B^{12} and of Vitamin B^{12}-Peptide Complex in Normal Subjects and in Patients with Partial Gastrectomy (Dr. G. Milhaud), 33
Intestinal Wall of the Rat *in vitro* · Influence of Sodium on the Transport of Magnesium across the (D. B. Ross), 840
Intestinal and Pancreatic Enzymes in Rats: Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by (S. K. Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Intoxication (Hexachlorobenzene): Acquired Porphyria in Man and Rat due to (Robert K. Ockner and Prof. Rudi Schmid), 499
Introducing Meteorites, *review* by Dr. H. J. Axon, 432
Introduction to Differential Geometry (Dr. T. J. Willmore), *review*, 613
Introduction to Industrial Mycology (George Smith), fifth edition, *review* by Prof. John Colhoun, 347
Introduction to Plant Anatomy, *review* by Dr. C. R. Metcalfe, 864
Inulin (Tritium-labelled), in the Kidney: Autoradiographical Detection of (J. Gayer, E. H. Graul and H. Hundeshagen), 500
Invernaver, Sutherland: New Nature Reserve at (Nature Conservancy), 360
Investigation into the Comparative Efficiency of Indexing Systems: Interim Report of the Test Programme of an (Cyril W. Cleverdon), (Aslib Cranfield Research Project), 359
Investigations of Rare Meteorites: International Control of, 967
Investment in Education—the Report of the Commission on Post-School Certificate and Higher Education in Nigeria, 169
  Nigeria's, 85
Invisible Lunatic, *review* by Dr. A. D. Booth, 784
Involutions and Ice-Wedges in Devon (Ronald S. Waters), 389
Iodide (Ethyl) Solutions: Photolysis of (Michael C. L Gerry and Prof. Gerald B. Porter), 655
Ion (The BH_4^-), in the Lithium Borohydride Lattice (C. J. H. Schutte), 745
Ion (Ferrous) Non-Enzymic Decarboxylation of Methionine by (Mendel Mazelis), 305
Ion Exchange (Permutit Co., Ltd. Film on), 28
Ion Transport (Active), across Large Canine Blood Vessel Walls: Evidence of (Prof. P. N Sawyer and J. Valmont), 470
Ionic Dissociation at the Peptide Linkage: Possibility of (P. F. Browne), 658
Ionic Strength (Low): Properties of Vessel Muscle Proteins extracted with Water or Salt Solutions of (Prof. L. Laszt), 230
Ionic Systems (Metallic and): Composition Requirements for Glass Formation in (Prof. M. H. Cohen and D. Turnbull), 131
Ionization in the *E*-Layer: Enhancement of, due to Solar Flares during the International Geophysical Year (G. H. Bazzard), 47
Ionization Detector Equipment (Standard): Gas Chromatographic Analysis of Permanent Gases using (Dr. R. A. Landowne and Dr. S. R. Lipsky), 571
Ionization Potential: Vibration Frequency and—Halide Molecules (S. S. Mitra), 914
Ionized Elements in Stellar Spectra: Oscillation Broadening of Lines from (Gunnar Eriksen), 651
Ionizing Radiation · Effect of *p*H on the Sensitiveness of Trypsin to (Prof. J. A. V. Butler and A. B Robins), 852
  A New Effect of, on Nucleoprotein (Dr. G. Hems), 849
Ionizing Radiations · Primary and Initial Effects of (Academy of Sciences of the U.S.S.R. International Symposium on), 110
Ionographic Properties (Haemoglobin), in Cotton Rats: Inherited (Prof. Charles W. Foreman), 585
Ionosphere: Skip-Distance Ray-focusing in the (E. Golton), 48
  The Total Electron Content of the, during the Magnetic Disturbance of November 12-13, 1960 (G. N. Taylor), 740
Ionosphere near the Geomagnetic Equator: Lunar Tide in the F_2 Layer of the (R. G. Rastogi), 214
Ionosphere (Middle): A Maximum of Temperature in the (Prof. O. Burkard), 474
Ionospheric *h'*(*f*) Curves · A New Method for the Calculation of *N*(*h*) Profiles from (H. Hojo), 562

Ionospheric Disturbance at the Time of Cosmic Ray Increases (C. Collins and D. H. Jelly), 128
Ionospheric Irregularities (Field-Aligned), and the Scintillation of Satellite Radio Transmissions (D. G. Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Ionospheric Scattering of Satellite Transmissions (J. Mawdsley and I. R. Richards), 906
Ions (Positive) : Emission of Soft Electromagnetic Radiation from Metals by the Impact of High-Energy Protons and (Prof Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
l'Iran : Analyse Zoogéographique des Mammifères de (Dr. Xavier Misonne), 21
Ireland (Great Britain and) : The Deer Stalking Grounds of (compiled by Col. G. Kenneth Whitehead), *review* by R. S. R. Fitter, 431
Iron Porphyrin Prosthetic Group A New Haemoprotein with a Unique, isolated from Human Erythrocytes (Dr. Martin Morrison), 765
Iron Requirement for a Dissimilatory Nitrate Reductase in *Neurospora crassa* (G. C. Walker and Dr. D. J. D. Nicholas), 141
Iron–Ethylenediamine Tetraacetic Acid : Absorption and Breakdown of, by Tomato Plants (Dr. D. G. Hill-Cottingham and C. P. Lloyd-Jones), 312
Iron (Serum), and its Transport Mechanism in the Fowl (Prof. Jose Planas, Sisinio de Castro and Jose Maria Recio), 668
Irradiated Rats · Experimental Allergic Encephalomyelitis (Prof. N. Allegretti and M Matošić), 500
Irradiated Rats (Normal and), injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in (Prof. N. Allegretti and B. Vitale), 673
Irradiation : Protective Effects of Di*iso*propylfluorophosphonate against the Lethal Effects of X-Rays before or after (D. A. Willoughby), 761
β-Irradiation of the Skin · Fibrosarcoma in a Rabbit following (L. A. George, S. Marks and L. K. Bustad), 770
Irradiation (Ultra-violet), of Micro-organisms · Theoretical Considerations in the (Dr. C. W. Hiatt), 678
Irradiation (Whole-body) : Labilization of Deoxyribonucleic Acid in Thymus Nucleoprotein after (Dr. Ulrich Hagen), 361
Irradiation Embrittlement of Molybdenum . Control of (D. N. Sethna, A. A. Johnson, K. J. Proud and S. S. Sheinin), 568
Irregular Fading of Satellite Transmissions (Dr W. C. Bain), 129
Irregularities (Field-Aligned Ionospheric), and the Scintillation of Satellite Radio Transmissions (D. G Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Irregularities (Spelling), and Reading Difficulty in English (Dr. W. R. Lee), 273
Irving, Henry Braid *Obituary* by J L. Nayler, 620
Isaak, G. R. : An Atomic Beam Spectrophotometer, 373
Island (Ellesmere) : A Biennial Copepod from Lake Hazen (Dr. I. A. McLaren), 774
Islands (Canary) : Potato Root Eelworm in the (R. Chamberlain), 773
Islands (Marshall) : A Re-Survey of Typhoon Effects on Jaluit Atoll in the (Dr. David I. Blumenstock, Dr. F. R. Fosberg and Charles G. Johnson), 618
Islands (Philippine) Birds of the (A. L. Rand and D. S. Rabor), 446
Isles of Scilly · Occurrence of a Species of *Halammohydra* on the (Prof. L. A. Harvey and J. B. J. Wells), 944
Isolation of Chromatographically Pure Rutin from Flowers of Elder (Jiří Davídek), 487
Isolation of L-Galactose-6-sulphate from a Seaweed Polysaccharide (J. R. Turvey and Dr. D. A. Rees), 831
Isolation of D-Glycero-D-galacto-heptitol from the Wound Exudate of Avocado Trees (J. K. N. Jones and R. A. Wall), 746
Isolation of Lysozyme-soluble Mucopeptides from the Cell Walls of *Escherichia coli* (Dr. J. Mandelstam), 855
Isolation of Nucleic Acids · Growth of Bacteria labelled with Heavy Isotopes for the (Dr. Julius Marmur and Carl L. Schildkraut), 636
Isolation of *Trypanosoma rhodesiense* from Wild *Glossina palpalis* (H. A. W. Southon and D. H. H. Robertson), 411
Isolation and some Properties of the Phages of *B. cereus* NRRL 569 (Dr. J. Foldes, Katalin Merétey and István Varga), 161
Isolation, Growth and Maintenance of Actinomycetes A Chitin Medium for (Yamuna Lingappa and Prof. John L. Lockwood), 158
*Iso*Leucine: Utilization of the Stereoisomers of, by *Lactobacillus arabinosus* 17-5 (Dr. Ichiro Chibata, Shigeki Yamada and Hiroshi Ito), 144
Isomerism (Chemical) · Influence of, on the Szilard–Chalmers Processes in Solids (T. Costea and I. Dema), 478
Isotopes (Heavy) · Growth of Bacteria labelled with, for the Isolation of Nucleic Acids (Dr. Julius Marmur and Carl L. Schildkraut), 636
Israel : Radioactive Fall-out in, resulting from the Nuclear Tests in the Sahara Desert (Y. Feige, E. Shalmon, J. Vardi, J. R. Gat (Gutmann), and Y. L Tokatly), 90

Lappert, Dr M F. : Appointed senior lecturer in chemistry at the University of Manchester, 797
Large Canine Blood Vessel Walls : Evidence of Active Ion Transport across (Prof P. N. Sawyer and I. Valmont), 470
Large Doses of X-Radiation : Influence of Hypothermia on the Survival of Mice after (L. Mráz and Dr. M. Praslička), 677
Large Red-Shift (R Minkowski), 713 ; (W A. Baum), 713
Large-Scale Industrial Vacuum Plant : User Experience of (Institution of Mechanical Engineers Symposium on), 275
Large-Scale Magnetic Field : Galactic Motions in a (Donat G. Wentzel), 907
Larsen, S , and Court, M N. : Soil Phosphate Solubility, 164
Larsen, S., and Gunary, D : Phosphate Requirement of Lupins grown as a Pioneer Crop on Culm Measure Soil with Impeded Drainage, 691
Larvae (*Simulium*) : Size of Particles ingested by (T. R. Williams, R. Connolly, H. B N Hynes and Prof W. E. Kershaw), 78
Larvae (*Xenopus*): Effect of Limb Ablation on Neurones in (Dr. A. F. W. Hughes and Dr. P R Lewis), 333
Lash, Dr J. W (Whitehouse, Dr. M. W , and): Effect of Cortisone and related Compounds on the Biogenesis of Cartilage, 37
Lasker, Sigmund E., and others : Identification of a Compound found during Separation of Purines in Human Urine, 671
Laskowitz, Isidor B. : Awarded the D. B. Steinman Award of 500 dollars of the New York Academy of Sciences, 19
László, M. B., and others : Experimental Data concerning the Connexion between Thyroid Function and Mucopolysaccharide (Hexosamine)-Level, 670
  Mucopolysaccharides and Thyroid Function, 670
Laszt, Prof. L : Properties of Vessel Muscle Proteins extracted with Water or Salt Solutions of Low Ionic Strength, 230
Later Stages of Protein Synthesis and the Role of Phospholipids in the Process (Dr. G. D. Hunter and G N. Godson), 140
Latex from *Hevea brasiliensis* : Thread-like Reticulum in, and its relation to Latex Particles (W. A Southorn), 1000
Latex Particles : Thread-like Reticulum in Latex from *Hevea brasiliensis* and its relation to (W. A. Southern), 1000
Latin America : Scientific Institutions and Scientists in, Vol. 4, Part 4, Argentina, N–Z (Unesco Science Co-operation Office, Montevideo), 361
Latitude Variation of Occurrence of Whistlers : Spread-*F* and the (D. G. Singleton), 215
Lattice (Lithium Borohydride) : The BH_4^- Ion in the (C. J. H Schutte), 745
Lattice Defects : Electrical, Optical and Mechanical Properties of (Summer School at the University of Ghent on the), (sponsored by NATO), 104
Lattices (Crystal) : Electron Microscopy of—an Anomalous Effect (Lewis T. Chadderton), 564
  Out-of-Focus Electron Microscope Images of Edges of (J. M. Cowley and A. F. Moodie), 477
Law (Bragg's) Optical Demonstration of (Prof. W. G Burgers), 741
Lawrence, R. F. : Biogeography of South-East Africa, 802
Laws (International), on Nuclear Incidents, 444
Lawson, D. I. : New Buildings at the Fire Research Station, 105
Laying Hen : Partition of Calcium and Phosphorus Excretion in the (S Hurwitz and Prof. P. Griminger), 759
Le Fèvre, Prof. R : Failure of first-year Students in Chemistry Examinations in 1960, 444
LePage, R. N , and others : Pyridine Nucleotide Metabolism in Heliotrine Poisoning, 593
Lead in Urine : Use of the Mercury Drop Electrode Method for Direct Evaluation of Minute Amounts of (Prof Wiktor Kemula and Zenon Kublik), 57
Lead and Aluminium : Effect of Air Pressure on the Fatigue of (Dr. K. U. Snowden), 53
Lead (Tetraethyl), in Petrol : A Rapid Method for the Determination of Tetramethyl Lead and (Dr. J. Van Rysselberge and R. Leysen), 478
Lead (Tetramethyl), and Tetraethyl Lead in Petrol A Rapid Method for the Determination of (Dr. J. Van Rysselberge and R. Leysen), 478
Leaf Area Index and Crop Growth-Rate Relationship of Radiation, (W. R. Stern and Prof. C M. Donald), 597
Leaf Copper Protein (A New), 'Plastocyanin', a Natural Hill Oxidant (Dr. Sakae Katoh and Dr. Atusi Takamiya), 665
Leaf Growth Promotion of, by Short Days in the Short-Day Plant *Chenopodium amaranticolor* (Roderick G. Thomas), 771
Leaf Movements (Endodiurnal), in *Phaseolus* : Temperature Coefficient of (Franz-Josef Leinweber), 1028
Leaf (Green-) Growth-stimulating Factor (A New), Phyllococosine, from Coconut Milk (Dr Susumu Kuraishi and Dr F. Shigeo Okumura), 148
Leaf and Stem Rusts of Wheat : Effects of Maleic Hydrazide on the Growth of (D. J. Samborski *et al.*), 187
Leakey, Dr. J. S. B. : New Finds at Olduvai Gorge, 649
Leather . Technology of Drying Fibrous Materials with particular reference to (Society of Leather Trades' Chemists Symposium on), 188
Leather Trades' Chemists, Society of : Symposium on the Technology of Drying Fibrous Materials with particular reference to Leather, 188
Leavey, L. E. . Wind Tunnels and Flow Visualization (Wind-Tunnel Tests to determine the Efficiency of a Proposed Extension to a Welding Shed on Suppressing Draughts), 109
Lebedinsky, A. V. : Primary and Initial Effects of Ionizing Radiations (Mathematical Formulation of the Processes leading to Cell Death), 111
Lecithin-splitting Enzyme of *Vibrio* El Tor (Sankar Mitra and G. C. Chatterjee), 837
Lee, Dr D H., and others : Applicability of Hydroxocobalamin as a Long-acting Vitamin B_{12}, 138
Lee, Dr. W. R. . Spelling Irregularities and Reading Difficulty in English (National Foundation for Educational Research in England and Wales, Occasional Publication No. 2), 274
Legge, J W. : Utilization of Water in Australia (Physical-chemical Properties of Water in relation to the Origin and Evolution of Life), 538
Legume Nodules . Root-knot Nematodes and (P. E Robinson), 506
Leguminosae Canavanine in (B A Birdsong, R. Alston and B. L. Turner), 360
Leigh, J H. : Low-Temperature Injury in Lovegrass (*Eragrostis curvula* (Schrad) Nees), 415
Leimanis, E., and Minorsky, N : Dynamics and Nonlinear Mechanics, *review* by Prof A. T Price, 865
Leinweber, Franz-Josef : Temperature Coefficient of Endodiurnal Leaf Movements in *Phaseolus*, 1028
Lenel, F V., and Ansell, G S : Powder Metallurgy (Yield Stress of Dispersed Particles), 367
Lenhoff, Howard M., and Bovaird, J. Action of Glutamic Acid and Glutathione Analogues on the *Hydra* Glutathione-Receptor, 486
Lenoir, Dr. J , and others A New Inheritable Property of Human Sera—the InV Factor, 586
Leonardo to Hegel : Western Intellectual Tradition from (Dr. J. Bronowski and Dr Bruce Mazlish), *review* by Dr D. Thomson, 520
Leopoldina German Academy of Sciences . Election of new Members, 273
Leptospira pomona : Examination of, by Gel Diffusion (P. G. Pande, P C. Sekariah and R. R. Shukla), 511
Lerner, Prof. Aaron B., and McGuire, Dr. Joseph S : Effect of Alpha- and Beta-Melanocyte Stimulating Hormones on the Skin Colour of Man, 176
Lesions (Pulmonary) : Neural Tissue and, in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant (Prof. M. Allegretti and B. Vitale), 673
Lesko, Matthew M , and others : Five Less-Common *Salmonella* Serotypes from Congo Reptiles, 240
Leslie, Dr. Ian : Biochemistry of Heredity—a General Hypothesis, 260
Less-Common (Five), *Salmonella* Serotypes from Congo Reptiles (Prof. MacDonald Fulton, Philomena Szafran and Matthew M Lesko), 240
Lesser, E., and others : Muscarinic Receptors, 671
Lethal Effects of X-Rays : Protective Effects of Diisopropylfluorophosphonate against the, before or after Irradiation (D. A. Willoughby), 761
Lethal Mutations in Brazilian Human Populations (Prof. N. Freire-Maia, A. Freire-Maia and A. Quelce-Salgado), 80
Letter from Erasmus Darwin to Jonas Dryander (Dr. John Ramsbottom), 424
*iso*Leucine : Utilization of the Stereoisomers of, by *Lactobacillus arabinosus* 17-5 (Dr Ichiro Chibata, Shigeki Yamada and Hiroshi Ito), 144
L-Leucine : Degradative Pathway of, in *Proteus vulgaris* (Shoji Sasaki), 400
Leucocytes : Influence of the Charge on a Serum Protein Molecule and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by (B. J. Northover), 574
Leuconostoc citrovorum : Biosynthesis of Acetoin by (M. Busse and Prof. O. Kandler), 774

Leukaemia—Research and Clinical Practice (Dr. F. G. J. Hayhoe), *review* by Dr. M. H. Salaman, 3
  Increased Dihydrofolate Reductase Activity as a Possible Basis of Drug *Resistance in* (Dr. D. K. Misra, Stewart R. Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Leukaemia *L* 1210 (Mouse Lymphocytic) : Effects of Nitrogen Mustard on the *Histochemistry of (Dr. George J. Furman, Prof. G. Adolph* Ackerman and Dr. Carl Cohen), 591
Leukaemic (Anti-) Effectiveness in Mice : Toxicity and, of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-Tetrahydropteroylglutamic Acid (Tetrahydroamethopterin), (Dr. J. A. R. Mead, J. M. Venditti, A. W. Schrecker, Dr. A Goldin and R. L. Kisliuk), 937
Level of Awareness : Changes in Mode of Respiration as an Indication of (Dr. L. Goldie and J. M. Green), 581
Levels of Serotonin during Convulsion and the Effect of Reserpine (Prof. E M Gal and P. A. Drewes), 234
Lever, Dr A. B P., and others · Pyrazine–Metal Halide Complexes—New Types of Metal–Ligand Polymers, 58
Lever, Dr. J. D. : Appointed to the chair of anatomy in the University College of South Wales and Monmouthshire, Cardiff, 531 ; work of, 531
Levy, S. (Conrad, M. A., and) · Photo-Emission from Metal Surfaces measured with Geiger Counters, 887
Lewis, Dr. D. T. · *Elementary Titrimetric Analysis, review, 7*
  Chemical Analysis of Resin-based Coating Materials, *review*, 175
  Industrial Fatty Acids and their Applications, *review*, 346
Lewis, F. A. (*Ubbelohde, Prof. A. R., and*) : *Graphite and its Crystal* Compounds, *review* by Dr. G. E. Bacon, 522
Lewis, Dr. J : Appointed to the University of London readership in chemistry at University College, 714
Lewis, Dr. J , and others Pyrazine–Mètal Halide Complexes—New Types of Metal–Ligand Polymers, 58
Lewis, Dr N. W : Line-Spread Functions of Photographic Emulsions, 909
Lewis, Dr. P. R. (Hughes, Dr. A. F. W , and) : Effect of Limb Ablation on Neurones in *Xenopus* Larvae, 333
Lewis, Dr. P R. (Shute, Dr. C. C. D , and) Cholinergic Nervous Pathways in the Forebrain, 332
Lewontin, Dr. Richard C , and others : Quantitative Zoology, revised edition, *review* by Prof. O. W. Richards, 256
Leydig's Cells (Foetal) : Steroid-3β-ol-Dehydrogenase Activity in (Dr. Mikko Niemi and Dr M. Ikonen), 592
Leysen, R. (Van Rysselberge, Dr. J , and) A Rapid Method for the Determination of Tetramethyl Lead and Tetraethyl Lead in Petrol, 478
Leytham, G. W. H. : *Psychology and the Individual*, 435
Li, Prof. Choh Hao, and others Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and Its Melanocyte-stimulating and *Corticotropin-releasing Activity*, 143
Liability (Third Party), in the Field of Nuclear Energy : Text of the Convention on (Organization for European Economic Co-operation, European Nuclear Energy Agency), 444
Library (National Lending), for Science and Technology : Expenditure on the, 622
Library (National Reference), for Science and Technology . Adjournment Debate in the House of Commons on the, 968
Library Association : *British Technology Index*, 969
Lichen Flora of the United States (Bruce Fink), second printing, *review* by Dr. R. W G. Dennis, 7
Liébecq, Prof. Claude, and others : Enzymatic Dephosphorylation of Adenosine Tetraphosphate, 661
Lieberman, Dr M., and Craft, Dr. C C. · Ethylene Production by Cytoplasmic Particles *from* Apple and Tomato Fruits in the Presence of Thiomalic and Thioglycolic Acid, 243
Life : An Education for, 863
  The Evolution of— its Origin, History and Future (edited by Prof. Sol Tax), (Evolution after Darwin, Vol. I), *review* by Dr. P. G. Fothergill, 340
  Shortening of, and Causes of Death in Mice exposed to a Single Whole-Body Dose of Radiation (Dr. Patricia J. Lindop and Prof J. Rotblat), 645
Life-History and Cyto-genetics of the Genus *Rubus* (Dr. Gordon Haskell), 713
Life's Long Journey (Dr. Kenneth Walker), *review* by T. H. Hawkins, 7
Life (Wild) : Toxic Chemicals and, 878
Life (Wild), in an African Territory (Dr. F. Fraser Darling), *review* by Prof. W. H. Pearsall, 783
'Ligand Exchange', a Novel Separation Technique (Dr. F. Helfferich), 1001
Ligand (Metal–) Polymers : Pyrazine–Metal Halide Complexes—New Types of (Dr A. B. P. Lever, Dr. J. Lewis and Prof. R. S. Nyholm), 58
Light : Deflexion of, in the Gravitational Field of the Sun (Dr. N. S Japolsky), 651
Light, Gibberellic Acid and Kinetin : Effect of, on Growth and Morphogenesis of *Striga* Seedlings (Growth and Morphogenesis of *Striga Seedlings*), *(Colin N. Williams)*, 378
Light and Optical Sensitization by Acridine-Orange : Effects of, on Living Bull Spermatozoa (C. van Duijn, jun.), 76
Light and Tritium-labelled Water : *Differential Sublimation Rates* of (Dr. R Moore and Dr E. R Buskirk), 149
Lightbown, J W. (Allison, Dr. A. C., and) . Inhibition of Cellular Respiration by Co-Carcinogenic Fractions of Croton *Oil*, 892
Lighting (Restricted) : Response of Japanese Quail to (Prof. Hans Abplanalp), 942
Limb Ablation : Effect of, on Neurones in *Xenopus* Larvae (Dr. A. F. W. Hughes and Dr. P. R. Lewis), 333
Lime Oil : Tumour-Promotion by, in the Mouse Forestomach (Winifred E. H. Peirce), 497
Limit (Upper), for Interstellar Millicycle Gravitational Radiation (Dr. Robert L. Forward, David Zipoy, Prof. J. Weber, Stewart Smith and Prof Hugo Benioff), 473
Lindegren, Dr Carl C. : A Hypothesis concerning the Mechanism of Gene Action, 959
Lindop, Dr. Patricia J , and Rotblat, Prof. J. . Shortening of Life and Causes of Death in Mice exposed to a Single Whole-Body Dose of Radiation, 645
Line-Spread Functions of Photographic Emulsions (Dr N. W. Lewis), 909
Linearity (Non-) : Location of the, in Horizontal Cell Response to Retinal Illumination (Dr. Richard Fatehchand, Dr. Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Lines from Ionized Elements in Stellar Spectra : Oscillation Broadening of (Gunnar Eriksen), 651
Ling, Dr. Rufus C. (Hess, Dr. Werner R , and) : Memory Effect in the Thermal Initiation of Explosives, 288
Lingappa, Yamuna, and Lockwood, Prof. John L. : A Chitin Medium for Isolation, Growth and Maintenance of Actinomycetes, 158
Link (Possible), with the Incidence of Glaucoma · Distribution of certain Poppy–Fumaria Alkaloids and a (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
Linkage in *Coffea arabica (Dr. A Carvalho)*, 685
Linkage between Deficiency of Glucose-6-phosphate Dehydrogenase and Colour-blindness (A Adam), 686
Linkage (Peptide) · Possibility of Ionic Dissociation at the (P. F. Browne), 658
Lipid Constituent (An Unidentified Ubichromenol-like), of Bakers' Yeast (E. E. Edwin, J Green, A. T. Diplock and J. Bunyan), 750
Lipids (Aorta), of Cockerels in the Initial Stage of Cholesterol- or Stilboestrol-induced Atherosclerosis : Fatty Acid Pattern in the (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Lipofuscin Pigmentation of Sheep Livers in Australia (Dr. Hans Winter), 674
Lipoic Acid : Morphogenetic Effects of, on Amphibian Embryos (Prof. J. Brachet), 156
Lipolytic Activity of some Anaerobic Bacteria (C. Gonzalez and G. Sierra), 601
Lipoprotein Composition of the Film lining the Lung (R E. Pattle and L. C. Thomas), 844
Lipoprotein Staining Method *for* Zone Electrophoresis (Dr. J. Kohn), 312
Lipoproteins (Low-density), in Blood : Reduced Fibrinolytic Activity of Atherosclerotic Sera caused by an Increase in (Dr. Nirmal Sarkar), 929
Lipsky, Dr. S. R. (Landowne, Dr. R. A., and) : Gas Chromatographic Analysis of Permanent Gases using Standard Ionization Detector Equipment, 571
Liquid (Gas–) Chromatograph : Rapid Identification of High Polymers using a Simple Pyrolysis Unit with a (C. E. Roland Jones and A. F. Moyles), 222
Liquid (Insulating) : Influence of an Electric Field upon the Heat Transfer from a Hot Wire to an (Dr. P. Keith Watson), 563
Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and Indium with Aliphatic Ethers · Influence of Molecular Structure on the (Dr. R R. Brooks and P. J. Lloyd), 375
Liquid Phase : Gas Chromatographic Separation of Low-boiling Hydrocarbons using Active Alumina as Support for the (Dr. I. Halász and E. E. Wegner), 570
Lister, Dr. H. : Elected a Fellow of the Royal Society of Edinburgh, 876
Lister, and others : Microbiology—Historical Contributions from 1776 to 1908 *by (edited by* Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Literary and Philosophical Society (Manchester) : Memoirs and Proceedings, Vol. 102 (1959-60), 273
Literature (Scientific), on Fire · References to (E. M. Shakeshaft and B. F. W. Rogowski), (Fire Offices' Committee, Joint Fire Research Organization, Library Bibliography No. 5, Part 10), 358
Literature (Zoological), for 1957, *review* by Dr. Edward Hindle, 89
Lithium Borohydride Lattice : The BH_4^- Ion in the (C. J. H. Schutte), 745
Liver : Glutamic Acid Metabolism in Brain and, during Infusion with Ammonia labelled with Nitrogen-15 (G. Takagaki, S. Berl, D. D. Clarke, D. P. Purpura and Prof H. Waelsch), 326
Liver in France Role of Alcohol in the Aetiology of Cirrhosis of the (Institut National d'Hygiene, Paris), 804
Liver (Fatty), due to Threonine Deficiency : Prevention of, by Moderate Caloric Restriction (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A E. Harper), 917
Liver (Normal), and the Novikoff Hepatoma Cells of the Rat : Comparative Effects of Liver and Tumour Ribonucleic Acids on the (Dr. S. De Carvalho and Dr. H. J. Rand), 815
Liver Cell Fractions (Rat) : Distribution of Coenzyme Q in (P. Seshadri Sastry, J. Jayaraman and Dr. T. Ramasarma), 577
Liver Proteins in Circulating Blood : Detection of (Dr. A. H. Gordon), 727
Liver and Depot Fatty Acids in Kwashiorkor (Dr. R. W. R. Baker and Dr. I. Macdonald), 406
Liver and Tumour Ribonucleic Acids : Comparative Effects of, on the Normal Liver and the Novikoff Hepatoma Cells of the Rat (Dr S DeCarvalho and Dr. H. J. Rand), 815
Liverpool College of Technology : Election of Honorary Associates, 446
Livers (Sheep), in Australia : Lipofuscin Pigmentation of (Dr. Hans Winter), 674
Living Bull Spermatozoa : Effects of Light and Optical Sensitization by Acridine-Orange on (C. van Duijn, jun.), 76
Living Systems : Self-Regulation in (Symposium at the National Research Council of Canada on), 799
Lloyd, Dr. H K. M : Appointed to the chair of metallurgy in the University College of South Wales and Monmouthshire, Cardiff, 797
Lloyd, L. E. (Crampton, E. W., and) : Fundamentals of Nutrition, *review* by A. M. Copping, 523
Lloyd, Peter : *Appointed director* general of engine research and development in the Ministry of Aviation, 104, 272 ; work of, 272
Lloyd, P. J. (Brooks, Dr. R. R., and) : Influence of Molecular Structure on the *Liquid/Liquid Extraction of the Chloro-Complexes of* Gallium and Indium with Aliphatic Ethers, 375
Lloyd-Jones, C. P. (Hill-Cottingham, Dr. D. G., and) : Absorption and Breakdown of Iron–Ethylenediamine Tetraacetic Acid by Tomato Plants, 312
Lo, Tung-bin, and others : Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and Its Melanocyte-stimulating and Corticotropin-releasing Activity, 143
Local Treatment of Experimental Burns with a Monoamine Oxidase Inhibitor (W. G. Spector and D. A. Willoughby), 489
Localization of Arginase in Rabbit Skin (Dr. Simon Rothberg and Dr. Eugene J. van Scott), 832
Localization of the Cells of Origin of the Ventral Spino-Cerebellar Tract (J. I. Hubbard and O. Oscarsson), 157

Localization of a Protease in the Cell of *Escherichia coli* (Dr. J. Chaloupka) 512

Localization of Water-soluble Compounds · A 'Dry' Mounting Autoradiographic Technique for the (P. J. Fitzgerald, Margery G. Ord and Dr. L. A. Stocken), 55

Localization (Granular), of Posterior Pituitary Hormones : Evidence for the (Shawn Schapiro and Lennart Stjarne), 669

Location of Manganese taken up in Short-term Absorption by Oat Roots, (E. R. Page), 597

Location of the Non-Linearity in Horizontal Cell Response to Retinal Illumination (Dr. Richard Fatehchand, Dr. Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463

Lockspeiser, Sir Ben : People and Machines, 284

Lockwood, Prof. John L. (Lingappa, Yamuna, and) : A Chitin Medium for Isolation, Growth and Maintenance of Actinomycetes, 158

Lockyer, R., and others : Enhancement of Atomic Absorption in the Flame by Organic Solvents, 830

Locomotion : Vertebrate (Zoological Society of London Symposium on), 97

Locusts : Enzymic Glucoside Synthesis in (Dr. J. N. Smith and Helen B. Turbert), 600

  Fate of Aldrin and Dieldrin in (A. J Cohen and Dr. J. N. Smith), 600

Loewenthal, Dr. L. J A. (Hackett, Dr C. J , and) . Differential Diagnosis of Yaws (World Health Organization, Monograph Series No. 45), 187

Logic (Mathematical) : A Précis of (J. M. Bocheński), translated from the French and German editions by Otto Bird, *review* by F. I. G. Rawlins, 88

Logistics : Essentials of, *review* by F. I. G. Rawlins, 88

London, Dr. H. : Elected a Fellow of the Royal Society, 967

London : Safeguarding Health in, 540

London County Council (Public Health Department, Scientific Branch) : Annual Report of the Scientific Adviser for 1959, 540

London School of Economics and Political Science · Retirement of Prof. R. Ogilvie Buchanan as professor of geography, 710

  Appointment of Dr. Emrys Jones as professor of geography, 710

London School of Hygiene and Tropical Medicine : Appointment of Prof. E. T. C. Spooner as Dean, 18

  Appointment of Prof. D. G. Evans to the University of London chair of bacteriology, 18

London Transport : New Laboratory of (A. T. Wilford), 448

Long, Albert G. : Awarded the Makdougall–Brisbane Prize (1958-60) of the Royal Society of Edinburgh, 876

Long Journey : Life's (Dr. Kenneth Walker), *review* by T. H. Hawkins, 7

Long-acting Vitamin B_{12} : Applicability of Hydroxocobalamin as a (Prof. G. B J. Glass, H. R. Skeggs, Dr. D. H. Lee, Dr. E. L. Jones and W. W. Hardy), 138

Longitudinal (The Quasi-) Approximation to the Appleton–Hartree Equation (A D. M. Walker), 742

Lords, House of : Debate on the Post Office Telephone Service, 532

Lorenz, Dr. Philip B. : Tortuosity in Porous Media, 386

Lorenz Parameter : Anomalous Conductivity and, in Dilute Silver–Manganese Alloys at Low Temperatures (Dr. M S R. Chari), 824

Loutit, Dr. J. F., and others : Proposed Revisions of 'Transplantese', 1024

Lovegrass (*Eragrostis curvula* (Schrad) Nees) : Low-Temperature Injury in (J H. Leigh), 415

Lovell, Sir Alfred : Elected to honorary life-membership of the New York Academy of Sciences, 19

Lovell, Sir Bernard : The Condition of Outer Space (Silvanus Thompson Memorial Lecture of the British Institute of Radiology), 625

Lovelock, Dr. J. E. : Gas Chromatography (Design and Operating Parameters of Argon Detectors), 26

  Affinity of Organic Compounds for Free Electrons with Thermal Energy—its Possible Significance in Biology, 729

Lovreček, B., and Kunst, B : Electrolytic Junction with Amplifying Properties, 804

Low-boiling Hydrocarbons : Gas Chromatographic Separation of, using Active Aluminia as Support for the Liquid Phase (Dr. I. Halász and E. E. Wegner), 570

Low-density Lipoproteins in Blood : Reduced Fibrinolytic Activity of Atherosclerotic Sera caused by an Increase in (Dr. Nirmal Sarkar), 929

Low Ionic Strength : Properties of Vessel Muscle Proteins extracted with Water or Salt Solutions of (Prof. L. Laszt), 230

Low-Temperature Injury in Lovegrass (*Eragrostis curvula* (Schrad) Nees), (J. H Leigh), 415

Low Temperatures : Anomalous Conductivity and Lorenz Parameter in Dilute Silver–Manganese Alloys at (Dr. M. S. R. Chari), 824

  Slugs at (Dr. Kenneth Mellanby), 944

Lowe, D. : Elected a Fellow of the Royal Society of Edinburgh, 876

Lower Fungi · Lysine Synthesis and Phylogeny of—some Chytrids versus *Hyphochytrium* (Prof. Henry J. Vogel), 1026

Lower Murray River · Rock Shelters of the (D. J. Mulvaney), 445

Lowry, Oliver : Biochemistry of Human Tumours (Techniques for the Quantitative Assay of Enzymes extracted from Samples the size of Common Histological Sections and by Micro-dissection), 627

Lubińska, Dr. L., and others : Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres—Gradient of Cholinesterase Activity, 122

Lubrication : Engineering Aspects of (Postgraduate Course on, at the Imperial College of Science and Technology, London), 624

Lucas, J. M. S. (Berg, S. S., and) : 6-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride Hydrochloride—a New Drug Active against *Babesia canis*, 64

Lucas, K. C. : The Robertson Creek Spawning Channel, 372

Lumbricus (Earthworm) : Giant Nuclei in the (Dr. R. L. Hancock), 685

Lunar Tide in the F_2 Layer of the Ionosphere near the Geomagnetic Equator (R. G. Rastogi), 214

Lunatic : Invisible, *review* by Dr. A. D. Booth, 784

Lund, Dr. J. W. G. : Indian Monographs on Algae, *review*, 343

Lung : Lipoprotein Composition of the Film lining the (R. E. Pattle and L. C. Thomas), 844

Lung Tissue (Homogenized Homologous), mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with (Prof. N. Allegretti and B. Vitale), 673

Lunik 2 : Impact of, on the Moon, 186

Lunik II (Sowjetischen Mondrakete) : Bericht uber Optische Beobachtungen anlässlich der Landung der (L. Detre), 186

Lupins grown as a Pioneer Crop of Culm Measure Soil with Impeded Drainage : Phosphate Requirement of (S. Larsen and D Gunary), 691

Lush, I. E. : Genetic Polymorphisms in the Egg Albumen Proteins of the Domestic Fowl, 981

Lyell Fund (a moiety of the) for 1961 of the Geological Society of London awarded to Dr. R. G. West and one to Dr. W. T. Dean, 100

Lyell Medal for 1961 of the Geological Society of London awarded to Dr. J. V. Harrison, 100

Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain : Electrophoretic Patterns of (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025

Lymph Nodes immunized against the Host : Survival of Cutaneous Homografts after Transplantation of (Dr. J. Vrubel), 853

Lymphocytic Leukaemia *L* 1210 (Mouse) : Effects of Nitrogen Mustard on the Histochemistry of (Dr. George J. Furman, Prof. G. Adolph Ackerman and Dr. Carl Cohen), 591

Lymphoid Cells (Myeloid and), from a Parental Strain : Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025

Lynch, G. J. E., and others : Field-Aligned Ionospheric Irregularities and the Scintillation of Satellite Radio Transmissions, 30

D-Lysergic Acid Methyl Carbinolamide : Some Pharmacological Actions of (Dr. A. Glasser), 313

Mescaline in the Dog : Identification of 3,4,5-Trimethoxyphenylacetic Acid as the Major Metabilite of (Prof. Elliot Spector), 751
π-Mesons (Negative) : The Possibility of Therapeutic Applications of Beams of (Dr. P H. Fowler and Dr. D. H. Perkins), 524

Metabolic Inhibitors : Effect of some, on Antibody Formation (Dr. J. Sterzl), 1022
Metabolic Product : Experimental Transmission of Sanguinarine in Milk—Detection of a (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 201
Metabolic State of Thiosulphate (Tadeusz W. Szczepkowksl, Prof. Boleslaw Skarsyński and Moroslawa Weber), 1007
Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyactic Acid by Bean Stems—Heterogeneity of the Ethanol-soluble, Ether-insoluble Products (Michael K. Bach and J. Fellig), 763
Metabolism (Basal and Maximal) : Total Cytochrome Oxidase Activity and its relation to (Dr. Ladislav Jansky), 921
Metabolism (Cholesterol)· Function of the Hypophysis–Thyroid System in the Rabbit Foetus with regard to (J. G. Bearn, H. B. Koerselman and T. R. E Pilkington), 318
Metabolism (Glucose), in the Perfused Heart : Fatty Acid and (Dr. Joseph C. Shipp, Dr. Lionel H. Opie and Dr. David Challoner), 1018
Metabolism (Glutamic Acid), in Brain and Liver during Infusion with Ammonia labelled with Nitrogen-15 (G. Takagaki, S. Berl, D. D. Clarke, D. P. Purpura and Prof. H Waelsch), 326
Metabolism (Pyridine Nucleotide), in Heliotrine Poisoning (Prof. G. S. Christie, R. N. LePage and Margot J. Bailie), 593
Metabolism (Vitamin A) : Relationship between High Temperature and, and the Fertility of Ewes (Margaret Ryle), 104
Metabolite (Major), of Mescaline in the Dog : Identification of 3,4,5-Trimethoxyphenylacetic Acid as the (Prof. Elliot Spector), 751
Metabolites (Tryptophan) Excretion of, after Physical Effort (Dr. L. Schmid), 64
Metal (New Structural), with Unique Properties : Fabrication of Beryllium Tubes and Sections—a (Chesterfield Tube Co., Ltd.), 976
Metal (Scandium) : Some Properties of (P. G. Mardon, J. L. Nichols, J. H. Pearce and D. M. Poole), 566
Metal Content : *HD* 101065—a *G*0 Star with High (Dr. Antoni Przybylski), 739
Metal Finishing, Institute of : Annual Conference, 797
Metal Halide (Pyrazine-) Complexes—New Types of Metal–Ligand Polymers (Dr. A. B. P. Lever, Dr. J Lewis and Prof. R. S Nyholm), 58
Metal–Ligand Polymers . Pyrazine–Metal Halide Complexes—New Types of (Dr. A. B. P. Lever, Dr. J. Lewis and Prof. R. S. Nyholm), 58
Metal Powder Industries Federation and the Metallurgical Society of the American Institute of Mining and Metallurgical Engineers International Conference on Powder Metallurgy, 365
Metal Surfaces : Photo-Emission from, measured with Geiger Counters (M. A. Conrad and S. Levy), 887
  Reactions on, at High Temperatures (F. T. Barcroft and J. R. Hayden), 133
Metallic Corrosion : International Congress on (Imperial College of Science and Technology, London), 713
Metallic Orbital : Nature of the (Prof. Linus Pauling), 656
Metallic and Ionic Systems : Composition Requirements for Glass Formation in (Prof. M. H. Cohen and D. Turnbull), 131
Metallurgical Engineers (Mining and), American Institute of (Metallurgical Society of the), (Metal Powder Industries Federation and the) : International Conference on Powder Metallurgy, 365
Metallurgical Plant (Chemical and) : Criticality Control in (European Nuclear Energy Agency of the Organization for European Economic Co-operation in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b H. International Symposium on), 797
Metallurgical Society of the American Institute of Mining and Metallurgical Engineers (Metal Powder Industries Federation and the) : International Conference on Powder Metallurgy, 365
Metallurgy : Powder (Metal Powder Industries Federation and the Metallurgical Society of the American Institute of Mining and Metallurgical Engineers International Conference on), 365
Metallurgy and Fuels (edited by H. M. Finniston and J. P. Howe), Vol. 2, (Progress in Nuclear Energy, Series 5), *review* by Dr. G. A. Geach, 5
Metals : Emission of Soft Electromagnetic Radiation from, by the Impact of High-Energy Protons and Positive Ions (Prof Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Metals, Institute of · Platinum Medal awarded to Major C. J. P. Ball, 533
  Rosenheim Medal awarded to Dr. P. B. Hirsch, 533
  Election of Officers, 533
  Spring Meeting and Annual General Meeting, 713
Metals (Body-centred Cubic Transition) : Theory of the Deformation and Fracture of (A. A Johnson), 826
Metastatic Calcification (Calciferol-induced), in the Rat : Inhibiting Effect of 2.4-Dinitrophenol on (R. A Grant, M Hathorn and Dr. Theodore Gillman), 317
Metcalfe, Dr. C. R. : Introduction to Plant Anatomy, *review*, 864
  Anatomy of the Monocotyledons, Vol. I, Gramineae, *review* by Prof. T. G. Tutin, 865
Meteorites · Introducing, *review* by Dr. H. J. Axon, 432
  Principles of (E. L. Krinov), translated from the Russian by Irene Vidziunas ; translation edited by Harrison Brown, *review* by Dr. H J. Axon, 432
Meteorites (Rare) : International Control of Investigations of, 967
Meteorological Field Course (Royal Meteorological Society and the Field Studies Council), 797
Meteorological Office (Air Ministry) : Geophysical Memoirs No 103, Upper Winds over the World, Parts I and 2 (H. Heastie and P. M. Stephenson), 543
Meteorological Organization (World) · Schedule of Conferences and Symposia, 970
Meteorological Organization, World (Advisory Committee on Arid Zone Research and the) : Joint Symposium on Changes of Climate, 361
Meteorological Society (Royal), and the Field Studies Council . Meteorological Field Course, 797
Meteorology (Agricultural) : Fourth Symposium in (Soil Climate with special reference to the British Isles), (University College of Wales, Aberystwyth), 714
'Methaemocyanin' : The Problem of (Dr. A. E. Needham), 308
Methionine : Non-Enzymic Decarboxylation of, by Ferrous Ion (Mendel Mazelis), 305
L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and its Melanocyte-stimulating and Corticotropin-releasing Activity : Synthesis of (Prof. Choh Hao Li, Eugen Schnabel, David Chung and Tung-bin Lo), 143
Method of Collagen Synthesis (G. B. Gerber and K. I. Altman), 813
Method of Determining Embyronic Orientation in the Hen's Egg (I. S. Robertson), 854
Method of Dissolving the Protective Spittle Masses of Frog Hopper Nymphs (Dr. G. F. Howden and A. T. Marshall), 509
Method of Dissolving Triacetyl-oleandomycin for the Assay of Sensitivity of Micro-organisms (Dr. J. W. Czekalowski), 752
Method of Obtaining Uniform Distribution of Wood Preservatives in Toxicity Test Blocks (D N R. Smith and R Cockcroft), 163
Method for Studying Thermal Stability of Bulk Thermosetting Polymers (R. W. Warfield), 1002
Method (A Lipoprotein Staining), for Zone Electrophoresis (Dr. J. Kohn), 312
Method (Mercury Drop Electrode) : Use of the, for Direct Evaluation of Minute Amounts of Lead in Urine (Prof Wiktor Kemula and Zenon Kublik), 57
Method (A New), for the Calculation of *N*(*h*) Profiles from Ionospheric *h*'(*f*) Curves (H. Hojo), 562
Method (A New), for Dating Ancient Glass (Robert H. Brill and Harrison P. Hood), 12
Method (A Plaque), for Assaying some Viruses isolated from Common Colds (Rosemary Parsons and Dr. D. A. J. Tyrrell), 640
Method (A Possible), of Sex Ratio Determination in the Parasitic Hymenopteran *Nasonia vitripennis* (Dr. P. E. King), 330
Method (A Rapid), for the Determination of Tetramethyl Lead and Tetraethyl Lead in Petrol (Dr. J. Van Rysselberge and R. Leysen), 478
Method (Serological), for the Determination of Human Chorionic Gonadotrophin : Clinical Application of a (Dr. Sam Brody and Dr. Gun Carlstrom), 841
Method (A Simple Paper Chromatographic), for Determination of Amino-Acid Activation Profiles in Tissue Preparations (Dr. Alexandra von der Decken), 145
Method (A Simplified), for the Study of Chromosomes in Man (Dr. M. A. Kinlough, Prof. H. N. Robson and Dr. D. L. Hayman), 420
Method (A Versatile), for Short-term Spectrum Analysis in 'Real-Time' (J. S. Gill), 117
Methods : X-Ray Analytical (Research and Control Instruments, Ltd , Conference on), 275
Methods for Determining the Rates of Catalase Synthesis and Destruction *in vivo* (Dr. V. E. Price, M. Rechcigl, jun., and R. W. Hartley, jun.), 62
Methods of Teaching Undergraduates (Appointment of a Committee by the University Grants Committee to study the), 880
Methods used by Universities of Contracting and of Recording and Controlling Expenditure (University Grants Committee), 427
Methods (Automatic and Semi-Automatic), in Analysis and Control (Medway College of Technology Symposium and Instrument Exhibition on), 447
Methods (Direct), of Estimation in the Spectrographic Analysis of Cobalt in Soil Concentrates (Dr. A. B. Calder), 165
Methods (Geophysical) : Prospecting in Archaeology by (Council for British Archaeology Conference on), 534
Methods (Physical), of Organic Chemistry (edited by Arnold Weissberger), Vol. 1, Parts 1 and 2, third edition, *review* by Dr. W. A. Waters, 954
Methods (Simple), for preparing Pointed Filaments for the Electron Microscope (Dr. D E. Bradley), 298
Methoxamine · Antiaccelerator Action of (Shoichi Imai, Tatsuro Shigei and Prof. Koroku Hashimoto), 493
6-Methoxybenzoxazolinone : Effect of, on the Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson and its Presence in Sweet Corn (*Zea mays* var. *saccharata* Bailey), (N. J. Whitney and C. G Mortimore), 596
Methyl Carbinolamide (D-Lysergic Acid) : Some Pharmacological Actions of (Dr. A. Glässer), 313
Methyl 'Cellosolve' : Toxic Hazard from Formulating the Insecticide Dimethoate in (Prof. John E. Casida and D M. Sanderson), 507
N-Methyl Groups : Apparent Migration of, in the Pyrimidine Series (Dr. D. J. Brown), 828
ε-N-Methyl-Lysine in *Salmonella* Flagellar Protein : A Gene determining Presence or Absence of (Dr B. A. D. Stocker, Dr. M. W. McDonough and Dr. R P. Ambler), 556
2-Methyl-Δ^2-Oxazoline Reaction of Phosphorylating Agents with (R. Greenhalgh), 829
3-Methylaminomethylindole : 3-Aminomethylindole and—New Constituents of Barley (Dr. S. Harvey Mudd), 489
Methylcholanthrene Sarcoma in Rats : Inhibiting Effect of Nicotinamide and Diphosphopyridine Nucleotide on the (M. Matsuyama, A. Maekawa and T. Nagayo), 673
4-Methylproline Absolute Configuration of, from Perry (Dr. L. F. Burroughs, S. Dalby, Prof. G W Kenner and Dr. R. C. Sheppard), 394
O-Methyltransferase (Catechol) · Augmentation of the Pressor Response to Guanethedine by Inhibition of (Dr. D. W. Wylie), 490
Metropolitan Microchemical Society Symposium on Microchemical Techniques (sponsored by the International Union of Pure and Applied Chemistry), 188
Mevalonic Acid (2-^{14}C-) Biosynthesis of ^{14}C-Sclareol and β-Sitosterol from (Prof. Harold J. Nicholas), 143
Meyer, Dr. Karl F. Awarded the Jessie Stevenson Kovalenko Medal of the United States National Academy of Sciences, 970
Meyer, Prof. Lillian Hoagland : Food Chemistry, *review* by A. M. Copping, 259
Mice : Effect of Radioactive Sulphydryl Compounds on the Oxygen Tension in the Spleen of (Dr. C. van der Meer, P W. Valkenburg and M. Remmelts), 588
  Influence of Hypothermia on the Survival of, after Large Doses of X-Radiation (L. Mráz and Dr. M. Praslička), 677
  Toxicity and Anti-leukaemic Effectiveness in, of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid (Tetrahydroamethopterin), (Dr J. A. R Mead, J. M. Venditti, A. W. Schrecker, Dr. A. Goldin and R. L. Kisliuk), 937
Mice exposed to a Single Whole-Body Dose of Radiation : Shortening of Life and Causes of Death in (Dr. Patricia J. Lindop and Prof. J. Rotblat), 645
Mice (C 57 Black), when compared with *CBA* and Swiss White Mice : Greater Susceptibility to *Mycobacterium johnei* of (Dr. R. L. Chandler), 602

Mice (*CBA* and Swiss White) : Greater Susceptibility to *Mycobacterium johnei* of *C.57* Black Mice, when compared with (Dr. R. L. Chandler), 602
Mice (*CBA/Lab* Strain of) : Histocompatible Colour Mutant from (Annie M. Brown and Margaret J. Cook), 1031
Mice (F_1 *C57Bl* Inbred) : Transfer of Tolerance to Skin Grafts in (Anna Skowron-Cendrzak), 595
Mice (Foetal *CBA*) : Haemoglobins of (J. Barrowman and Dr. K. B. Roberts), 409
Mice (Hybrid F_1), Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain : Electrophoretic Patterns of Lymph Node Proteins in (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025
Mice (Swiss White) : Greater Susceptibility to *Mycobacterium johnei* of *C.57* Black Mice, when compared with *CBA* and (Dr. R. L. Chandler), 602
Micklem, Dr. H. S., and others : Proposed Revisions of 'Transplantese', 1024
Microbial Production of Carbon Monoxide from Flavonoids (D. W. S. Westlake, J. M. Roxburgh and G. Talbot), 510
Microbiological Changes in Freshly Moistened Soil (Dr. E. Griffiths and H. F. Birch), 424
Microbiology—Historical Contributions from 1776 to 1908 by Spallanzani, Schwann, Pasteur, Cohn, Tyndall, Koch, Lister, Schloesing, Burrill, Ehrlich, Winogradsky, Warington, Beijerinck, Smith, Orla-Jensen (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Microchemical Society (Metropolitan) : Symposium on Microchemical Techniques (sponsored by the International Union of Pure and Applied Chemistry), 188
Microchemical Techniques (Metropolitan Microchemical Society Symposium on, sponsored by the International Union of Pure and Applied Chemistry), 188
Microfibrils (Single), of Bacterial Cellulose : Variation of Elasticity along (J. Ross Colvin), 1029
Microhardness and other Properties of Magnesium Compounds with the Calcium Fluoride Structure (E. R. Petty), 132
Micron (Sub-) Particles · Sampling of, for Electron Microscopy (C. E. Billings, W. J. Megaw and R. D. Wiffen), 336
Micro-organisms . Method of Dissolving Triacetyl-oleandomycin for the Assay of Sensitivity of (Dr. J. W. Czekalowski), 752
  Theoretical Considerations in the Ultra-violet Irradiation of (Dr. C. W. Hiatt), 678
Micro-organisms of Different Deoxyribonucleic Acid Composition : Composition of various Ribonucleic Acid Fractions from (Carl R. Woese), 920
Micropitting of Titanium during Anodic Oxidation in Formic Acid (R. A. Piggott and Dr L. L. Schreir), 216
Microscope (Electron) : Simple Methods for preparing Pointed Filaments for the (Dr. D. E. Bradley), 298
Microscope (Electron) Images (Out-of-Focus), of Edges of Crystal Lattices (J. M. Cowley and A. F. Moodie), 477
Microscopic Sedimentary Petrography (Prof. Albert V. Carozzi), *review* by Dr. F S. Wallis, 257
Microscopic (Electron) Autoradiography in a Magnetic Field (Dr. Carl G. Harford and Alice Hamlin), 505
Microscopical Society, Royal : Symposium on the Application of Interference Microscopy to Problems of Research, 714
Microscopy (Electron) : Sampling of Sub-micron Particles for (C. E. Billings, W. J. Megaw and R D. Wiffen), 336
Microscopy (Electron), of Crystal Lattices—an Anomalous Effect (Lewis T. Chadderton), 564
Microscopy (Interference) : Application of, to Problems of Research (Royal Microscopical Society Symposium on), 714
Micryphantidae—Zwergspinnen (Dr. Hermann Wiehle), (Die Tierwelt Deutschlands und der Angrenzenden Meeresteile nach ihren Merkmalen und nach ihrer Lebensweise, begrundet von Prof. Dr Friedrich Dahl, weitergefuhrt von Maria Dahl und Prof. Dr. Hans Bischoff, Teil 47, Spinnentiere oder Arachnoidea (Araneae), 11), *review* by Dr. Eric Duffey, 344
Middle East and North Africa : Science Planning, Development and Co-operation in the Countries of the (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
Middle Ionosphere : A Maximum of Temperature in the (Prof. O. Burkard), 474
Midgley, Dr J. W., and Teer, D. G. : Surface Orientation and Friction o Graphite, Graphitic Carbon and Non-Graphitic Carbon, 735
Miettinen, J. K , and others : Strontium-90 and Caesium-137 in Grass and Milk in Finland during 1959, 324
Migration (Apparent), of N-Methyl Groups in the Pyrimidine Series (Dr. D. J. Brown), 828
Migration (Insect) : A Turning Point in the Study of (Dr. J. S. Kennedy), 785
Migratory Moth : Accidental Radioactive Labelling of a (Dr. H. B. D. Kettlewell and M. J. Heard), 676
Mijović, Dr. Valerie, and others : Distribution of certain Poppy-Fumaria Alkaloids and a Possible Link with the Incidence of Glaucoma, 198
  Experimental Transmission of Sanguinarine in Milk—Detection of a Metabolic Product, 201
Mikusiński, Prof. Jan : Operational Calculus, *review* by Prof. T. A. A. Broadbent, 700
Miles, Prof. A. A. . Elected a Fellow of the Royal Society, 967
Milhaud, Dr. G. Intestinal Absorption of Vitamin B_{12} and of a Vitamin B_{12}-Peptide Complex in Normal Subjects and in Patients with Partial Gastrectomy, 31
Milk : Experimental Transmission of Sanguinarine in—Detection of a Metabolic Product (Dr. Sohrab A E. Hakim, Dr. Valerie Mijović and Dr James Walker), 201
Milk in Cattle : Relationships between Blood Groups and the Fat Percentage of the (Jan Rendel), 408
Milk-yield of Cows : Effects of Pulped Soybean Silage on the (Dr. E. Kurnik, D. Gábos and B. Pozsár), 492
Milk (Coconut) : A New Green-Leaf Growth-stimulating Factor, Phyllococosine, from (Dr. Susumu Kuraishi and Dr. F. Shigeo Okumura), 148
Milk (Cow's) · Some Factors Influencing the Food-Chain Transport of Radioactive Materials into (D. Merton and O. Suschny), 806
Milk (Grass and), in Finland : Strontium-90 and Caesium-137 in, during 1959 (J. K. Miettinen, O. Paakkola, R. Näsänen, A. Vuorinen and D. Merten), 324
Millen, Dr. D. J. : Kinetic Theory of Gases, *review*, 783
Millennium : Mambu, a Melanesian (Dr. Kenelm Burridge), *review* by Dr. R. F. Fortune, 523
Miller, T. G. : New Universities (Full Participation of all the Academic Staff in the Governing of the Institution), 24
Millicycle Gravitational Radiation (Interstellar) : Upper Limit for (Dr. Robert L. Forward, David Zipoy, Prof. J. Weber, Stewart Smith and Prof. Hugo Benioff), 473
Millin, D. J., and Smith, M. H. : Nature and Composition of Dental Plaque, 664
Milne, Dr M. D : Appointed to the University of London chair of medicine at Westminster Medical School, 22
Mindlin, S. Z , and others : Genetic Control of Oxytetracycline Biosynthesis, 939
Mineral Processing, *review* by Dr. A. R. Burkin, 87
Mineral Processing (Dr. E. J. Pryor), revised and enlarged edition of An Introduction to Mineral Dressing, *review* by Prof. S. G. Ward, 258
Mineralogical Society (Clay Minerals Group), and the British Society of Soil Science : Joint Discussion on Weathering, 361
Mineralogy and Petrology at Cambridge, 793
Minimum Rates of Flow in Therapy with Sulphonamides (Prof. Eino Nelson), 928
Mining and Metallurgical Engineers, American Institute of (Metallurgical Society of the), (Metal Powder Industries Federation and the) : International Conference on Powder Metallurgy, 365
Minkowski, R. : A Large Red-Shift, 713
Minorsky, N. (Leimanis, E., and) : Dynamics and Nonlinear Mechanics, *review* by Prof. A. T. Price, 865
Minute Amounts of Lead in Urine : Use of the Mercury Drop Electrode Method for Direct Evaluation of (Prof. Wiktor Kemula and Zenon Kublik), 57
Misonne, Dr. Xavier : Analyse Zoogéographique des Mammifères de l'Iran, 21
Misra, Dr. D. K., and others : Increased Dihydrofolate Reductase Activity as a Possible Basis of Drug Resistance in Leukaemia, 39
Mitarai, Dr Genyo, and others : Location of the Non-Linearity in Horizontal Cell Response to Retinal Illumination, 463
Mitchell, A. : Appointed to a C. H. Desch Research Fellowship in the University of Sheffield, 714
Mitchener, Dr. James (Rice, Prof. W. G., and) : Histochemical Evidence of 5-Hydroxytryptamine in a Dog Mast Cell Tumour, 767
Mitochondria : Energy-linked Cytochrome Oxidation in (Prof. Britton Chance), 719
Mitochondrial Equivalents : Plasma Membranes and, as Functionally Co-ordinated Structures (Prof. Stuart Mudd, Dr. Tomio Kawata, John I. Payne, Dr. Theodore Sall and Prof Atsushi Takagi), 79
Mitra, Sankar, and Chatterjee, G. C. : Lecithin-splitting Enzyme of *Vibrio* El Tor, 837
Mitra, S. N. : Awarded the 1960 Prize of the Institution of Telecommunication Engineers of India, 447
Mitra, S. S. : Vibration Frequency and Ionization Potential—Halide Molecules, 914
Mitsuhashi, Prof. S., and others : Elimination of Transmissible Drug-resistance by Treatment with Acriflavin, 947
Mitz, Dr. Milton A., and Summaria, Louis J · Synthesis of Biologically Active Cellulose Derivatives of Enzymes, 576
Miyamoto, S. (Koketsu, Prof. K., and) : Release of Calcium-45 from Frog Nerves during Electrical Activity, 402
  Significance of Membrane Calcium in Calcium-free and Potassium-rich Media, 403
Mobility of Point Defects in Titanium and Zirconium : Production and (E. Smith and M. S. Stagg), 300
Mode of Action of an Antheridium-inducing Substance in Ferns (Dr. Ulrich Naf), 900
Mode of Respiration as an Indication of Level of Awareness : Changes in (Dr. L Goldie and J. M. Green), 581
Moderate Caloric Restriction : Prevention of Fatty Liver due to Threonine Deficiency by (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A. E Harper), 917
Modern Armamentarium of Therapeutics, *review* by Prof. F. Bergel, 699
Modern China : Medicine and Public Health in (Dr William Y. Chen), 795
Modern Optical Theory : A Unified Treatment of, *review* by Dr. C. A Taylor, 429
Modern Technology : Classical Physics and, *review* by Dr. W. A. Waters, 954
Modification of Radiation Damage in Seeds by Post Treatment (Dr. W. Klingmuller), 413
Modifying the Present Terminology : Haemoglobins, Myoglobins and Erythrocruorins—a Proposal for (Dr Malcolm H. Smith), 225
Modifying Factors of Amino-acid Antagonisms in a Mutant of *Neurospora crassa* (H. E. Brockman and A. Gib DeBusk), 940
Mohammed, A. H., and El Karemi, M. M. A : Immunity of Bee Keepers to some Constituents of Bee Venom—Phospholipase-A Antibodies, 837
Moir, G. F. J., and others : Natural Rubber Research, 193
Moistened Soil (Freshly) : Microbiological Changes in (Dr. E. Griffiths and H. F. Birch), 424
Molecular Properties of Conjugated Proteins isolated from Exudates (Prof. Antonio Caputo), 395
Molecular Sieve Behaviour of Dental Enamel (D. F. G. Poole, K. V. Mortimer, A. I Darling and Dr. W. D. Ollis), 998
Molecular Spectroscopy (International Union of Pure and Applied Chemistry, Koninklijke Nederlandse Chemische Vereniging and the Nederlandse Natuurkundige Vereniging fifth European Congress on), 797
Molecular Structure : Influence of, on the Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and Indium with Aliphatic Ethers (Dr. R R Brooks and P. J. Lloyd), 375
Molecular Weight Distributions from Rheological Measurements : Polymers and the Theory of Numbers— (E. Menefee and W. L. Peticolas), 745
Molecular Weights of Unknown Materials in Solution : Accurate Determination of (R. A. Pasternak and Leonard A. Cavanagh), 446
Molecule (Serum Protein) : Influence of the Charge on a, and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes (B. J. Northover), 574

Molecules : Atoms and, *review* by Dr. G. A. Jones, 172
  Basic Physics of Atoms and (Dr. U. Fano and L. Fano), *review* by Dr. G. A Jones, 172
Molecules (Halide) : Vibration Frequency and Ionization Potential— (S. S. Mitra), 914
Molecules (Small) : Diffusion of (Prof. C. Rossi and E. Bianchi), 822
Molecules and Crystals : The Nature of the Chemical Bond and the Structure of (Prof. Linus Pauling), third edition, *review* by Prof. C. A. Coulson, 3
Molybdenum : Control of Irradiation Embrittlement in (D. N. Sethna, A. A. Johnson, K. J. Proud and S. S. Sheinin), 568
Molybdenum and Tungsten (Zerovalent Vanadium, Chromium,) : Complexes of, with a Ditertiary Phosphine (Dr. J. Chatt and H. R. Watson), 1003
Mondrakete *Lunik* II (Sowjetischen) . Bericht uber Optische Beobachtungen anlässlich der Landung der (L. Detre), 186
Monib, M., and others : Chloramphenicol, a Simultaneous Carbon and Nitrogen Source for a *Streptomyces* sp. from Egyptian Soil, 775
Monkey Heart Cells (Salk 'Altered'), and Ehrlich Ascites Carcinoma Cells : Immunological Cross-Reactions between (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Monoamine Oxidase Inhibitor : Local Treatment of Experimental Burns with a (W. G. Spector and D. A. Willoughby), 489
Monobromide (Aluminium) : Dissociation Theory of (Dr. R. F. Barrow), 480
Monocotyledons : Anatomy of the (Dr. C. R. Metcalfe), Vol. I, Gramineae, *review* by Prof. T. G. Tutin, 865
Monolayers : Polymer (J. M. Hammond, Monica H. Williams and W. G. P. Robertson), 549
Monomer (Fibrin) : Optical Rotatory Dispersion of the Thrombin-induced Conversion of Fibrinogen to (Prof. C. M. Kay and M. M. Marsh), 307
Monosaccharide Sequence in *Pneumococcus* Type XIV Polysaccharide (Dr. S. A. Barker, M. C. Keith and Prof. M. Stacey), 746
Monosynaptic Responses (Spinal), from Tenotomized Muscles in Cats : Plastic Changes of (Dr. W. Kozak and Dr. R. A. Westerman), 753
Monoxide (Carbon), from Flavonoids : Microbial Production of (D. W. S. Westlake, J. M. Roxburgh and G. Talbot), 510
Monsanto Chemicals, Ltd. : Appointment of Dr. I. S. Wilson as senior scientist, 272
Montefinale, Gabriella, and others : Labelling of Organic Compounds by Mercury-photosensitized Reaction with Tritium Gas, 54
Moodie, A. F. (Cowley, J. M., and) : Out-of-Focus Electron Microscope Images of Edges of Crystal Lattices, 477
Moon : Impact of *Lunik* 2 on the, 186
Moore, Dr. R., and Buskirk, Dr. E. R. : Differential Sublimation Rates of Light and Tritium-labelled Water, 149
Moore, T. : Advising the Farmer (Ways in which Advisers could be Most Useful to Farmers), 883
Mores, Patricia A. (Wells, Prof. W. W., and): An Evaluation of the Use of Digitonin for the Analysis of Faecal Sterols, 483
Moritz, Robert Edouard : On Mathematics and Mathematicians (formerly titled Memorabilia Mathematica or the Philomath's Quotation Book), *review* by Prof. T. A. A. Broadbent, 258
Mormyrid (Nile), *Hyperobisus bebe* (Lacepede) : Fecundity of the (G. Nawar), 274
Morphogenesis : Plant (Prof. Edmund W Sinnott), *review* by Prof. C. W. Wardlaw, 697
Morphogenesis of *Striga* Seedlings : Growth and (Colin N. Williams)—Effect of Light, Gibberellic Acid and Kinetin on Growth and Morphogenesis of *Striga* Seedlings, 378 ; Influence of the Host Rhizosphere on the Morphogenesis of *Striga* Seedlings, 380
Morphogenetic Effects of Lipoic Acid on Amphibian Embryos (Prof. J. Brachet), 156
Morphological Characterization of the Virus of the Human Common Wart (*Verruca vulgaris*), (M. G. Williams, A. F. Howatson and J. D. Almeida), 895
Morphological Separation of Cytological Races in *Ranunculus ficaria* L. (Dr. V. H. Heywood and Dr. S. Walker), 604
Morphology : Quantitative, *review* by Prof. O. W Richards, 256
Morrison (A. Cressy) Award of 400 dollars of the New York Academy of Sciences awarded to Dr. Minoru Tsutsui, 19
Morrison, Dr. Martin : A New Haemoprotein with a Unique Iron Porphyrin Prosthetic Group isolated from Human Erythrocytes, 765
Morrison, Dr. T. M. : Fixation of Nitrogen-15 by Excised Nodules of *Discaria toumatou*, 945
Mortimer, Dr. C. T. : Post-Secondary and Higher Education in Nigeria, 95
Mortimer, K. V., and others : Molecular Sieve Behaviour of Dental Enamel, 998
Mortimore, C. G. (Whitney, N. J. and) : Effect of 6-Methoxybenzoxazolinone on the Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson and its Presence in Sweet Corn (*Zea mays* var. *saccharata* Bailey), 596
Morton, Dr. J. R., and others : Identification of the Radical $\cdot CH_2(CO_2H)$, 481
Mosaic (Centrosema), a Plant Virus Disease transmitted by both Aphids and Plant Bugs (R. J. Van Velsen and Dr. N. C. Crowley), 858
Mosaic Virus (Tobacco) : Analysis of the Cross-Reaction between Two Strains of (Prof. Irving Rappaport), 986
  Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from (Dr. T. O. Diener), 687
Mosquito Attractant : Lysine as a (Prof. A. W. A. Brown and A. G. Carmichael), 508
Mosquitoes (Culicine) : A New Virus isolated from (B. M. McIntosh, R. H. Kokernot and H. E. Paterson), 274
Moss, Dr. T. S. (Hughes, N. D. P., and) : Some Solar Lines in the Infra-Red Spectrum observed from a High-Flying Aircraft, 908
Mössbauer, Dr. Rudolf L. : Awarded the 1960 Research Corporation Award by the California Institute of Technology and Research Corporation, 275
Mossige, Jeanne (Eker, Reidar, and) : A Dominant Gene for Renal Adenomas in the Rat, 858
Moth (Migratory) : Accidental Radioactive Labelling of a (Dr. H. B. D. Kettlewell and M. H. Heard), 676
Motions (Galactic), in a Large-Scale Magnetic Field (Donat G Wentzel), 907
Motoneurones : Anionic Permeability of the Inhibitory Postsynaptic Membrane of (Dr. T. Araki, M. Ito and O. Oscarsson), 65
Motor-Car Exhaust Gases : Detection of Free Charges from (Dr. T. Westermark), 910
Motz, Prof. Lloyd : Existence of Net Electric Charges on Stars, 994
Moult Cycle of an Insect : Ribonucleic Acids in the (A. Krishnakumaran), 243
Mountain Sheep (Welsh) : The Synchronous Discharge of Apocrine Sweat Glands of the (Dr. John Bligh), 582
Mountford, C. P. : Rock Carvings at Ewaninga in Central Australia, 103
Mounting (A 'Dry'), Autoradiographic Technique for the Localization of Water-soluble Compounds (P. J. Fitzgerald, Margery G. Ord and Dr. L. A. Stocken), 55
Mouse (*C3H*) : Fluorescence and Haemolytic Activity of Tumours and Normal Tissues of the (Dr. Eric Ponder and Ruth V. Ponder), 643
Mouse Forestomach : Tumour-Promotion by Lime Oil in the (Winifred E. H. Peirce), 497
Mouse Lymphocytic Leukaemia *L* 1210 : Effects of Nitrogen Mustard on the Histochemistry of (Dr. George J. Furman, Prof. G. Adolph Ackerman and Dr. Carl Cohen), 591
Movements (Endodiurnal Leaf), in *Phaseolus* : Temperature Coefficient of (Franz-Josef Leinweber), 1028
Movements (Saccadic Eye) : Subjective Analysis of (Dr. J. G. Thomas), 842
Moxon, G. . People and Machines, 283
Moyles, A. F. (Jones, C. E. Roland, and) : Rapid Identification of High Polymers using a Simple Pyrolysis Unit with a Gas–Liquid Chromatograph, 222
Mráz, L., and Praslička, Dr. M. : Influence of Hypothermia on the Survival of Mice after Large Doses of X-Radiation, 677
Mucin : Bovine Submaxillary (S. Tsuiki, Y. Hashimoto and Dr. W. Pigman), 399
Mucopeptides (Lysozyme-soluble) : Isolation of, from the Cell Walls of *Escherichia coli* (Dr. J. Mandelstam), 855
Mucopolysaccharide (Hexosamine)-Level : Experimental Data concerning the Connexion between Thyroid Function and (Prof St. Krompecher, Cs. Hadházy, G. Berencsi, E. H. Oláh and M. B. László), 670
Mucopolysaccharides and Thyroid Function (Prof St. Krompecher, B. Fornet G. Balogh, E. H. Oláh and M. B. László), 670
Mucus (Fish) : Presence of Blood Antigens in, and its Possible Parasitological Significance (Prof. Fergus J. O'Rourke), 943
Mudd, Prof. Stuart, and others : Plasma Membranes and Mitochondrial Equivalents as Functionally Co-ordinated Structures, 79
Mudd, Dr. S. Harvey : 3-Aminomethylindole and 3-Methylaminomethylindole—New Constituents of Barley, 489
Müller, Alexander, and Witt, Dr. H. T. : Trapped Primary Product of Photosynthesis in Green Plants, 944
Muller, Dr. H. G : Weissenberg Effect in the Thick White of the Hen's Egg, 213
Muller, Prof. Herman J. : Elected a Member of the General Biology Section of the Leopoldina German Academy of Sciences, 273
Mullin, Dr. J. W. : Title of reader in chemical engineering (at University College, London), conferred on, 534
Multiplication of Bacteriophage : Inhibition of, by Actinomycin (Atsuo Nakata, Mutsuo Sekiguchi and Prof. Junichi Kawamata), 246
Multiplication of Influenza Virus : Inhibition of the, by Aniline Derivatives of the Francis Inhibitor (Dr. I. Hollós), 553
Multi-stranded Deoxyribonucleic Acid as determined by X-Irradiation (Prof. Liebe F. Cavalieri, Roland Finston and Barbara Hatch Rosenberg), 833
Mulvaney, D. J. : Rock Shelters of the Lower Murray River, 445
Munkner, Troels (Clausen, Dr. Jørgen, and) : Transferrin in Normal Cerebrospinal Fluid, 60
Murchison Fund for 1961 of the Geological Society of London awarded to Dr. J Ineson, 100
Murchison Grant of the Royal Geographical Society awarded to Prof. K. M. Buchanan, 443
Murchison Medal for 1961 of the Geological Society of London awarded to W N. Edwards, 100
Murphy, G. F., and others: Conversion of DL-*m*-Tyrosine to Dopamine in the Rat, 577
Murrah Buffalo Calves : Effect of Exposure to Sun and Exercise on Heat Tolerance Coefficient in (D. S. Bhatnagar and N. C. Chaudhary), 844
Murray, Dr. J. D., and others : Streaming of Interstellar Hydrogen in the Vicinity of the Sun, 957
Murray, Sir Keith : Agricultural History, 368
Murray River (Lower) . Rock Shelters of the (D. J. Mulvaney), 445
Murthy, S. K., and others : Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in Rats, 482
Muscarinic Receptors (Dr. A. H. Beckett, N. J. Harper, J. W. Clitherow and E. Lesser), 671
Muscle (Artificial *p*H-) : Action Potential with an (D. H. Walters, Prof. W. Kuhn and Hans J. Kuhn), 381
Muscle (Pork) : Rate of Anaerobic Glycolysis versus Structure in (J. Wismer-Pedersen and E. J. Briskey), 318
Muscle (Sheep Cardiac) · Relationship of the Sarcoplasmic Reticulum to Sarcolemma in (F. O. Simpson and S. J. Oertelis), 758
Muscle (Ventricular), of the Dog : Glutamic Oxaloacetic Transaminase Activity in Different Zones of the (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr. Enrique Savino and Dr. Manuel René Malinow), 315
Muscle Fibres (Skeletal), of the Frog : Influence of Calcium on the Potassium-Contracture of 'Slow' and 'Fast' (P. Pauschinger and Prof. K. Brecht), 583
Muscle Proteins (Vessel), extracted with Water or Salt Solutions of Low Ionic Strength Properties of (Prof. L. Laszt), 230
Muscles (Smooth), and Blood Vessels : Polypeptides which affect—Proceedings of a Symposium held in London, 1959 (edited by M. Schachter), (Biological Council's Co-ordinating Committee for Symposia on Drug Action Series, Vol. 4), *review* by Prof. J. H. Gaddum, 257
Muscles (Tenotomized), in Cats · Plastic Changes of Spinal Monosynaptic Responses from (Dr. W. Kozak and Dr. R. A. Westerman), 753
Musculature (Flight-) · Degeneration of, in the Corixidae and Notonectidae (E. C. Young), 328
Museum (Australian) : New Wing of the, 186
Museum (Bernice P. Bishop), Hawaii : Annual Report for 1959 (Prelude to a Plan), 20

Museum (Chicago Natural History) : *Fieldiana*, Zoology, Vol. 35, No. 7, Birds of the Philippine Islands (A. L. Rand and D. S. Rabor), 446
Museum (National), of Wales : Fifty-third Annual Report (1959-60), 796
Museum (National Art Gallery and Dominion), Wellington, New Zealand, Report for 1959-60, 623
Museum (Transvaal) : *Bulletin* of the, No 5, 796
Museum and Art Gallery (Durban) : Report for 1959-60, 969
Mushrooms · Tocopherol, Ubiquinones and Ubichromenols in Yeast and (A. T. Diplock, J Green, E. E. Edwin and J. Bunyan), 749
Mustard (Nitrogen) : Effects of, on the Histochemistry of Mouse Lymphocytic Leukaemia *L* 1210 (Dr. George J. Furman, Prof G. Adolph Ackerman and Dr. Carl Cohen), 591
Mutant of *Neurospora crassa* : Modifying Factors of Amino-acid Antagonisms in a (H. E. Brockman and A. Gib DeBusk), 940
Mutant (Histocompatible Colour), from *CBA/Lab* Strain of Mice (Annie M. Brown and Margaret J. Cook), 1031
Mutations Structural (Prof. H R. Mahler and Dean Fraser), 948
Mutations (Expressed), in *Schizophyllum commune* : Origin of (Dr Stanley Dick and Dr. John R. Raper), 81
Mutations (Lethal), in Brazilian Human Populations (Prof N. Freire-Maia, A. Freire-Maia and A Quelce-Salgado), 80
Muzli, Dr Erminio · Detection by Fluorescence of Oxytetracycline bound to Bone, 934
Mycobacterium johnei : Great Susceptibility to, of C.57 Black Mice, when compared with *CBA* and Swiss White Mice (Dr. R. L Chandler), 602
Mycobacterium phlei . Polysaccharides of (R. J. German, Dr A. S Jones and M. Nadarajah), 1008
Mycological Society (British) : Symposium on Epidemics of Black (Stem) Rust of Wheat, 285
Mycology (Industrial) : An Introduction to (George Smith), fifth edition, *review* by Prof. John Colhoun, 347
Mycoplasma mycoides : Glycerol in—Unbalanced Growth of *Mycoplasma mycoides* caused by Glycerol Deficiency (A. W. Rodwell) ; A Polyglycerophosphate Compound from *Mycoplasma mycoides* (P. Plackett), 125
  A Polyglycerophosphate Compound from (Glycerol in *Mycoplasma mycoides*), (P Plackett), 125
  Unbalanced Growth of, caused by Glycerol Deficiency (Glycerol in *Mycoplasma mycoides*), (A W. Rodwell), 125
Myeloid and Lymphoid Cells from a Parental Strain · Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with (V. Schwarzmann, Prof G. Mathe and J L. Amiel), 1025
Myocardial Tissue Changes associated with Rigor Mortis (Piero Gallo), 114
Myoglobins and Erythrocruorins : Haemoglobins,—a Proposal for Modifying the Present Terminology (Dr Malcolm H Smith), 225
Myxoviruses : Determination of the Concentration of, and of some Specific Antisera, based on Neuroaminidase Activity (Dr J. Jacobs and Dr. J. N. Walop), 334

NADARAJAH, M., and others : Polysaccharides of *Mycobacterium phlei*, 1008
Näf, Dr. Ulrich : Mode of Action of an Antheridium-Inducing Substance in Ferns, 900
Nagayo, T., and others : Inhibiting Effect of Nicotinamide and Diphosphopyridine Nucleotide on the Methylcholanthrene Sarcoma in Rats, 673
Nair, K. K , and others : Relative Efficiencies of Indian Languages, 614
Nakada, Dr. Daisuke, and Ryan, Dr. Francis J : Replication of Deoxyribonucleic Acid in Non-dividing Bacteria, 398
Nakata, Atsuo, and others : Inhibition of Multiplication of Bacteriophage by Actinomycin, 246
Nalivkin, Academician D V. : The Geology of the U.S S.R. (translated from the Russian by Dr. S. I. Tomkeieff), *review* by Prof. C. F. Davidson, 610
Nanjundayya, Dr. C. : Textile Research Institute of the Bombay Textile Research Association, 450
Napier, Dr. J. R.· Vertebrate Locomotion (Evolution of Prehensility in the Primate Hand), 98
Näsanen, R , and others · Strontium-90 and Caesium-137 in Grass and Milk in Finland during 1959, 324
Nash, Dr Michael J. (Watson, Prof Stephen J., and) : The Conservation of Grass and Forage Crops, second edition, *review* by Dr. William Davies, 4
Nasonia vitripennis · A Possible Method of Sex Ratio Determination in the Parasitic Hymenopteran (Dr. P. E. King), 330
National Academy of Sciences (United States) : Mary Clark Thompson Medal awarded to Dr Norman Dennis Newell, 880
  Jessie Steven Kovalenko Medal awarded to Dr. Karl F. Meyer, 970
National Agricultural Advisory Service : Appointment of E. Ll Harry as regional director of the South Western Region, 447
National Art Gallery and Dominion Museum, Wellington, New Zealand : Report for 1959-60, 623
National Association for Mental Health : Fourteenth Annual Report, 186
National Bureau of Standards (United States), and others : Symposium on Temperature—its Measurement and Control in Science and Industry, 22
National Cancer Institute, and others · International Conference on the Biochemistry of Human Tumours, 627
National Food Survey Committee : Annual Report of the (Domestic Food Consumption and Expenditure, 1958), (Ministry of Agriculture, Fisheries and Food), 197
National Foundation for Educational Research in England and Wales : Occasional Publication No. 2, Spelling Irregularities and Reading Difficulty in English (Dr. W. R. Lee), 273
National Fuel and Power Policy—a Policy Statement (Association of Scientific Workers), 626
National Institutes of Health (United States) : Activities in the Field of Gerontology—Research Grant and Training Projects Active on January 31, 1960, and Intramural Research Projects carried on during Calendar Year 1959 (United States Department of Health, Education and Welfare—Public Health Service, Publication No. 761), 21
National Lending Library for Science and Technology : Expenditure on the, 622
National Museum of Wales : Fifty-third Annual Report (1959-60), 796
National Park Guides : No 3, Peak District (edited by Patrick Monkhouse), 533
National Parks in Britain : Afforestation in, 711
National Reference Library for Science and Technology : Adjournment Debate in the House of Commons on the, 968
National Research Council of Canada : Appointment of Dr. D. C. Rose as director of the Division of Pure Physics, 444, *erratum*, 797
  Symposium on Self-Regulation in Living Systems, 799
National Research Development Corporation : Report for 1959-60, 882
National Research Development Corporation of India : Sixth Annual Report (1959-60), 878
National Science Foundation (United States) : *Current Research and Development in Scientific Documentation*, No. 7, 185
  Appointment of Dr. Christopher E. Barthel, jun , to the Office of Special International Programmes, 625
  Scientific and Technical Personnel in American Industry (Bureau of Labour Statistics of the Department of Labour), 794
National Union of Teachers : Treasure Chest for Teachers, 20
  Mathematics in the Junior School (J. S. Flavell), 20
  Annual Conference, 880
National Union of Teachers, and others : Discussion Conference on Science and Education, 534
National University of Australia, Canberra : Appointment of Dr. B. H. Neumann to the newly established chair of mathematics, 185
National Vegetable Research Station Association : Members' Day (Soil Physical Conditions affecting Plant Growth), 625
Nationalized Industries : Report from the Select Committee on, together with the Proceedings of the Committee, Minutes of Evidence and Appendices—British Railways, 607
NATO : Summer School at the University of Ghent on the Electrical, Optical and Mechanical Properties of Lattice Defects, 104
  Technical Sessions at Istanbul of the Fluid Dynamics Panel of AGARD (Wind Tunnels and Flow Visualization), 108
  Calendar of AGARD Meetings, 879
Natti, Dr. Giulo · Elected to honorary life-membership of the New York Academy of Sciences, 19
Natural Hill Oxidant · A New Leaf Copper Protein 'Plastocyanin', a (Dr. Sakae Katoh and Dr. Atusi Takamiya), 665
Natural History, Peabody Museum of : Annual Report for 1960 (Yale University), 186
Natural History Museum (Chicago) : *Fieldiana*, Zoology, Vol. 35, No. 7, Birds of the Philippine Islands (A. L. Rand and D. S Rabor), 446
Natural History Research : International, 623
Natural Products : Some Aspects of the Chemistry of (Chemical Society Symposium on), 625
Natural Resources : Conservation of, 779
Natural Rubber Research (Rubber Research Institute of Malaya and the Government of the Federation of Malaya Conference on), 193
Natural Sciences, Swiss Society for · One hundred and fortieth Annual Session (Dr. R. C H Tanner), 884
Natural Tungsten : Excitation Functions of (d,α)- and $(d,\alpha n)$- Reactions on (A. Demildt), 51
Naturally Occurring Alpha-Activity of Drinking Water (R. C. Turner, J. M. Radley and Prof W. V. Mayneord), 348
Nature, International Youth Federation for the Study and Conservation of : Report for 1959, 623
Nature Conservancy · New Nature Reserve at Invernaver, Sutherland, 360
  Rostherne Mere, Cheshire, Nature Reserve, 532
  Report for 1959-60, 798
  Appointment of Lord Hurcomb as chairman, 880
Nature Reserve · Rostherne Mere, Cheshire, as a (Nature Conservancy), 532
Nature Reserve (New), at Invernaver, Sutherland (Nature Conservancy), 360
Nature of the Chemical Bond and the Structure of Molecules and Crystals (Prof. Linus Pauling), third edition, *review* by Prof. C. A. Coulson, 3
Nature of the Metallic Orbital (Prof. Linus Pauling), 656
Nature of the Reactions involved in the Pyrolysis of *n*-Butane Inhibited by Propylene (J H. Purnell and C. P. Quinn), 656
Nature of the Ribosomes present in Bacteria and Yeast—a Re-Appraisal (T. J Bowen, Dr. S. Dagley, Dr. J. Sykes and Dr. D. G. Wild), 638
Nature (Auto-Alloploid), of *Pennisetum squamulatum* Fresen (B. D. Patil, M. W. Hardas and A. B Joshi), 419
Nature and Composition of Dental Plaque (D. J Millin and M. H. Smith), 664
Nature of Thyroxine-binding Globulin in Human Serum (Dr. J. R. Tata), 573
Navy (Royal) · Development of Electrical Engineering in the (Sir Hamish Maclaren), 364
Natuurkundige Vereniging (Nederlandse), and others : Fifth European Congress on Molecular Spectroscopy, 797
Nawar, G. : Fecundity of the Nile Mormyrid, *Hyperopisus bebe* (Lacepede), 274
Naylor, J. L : *Obituary* of Henry Braid Irving, 620
Nebulae, Galaxies and Cosmology, *review* by J B Alexander, 867
Nebulose e gli Universi-isole (Giorgio Abetti e Margherita Hack), *review* by J B. Alexander, 867
Nederlandse Chemische Vereniging (Koninklijke), and others : Fifth European Congress on Molecular Spectroscopy, 797
Nederlandse Natuurkundige Vereniging, and others : Fifth European Congress on Molecular Spectroscopy, 797
Needham, Dr. A. E. : The Problem of 'Methaemocyanin', 308
Negative π-Mesons : The Possibility of Therapeutic Applications of Beams of (Dr P. H. Fowler and Dr D. H Perkins), 524
Nelson of Stafford, Lord : Elected an honorary member of the Institution of Electrical Engineers, 797
Nelson, Prof. Eino . Minimum Rates of Flow in Therapy with Sulphonamides, 928
Nematode in Tomato Plants grown on Sodium-deficient Water Cultures : Growth of a (A. F Bird and P. F. Brownell), 418
Nematodes (Root-knot), and Legume Nodules (P. E. Robinson), 506
Nematology (Plant) Recent Developments in (Association of Applied Biologists Symposium on), 715
Nerve-Endings (Dentinal) : Continuous Regeneration of the (Prof. D. Hattyasy), 72

Nerve Fibres : Gradient of Cholinesterase Activity and of Choline Acetylase Activity in—Gradient of Cholinesterase Activity (Dr. L. Lubińska, S. Niemierko and B. Oberfeld), 122 ; Gradient of Choline Acetylase Activity (Dr. Catherine O. Hebb and Ann Silver), 123
Nerve Trunks (Peripheral) : Mast Cells in (H. J. Gamble and Prof. Stephen Goldby), 766
Nerves (Frog), during Electrical Activity . Release of Calcium-45 from (Prof. K. Koketsu and S. Miyamoto), 402
Nerves (Sympathetic) : Lack of Uptake of Catecholamines after Chronic Denervation of (Dr. G. Hertting, Dr. J. Axelrod, I. J. Kopin and L. G. Whitby), 66
Nervous Activity : Higher (New York Academy of Sciences and the Academy of Medical Sciences of the U S.S.R. Conference on), 282
Nervous Activity in relation to the Respiratory Cycle (E. W Poole), 579
Nervous Pathways (Cholinergic), in the Forebrain (Dr C. C. D. Shute and Dr. P. R. Lewis), 332
Nervous System (Elementary Central) : Pharmacological Specificities of Neurones in an (Dr H Gerschenfeld and Dr. L. Tauc), 924
Ness (Mrs Patrick) Award of the Royal Geographical Society awarded to R. M. L. Mason and A. R. Hanbury-Tenison, 443
Nestor, a New Reactor at Winfrith (United Kingdom Atomic Energy Authority), 969
Net Electric Charges on Stars : Existence of (Dr. Ludwig Oster and Kenelm W Philip), 43 ; (Prof. V. A. Bailey), 43, 995 ; (Prof. Lloyd Motz), 994
Netherlands Atom Forum · Establishment of the, 969
Netherlands Postal and Telecommunications Services (Staff of the Ionosphere and Radio-Astronomy Section of the) : The Cosmic Ray Flare on November 12, 1960, and Solar Activity during the period November 10-15, 1960, 438
Neugebauer, A , and others (edited by) : Structure and Properties of Thin Films—Proceedings of an International Conference, New York, 1959, *review* by Dr. J. Ring, 613
Neumann, Dr. B H. : Appointed to the newly established chair of mathematics at the National University of Australia, Canberra, 185 ; work of, 185
Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant (Prof N. Allegretti and B Vitale), 673
Neuraminidase Activity : Determination of the Concentration of Myxoviruses and of some Specific Antisera, based on (Dr. J. Jacobs and Dr. J. N. Walop), 334
Neurohypophyseal Hormones · Action of, on the Sodium Fluxes of a Freshwater Teleost (Dr. J. Maetz and M. Juine), 152
Neurones in an Elementary Central Nervous System : Pharmacological Specificities of (Dr H. Gerschenfeld and Dr L. Tauc), 924
Neurones in *Xenopus* Larvae : Effect of Limb Ablation on (Dr. A. F. W. Hughes and Dr. P. R. Lewis), 333
Neurospora crassa : An Iron Requirement for a Dissimilatory Nitrate Reductase in (G. C. Walker and Dr. D. J. D. Nicholas), 141
  Modifying Factors of Amino-Acid Antagonisms in a Mutant of (H. E. Brockman and A Gib DeBusk), 940
  Protective Action of Calcium Gluconate against After-Effects of X-Irradiation on Conidia of (Prof. J. Weijer), 760
Neurosurgery, Vol 2 (edited by R. Glen Spurling and Barnes Woodhall), (Medical Department, United States Army, Surgery in World War II), *review* by J. E A O'Connell, 344
Neurosurgery in War-Time, *review* by J. E. A. O'Connell, 344
New, Dr. D. A. T., and others : Honeybee Communication when the Sun is close to the Zenith, 155
New Amino-Acid Amine from *Ecballium* : *N*-Ethyl-L-Asparagine, a (D. O. Gray and Dr. L Fowden), 401
New Amino-Sugars (Two), from an Antigenic Polysaccharide of *Pneumococcus* (Dr. S. A Barker, Dr J. S. Brimacombe, M. J. How, Prof. M. Stacey and Dr J. M. Williams), 303
New Anthelmintic with Unusual Properties (A. W. J. Broome and N Greenhalgh), 59
New Atomic Energy Authority Reactor, 711
New British Base in the Antarctic, 711
New British Oceanographic Research Ship, 102
New Buildings at the Fire Research Station (D I. Lawson), 105
New Class of the Complex Hydrides (Dr. J. Kollonitsch), 1005
New Constituents of Barley : 3-Aminomethylindole and 3-Methylaminomethylindole— (Dr. S Harvey Mudd), 489
New Drug Active against *Babesia canis* : 6-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride Hydrochloride—a (S. S. Berg and J. M. S Lucas), 64
New Effect of Ionizing Radiation on Nucleoprotein (Dr. G. Hems), 849
New Finds at Olduvai Gorge (Dr. L. S B Leakey), 649
New Frog, *Hyla bokermanni*, n sp , from Brazil (Coleman J. Goin), 274
New Gibberellins : Promotion of Cucumber Hypocotyl Growth by Two (Dr. P. W. Brian and H. G. Hemming), 74
New Green-Leaf Growth-stimulating Factor, Phyllococosine, from Coconut Milk (Dr. Susumi Kuraishi and Dr. F. Shigeo Okumura), 148
New Guinea (Australian) : Haptoglobin and Transferrin Types in the Kuru Region of (Prof J. H. Bennett, C. O. Auricht, A. J. Gray, Dr. R. L. Kirk and L. Y. C. Lai), 68
New Haemoglobin Variants in a Very Young Human Embryo : Two (Dr E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496
New Haemoprotein with a Unique Iron Porphyrin Prosthetic Group isolated from Human Erythrocytes (Dr Martin Morrison), 765
New Immunological Entity ? Identification of So-called Atypical Macroglobulinaemia as an Atypical Form of β_2A-Paraproteinaemia—a (R. E. Ballieux, Dr. J W. Imhof and G. H. Niehaus), 768
New Inheritable Property of Human Sera—the InV Factor (Dr. C. Ropartz, Dr. J. Lenoir and Dr. L Rivat), 586
New Intermetallic Compounds of Thorium of the Type Th_7X_3 Some (J. R. Thomson), 217
New Laboratory of London Transport (A. T. Wilford), 448
New Leaf Copper Protein 'Plastocyanin', a Natural Hill Oxidant (Dr. Sakae Katoh and Dr. Atusi Takamiya), 665
New Method for the Calculation of $N(h)$ Profiles from Ionospheric $h'(f)$ Curves (H Hojo), 562
New Method for Dating Ancient Glass (Robert H. Brill and Harrison P. Hood), 12
New Nature Reserve at Invernaver, Sutherland (Nature Conservancy), 360
New Pulsed X-Ray Generator (Zenith Radio Corporation), 879
New Reactor at Winfrith : *Nestor*, a (United Kingdom Atomic Energy Authority), 969
New Recurrent Series in Inbreeding Phenomena (F. A. Marçallo and Prof. N. Freire-Maia), 421
New Research Laboratories of Hilger and Watts, Ltd. (N. J. Goodman), 189
New Species of *Chaetacis* from South America (Arthur M. Chickering), 446
New Stomatopod Crustaceans in West Africa, 360
New Structural Metal with Unique Properties : Fabrication of Beryllium Tubes and Sections—a (Chesterfield Tube Co. Ltd.,), 976
New Synthetic Route to Dialkylphosphinous Chlorides (J. L. Ferron), 916
New Thermionic Generator (Prof. D Gabor), 868
New Type of Phenomenon of Flow Birefringence in Macromolecular Solutions (Shoei Fujishige), 653
New Types of Metal–Ligand Polymers : Pyrazine–Metal Halide Complexes—(Dr. A. B. P. Lever, Dr. J. Lewis and Prof. R S. Nyholm), 58
New Universities (Conference of Universities of the United Kingdom, Discussion on), 23
New Virus isolated from Culicine Mosquitoes (B. M. McIntosh, R. H. Kokernot and H. E. Paterson), 274
New West Durham Borehole, 878
New Year Honours, 18
New York Academy of Sciences : Election of Dr. Frederick Y. Wiselogle as president, 19
  Election of Sir Edward Dodds, Sir Alfred Lovell, Dr. Gulio Natti, Dr. Franz Buchner and Dr. J. J. Trillat as honorary life-members, 19
  D. B. Steinman Award of 500 dollars awarded to Isidor B. Laskowitz, 19
  A. Cressy Morrison Award of 400 dollars awarded to Dr. Minoru Tsutsui, 19
New York Academy of Sciences and the Academy of Medical Sciences of the U.S.S.R. : Conference on Higher Nervous Activity, 282
New York Botanical Garden . Diseases and Pests of Ornamental Plants (Pascal P. Pirone, Bernard O. Dodge and Harold W. Rickett), third edition, *review* by Derek A. Reid, 956
New Zealand : Changes in Sea-level recorded in (J. C. Schofield), 533
  The Hydrocharitaceae in (R. Mason), 718
  Scientific Research in, 370
New Zealand Department of Scientific and Industrial Research : Report for 1959-60, 370
New Zealand National Art Gallery and Dominion Museum : Report for 1959-60, 623
New Zealand *Poa* · High Polyploidy in a (J. B. Hair and E. J. Beuzenberg), 160
New-born Pigs : Characteristics of γ-Globulin, lacking Antibody Properties, in (Dr. F. Franek, Dr. I Říha and Dr. J. Sterzl), 1020
Newell, Dr. Norman Dennis : Awarded the Mary Clark Thompson Medal of the United States National Academy of Sciences, 880
Newkirk, J. B., and others (edited by) : Structure and Properties of Thin Films—Proceedings of an International Conference, New York, 1959, *review* by Dr. J. Ring, 613
Newman, R. P. : Appointed head of the Members' Service Department of the British Welding Research Association, 625
Newton, Dr. B. A · Recent Advances in Fields of Parasitological Research (The Mode of Action of Quaternary Ammonium Trypanocides), 192
Newton, Isaac · The Correspondence of (edited by Prof. H. W. Turnbull), Vol. 2, 1676-1687, *review* by Prof. L. Rosenfeld, 171
Newton, Isaac, and others (Founders of British Science), (J. G. Crowther), *review* by Dr. W. P. D. Wightman, 259
Newton, J. S. . People and Machines (Education and Training of Technicians), 284
Niah Cave, Sarawak : An Extinct Giant Pangolin and associated Mammals from (Tom Harrisson, D. A. Hooijer and Lord Medway), 166
Nicholas, Dr. D. J. D. (Walker, G. C., and) : An Iron requirement for a Dissimilatory Nitrate Reductase in *Neurospora crassa*, 141
Nicholas, Dr. D. J D., and others : Use of Radioactive Nitrogen in Studying Nitrogen Fixation in Bacterial Cells and their Extracts, 634
Nicholas, Prof. Harold J. : Biosynthesis of ^{14}C-Sclareol and β-Sitosterol from 2-^{14}C-Mevalonic Acid, 143
Nichols, J. L., and others : Some Properties of Scandium Metal, 566
Nickel : Octahedral Co-ordination of, in Nickel (II) *Bis*acetylacetone (Dr. G J Bullen, Dr. R. Mason and Dr. Peter Pauling), 291
Nickel (II) *Bis*acetylacetone : Octahedral Co-ordination of Nickel in (Dr. G. J. Bullen, Dr. R. Mason and Dr. Peter Pauling), 291
Nicotinamide and Diphosphopyridine Nucleotide : Inhibiting Effect of, on the Methylcholanthrene Sarcoma in Rats (M. Matsuyama, A. Maekawa and T. Nagayo), 673
Niehaus, G. N , and others . A Pyroninophilic Component in Pathological Serum Proteins and Urinary Proteins, 60
  Identification of So-called Atypical Macroglobulinaemia as an Atypical Form of β_2A-Paraproteinaemia—a New Immunological Entity ?, 768
Niemi, Dr. Mikko, and Ikonen, Dr. M. : Steroid-3β-ol-Dehydrogenase Activity in Foetal Leydig's Cells, 592
Niemierko, S , and others : Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres—Gradient of Cholinesterase Activity, 122
Nigeria : Post-Secondary and Higher Education in (Dr. C. T. Mortimer), 95
  The Report of the Commission on Post-School Certificate and Higher Education in—Investment in Education, 169
Nigeria (Eastern) : Seventeenth-Century Bronze Finds in (Thurstan Shaw), 187
Nigeria's Investment in Education, 85
Night Sky, in February, 275 ; in March, 625 ; in April, 970
Nile Mormyrid, *Hyperopisus bebe* (Lacepede) : Fecundity of the (G. Nawar), 274
Ninhydrin Assay in the Presence of Thiol Compounds (John R. Whitaker), 662
Niobium to Vanadium : An Unusual Feature of the Fusion Welding of (R. D. Johnston and L. W. Derry), 52
Niobium Dioxide (NbO_2) : Interactions of NO_2–N_2O_4 and (Dr. Frederick Vratny), 479
Nisonoff, Prof. A., and others : Separation of Univalent Fragments of Rabbit Antibody by Reduction of a Single, Labile Disulphide Bond, 293
Nitowsky, Dr. Harold M., and Herz, Dr. Fritz · Alkaline Phosphatase in Cell Cultures of Human Origin, 756

INDEX

Nitrate Reductase in *Neurospora crassa* : An Iron Requirement for a Dissimilatory (G. C. Walker and Dr. D. J. D. Nicholas), 141
Nitric Oxide : Rates of the Reactions of Nitrogen Atoms with Oxygen and with (M. A. A. Clyne and Dr. B. A. Thrush), 56
Nitric Oxide (Vibrationally Excited), produced in the Flash Photolysis of Nitrosyl Chloride (Dr. N. Basco and Prof. R G. W. Norrish), 455
'Nitric Oxide—and Oxygen Effect' in X-irradiated *Shigella flexneri* (Dr. W. M. Dale, J V. Davies and C Russell), 851
Nitrogen : Apparent Reversal of Xanthine Oxidase in *Chlorella vulgaris* Starved of (Michael K. Bach), 485
Nitrogen-15 · Fixation of, by Excised Nodules of *Discaria toumatou* (Dr. T. M Morrison), 945
  Glutamic Acid Metabolism in Brain and Liver during Infusion with Ammonia labelled with (G. Takagaki, S. Berl, D D. Clarke, D. P. Purpura and Prof. H. Waelsch), 326
Nitrogen (Atmospheric) : Possibility of Fixation of, by the Rice Plant (Dr. M. G R. Hart and Dr. E. H. Roberts), 598
Nitrogen (Radioactive) : Use of, in Studying Nitrogen Fixation in Bacterial Cells and their Extracts (Dr. D. J. D. Nicholas, Dr. D. J. Silvester and Dr. J. F. Fowler), 634
Nitrogen Atom (Asymmetric) : Specification of—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and Quaternary Ammonium Salts (G. Bernáth), 304
Nitrogen Atoms : Rates of the Reactions of, with Oxygen and with Nitric Oxide (M. A. A. Clyne and Dr. B A. Thrush), 56
Nitrogen Fixation in Bacterial Cells and their Extracts : Use of Radioactive Nitrogen in studying (Dr. D. J. D. Nicholas, Dr. D. J. Silvester and Dr. J. F. Fowler), 634
Nitrogen Mustard : Effects of, on the Histochemistry of Mouse Lymphocytic Leukaemia L 1210 (Dr. George J. Furman, Prof. G. Adolph Ackerman and Dr Carl Cohen), 591
Nitrogen Source (A Simultaneous Carbon and), for a *Streptomyces* sp. from Egyptian Soil : Chloramphenicol, a (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775
NO_2–N_2O_4 and Niobium Dioxide (NbO_2) : Interactions of (Dr. Frederick Vratny), 479
Nitrosyl Chloride : Vibrationally Excited Nitric Oxide produced in the Flash Pyrolysis of (Dr. N. Basco and Prof. R. G. W Norrish), 455
Noakes, G. R. : The 1961 Exhibition of the Institute of Physics and the Physical Society, 535
Noble, B. : Elected a Fellow of the Royal Society of Edinburgh, 876
Node (Lymph) Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain : Electrophoretic Patterns of (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025
Nodes (Lymph), immunized against the Host : Survival of Cutaneous Homografts after Transplantation of (Dr. J. Vrubel), 853
Nodules (Excised), of *Discaria toumatou* : Fixation of Nitrogen-15 by (Dr. T. M. Morrison), 945
Nodules (Legume) : Root-knot Nematodes and (P .E. Robinson), 506
Nomenclature of Human Chromosomes, 796
Nomenclature (Cahn–Ingold–Prelog) : Application of the, to some Tertiary Amines and Quaternary Ammonium Salts—Specification of Asymmetric Nitrogen Atom (G. Bernáth), 304
Non-Dividing Bacteria : Replication of Deoxyribonucleic Acid in (Dr. Daisuke Nakada and Dr. Francis J. Ryan), 398
Non-Enzymic Decarboxylation of Methionine by Ferrous Ion (Mendel Mazelis), 305
Non-Graphitic Carbon : Surface Orientation and Friction of Graphite, Graphitic Carbon and (Dr. J. W. Midgley and D. G. Teer), 735
Nonlinear Mechanics : Dynamics and (E. Leimanis and N. Minorsky), review by Prof. A. T. Price, 865
Non-Linearity : Location of the, in Horizontal Cell Response to Retinal Illumination (Dr. Richard Fatehchand, Dr. Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Nord, F. F., and others : 'Active Centre' Studies in Trypsin, 809
Normal Cells : *In vitro* Transformation of, by Polyoma Virus (Dr. Leo Sachs and Dan Medina), 457
Normal Cerebrospinal Fluid : Transferrin in (Dr. Jørgen Clausen and Troels Munkner), 60
Normal Human Sera : Precipitating Factor for Aggregated γ-Globulins in (Dr. A. Taranta, Dr. H. S. Weiss and E. C. Franklin), 239
Normal Liver and the Novikoff Hepatoma Cells of the Rat : Comparative Effects of Liver and Tumour Ribonucleic Acids on the (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Normal Mode Interpretation of the Sound Propagation in Whispering Galleries (Yasuô Sato), 475
Normal Sheep and Sheep affected with Scrapie : Brain Glycogen- and Copper-Levels in (C. le Q. Darcel, R. J. Avery and R. B. Carson), 410
Normal Subjects and in Patients with Partial Gastrectomy : Intestinal Absorption of Vitamin B_{12} and of a Vitamin B_{12}-Peptide Complex in (Dr. G. Milhaud), 31
Normal Threshold of Hearing : British (L. S. Whittle and D. W. Robinson), 617
Normal Tissues of the *C3H* Mouse : Fluorescence and Haemolytic Activity of Tumours and (Dr. Eric Ponder and Ruth V. Ponder), 643
Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in (Prof. N Allegretti and V. Vitale), 673
Norrish, Prof. R. G. W. (Basco, Dr. N., and) : Vibrationally Excited Nitric Oxide produced in the Flash Pyrolysis of Nitrosyl Chloride, 455
North Africa : Science Planning, Development and Co-operation in the Countries of the Middle East and (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
North Atlantic Biogeography (To be published by the American Geographical Society), 358
Northcott, Prof. D. G. : Elected a Fellow of the Royal Society, 967
Northern Affairs and National Resources, Department of (Canada) : Bulletin No. 163, Anthropological Series No. 46, Indian Days on the Western Prairies (Marius Barbeau), 187
Northern Rockling in the Clyde Sea Area (T. B. Bagenal), 1028
Northover, B. J. : Influence of the Charge on a Serum Protein Molecule and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes, 574
Notation for the Gm Groups (Prof. R. Grubb), 845
Notni, P., and Oleak, H. : Rotation Period of the Artificial Satellite 1958δ1, 737
Notonectidae : Degeneration of Flight-musculature in the Corixidae and (E. C. Young), 328
Notter, Dr. Gustaf (Holmgren, Dr. Uno, and) : A Technique for Destruction of the Pineal Body using Yttrium-90 Spheres, 773
Novel Separation Technique : 'Ligand Exchange', a (Dr. F. Helfferich), 1001
Novikoff Hepatoma Cells of the Rat : Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Ntailianas, H. A. (Grimbleby, Dr. F. H., and) : Binding of Trichloroacetic Acid by Protein, 835
Nuclear Energy : Progress in, Series 5, Metallurgy and Fuels, Vol. 2 (edited by H. M. Finniston and J. P. Howe), *review* by Dr. G. A. Geach, 5
  The Real Matter of, *review* by Dr. G. A. Geach, 5
  Text of the Convention on Third Party Liability in the Field of (Organization for European Economic Co-operation, European Nuclear Energy Agency), 444
Nuclear Energy Agency, European (Organization for European Economic Co-operation) : Text of the Convention on Third Party Liability in the Field of Nuclear Energy, 444
Nuclear Energy Agency, European (Organization for European Economic Co-operation), in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H : International Symposium on Criticality Control in Chemical and Metallurgical Plant, 797
Nuclear Explosions (Underground) : Research on the Detection and Identification of (United Kingdom Atomic Energy Authority), 445
Nuclear Fission Reactor : Random Fluctuations in a (L. G. Kemeny and Samaun), 130
Nuclear Fusion (*Journal of Plasma Physics and Thermonuclear Fusion*), Vol. 1, No 1 (International Atomic Energy Agency), 712
Nuclear Incidents : International Laws on, 444
Nuclear Installations : Health Physics in—Symposium organized by the Danish Atomic Energy Commission and the Organization for European Economic Co-operation, 1959, *review* by W. J. Whitehouse, 347
Nuclear Research : Co-operative, 878
Nuclear Test Explosions (Sahara) : Deposition of Fission Product Nuclides after Two (Dr. V. Havlovic), 977
Nuclear Tests : Observations of Fall-out in India during the Period of Cessation of (K. G. Vohra and V. S. Bhatnagar), 286
Nuclear Tests in the Sahara Desert : Radioactive Fall-out in Israel resulting from the (Y. Feige, E. Shalmon, J. Vardi, J. R. Gat (Gutmann), and Y. L. Tokatly), 90
Nuclear and Allied Radiations : The Hazards to Man of—a Second Report (Medical Research Council), 629
Nucleases (Blood), and Infectious Viral Nucleic Acids (Roger M. Herriott, John H. Connolly and Shanta Gupta), 817
Nuclei (Giant), in the Earthworm *Lumbricus* (Dr. R. L. Hancock), 685
Nucleic Acid Preparations from Tobacco Mosaic Virus : Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of (Dr. T. O Diener), 687
Nucleic Acids : Growth of Bacteria labelled with Heavy Isotopes for the Isolation of (Dr. Julius Marmur and Carl L. Schildkraut), 636
  Submolecular Structure of the (Prof. Bernard Pullman and Alberte Pullman), 725
Nucleic Acids in Deuterium Oxide Solution (Y. Kyogoku, M. Tsuboi, T Shimanouchi and I. Watanabe)—An Infra-red Criterion of the Base Pairing in Nucleic Acid Structure, 120; Parallelism of the Hypochromicity at 260 mμ and the Hyperchromicity at 1,685 cm. $^{-1}$ of Nucleic Acids in Deuterium Oxide Solution, 121
Nucleic Acids as Transplantation Antigens (Dr. André Castermans), 504
Nucleic Acids (Infectious Viral) : Blood Nucleases and (Roger M. Herriott, John H. Connolly and Shanta Gupta), 817
Nucleoprotein : A New Effect of Ionizing Radiation on (Dr. G. Hems), 849
Nucleoprotein (Thymus) : Labilization of Deoxyribonucleic Acid in, after Whole-body Irradiation (Dr. Ulrich Hagen), 361
Nucleotide (Diphosphopyridine): Inhibiting Effect of Nicotinamide and, on the Methylcholanthrene Sarcoma in Rats (M. Matsuyama, A. Maekawa and T. Nagayo), 673
Nucleotide (Pyridine) Metabolism in Heliotrine Poisoning (Prof. G. S Christie, R. N. LePage and Margot J. Bailie), 593
Nucleus (Cell) : Uptake of Deoxyribonucleic Acid (DNA)—a Special Property of the (Dr. M. Hill), 916
Nuclides (Fission Product) : Deposition of, after Two Sahara Nuclear Test Explosions (Dr. V. Havlovic), 977
Nuffield Foundation : Grant of £20,000 to the University College of North Staffordshire, for the purpose of setting up and maintaining a special library, to be known as the Nuffield Library, 714
  Fifteenth Annual Report (1959-60), 881
Nuffield Foundation (Royal Society and) Commonwealth Bursaries : Awards, 100
Nuffield Unit of Tropical Animal Ecology, 276
Numbers : Polymers and the Theory of—Molecular Weight Distributions from Rheological Measurements (E. Menefee and W. L. Peticolas), 745
Nutrition : Fundamentals of (E. W. Crampton and L. E. Lloyd), *review* by A. M. Copping, 523
Nutrition Society : Symposium on Calorie Balance in Man, 536
Nutrition and Food Technology : Dictionary of (Dr. Arnold E. Bender), *review* by A. M. Copping, 433
Nutrition and Physical Fitness (Dr. L. Jean Bogert), seventh edition, review, 613
Nyberg, Wolmar, and others : Excretion and Hepatic Storage of 5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58, 764
Nyholm, Prof. R. S., and others : Pyrazine–Metal Halide Complexes—New Types of Metal–Ligand Polymers, 58
Nymphs (Frog Hopper) : A Method of Dissolving the Protective Spittle Masses of (Dr. G. F. Howden and A. T. Marshall), 509

OAT Roots : Location of Manganese taken up in Short-term Absorption by (E. R. Page), 597
Oberfeld, B., and others · Gradient of Cholinesterase Activity and of Choline Acetylase Activity in Nerve Fibres—Gradient of Cholinesterase Activity, 122

Observation (A Radar), of a Sea-Breeze Front (Dr. E. Eastwood and G. C. Rider), 978
Observations of Fall-out in India during the Period of Cessation of Nuclear Tests (K. G. Vohra and V. S. Bhatnagar), 286
Observations (Auroral), at Halley Bay, Antarctica, during 1959 (M. A. Sheret and G. M Thomas), 826
Obtaining Uniform Distribution of Wood Preservatives in Toxicity Test Blocks : A Method of (D. N. R. Smith and R. Cockcroft), 163
Occurrence of an Egg-String in *Enoplus communis* Bastian, 1865 (Nematoda : Enoplidae), (Bruce E. Hopper), 331
Occurrence of Heparin in the Blood of Fish and its Prevention of the Clotting of Fish Plasma (Dr. S. Z. Qasim and R. Hasan), 764
Occurrence of a Species of *Halammohydra* on the Isles of Scilly (Prof. L. A. Harvey and J. B. J. Wells), 944
Occurrence of Whistlers : Spread-F and the Latitude Variation of (D. G. Singleton), 215
Occurring (Naturally) Alpha-Activity of Drinking Water (R. C. Turner, J. M. Radley and Prof. W. V. Mayneord), 348
Ocean (Pacific) Waters : Organic Acids in (Peter M. Williams), 219
Oceanographic Research Ship : New British, 102
Ockner, Robert K., and Schmid, Prof. Rudi : Acquired Porphyria in Man and Rat due to Hexachlorobenzene Intoxication, 499
O'Connell, J. E. A. : Neurosurgery in War-Time, *review*, 344
Octahedral Co-ordination of Nickel in Nickel (II) Bisacetylacetone (Dr. G. J. Bullen, Dr. R. Mason and Dr. Peter Pauling), 291
Oertelis, S. J. (Simpson, F. O., and) : Relationship of the Sarcoplasmic Reticulum to Sarcolemma in Sheep Cardiac Muscle, 758
Œstrogen : Effects of, on Somatic Variation of an Erythrocyte Agglutinogen in Chickens (S. L. Scheinberg and R. Reckel), 295
Oettinger, Prof. Anthony G. : Automatic Language Translation, *review* by Dr. A. D. Booth, 784
Ogilvie, L. : Epidemics of Black (Stem) Rust of Wheat, 285
Ohnuki, Y., and others : Chromosome Anomaly in Two Cases of Cerebral Palsy, a Brother and Sister, 154
Oil : Western Dependence on (Prof. R. J. Sarjant), 626
Oil in Safflower Seed : Estimation of (S. H. Pawlowski), 772
Oil (Croton) : Inhibition of Cellular Respiration by Co-Carcinogenic Fractions of (Dr. A. C. Allison and J. W. Lightbown), 892
Oil (Lime) : Tumour-Promotion by, in the Mouse Forestomach (Winifred E. H. Peirce), 497
Oil (Refined Corn) : Inability of, to Influence Spontaneous Arteriosclerosis of Old Hens (K. F. Gey and Dr. A. Pletscher), 491
Oil Palm Seed : Effect of High-Temperature and Pre-Treatment on the Germination of (A. R. Rees), 74
Oils (Crude) : Proton Relaxation in (R. J. S. Brown), 387
Okumura, Dr. F. Shigeo (Kuraishi, Dr. Susumu, and) : A New Green-Leaf Growth-Stimulating Factor, Phyllococosine, from Coconut Milk, 148
Oláh, E. H., and others : Experimental Data concerning the Connexion between Thyroid Function and Mucopolysaccharide (Hexosamine)-Level, 670
  Mucopolysaccharides and Thyroid Function, 670
Old Hens : Inability of Refined Corn Oil to influence Spontaneous Arterio-sclerosis of (K. F. Gey and Dr. A. Pletscher), 491
Old Sea-Water at its Bottom : A Second Lake with (Kaare Strøm), 913
Olduvai Gorge : New Finds at (Dr. L. S. B Leakey), 649
Olduvai Gorge (Bed I) : Sites yielding Hominid Remains in (J. Desmond Clark), 903
Oleak, H. (Notni, P., and) : Rotation Period of the Artificial Satellite 1958δ1, 737
Ollis, Dr. W. D., and others . Molecular Sieve Behaviour of Dental Enamel, 998
One Person : Four Adult Haemoglobin Types in (Dr. C. Baglioni and Prof. V. M. Ingram), 465
O'Neill, Prof. H. : Elected president of the Institute of Metals, 533
Onkiehong, L., and Desty, D. H. : Gas Chromatography (Hydrogen Flame and Argon Ionization Detectors), 26
Oocytes (Mammalian) : The Pachytene Stage in (B. M. Slizynski), 683
Opal in the Animal Body (G. Baker and L. H. P. Jones), 682
Operational Calculus (Prof. Jan Mikusiński), *review* by Prof. T. A. A. Broadbent, 700
Opie, Dr. Lionel H., and others : Fatty Acid and Glucose Metabolism in the Perfused Heart, 1018
Opium Alkaloids : O-Demethylation as a Biosynthetic Pattern in the Formation of (Frank R. Stermitz and Prof. Henry Rapoport), 310
Opportunities (Better), in Technical Education (Dr. P. F. R. Venables), 701
Optical Demonstration of Bragg's Law (Prof. W. G. Burgers), 741
Optical Rotatory Dispersion of the Thrombin-induced Conversion of Fibrinogen to Fibrin Monomer (Prof. C. M. Kay and M. M. Marsh), 307
Optical Sensitization by Acridine-Orange ; Effects of Light and, on Living Bull Spermatozoa (C. van Duijn, Jun.), 76
Optical Theory (Modern) : A Unified Treatment of, *review* by Dr. C. A. Taylor, 429
Optical and Mechanical Properties of Lattice Defects : Electrical, (Summer School at the University of Ghent on the), (sponsored by NATO), 104
Optics : Principles of (Prof. Max Born and Prof. Emil Wolf), *review* by Dr. C. A. Taylor, 429
Optische Beobachtungen anlässlich der Landung der Sowjetischen Mondrakete *Lunik II* : Bericht über (L. Detre), 186
Orbital (Metallic) : Nature of the (Prof. Linus Pauling), 656
Ord, Margery G., and others : A 'Dry' Mounting Autoradiographic Technique for the Localization of Water-soluble Compounds, 55
Ordnance Survey : Appointment of Brigadier A. H. Dowson as director general, with the rank of Major-General, 104
  Sheet 856, Map of Ilfracombe and District, 713
Organic Acids in Pacific Ocean Waters (Peter M. Williams), 219
Organic Chemistry, . Physical Methods of (edited by Arnold Weissberger), Vol. I, Parts I and 2, third edition, *review* by Dr. W. A. Waters, 954
Organic Compounds : Affinity of, for Free Electrons with Thermal Energy—its Possible Significance in Biology (Dr. J E. Lovelock), 729
  Crystal Structures of (X-Ray Analysis Group of the Institute of Physics and the Physical Society Spring Conference on), 275, 797
  Labelling of, by Mercury-photosensitized Reaction with Tritium Gas (Fulvio Cacace, Angelo Guarino and Gabriella Montefinale), 54
Organic Gold Salt : Effect of an, on Eaton's Primary Atypical Pneumonia Agent and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Organic Halides as Electron Acceptors in Charge Transfer Compounds (T. Bjorvatten, Prof. O. Hassel and Chr. Rømming), 137
Organic Solvents : Enhancement of Atomic Absorption in the Flame by (R. Lockyer, J. E. Scott and Susan Slade), 830
Organic Solvents (Water-miscible) : Activation of Cockroach Acetylcholinesterase by (Dr. E. H. Colhoun), 309
Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet : Experimental Pre-Thrombotic State of an (Prof. B A. Kudrjashov, G. G. Bazaslan, N. P. Sytina and G. V. Andreenko), 67
Organization for European Economic Co-operation (Danish Atomic Energy Commission and the) : Symposium on Health Physics in Nuclear Installations, 1959, *review* by W. J. Whitehouse, 347
Organization for European Economic Co-operation (European Nuclear Energy Agency) : Text of the Convention on Third Party Liability in the Field of Nuclear Energy, 444
Organization for European Economic Co-operation (European Nuclear Energy Agency), in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H. : International Symposium on Criticality Control in Chemical and Metallurgical Plant, 797
Organization of Function in Trypanosome Flagella (Dr. P. J. Walker), 1017
Organization and Financing of Research in Biochemistry and Allied Sciences in Great Britain (edited by K. S. Dodgson), (Biochemical Society), 794
Orientation (Embryonic), in the Hen's Egg : A Method of determining (I. S. Robertson), 854
Orientation (Surface), and Friction of Graphite, Graphitic Carbon and Non-Graphitic Carbon (Dr. J. W. Midgley and D. G. Teer), 735
Origin of Expressed Mutations in *Schizophyllum commune* (Dr. Stanley Dick and Dr. John R. Raper), 81
Origin of some Primary Coal Tar Components (Dr. M. Vahrman), 136
Origin of the Ventral Spino-Cerebellar Tract : Localization of the Cells of (J. I. Hubbard and O. Oscarsson), 157
Origin and Evolution of Coal (Dr. P. J. Adams), 712
Origins of the Copernican Revolution (Dr. J. R. Ravetz), 859
Orla-Jensen, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Orlova, N. V., and others : Genetic Control of Oxytetracycline Biosynthesis, 939
Ornamental Plants : Diseases and Pests of (Pascal P. Pirone, Bernard O. Dodge and Harold W. Rickett), third edition, *review* by Derek A. Reid, 956
Ornithine Transcarbamylase Repression A Requirement for 2-Thiouracil of 2-Thiouracil-grown *Escherichia coli* under Conditions of (Ada Zamir and Dr. Ruth Ben-Ishai), 922
O'Rourke, Prof. Fergus J. : Presence of Blood Antigens in Fish Mucus and its Possible Parasitological Significance, 943
Oryza sativa Linn. : Differential Radiosensitivity in Rice, at the Genotypic Level (H. K. Shama Rao and K. C. Bora), 762
Oscarsson, O., and others : Anionic Permeability of the Inhibitory Postsynaptic Membrane of Motoneurones, 65
Oscarsson, O. (Hubbard, J. I., and) : Localization of the Cells of Origin of the Ventral Spino-Cerebellar Tract, 157
Oscillation Broadening of Lines from Ionized Elements in Stellar Spectra (Gunnar Eriksen), 651
Oscillations : Frictional (R. T. Spurr), 50
Osmond, Dr. D. A., and Bullock, P. : Soil Fauna in relation to Soil Formation and Fertility (Soil Fauna in relation to Pedology), 367
Oster, Dr. Ludwig, and Philip, Kenelm W. : Existence of Net Electric Charges on Stars, 43
Ottaway, Prof. C. W. : Vertebrate Locomotion (Terrestrial Locomotion of Dogs and Horses), 98
Out-of-Focus Electron Microscope Images of Edges of Crystal Lattices (J. M. Cowley and A. F. Moodie), 477
Outer Space : The Condition of (Sir Bernard Lovell), 625
Overseas Governments : Service with (Colonial Office), 29
Owen, Richard : Request from Prof. Jacob W. Gruber for biographical material relating to, 796
Overflow of Cold Deep Water across the Iceland–Greenland Ridge (J. G Harvey), 911
Ovine Foetal Resorption caused by *Toxoplasma gondii* Infection (I. D. Smith), 939
Oxidant (Hill) : A New Leaf Copper Protein 'Plastocyanin', a Natural (Dr Sakae Katoh and Dr. Atusi Takamiya), 665
Oxidants (Anti-) in the Rat : Role of Tocopherol, Selenium and (E. E. Edwin, J. Bunyan, A. T. Diplock and J. Green), 737
Oxidase (Monoamine) Inhibitor : Local Treatment of Experimental Burns with a (W. G. Spector and D. A. Willoughby), 489
Oxidase (Total Cytochrome) Activity, and its relation to Basal and Maximal Metabolism (Dr. Ladislav Jánsky), 921
Oxidase (Xanthine) Action : Apparent Reversal of, in *Chlorella vulgaris* Starved of Nitrogen (Michael K. Bach), 485
Oxidation of Chromium (II) Amines by Water (Kenneth D. Kopple, George F. Svatos and Prof. Henry Taube), 393
Oxidation, Hydration, Dehydration and Cracking Catalysts (edited by Paul H. Emmett), (Catalysis, Vol. 7), *review* by Dr. E. B. Maxted, 88
Oxidation (Anodic), in Formic Acid : Micropitting of Titanium during (R. A. Piggott and Dr. L. L. Shreir), 216
Oxidation (Chemical), of Uridine Diphosphate-Glucose to Uridine Diphosphate-Glucuronic Acid (Dr. Bernard Jacobson and Dr. Eugene A. Davidson), 663
Oxidation (Energy-linked Cytochrome), in Mitochondria (Prof. Britton Chance), 719
Oxide (Deuterium) Solution : Nucleic Acids in (Y. Kyogoku, M. Tsuboi, T. Shimanouchi and I. Watanabe)—An Infra-red Criterion of the Base Pairing in Nucleic Acid Structure, 120 ; Parallelism of the Hypochromicity at 260 mμ and the Hyperchromicity at 1,685 cm^{-1} of Nucleic Acids in Deuterium Oxide Solution, 121
Oxide (Nitric) : Rates of the Reactions of Nitrogen Atoms with Oxygen and with (M. A. A. Clyne and Dr. B. A. Thrush), 56
  Vibrationally Excited, produced in the Flash Photolysis of Nitrosyl Chloride (Dr. N. Basco and Prof. R. G. W. Norrish), 455
Oxide ('Nitric)—and Oxygen Effect' in X-Irradiated *Shigella flexneri* (Dr. W. M. Dale, J. V. Davies and C. Russell), 851
Oximase (Transoximase–) Reaction : Glutamic Acid Formation by (Prof. K. Yamafuji, S. Hatano and A. Ida), 397

Oxygen and with Nitric Oxide . Rates of the Reactions of Nitrogen Atoms with (M. A. A. Clyne and Dr. B. A. Thrush), 56
Oxygen Atoms · Reaction of, with Hydrogen (M. A. A. Clyne and Dr. B. A. Thrush), 135
Oxygen Effect' : 'Nitric Oxide—and, in X-Irradiated *Shigella flexneri* (Dr. W. M. Dale, J. V. Davies and C. Russell), 851
Oxygen Tension in the Spleen of Mice : Effect of Radioactive Sulphydryl Compounds on the (Dr. C. van der Meer, P. W. Valkenburg and M. Remmelts), 588
Oxytetracycline bound to Bone : Detection by Fluorescence of (Dr. Erminio Muzii), 934
Oxytetracycline Biosynthesis · Genetic Control of (S. I Alikhanian, N. V. Orlova, S. Z. Mindlin and Z. M. Zaitzeva), 939

PAAKKOLA, O., and others : Strontium-90 and Caesium-137 in Grass and Milk in Finland during 1959, 324
Paál, Gy. (Balázs, B., and) : The Interpretation of Cosmology, 992
Pachytene Stage in Mammalian Oocytes (B. M. Slizynski), 683
Pacific Ocean Waters : Organic Acids in (Peter M. Williams), 219
Pacific Science Congress : Tenth, 188
Page, E. R. : Location of Manganese taken up in Short-term Absorption by Oat Roots, 597
Pakistan : More Planning in (Political and Economic Planning, Broadsheet No. 446), 539
Palaeoecology of Carboniferous Peat Bogs (A. H V. Smith), 744
Palaeomagnetic Evidence relevant to a Change in the Earth's Radius (Allan Cox and Richard R. Doell), 45
Palaeomagnetism (Institute of Physics and the Physical Society Conference on), 534
Palaeomagnetism in some East Greenland Sedimentary Rocks (D. E. T. Bidgood and W. B. Harland), 633
Palm (Oil) Seed : Effect of High-Temperature and Pre-Treatment on the Germination of (A. R. Rees), 74
Palsy (Cerebral) · Chromosome Anomaly in Two Cases of, a Brother and Sister (Dr J. Blumel, Y. Ohnuki and A. Awa), 154
Pancreatic Enzymes (Intestinal and), in Rats : Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by (S. K Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Pancreatic Ribonuclease : Use of Snake Venom Phosphodiesterase in place of, for the Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus (Dr. T. O. Diener), 687
Pande, P. G., and others . Examination of *Leptospira pomona* by Gel Diffusion, 511
Pangolin (An Extinct Giant), and associated Mammals from Niah Cave, Sarawak (Tom Harrisson, D. A. Hooijer and Lord Medway), 166
Panov, D. Yu : Automatic Translation (translated from the Russian by R. Kisch, edited by A. J. Mitchell), *review* by Dr. A. D Booth, 784
Pantothenic Acid (Calcium Pantothenate) : Effects of, and of Thyroxine on the Development of Chicken Embryos (Prof. C. Vacca, G. V. Pelagalli and A. Schiavo), 66
Paper Chromatographic Method (A Simple), for Determination of Amino-Acid Activation Profiles in Tissue Preparations (Dr Alexandra von der Decken), 145
Parameter (Lorenz) : Anomalous Conductivity and, in Dilute Silver–Manganese Alloys at Low Temperatures (Dr. M. S. R. Chari), 824
β_2A-Paraproteinaemia : Identification of So-called Atypical Macroglobulinaemia as an Atypical Form of—a New Immunological Entity? (R. E. Ballieux, Dr. J W. Imhof and G. H. Niehaus), 768
Parasitic Hymenopteran *Nasonia vitripennis* : A Possible Method of Sex Ratio Determination in the (Dr. P. E. King), 330
Parasitological Research : Recent Advances in Fields of (Parasitology Group of the Institute of Biology Discussion on), 192
Parasitological Significance : Presence of Blood Antigens in Fish Mucus and its Possible (Prof. Fergus J. O'Rourke), 943
Parasitology : Research in (Sheila Willmott), 192
Parental Strain : Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025
Park Guides (National) : No. 3, Peak District (edited by Patrick Monkhouse), 533
Parkin, J. · Evolution of the Flower, *review*, 519
Parks (National), in Britain : Afforestation in, 711
Parrish, B. B : Elected a Fellow of the Royal Society of Edinburgh, 876
Parsons, Rosemary, and Tyrrell, Dr. D A. J. : A Plaque Method for Assaying some Viruses isolated from Common Colds, 640
Partial Gastrectomy : Intestinal Absorption of Vitamin B_{12} and of a Vitamin B_{12}-Peptide Complex in Normal Subjects and in Patients with (Dr. G. Milhaud), 31
Particle Beds : Flow Patterns in (N. J. Hassett), 997
Particle Displacements (Radial), in Poiseuille Flow of Suspensions (Dr. G. Segré and Dr. A. Silberberg), 209
Particles ingested by *Simulium* Larvae : Size of (T. R. Williams, R. Connolly, H. B N Hynes and Prof W. E Kershaw), 78
Particles (Cytoplasmic) : Ethylene Production by, from Apple and Tomato Fruits in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr. C C Craft), 243
Particles (Electrically Charged), in Tobacco Smoke : Possible Biological Effects of (Dr. K. H. Kingdon), 180
Particles (Latex) : Thread-like Reticulum in Latex from *Hevea brasiliensis* and its relation to (W A. Southorn), 1000
Particles (Resin) : Uptake of Small, by the Alimentary Canal of the Calf (J. M. Payne and B F. Sansom), 494
Particles (Sub-micron) : Sampling of, for Electron Microscopy (C. E. Billings, W. J. Megaw and R. D. Wiffen), 336
Partition of Calcium and Phosphorus Excretion in the Laying Hen (S. Hurwitz and Prof. P Griminger), 759
Pasini, C., and others : *In vitro* Decarboxylation of Tryptophans by Mammalian Decarboxylase, 483
Passive Films formed in the Kolbe Reaction : Delayed Gas Evolution from (Prof B. E. Conway and M. Dzieciuch), 914

Pigman, Dr. Ward, and others : Rehardening of Softened Enamel Surfaces of Human Teeth by Solutions of Calcium Phosphates, 226
  Bovine Submaxillary Mucin, 399
Pigment (Yellow), of *Drosophila* : Enzymatic Reduction of the (Toshifumi Taira), 231
Pigmentation (Lipofuscin), of Sheep Livers in Australia (Dr. Hans Winter), 674
Pigs (New-born) : Characteristics of γ-Globulin, lacking Antibody Properties, in (Dr. F. Franek, Dr. I. Ríha and Dr. J. Sterzl), 1020
Pilkington, T. R E., and others : Function of the Hypophysis–Thyroid System in the Rabbit Foetus with regard to Cholesterol Metabolism, 318
Pilkington Brothers and the Glass Industry (T. C. Barker), *review* by Prof. R. W Douglas, 342
Pilton, Phyllis E. · Reproduction in the Great Grey Kangaroo, 984
Pineal Body : A Technique for Destruction of the, using Yttrium-90 Spheres (Dr. Uno Holmgren and Dr. Gustaf Notter), 773
Pioneer Crop on Culm Measure Soil with Impeded Drainage : Phosphate Requirement of Lupins grown as a (S. Larsen and D. Gunary), 691
Pirani, Dr. F. A. E. : Title of reader in mathematics in the University of London (at King's College) conferred on, 188
Piricularia oryzae Cav. on the Rice Plant : Relations of Intensity of Photosynthesis and Appearance of (R. Vámos, F. Zsoldos and I. Petrasovits), 407
Pirone, Pascal P., and others : Diseases and Pests of Ornamental Plants, third edition, *review* by Derek A. Reid, 956
Pitcher, Dr. R. S. · Recent Developments in Plant Nematology (Nematode Vectors of Virus Diseases), 716
Pitot, Henry, in collaboration with Potter, V. R. : Biochemistry of Human Tumours (Enzymatic Constitution of a series of Transplanted Rat Hepatomas as compared with that of Normal and Regenerating Liver), 628
Pituitary Hormones (Posterior) · Evidence for the Granular Localization of (Shawn Schapiro and Lennart Stjarne), 669
Plackett, P. : Glycerol in *Mycoplasma mycoides*—A Polyglycerophosphate Compound from *Mycoplasma mycoides*, 125
Plan : Prelude to a (Annual Report for 1959 of the Bernice P. Bishop Museum, Hawaii), 20
Planas, Prof. Jose, and others : Serum Iron and its Transport Mechanism in the Fowl, 668
Planning in Pakistan : More (Political and Economic Planning, Broadsheet No. 446), 539
Planning Board : A Science, 453
Plant *Chenopodium amaranticolor* : Promotion of Leaf Growth by Short Days in the Short-Day (Roderick G Thomas), 771
Plant (Chemical and Metallurgical) : Criticality Control in (European Nuclear Energy Agency of the Organization for European Economic Co-operation in collaboration with Kernreaktor Bau- und Betriebsgesellschaft m.b.H. International Symposium on), 797
Plant (Rice) : Possibility of Fixation of Atmospheric Nitrogen by the (Dr. M. G. R. Hart and Dr. E. H. Roberts), 598
  Relations of Intensity of Photosynthesis and Appearance of *Piricularia oryzae* Cav. in the (R. Vámos, F. Zsoldos and I. Petrasovits), 407
Plant (Vacuum) : User Experience of Large-Scale Industrial (Institution of Mechanical Engineers Symposium on), 275
Plant (Young Carnation) . Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a Seed Dressing, in the Tissues of the (June Robson and P. Fenn), 501
Plant Anatomy : Introduction to, review by Dr. C. R. Metcalfe, 864
Plant Breeding, Indian Society of Genetics and · Election of Officers, 796
Plant Bugs : Centrosema Mosaic, a Plant Virus Disease transmitted by both Aphids and (R. J. Van Velsen and Dr. N. C. Crowley), 858
Plant Diseases : Viruses and (Dr. L. O. Kunkel), 630 ; (Dr. Karl Maramorosch), 630
Plant Growth : Soil Physical Conditions affecting (National Vegetable Research Station Association Members' Day), 625
Plant Morphogenesis (Prof. Edmund W. Sinnott), *review* by Prof. C. W. Wardlaw, 697
Plant Nematology : Recent Developments in (Association of Applied Biologists Symposium on), 715
Plant Phenolics in Industry : The Importance of (Plant Phenolics Group Meeting on), 625
Plant Phenolics Group : Meeting on the Importance of Plant Phenolics in Industry, 625
Plant Protection : Hygiene and (L. I. Medved), 279
Plant Virus Disease transmitted by both Aphids and Plant Bugs : Centrosema Mosaic, a (R. J. Van Velsen and Dr. N. C. Crowley), 858
Plant- and Soil-Water Relations : Terminology in (Dr. M. L. McGlashan), 207 ; (Dr. R. O. Slatyer and Dr. S. A. Taylor), 208
Plants : Effect of Polyhydric Alcohols to Frost Hardness in (Dr. Akira Sakai), 416
  The Water Relations of (British Ecological Society Symposium on), 970
Plants (Green) : Trapped Primary Product of Photosynthesis in (Alexander Muller and Dr. H. T. Witt), 944
Plants (Higher): Studies of Climatic Ecotypes in—the Temperature Dependence of Apparent Photosynthesis in Different Populations of *Solidago virgaurea* (O. Bjorkman, C. Florell and P. Holmgren), 624
Plants (Ornamental): Diseases and Pests of (Pascal P. Pirone, Bernard O. Dodge and Harold W. Rickett), third edition, review by Derek A. Reid, 956
Plants (Seed) : Anatomy of (Prof. Katherine Esau), review by Dr. C. R. Metcalfe, 864
Plants (Tomato) : Absorption and Breakdown of Iron–Ethylenediamine Tetraacetic Acid by (Dr. D. G. Hill-Cottingham and C. P. Lloyd-Jones), 312
Plants (Tomato) grown on Sodium-deficient Water Cultures : Growth of a Nematode in (A. F. Bird and P. F. Brownell), 418
Plants and Soils : Soluble Aluminium in (S. A. Harris), 513
Plaque (Dental) : Nature and Composition of (D. J. Millin and M. H. Smith), 664
Plaque Method for Assaying some Viruses isolated from Common Colds (Rosemary Parsons and Dr. D. A. J. Tyrrell), 640
Plasma (Fish) : Occurrence of Heparin in the Blood of Fish and its Prevention of the Clotting of (Dr S. Z. Qasim and R. Hasan), 764
Plasma (Human) : Strontium-90 in (Dr. G. E. Harrison, Alice Sutton and Dr. W D'A. Maycock), 324
Plasma-flow (Renal) : Conjugation of *p*-Aminohippurate by the Kidney and Effective (Dr. B. P. Setchell and E. Blanch), 230
Plasma Membranes and Mitochondrial Equivalents as Functionally Coordinated Structures (Prof. Stuart Mudd, Dr. Tomio Kawata, John I. Payne, Dr Theodore Sall and Prof. Atsushi Takagi), 79
Plastic Changes of Spinal Monosynpatic Responses from Tenotomized Muscles in Cats (Dr. W. Kozak and Dr. R. A. Westerman), 753
Plasticity : Elasticity and (Prof. J. N. Goodier and Prof. P. G. Hodge), *review* by Prof A. T. Price, 865
  Elementary (Imperial College of Science and Technology, London, Course on), 447
Plastics Convention : Ninth German (Deutsche Kunststoff-Industrie), 625
'Plastocyanin' : A New Leaf Copper Protein—a Natural Hill Oxidant (Dr. Sakae Katoh and Dr. Atusi Takamiya), 665
Platelets (Human Blood) . Fibrinolytic Activities present in (Dr. Rudolf Holemans and Dr. Rudolf Gross), 238
Platinum Medal for 1961 of the Institute of Metals awarded to Major C. J. P. Ball, 533
Platt, Kenneth H. : Appointed secretary of the Institution of Mechanical Engineers, 534
Pledge, H. T. : *Obituary* by Dr. S E. Janson, 357
Pletscher, Dr A. (Gey, K. F., and) : Inability of Refined Corn Oil to Influence Spontaneous Arteriosclerosis of Old Hens, 491
Pneumococcus: Two New Amino-Sugars from an Antigenic Polysaccharide of (Dr. S A. Barker, Dr J. S Brimacombe, M. J. Hay, Prof. M. Stacey and Dr J. M. Williams), 303
Pneumococcus Type XIV Polysaccharide: Monosaccharide Sequence in (Dr. S. A Barker, M. C. Keith and Prof. M. Stacey), 746
Pneumonia Agent (Eaton's Primary Atypical) : Effect of an Organic Gold Salt on, and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Poa (New Zealand) : High Polyploidy in a (J. B. Hair and E. J. Beuzenberg), 160
Pocock, P. J. : Wind Tunnels and Flow Visualization, 109
Point-Contact Diodes (Gallium Phosphide) : Radiative Recombination in (Dr H. C. Gorton, Dr. J. M. Swartz and Dr. C. S. Peet), 361
Point Defects in Titanium and Zirconium : Production and Mobility of (E. Smith and M. S Stagg), 300
Pointed Filaments for the Electron Microscope : Simple Methods for preparing (Dr. D. E. Bradley), 298
Poiseuille Flow of Suspensions : Radial Particle Displacements in (Dr. G. Segré and Dr A. Silberberg), 209
Poisoning (Heliotrine) · Pyridine Nucleotide Metabolism in (Prof. G. S. Christie, R. N LePage and Margot J. Bailie), 593
Poland : History of Science in, 103
Polar Axis : X-Ray Correlation of the A-B Layer Order of Cadmium Selenide with the Sign of the (R. Zare, W. R. Cook, Jun., and L. R. Shiozawa), 217

Polarographic Behaviour of Chromium–Dipyridyl Complexes (Dr. A. A. Vlček), 393
Policy : A National Fuel and Power—a Policy Statement (Association of Scientific Workers), 626
Policy in Perspective—Report of the British Association for Commercial and Industrial Education Annual Conference (Cambridge, 1960), 863
Poliomyelitis : Third Report of the Expert Committee on (United Nations, World Health Organization, Technical Report Series No. 203), 542
Polish Academy of Sciences : *Quarterly Review of Publications*, 186
Polish Scientific Publications, 186
Political and Economic Planning : Broadsheet No. 446, More Planning in Pakistan, 539
  Broadsheet No. 447, Community Mental Health Services, 717
Pollard, E. C. : Primary and Initial Effects of Ionizing Radiations (Use of Radiation as an Analytical Method for determining the Size and Shape of Functional Units within Cells), 111
Pollen Germination in some Gramineae (Dr. P. O. Wiehe), 328
Polunin, Dr. I. : Impact of Man on the Vegetation of the Humid Tropics (Social and Economic Aspects of Early Man's Action on the Forests—Aspects of Human Health and Disease under conditions of Shifting Cultivation), 25
Poly-β-Hydroxybutyric Acid in Bacteria : Enzymatic Synthesis of (Dr. J. M. Merrick and Prof. M. Doudoroff), 890
Pólya, Dr. L. : Injury by Soaking of *Populus alba* Seeds, 159
Polyethylene : Effect of Corona Discharges on (L. R. Hougen), 274
Polyethylene Glycol Use of, in Biology (Dr. J. H. Fraser), 241
Polyglycerophosphate Compound from *Mycoplasma mycoides* (Glycerol in *Mycoplasma mycoides*), (P. Plackett), 125
Polyhydric Alcohols : Effect of, to Frost Hardiness in Plants (Dr. Akira Sakai), 416
Polyisoprene : Incorporation of [1-^{14}C]-*iso*Pentenyl Pyrophosphate into (B. L. Archer, G. Ayrey, E. G. Cockbain and G. P. McSweeney), 663
Polylysine : Effect of, on the Absorption Spectrum of Haemin (Dr. G. Blauer), 396
Polymer Monolayers (J. M Hammond, Monica H. Williams and W. G. P. Robertson), 549
Polymers : Direct-Current Conductivity of Textiles, Proteins and other (Dr. C. P. S. Taylor), 388
Polymers (Thermosetting) : Method for Studying Thermal Stability of Bulk (R. W. Warfield), 1002
Polymers and the Theory of Numbers—Molecular Weight Distributions from Rheological Measurements (E. Menefee and W. L. Peticolas), 745
Polymers (High) : Rapid Identification of, using a Simple Pyrolysis Unit with a Gas–Liquid Chromatograph (C. E. Roland Jones and A. F. Moyles), 222
Polymers (Metal–Ligand) : Pyrazine–Metal Halide Complexes—New Types of (Dr. A. B. P. Lever, Dr. J. Lewis and Prof. R S. Nyholm), 58
Polymorph of Rankinite : Kilchoanite, a (Dr. S. O. Agrell and Dr. P. Gay), 743
Polymorphisms (Genetic), in the Egg Albumen Proteins of the Domestic Fowl (I. E. Lush), 981
Polynuclear Hydrocarbons : Mammary Cancer induced by a Single Feeding of, and its Suppression (Prof. Charles Huggins, Lorraine C. Grand and Filomena P. Brillantes), 204
Polyoma Virus : *In vitro* Transformation of Normal Cells by (Dr. Leo Sachs and Dan Medina), 457
Polypeptide Chains of Haemoglobin A_2 (Dr. E. R. Huehns and Dr. E. M. Shooter), 918
Polypeptides which affect Smooth Muscles and Blood Vessels—Proceedings of a Symposium held in London, 1959 (edited by M. Schachter), (Biological Council's Co-ordinating Committee for Symposia on Drug Action Series, Vol. 4), *review* by Prof. J. H. Gaddum, 257
Polyphemus pediculus (L.) (Crustacea, Cladocera) : Biliverdin in the Eyes of (J. Green), 227
Polyploidy (High), in a New Zealand *Poa* (J. B. Hair and E. J. Beuzenberg), 160
Polysaccharide (Antigenic), of *Pneumococcus* : Two New Amino-Sugars from an (Dr. S A. Barker, Dr. J. S. Brimacombe, M. J. Hay, Prof. M. Stacey and Dr. J. M. Williams), 303
Polysaccharide (*Pneumococcus* Type XIV) : Monosaccharide Sequence in (Dr. S. A. Barker, M. C Keith and Prof. M Stacey), 746
Polysaccharide (Seaweed) : Isolation of L-Galactose-6-sulphate from a (J. R Turvey and Dr. D A. Rees), 831
Polysaccharides : Sulphated, *review* by Dr. W J. Whelan, 256
Polysaccharides in Biology—Transactions of the Fourth Conference, Princeton, 1958 (edited by G. F. Springer), *review* by Dr. W. J. Whelan, 256
Polysaccharides of *Mycobacterium phlei* (R J. German, Dr. A. S. Jones and M. Nadarajah), 1008
Ponder, Dr. Eric, and Ponder, Ruth V. : Fluorescence and Haemolytic Activity of Tumours and Normal Tissues of the *C3H* Mouse, 643
Ponder, Ruth V. (Ponder, Dr. Eric, and) : Fluorescence and Haemolytic Activity of Tumours and Normal Tissues of the *C3H* Mouse, 643
Poole, D. F. G., and others : Molecular Sieve Behaviour of Dental Enamel, 998
Poole, D. M., and others : Some Properties of Scandium Metal, 566
Poole, E. W. : Nervous Activity in relation to the Respiratory Cycle, 579
Popjak, Dr. G. J. : Elected a Fellow of the Royal Society, 967
Pople, Dr. J. A. : Elected a Fellow of the Royal Society, 967
Popovic, Prof. Dragoslav : Appointed director of the International Atomic Energy Agency's Safeguards Division, 970
Poppy–Fumaria Alkaloids : Distribution of certain, and a Possible Link with the Incidence of Glaucoma (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
Popular Handbook of Rarer British Birds (P. A. D. Hollom), *review* by Sir Landsborough Thomson, 7
Population Subjects : Studies on Medical and, No. 16, Area of Residence of Mental Hospital Patients (Registrar General), 716
Population (World) Conflicting Hypotheses on the Growth of (Dr. Max Pettersson), 1032
Populations (Brazilian Human) : Lethal Mutations in (Prof N. Freire-Maia, A. Freire-Maia and A. Quelce-Salgado), 80
Populations (Different), of *Solidago virgaurea* : Studies of Climatic Ecotypes in Higher Plants—the Temperature Dependence of Apparent Photosynthesis in (O. Bjorkman, C. Florell and P. Holmgren), 624
Populations (*Drosophila*) : Diurnal Temperature Fluctuation and Genetic Variance in (J. A. Beardmore), 162
Populations (Tropical) : Haptoglobins and Transferrins of Two (Dr. B S. Blumberg and Zora Gentile), 897
Populus alba Seeds : Injury by Soaking of (Dr. L. Pólya), 159
Porter, Prof. R. Clay : Wind Tunnels and Flow Visualization, 109
Pork Muscle : Rate of Anaerobic Glycolysis versus Structure in (J. Wismer-Pedersen and E. J. Briskey), 318
Porosities : Tissue Responses to Filter Membranes of various (Prof. R. C. Curran and J. A. M. Ager), 1023
Porous Glass Chromatography (Herbert L. MacDonell), 302
Porous Materials : Diffusion through (J. R. Bell and Dr P. Grosberg), 980
Porous Media : Tortuosity in (Dr. Philip B. Lorenz), 386
Porphyria (Acquired), in Man and Rat due to Hexachlorobenzene Intoxication (Robert K. Ockner and Prof. Rudi Schmid), 499
Portal Blood Ammonia : Rapid Reduction of (O. W. Wendel and E. M. Brophy), 404
Porter, Prof. Gerald B. (Gerry, Michael C. L., and) : Photolysis of Ethyl Iodide Solutions, 655
Porteus, Prof. S. D., and Diamond, A. L. : Measurement of Psychomotor Perseverative Tendencies, 691
Portuguese East African : Coronary Artery of the (Joseph Gillman, Christine Gilbert and Manuel D. Prates), 623
Posener, Dr. P. W. : Utilization of Water in Australia, 538
Positive Ions : Emission of Soft Electromagnetic Radiation from Metals by the Impact of High-Energy Protons and (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Possibility of Fixation of Atmospheric Nitrogen by the Rice Plant (Dr. M. G. R. Hart and Dr. E. H. Roberts), 598
Possibility of Ionic Dissociation at the Peptide Linkage (P. F. Browne), 658
Possibility of Therapeutic Applications of Beams of Negative π-Mesons (Dr. P. H Fowler and Dr. D. H. Perkins), 524
Possible Basis of Drug Resistance in Leukaemia : Increased Dihydrofolate Reductase Activity as a (Dr. D. K. Misra, Stewart R. Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Possible Biological Effects of Electrically Charged Particles in Tobacco Smoke (Dr. K. H. Kingdon), 180
Possible Explanation of some Aspects of Drug Action : Repression and De-repression of Enzyme Synthesis as a (Prof. Louis Shuster), 314
Possible Link with the Incidence of Glaucoma : Distribution of certain Poppy–Fumaria Alkaloids and a (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr. James Walker), 198
Possible Method of Sex Ratio Determination in the Parasitic Hymenopteran *Nasonia vitripennis* (Dr. P. E. King), 330
Possible Parasitological Significance : Presence of Blood Antigens in Fish Mucus and its (Prof. Fergus J. O'Rourke), 943
Possible Relationship to Favism : Action of *Vicia faba* on Erythrocytes—(Dr. J. E. Bowman and Dr. D. G. Walker), 555
Possible Role in Photosynthesis : Spectral Characteristics of Aggregated Chlorophyll and its (Seymour Steven Brody and Marcia Brody), 547
Possible Significance in Biology : Affinity of Organic Compounds for Free Electrons with Thermal Energy—its (Dr J. E. Lovelock), 729
Possible Sources of Tartronate Deficiency in Man (Laurence G. Wesson), 147
Post-School Certificate and Higher Education in Nigeria : The Report of the Commission on—Investment in Education, 169
Post-Secondary and Higher Education in Nigeria (Dr. C. T. Mortimer), 95
Post Office Telephone Service (Debate in the House of Lords), 532
Post Treatment : Modification of Radiation Damage in Seeds by (Dr. W. Klingmuller), 413
Postal and Telecommunications Services, Netherlands (Staff of the Ionosphere and Radio-Astronomy Section of the) : The Cosmic Ray Flare on November 12, 1960, and Solar Activity during the period November 10-15, 1960, 438
Poster, A. : Powder Metallurgy (Slip Casting of Metal Powders), 366
Posterior Pituitary Hormones : Evidence for the Granular Localization of (Shawn Schapiro and Lennart Stjarne), 669
Postgraduate Course on Engineering Aspects of Lubrication (Imperial College of Science and Technology, London), 624
Postgraduate Education for General Practitioners, 103
Postgraduate Medical School of London : Title of reader in clinical rheology conferred on D. G. Melrose, 534
Postsynaptic Membrane (Inhibitory), of Motoneurones : Anionic Permeability of the (Dr. T. Araki, M. Ito and O. Oscarsson), 65
Potassium-Contracture of 'Slow' and 'Fast' Skeletal Muscle Fibres of the Frog Influence of Calcium on the (P. Pauschinger and Prof. K. Brecht), 583
Potassium Tartrate : Use of, for Equilibrium Density-gradient Centrifugation of Animal Viruses (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Potassium-rich Media : Significance of Membrane Calcium in Calcium-free and (Prof. K. Koketsu and S. Miyamoto), 403
Potato Root Eelworm in the Canary Islands (R. Chamberlain), 773
Potential (Action), with an Artificial *p*H-Muscle (D. H. Walters, Prof. W. Kuhn and Hans J. Kuhn), 381
Potential (Ionization) : Vibration Frequency and—Halide Molecules (S. S Mitra), 914
Potentials (Recurrent Response) : Photographic Cumulation of (Prof Lorrin A. Riggs, C. R. Cavonius and Dr. E. Parker Johnson), 383
Potter, Betty Ann (McGeachin, Prof. Robert L., and) : Electrophoretic Behaviour of Rat Serum Amylase, 751
Potter, V. R. : Biochemistry of Human Tumours (Technique for Enzyme Assays with Very Small Samples), 627
Potter, V. R. (Pitot, Henry, in collaboration with) : Biochemistry of Human Tumours (Enzymatic Constitution of a series of Transplanted Rat Hepatomas as compared with that of Normal and Regenerating Liver), 628
Powder Metallurgy (Metal Powder Industries Federation and the Metallurgical Society of the American Institute of Mining and Metallurgical Engineers International Conference on), 365
Power, Ministry of : Appointment of M. A. L. Banks as a member of the Advisory Council on Research and Development, 188
Power Policy : A National Fuel and—a Policy Statement (Association of Scientific Workers), 626
Powers, E. L. : Primary and Initial Effects of Ionizing Radiations (Electron Spin Resonance Method to confirm the presence of a number of Different Types of Trapped Free Radicals), 112
Poynton, J. C. : Biogeography of South-East Africa, 801

Pozsár, B., and others : Effects of Pulped Soybean Silage on the Milk-yield of Cows, 492
Practical Training in the Electrical Engineering Industry : The Training of Graduates—a Report of the Joint Committee on, revised re-issue (Institution of Electrical Engineers), 542
Practitioners (General) : Postgraduate Education for, 103
Prairies (Western) : Indian Days on the (Marius Barbeau), 187
Pranatis, A. L , and Seigle, L. L : Powder Metallurgy (Sintering of Iron, Copper and Nickel), 366
Praslička, Dr. M. (Mráz, L., and) : Influence of Hypothermia on the Survival of Mice after Large Doses of X-Radiation, 677
Prates, Manuel D., and others : Coronary Artery of the Portuguese East African, 623
Pratt, J. G. D. : Tides at Shackleton, Weddell Sea (Trans-Antarctic Expedition, 1955-1958, Scientific Reports, No. 4), *review* by J R. Rossiter, 346
  A Gravity Traverse of Antarctica (Trans-Antarctic Expedition, 1955-1958, Scientific Reports No. 2), *review* by G. de Q Robin, 781
  Seismic Soundings across Antarctica (Trans-Antarctic Expedition, 1955-1958, Scientific Reports No. 3), *review* by G. de Q. Robin, 781
Pre-Thrombotic State (Experimental), of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet (Prof. B. A. Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
Pre-Treatment : Effect of High-Temperature and, on the Germination of Oil Palm Seed (A. R. Rees), 74
Precipitating Factor for Aggregated γ-Globulins in Normal Human Sera (Dr. A. Taranta, Dr. H S Weiss and E. C. Franklin), 239
Précis of Mathematical Logic (J. M. Bocheński), translated from the French and German editions by Otto Bird, *review* by F. I G. Rawlins, 88
Prehistoric Man : The Gods of (Prof. Johannes Maringer), translated from the German by Mary Ilford, *review* by Prof. R J. C Atkinson, 610
Prejudice (Racial), and Mental Health, *review* by T. H. Hawkins, 173
Prelude to a Plan (Annual Report for 1959 of the Bernice P. Bishop Museum, Hawaii), 20
Preparation (Rapid), of Fresh Frozen Sections of Barley Roots (Dr. Maurice Fried and Alicelia H Franklin), 414
Preparations (Compounded Medicinal) : Labelling Procedure for (Association of British Pharmaceutical Industry, the Proprietary Association of Great Britain and the Association of Public Analysts), 712
Preparations (Nucleic Acid), from Tobacco Mosaic Virus : Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of (Dr. T. O. Diener), 687
Preparations (Tissue) : A Simple Paper Chromatographic Method for Determination of Amino-Acid Activation Profiles in (Dr. Alexander von der Decken), 145
Preparing Pointed Filaments for the Electron Microscope : Simple Methods for (Dr D. E. Bradley), 298
Presence of Blood Antigens in Fish Mucus and its Possible Parasitological Significance (Prof. Fergus J. O'Rourke), 943
Presence of Enterochromaffin Cells in the Gut of Amphioxus (Dr. Giuseppe Gerzeli), 237
Presence in Horse Serum of Two Inhibitors of Avid *A2* Influenza Virus Strains (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Presence in Sweet Corn (*Zea mays* var *saccharata* Bailey) : Effect of 6-Methoxybenzoxazolinone on the Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson and its (N. J Whitney and C G. Mortimore), 596
Presence of Thiomalic and Thioglycollic Acid : Ethylene Production by Cytoplasmic Particles from Apple and Tomato Fruits in the (Dr. M. Lieberman and Dr C. C Craft), 243
Presence or Absence of ε-N-Methyl-Lysine in *Salmonella* Flagellar Protein : A Gene determining (Dr. B. A. D. Stocker, Dr. M. W. McDonough and Dr. R P. Ambler), 556
Preservatives (Wood), in Toxicity Test Blocks: A Method of Obtaining Uniform Distribution of (D. N. R. Smith and R. Cockcroft), 163
Pressor Response to Guanethedine : Augmentation of the, by Inhibition of Catechol O-Methyltransferase (Dr. D. W. Wylie), 490
Pressure in Vacuum Physics : Measurement of (W W Forrest), 476
Pressure (Air) : Effect of, on the Fatigue of Lead and Aluminium (Dr. K. U. Snowden), 53
Pressure (Blood), in Man : Seasonal Variation in (Dr. Geoffrey Rose), 235
Prevention of the Clotting of Fish Plasma : Occurrence of Heparin in the Blood of Fish and its (Dr. S. Z Qasim and R. Hasan), 764
Prevention of Fatty Liver due to Threonine Deficiency by Moderate Caloric Restriction (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A. E. Harper), 917
Prevention of Vagotomy of Erythrocytosis induced by Hypoxaemia (Dr. D. F. J. Halmagyi and H. J. H. Colebatch), 757
Price, Prof A. T. : Surveys in Applied Mathematics, *review*, 865
Price, Dr. V E., and others : Methods for Determining the Rates of Catalase Synthesis and Destruction *in vivo*, 62
Priestley, Dr. C. H. B. Utilization of Water in Australia (Conservation), 538
Primary Atypical Pneumonia Agent (Eaton's) Effect of an Organic Gold Salt on, and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Primary Coal Tar Components : Origin of some (Dr. M Vahrman), 136
Primary Product (Trapped), of Photosynthesis in Green Plants (Alexander Muller and Dr. H. T. Witt), 944
Primary and Initial Effects of Ionizing Radiations (Academy of Sciences of the U.S S R International Symposium on), 110
Primavesi, G. R. : Gas Chromatography—Definitions and Retention Parameters, 280
Principes de la Théorie Électromagnétique et de la Relativité (Prof. Marie-Antoinette Tonnelat), *review* by Prof. J. Hamilton, 87
Principles of Meteorites (E. L. Krinov), translated from the Russian by Irene Vidziunas ; translation edited by Harrison Brown, *review* by Dr. H. J. Axon, 432
Principles of Optics (Prof Max Born and Prof. Emil Wolf), *review* by Dr C. A. Taylor, 429
Pringle, J. A. : Biogeography of South-East Africa, 802
Pringsheim, Prof. Peter : Eightieth birthday of, 877
Priorities for Research in the Social Sciences in Industry (A. B. Cherns), 541
Problem of Communication : Science and Industry—the (Department of Scientific and Industrial Research National Conference on), 275
Problem of Freedom and Efficiency in Universities (Dr A. P. Rowe), 360
Problem of 'Methaemocyanin' (Dr. A. E. Needham), 308
Problems of Ageing, 21
Problems in Cybernetics, No. 1, 795
Problems of Research : Application of Interference Microscopy to (Royal Microscopical Society Symposium on), 714
Problems of University Administration in Britain and the Commonwealth : Freedom and Efficiency— (Committee on Science and Freedom, Manchester, Bulletin No. 16), 517
Procedure (Diphenylamine), for estimating Deoxyribonucleic Acid : Interference in the (Dr. T. F. Slater), 834
Procedure (Labelling), for Compounded Medicinal Preparations (Association of British Pharmaceutical Industry, the Proprietary Association of Great Britain and the Association of Public Analysts), 712
Process : Later Stages of Protein Synthesis and the Role of Phospholipids in the (Dr. G. H. Hunter and G. N. Godson), 140
Processes (Szilard–Chalmers), in Solids : Influence of Chemical Isomerism on the (T. Costea and I Dema), 478
Processing : Mineral, *review* by Dr. A R. Burkin, 87
  Mineral (Dr. E. J. Pryor), revised and enlarged edition of An Introduction to Mineral Dressing, *review* by Prof. S G. Ward, 258
Processing of Raw Materials (Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy (Geneva, 1958), Vol. 3), *review* by Dr. A. R. Burkin, 87
Product (Metabolic) : Experimental Transmission of Sanguinarine in Milk—Detection of a (Dr. Sohrab A. E. Hakim, Dr. Valerie Mijović and Dr James Walker), 201
Product (Trapped Primary), of Photosynthesis in Green Plants (Alexander Muller and Dr H. T Witt), 944
Production Zooplankton (International Council for the Exploration of the Sea Symposium on), 360
Production of Pyrazine Derivatives in the Radiolysis of Aqueous Solutions of the Cyclic Dipeptides (Mathilde Kland-English and Warren M. Garrison), 302
Production (Ethylene), by Cytoplasmic Particles from Apple and Tomato Fruits in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr. C. C. Craft), 243
Production (Microbial), of Carbon Monoxide from Flavonoids (D. W. S. Westlake, J. M. Roxburgh and G. Talbot), 510
Production and Mobility of Point Defects in Titanium and Zirconium (E. Smith and M. S Stagg), 300
Products (Ethanol-soluble, Ether-insoluble) : Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by Bean Stems—Heterogeneity of the (Michael K Bach and J. Fellig), 763
Products (Natural) : Some Aspects of the Chemistry of (Chemical Society Symposium on), 625
Profile (Soil) : *C* Horizon of the (D. F. Ball), 688 ; (Dr. S. G. Willimott and D. W. Gilchrist Shirlaw), 689
Profile (Soil) Development : Glaciation in Wales as related to (Welsh Soils Discussion Group Meeting on), 275
N(*h*) Profiles from Ionospheric *h*'(*f*) Curves : A New Method for the Calculation of (H. Hojo), 562
Profiles (Amino-Acid Activation), in Tissue Preparations : A Simple Paper Chromatographic Method for Determination of (Dr. Alexandra von der Decken), 145
Progress in Alkaloid Chemistry, *review* by Dr. E G. Kellett, 430
Progress in British Broadcasting, 369
Progress in Nuclear Energy . Series 5, Metallurgy and Fuels, Vol. 2 (edited by H. M. Finniston and J. P Howe), *review* by Dr. G. A Geach, 5
Progress in Vacuum Science and Technology (edited by A. S. D. Barrett), *review* by Dr R. O Jenkins, 867
Progress (Scientific) : Christianity and, *review* by R Brightman, 173
Projections (Land's Two-Colour) : The Eye, the Brain and (Dr. W. A. H. Rushton), 440
Proliferation (Cell) Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of Data on (Eugene P. Cronkite, Samuel W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Promotion of Cucumber Hypocotyl Growth by Two New Gibberellins (Dr. P. W Brian and H. G Hemming), 74
Promotion of Leaf Growth by Short Days in the Short-Day Plant *Chenopodium amaranticolor* (Roderick G Thomas), 771
Promotion (Tumour-) by Lime Oil in the Mouse Forestomach (Winifred E H. Peirce), 497
Propagation (Sound), in Whispering Galleries : Normal Mode Interpretation of the (Yasuo Satô), 475
Properties of the Phages of *B. cereus* NRRL 569 : Isolation and some (Dr. J. Foldes, Katalin Merétey and István Varga), 161
Properties of Scandium Metal : Some (P. G. Mardon, J. L. Nichols, J. H. Pearce and D M. Poole), 566
Properties of Stressed Bone (Prof C J. Dreyer), 594
Properties of Thin Films : Structure and—Proceedings of an International Conference, New York, 1959 (edited by A. Neugebauer, J. B. Newkirk and D A. Vermilyea), *review* by Dr. J. Ring, 613
Properties of Timber : The Strength and (F H. Armstrong), (Forest Products Research Laboratory, Bulletin No 45), 975
Properties of Vessel Muscle Proteins extracted with Water or Salt Solutions of Low Ionic Strength (Prof L. Laszt), 230
Properties (Amplifying) : Electrolytic Junction with (B. Lovreček and B. Kunst), 804
Properties (Antibody) : Characteristics of γ-Golbulin lacking, in New-born Pigs (Dr. F. Franek, Dr I. Říha and Dr. J Sterzl), 1020
Properties (Electrical, Optical and Mechanical), of Lattice Defects (Summer School at the University of Ghent on the), (sponsored by NATO), 104
Properties (Electronic), of Phenazine (S. Aftergut and G. P. Brown), 827
Properties (Haemoglobin Ionographic), in Cotton Rats : Inherited (Prof. Charles W. Foreman), 585
Properties (Microhardness and other), of Magnesium Compounds with the Calcium Fluoride Structure (E. R. Petty), 132
Properties (Molecular), of Conjugated Proteins isolated from Exudates (Prof. Antonio Caputo), 395
Properties (The Psychotomimetic), of 3,4,5-Trimethoxyamphetamine (Alexander T. Shulgin, Sterling Bunnell and Thornton Sargent, III), 1011

Properties (Unusual) : A New Anthelmintic with (A. W. J. Broome and N. Greenhalgh), 59
Property (A New Inheritable), of Human Sera—the InV Factor (Dr. C. Ropartz, Dr. J. Lenoir and Dr. L. Rivat), 586
Property (Special), of the Cell Nucleus : Uptake of Deoxyribonucleic Acid (DNA)—a (Dr. M Hill), 916
Proposal for Modifying the Present Terminology : Haemoglobins, Myoglobins and Erythrocruorins—a (Dr. Malcolm H. Smith), 225
Proposed Revisions of 'Transplantese' (Dr P A Gorer, Dr. J. F. Loutit and Dr H. S. Micklem), 1024
Proprietary Association of Great Britain, and others : Labelling Procedure for Compounded Medicinal Preparations, 712
Propylene : Nature of the Reactions involved in the Pyrolysis of *n*-Butane inhibited by (J. H. Purnell and C. P. Quinn), 656
Prospecting in Archaeology by Geophysical Methods (Council for British Archaeology Conference on), 534
Prosthetic Group (Iron Porphyrin) : A New Haemoprotein with a Unique, isolated from Human Erythrocytes (Dr Martin Morrison), 765
Protease in the Cell of *Escherichia coli* : Localization of a (Dr. J Chaloupka), 512
Protection (Plant) : Hygiene and (L. I. Medved), 279
Protective Action of Calcium Gluconate against After-Effects of X-Irradiation on Conidia of *Neurospora crassa* (Prof J. Weijer), 760
Protective Effects of Di*iso*propylfluorophosphonate against the Lethal Effects of X-Rays before or after Irradiation (D A Willoughby), 761
Protective Spittle Masses of Frog Hopper Nymphs : A Method of Dissolving the (Dr G. F Howden and A. T. Marshall), 509
Protein : Binding of Trichloroacetic Acid by (Dr. F. H. Grimbleby and H. A. Ntailianas), 835
  Cytology of Cells which Synthesize (M. S. C Birbeck and Dr. E. H. Mercer), 558
  A New Leaf Copper, 'Plastocyanin', a Natural Hill Oxidant (Dr. Sakae Katoh and Dr Atusi Takamiya), 665
Protein (A Fatty Acid/) Complex in Human Hair (A. W. Holmes), 923
Protein (*Salmonella* Flagellar) : A Gene determining Presence or Absence of ε-N-Methyl-Lysine in (Dr B A D. Stocker, Dr. M. W. McDonough and Dr R P. Ambler), 556
Protein Derivatives (Bence-Jones) : Action of Trypsin on (Dr. Umberto Ferrini and Dr. Romano Zito), 485
Protein Molecule (Serum) : Influence of the Charge on a, and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes (B. J. Northover), 574
Protein Synthesis : Induced (Prof. Sam M. Beiser and Prof Stuart W. Tanenbaum), 659
  Later Stages of, and the Role of Phospholipids in the Process (Dr. G D Hunter and G. N. Godson), 140
Protein and Ribonucleic Acid in the Growth of Fern Gametophytes (Y. Hotta), 455
Proteins from Wheat Flour soluble in Acetic Acid : Chromatography of the (Dr. D. H. Simmonds and Dr. D. J Winzor), 306
Proteins (Conjugated), isolated from Exudates : Molecular Properties of (Prof Antonio Caputo), 395
Proteins (Egg Albumen), of the Domestic Fowl : Genetic Polymorphisms in the (I. E. Lush), 981
Proteins (Fibrous) : α-Configuration of (R. D. B. Fraser and T. P. MacRae), 572
Proteins (Liver), in Circulating Blood : Detection of (Dr. A. H. Gordon), 727
Proteins (Lymph Node), and Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain : Electrophoretic Patterns of (V Schwarzmann, Prof G. Mathe and J. L Amiel), 1025
Proteins (Pathological Serum), and Urinary Proteins : A Pyroninophilic Component in (R. E Ballieux, G N Niehaus and Prof. M. T. Jansen), 60
Proteins (Urinary) : A Pyroninophilic Component in Pathological Serum Proteins and (R E Ballieux, G. N Niehaus and Prof. M. T. Jansen), 60
Proteins (Vessel Muscle), extracted with Water or Salt Solutions of Low Ionic Strength : Properties of (Prof. L Laszt), 230
Proteins and other Polymers : Direct-Current Conductivity of Textiles, (Dr. C. P. S. Taylor), 388
Proteus (Genus) : Lysogenic Conversion in the (Prof J N. Coetzee), 946
Proteus vulgaris : Degradative Pathway of L-Leucine in (Shoji Sasaki), 400
Proton Relaxation in Crude Oils (R J. S. Brown), 387
Protons (High-Energy), and Positive Ions Emission of Soft Electromagnetic Radiation from Metals by the Impact of (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Proud, K. J , and others Control of Irradiation Embrittlement in Molybdenum, 568
Proximal Tubular Secretion (Renal) : Dynamics of (Dr Fredrik Kiil), 927
Pryor, Dr E. J. : Mineral Processing, revised and enlarged edition of An Introduction to Mineral Dressing, *review* by Prof S. G. Ward, 258
Przybylski, Dr. Antoni : *HD* 101065—a *G*0 Star with High Metal Content, 739
Psychology and Belief : Biology, (Dr W. H Thorpe), 445
Psychology and the Individual (G. W. H. Leytham), 435
Psychomotor Perseverative Tendencies : Measurement of (Prof. S. D. Porteus and A. L Diamond), 691
Psychotomimetic Properties of 3,4,5-Trimethoxyamphetamine (Alexander T. Shulgin, Sterling Bunnell and Thornton Sargent, III), 1011
Public Analysts, Association of, and others : Labelling Procedure for Compounded Medicinal Preparations, 712
Public Health in Modern China : Medicine and (Dr. William Y. Chen), 795
Public Health Service (United States), and others : International Conference on the Biochemistry of Human Tumours, 627
Public Relations and Management (David Finn), *review* by T. H. Hawkins, 433
Public Services Conference (London, 1960) : Report of the (Colonial Office No. 347), (Colonial Office), 29
Publication of Calorimetric and Thermodynamic Data, 454
Publications : Polish Scientific, 186
Pullman, Alberte (Pullman, Prof. Bernard, and) : Submolecular Structure of the Nucleic Acids, 725
Pullman, Prof. Bernard, and Pullman, Alberte : Submolecular Structure of the Nucleic Acids, 725
Pulmonary Lesions : Neural Tissue and, in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant (Prof N Allegretti and B Vitale), 673
Pulped Soybean Silage : Effects of, on Milk-yield of Cows (Dr. E. Kurnik, D. Gábos and B. Pozsár), 492
Pulsed X-Ray Generator : New (Zenith Radio Corporation), 879
Pure Mathematics at Swansea, 622
Pure Rutin (Chromatographically) : Isolation of, from Flowers of Elder (Jirí Davídek), 487
Pure and Applied Chemistry, International Union of : *Journal* of the, 20
  Symposium on Microchemical Techniques (organized by the Metropolitan Microchemical Society), 188
Pure and Applied Chemistry, International Union of, and others : Fifth European Congress on Molecular Spectroscopy, 797
Purification Unit (Sea-Water), based on New Principles (General Electric Co. of America), 969
Purines in Human Urine : Identification of a Compound found during Separation of (Dr. Herbert Singer, Arax Gulbenkian, Sigmund E. Lasker and Charles L. Fox, Jun.), 671
Purnell, J H , and Quinn, C. P. : Nature of the Reactions involved in the Pyrolysis of *n*-Butane inhibited by Propylene, 656
Purpura, D. P., and others : Glutamic Acid Metabolism in Brain and Liver during Infusion with Ammonia labelled with Nitrogen-15, 326
Purves, P. E. (Fraser, F. C., and) : Hearing in Cetaceans, 187
Pyrazine Derivatives : Production of, in the Radiolysis of Aqueous Solutions of the Cyclic Dipeptides (Mathilde Kland-English and Warren M. Garrison), 302
Pyrazine–Metal Halide Complexes—New Types of Metal–Ligand Polymers (Dr. A. B. P. Lever, Dr J. Lewis and Prof. R. S. Nyholm), 58
Pyridine Nucleotide Metabolism in Heliotrine Poisoning (Prof. G. S. Christie, R. N. LePage and Margot J Bailie), 593
Pyrimidine Series : Apparent Migration of N-Methyl Groups in the (Dr. D. J Brown), 828
Pyrolysis of *n*-Butane inhibited by Propylene : Nature of the Reactions involved in the (J H. Purnell and C. P. Quinn), 656
Pyrolysis Unit with a Gas–Liquid Chromatograph : Rapid Identification of High Polymers using a Simple (C. E Roland Jones and A. F. Moyles), 222
Pyrolysis (Flash), of Nitrosyl Chloride : Vibrationally Excited Nitric Oxide produced in the (Dr. N. Basco and Prof. R. G. W Norrish), 455
Pyroninophilic Component in Pathological Serum Proteins and Urinary Proteins (R. E Ballieux, G. N. Niehaus and Prof. M. T. Jansen), 60
Pyrophosphate ([1-^{14}C]-*iso*Pentenyl) : Incorporation of, into Polyisoprene (B. L. Archer, G. Ayrey, E. G. Cockbain and G. P. McSweeney), 663

QADRI, Dr. S. S. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 101
Qasim, Dr. S. Z., and Hasan, R. : Occurrence of Heparin in the Blood of Fish and its Prevention of the Clotting of Fish Plasma, 764
Quail (Japanese) : Response of, to Restricted Lighting (Prof Hans Abplanalp), 942
Quantitative Cytochemistry using Directly Applied Radioactive Reagents (Dr. E. A. Barnard and J. Marbrook), 412
Quantitative Morphology, *review* by Prof O. W. Richards, 256
Quantitative Zoology (George Gaylord Simpson, Anne Roe and Dr. Richard C. Lewontin), revised edition, *review* by Prof. O. W. Richards, 256
Quarelli, Dr. Elena : Socrates and the Animals (translated from the Italian by Kathleen Speight), *review* by B. J. G. Maitland, 523
Quarrell, Prof. A. G. : Beryllium, *review*, 345
Quartz : Whisker Growth from (R. J. Jaccodine and R. K. Kline), 298
Quasi-Longitudinal Approximation to the Appleton–Hartree Equation (A. D. M. Walker), 742
Quaternary Ammonium Salts : Specification of Asymmetric Nitrogen Atom—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and (G. Bernáth), 304
Queen Mary College, London : Appointment of Dr. F. A Goldsworthy as reader in applied mathematics, 22
  Appointment of Dr. C. R. Webb as reader in mechanical engineering, 22
  Dr. F. A Goldsworthy—unable to accept the appointment of reader in applied mathematics, 188
  Title of reader in physics in the University of London conferred on Dr. R. O. Davies, 797
Queen's University, Belfast : Appointment of B. E. S. Gunning as lecturer in botany, 714
  Appointment of Dr. W. D. McGrath as lecturer in physical chemistry, 714
  Appointment of B. C. S. Wilson as lecturer in archaeology, 714
  Grant of £695 from the Department of Scientific and Industrial Research, for the purchase of an argon chromatograph, and £768, for the purchase of a gas chromatograph with flame ionization detector, both for research in the Department of Chemistry, 714
  Grant of £5,500 from the Wellcome Trust, for the purchase of an Akashi electron microscope and an ultramicrotome, for use in research by the Department of Zoology, 714
Quelce-Salgado, A., and others : Lethal Mutations in Brazilian Human Populations, 80
Quelea : The (Commission for Technical Co-operation in Africa South of the Sahara Symposium on), 359
Quevedo, Jun., Walter C., and others : Induction of Melanotic Tumours in the White ('Partial Albino') Syrian Hamster, 936
Quinn, C. P. : Gas Chromatography (Theory and Application—Capillary Columns), 27
Quinn, C. P. (Purnell, J. H., and) : Nature of the Reactions involved in the Pyrolysis of *n*-Butane inhibited by Propylene, 656
Quintarelli, Dr. G., and Robinson, Dr. L. : Histochemistry of Human Sublingual Glands, 935
Quisumbing, Dr. E. : Impact of Man on the Vegetation of the Humid Tropics (New Food-Plants taken up in the Philippines), 25 ; (Effects of Shifting Cultivation), 25

RABBIT : Fibrosarcoma in a, following β-Irradiation of the Skin (L. A. George, S Marks and L. K Bustad), 770
Rabbit Antibody : Separation of Univalent Fragments of, by Reduction of a Single, Labile Disulphide Bond (Prof. A. Nisonoff, G Markus and F. C. Wissler), 293

Rabbit Foetus : Function of the Hypophysis–Thyroid System in the, with regard to Cholesterol Metabolism (J. G. Bearn, H. B. Koerselman and T. R. E. Pilkington), 318
Rabbit Skin : Localization of Arginase in (Dr. Simon Rothberg and Dr. Eugene J. van Scott), 832
Rabbits : Cardiac Effects of Streptolysin O in (Prof. S. P. Halbert, R. Bircher, and E. Dahle), 232
Raben, Dr. M S., and others : Adipokinetic Activity of Synthetic Peptides related to Corticotropin, 681
Rabinovitch, A , and others : Conversion of DL-*m*-Tyrosine to Dopamine in the Rat, 577
Rabor, D. S. (Rand, A. L., and) : Birds of the Philippine Islands, 446
Race Relations and Mental Health (Marie Jahoda), *review* by T. H Hawkins, 173
Racial Prejudice and Mental Health, *review* by T. H. Hawkins, 173
Radar Echoes from the Aurora at 1,300 mc./s. (Dr. E Eastwood, G. A Isted and J. D. Bell), 115
Radar Observation of a Sea-Breeze Front (Dr. E. Eastwood and G. C. Rider), 978
Radial Particle Displacements in Poiseuille Flow of Suspensions (Dr. G. Segré and Dr. A. Silberberg), 209
Radiation : Hazards of (Dr C. Auerbach), 629
  Shortening of Life and Causes of Death in Mice exposed to a Single Whole-body Dose of (Dr. Patricia J. Lindop and Prof. J. Rotblat), 645
  Tritium as a Source of, in Electron Spin Resonance Studies (Jerzy Kroh, Basil C. Green and Dr. John W. T. Spinks), 655
Radiation (Gravitational) : Upper Limit for Interstellar Millicycle (Dr. Robert L. Forward, David Zipoy, Prof. J. Weber, Stewart Smith and Prof. Hugo Benioff), 473
Radiation (Ionizing) : Effect of *p*H on the Sensitiveness of Trypsin to (Prof. J. A. V. Butler and A. B. Robins), 852
Radiation (Ionizing) : A New Effect of, on Nucleoprotein (Dr. G. Hems), 849
Radiation (Soft Electromagnetic), from Metals · Emission of, by the Impact of High-Energy Protons and Positive Ions (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Radiation (Ultrasonic) : Effects of, in *Escherichia coli B* using Fluorochrome Acridine Orange as a Vital Stain (S. S. Ranade, V. G. Tatake and K. S Korgaonkar), 931
Radiation Carcinogenesis · Dose-Response Relationship in (Dr Niels Arley and Reidar Eker), 151
Radiation Damage in Graphite : Aggregation and Dispersal of (W. N. Reynolds, P. A. Thrower and B. E. Sheldon), 824
Radiation Damage in Seeds : Modification of, by Post Treatment (Dr. W. Klingmüller), 413
Radiation Effects in Inorganic Solids (Faraday Society General Discussion on), 447
Radiation, Leaf Area Index and Crop Growth-Rate : Relationship of (W. R. Stern and Prof. C. M. Donald), 597
Radiations (Ionizing) : Primary and Initial Effects of (Academy of Sciences of the U.S.S.R. International Symposium on), 110
Radiations (Nuclear and Allied) : The Hazards to Man of—a Second Report (Medical Research Council), 629
Radiative Recombination in Gallium Phosphide Point-Contact Diodes (Dr. H. C. Gorton, Dr. J. M. Swartz and Dr. C. S. Peet), 361
Radical $\cdot CH_2(CO_2H)$: Identification of the (A. Horsfield, Dr. J. R. Morton and Dr. D. H. Whiffen), 481
Radical (Free-) Chemistry : Vistas in (edited by Dr. W. A. Waters), *review* by Dr. A. B. Callear, 433
Radio Research during 1959 (Prof. W. J. G. Beynon), 539
Radio Research Board : Report of the, and the Report of the Director of Radio Research (1959), (Department of Scientific and Industrial Research), 539
Radio Source Cassiopeia A : Secular Variation of the Flux Density of the (Dr. J. A. Hogbom and Dr. J. R. Shakeshaft), 561
Radio Sources (Distant) : Cosmological Significance of Angular Measurements of (Dr. W. Davidson), 991
Radio Spectroscopy Group (British) : Spring Meeting, 880
Radio Transmissions (Satellite) : Field-Aligned Ionospheric Irregularities and the Scintillation of (D. S. Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Radioactive Fall-out in Israel resulting from the Nuclear Tests in the Sahara Desert (Y. Feige, E. Shalmon, J. Vardi, J. R. Gat (Gutmann), and Y. L. Tokatly), 90
Radioactive Labelling (Accidental), of a Migratory Moth (Dr. H. B. D. Kettlewell and M. J. Heard), 676
Radioactive Materials into Cow's Milk : Some Factors Influencing the Food-Chain Transport of (D. Merten and O. Suschny), 806
Radioactive Materials in Food and Agriculture (Report of an Expert Committee of the Food and Agriculture Organization of the United Nations), 712
Radioactive Nitrogen · Use of, in Studying Nitrogen Fixation in Bacterial Cells and their Extracts (Dr. D. J. D. Nicholas, Dr. D. J. Silvester and Dr. J. E. Fowler), 634
Radioactive Reagents : Quantitative Cytochemistry using Directly Applied (Dr. E. A. Barnard and J. Marbrook), 412
Radioactive Substances Advisory Committee : Appointment of Sir Brian Windeyer as chairman, 104
Radioactive Sulphydryl Compounds : Effect of, on the Oxygen Tension in the Spleen of Mice (Dr. C. van der Meer, P. W. Valkenburg and M. Remmelts), 588
Radioactive Water Vapour : Absorption of Inhaled (J. B. West and C. T. Dollery), 588
Radioactivity in the Sea : Research on the Effects of (International Atomic Energy Agency), 877
Radiochemistry · Advances in Inorganic Chemistry and (edited by H. J. Emeléus and A. G. Sharpe), Vol. 2, *review* by Dr. D. W. A. Sharp, 521
Radiology, British Institute of : Annual Congress and Exhibition, 624
  Silvanus Thompson Memorial Lecture, The Condition of Outer Space (Sir Bernard Lovell), 625
Radiolysis of Aqueous Solutions of the Cyclic Dipeptides : Production of Pyrazine Derivatives in the (Mathilde Kland-English and Warren M. Garrison), 302
Radioresistance of Sporulating Cells of *Bacillus cereus* : Changes in (Dr. Vladimir Vinter), 589
Radiosensitivity (Differential), in Rice (*Oryza sativa* Linn.) at the Genotypic Level (H. K. Shama Rao and K. C. Bora), 762
Radius (Earth's) : Palaeomagnetic Evidence relevant to a Change in the (Allan Cox and Richard R. Doell), 45
Radley, J. M., and others : Naturally Occurring Alpha-Activity of Drinking Water, 348
Rae, Dr B. B. : Elected a Fellow of the Royal Society of Edinburgh, 876
Raeburn, Prof. J. R. : Elected a Fellow of the Royal Society of Edinburgh, 879
Railways . British—Report from the Select Committee on Nationalized Industries, together with the Proceedings of the Committee, Minutes of Evidence and Appendices, 607
Railways (British) : Scientific and Technical Resources of, 607
Raimes, Dr S. : Title of reader in mathematics in the University of London (at the Imperial College of Science and Technology) conferred on, 188
Ramachandran, V., and others : Relative Efficiencies of Indian Languages, 614
Ramakrishna, Dr. B. S., and others : Relative Efficiencies of Indian Languages 614
Ramasarma, Dr. T., and others : Distribution of Coenzyme Q in Rat Liver Cell Fractions, 577
Ramsay, Dr. (Archbishop of York) : New Universities (Underlying Principles which should guide a New University), 23
Ramsay Memorial Fellowships Trust : Ramsay Memorial Fellowship for advanced students of chemistry, 534
Ramsbottom, Dr. John : Letter from Erasmus Darwin to Jonas Dryander, 424
Ranade, S. S., and others : Effects of Ultrasonic Radiation in *Escherichia coli B* using Fluorochrome Acridine Orange as a Vital Stain, 931
Rand, A. L., and Rabor, D. S. : Birds of the Philippine Islands, 446
Rand, Dr. H. J. (DeCarvalho, Dr. S., and) : Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the Novikoff Hepatoma Cells of the Rat, 815
Randhawa, Dr M. S. : Zygnemaceae, *review* by Dr. J. W. G. Lund, 343
Random Fluctuations in a Nuclear Fission Reactor (L. G. Kemeny and Samaun), 130
Ranga Swamy, N. S., and others : Cotton in India, *review* by Prof. S. C. Harland, 86
Range (Host-) of a *Streptomyces aureofaciens* Actinophage (R. Weindling, H D. Tresner and Dr. E. J. Backus), 603
Rankin, Prof. J. S. : *Obituary* by J. W. Sharpe, 271
Rankinite : Kilchoanite, a Polymorph of (Dr. S. O. Agrell and Dr. P. Gay), 743
Ranunculus ficaria L. : Morphological Separation of Cytological Races in (Dr. V. H. Heywood and Dr. S. Walker), 604
Rao, H. K. Shama, and Bora, K. C. : Differential Radiosensitivity in Rice (*Oryza sativa* Linn.) at the Genotypic Level, 762
Raper, Dr. John R. (Dick, Dr Stanley, and) : Origin of Expressed Mutations in *Schizophyllum commune*, 81
Rapid Identification of High Polymers using a Simple Pyrolysis Unit with a Gas–Liquid Chromatograph (C. E. Roland Jones and A. F. Moyles), 222
Rapid Method for the Determination of Tetramethyl Lead and Tetraethyl Lead in Petrol (Dr. J. Van Rysselberge and R. Leysen), 478
Rapid Preparation of Fresh Frozen Sections of Barley Roots (Dr. Maurice Fried and Alicelia H Franklin), 414
Rapid Reduction of Portal Blood Ammonia (O. W. Wendel and E. M. Brophy), 404
Rapoport, Prof. Henry (Stermitz, Frank R., and) : O-Demethylation as a Biosynthetic Pattern in the Formation of Opium Alkaloids, 310
Rappaport, Prof. Irving : Analysis of the Cross-Reaction between Two Strains of Tobacco Mosaic Virus, 986
Rare-Earth Chemistry, *review* by Dr. J. S. Anderson, 345
Rare Meteorites : International Control of Investigations of, 967
Rarer British Birds : The Popular Handbook of (P. A. D. Hollom), *review* by Sir Landsborough Thomson, 7
Rastogi, R. G. : Lunar Tide in the F_2 Layer of the Ionosphere near the Geomagnetic Equator, 214
Rat : Acquired Porphyria in Man and, due to Hexachlorobenzene Intoxication (Robert K. Ockner and Prof. Rudi Schmid), 499
  Comparative Effects of Liver and Tumour Ribonucleic Acids on the Normal Liver and the Novikoff Hepatoma Cells of the (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
  Conversion of DL-*m*-Tyrosine to Dopamine in the (Prof. T. L. Sourkes, G. F. Murphy and A. Rabinovitch), 577
  A Dominant Gene for Renal Adenomas in the (Reidar Eker and Jeanne Mossige), 858
  Effect of Urinary *p*H on 5-Hydroxytryptamine Excretion in the (M. Sandler and R. G. Spector), 838
  Inhibiting Effect of 2:4-Dinitrophenol on Calciferol-induced Metastatic Calcification in the (R. A. Grant, M. Hathorn and Dr. Theodore Gillman), 317
  Role of Selenium in relation to Ubiquinone in the (J. Green, E. E. Edwin, A. T. Diplock and J. Bunyan), 748
  Role of Tocopherol, Selenium and Anti-oxidants in the (E. E. Edwin, J. Bunyan, A. T. Diplock and J. Green), 747
Rat *in vitro* : Influence of Sodium on the Transport of Magnesium across the Intestinal Wall of the (D. B. Ross), 840
Rat Liver Cell Fractions : Distribution of Coenzyme Q in (P. Seshadri Sastry, J. Jayaraman and Dr. T. Ramasarma), 577
Rat Serum Amylase : Electrophoretic Behaviour of (Prof. Robert L. McGeachin and Betty Ann Potter), 751
Rate of Anaerobic Glycolysis versus Structure in Pork Muscle (J. Wismer-Pedersen and E. J. Briskey), 318
Rate of Evaporation from Different Regions of the Skin of Indian Zebu Cattle (Dr. D. Roy Chowdhury and Dr. D. P. Sadhu), 491
Rates of Catalase Synthesis and Destruction *in vivo* : Methods for Determining the (Dr. V. E. Price, M. Rechcigl, jun., and R. W. Hartley, jun.), 62
Rates of Flow (Minimum), in Therapy with Sulphonamides (Prof. Eino Nelson), 928
Rates of the Reactions of Nitrogen Atoms with Oxygen and with Nitric Oxide (M. A. A. Clyne and Dr. B. A. Thrush), 56
Ratio (The Conversion), as a Discriminatory Test for Thyroid Activity in Fish (C. P. Hickman, jun.), 1012

Rats : Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in (S. K. Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
  Inhibiting Effect of Nicotinamide and Diphosphopyridine Nucleotide on the Methylcholanthrene Sarcoma in (M. Matsuyama, A. Maekawa and T. Nagayo), 673
  Retention of Zinc-65 in the Bones of (Dr. D. M. Taylor), 932
Rats with Allergic Encephalomyelitis : Antibodies against Autologous Brain in (S. Martin Harwin, Prof. Philip Y. Paterson and Norman C. Didakow), 322
Rats (Cotton) Inherited Haemoglobin Ionographic Properties in (Prof. Charles W. Foreman), 585
Rats (Irradiated) : Experimental Allergic Encephalomyelitis in (Prof N. Allegretti and M. Matošić), 500
Rats (Normal and Irradiated), injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in (Prof. N. Allegretti and B. Vitale), 673
Rats (Pathogen-free) · Spontaneous Cytomegalic Inclusion Body Disease Involving Lacrimal Glands of Caesarian-derived (so-called), (Dr. Hans Meier), 534
Rats (Vitamin A-deficient) : Amino-Acid Patterns in (P. Malathi, P. Seshadri Sastry and Dr. J. Ganguly), 660
Rats (White) : Distribution of Acetylcholine and Cholinesterase in the Heart of (Dr. J Vlk, Dr. S. Tuček and Dr. V. Habermann), 923
Ravetz, Dr. J. R. : Origins of the Copernican Revolution, 859
Raw, Dr. F. : Soil Fauna in relation to Soil Formation and Fertility (Mechanics of Earthworm Influence), 367
Raw Materials : Processing of (Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy (Geneva, 1958), Vol. 3), *review* by Dr. A. R. Burkin, 87
Rawlins, F. I. G. · Essentials of Logistics, *review*, 88
Ray, John, and others (Founders of British Science), (J. G. Crowther), *review* by Dr. W. P. D. Wightman, 259
Ray, T. C. (Hallam, Dr. H. E., and): Dielectric and Dipolar Interaction Theories of Solvent-induced Infra-Red Frequency Shifts, 915
Ray (Cosmic) Flare on November 12, 1960, and Solar Activity during the period November 10-15, 1960 (Staff of the Ionosphere and Radio-Astronomy Section of the Netherlands Postal and Telecommunications Services), 438
Ray (Cosmic) Increases : Ionospheric Disturbance at the Time of (C. Collins and D. H. Jelly), 128
Ray-focusing (Skip-Distance), in the Ionosphere (E. Golton), 48
Rayon Research Association (British), (British Cotton Industry Research Association and the) : Merger of the, to be called the Cotton, Silk and Man-made Fibres Research Association, 531
Re-Survey of Typhoon Effects on Jaluit Atoll in the Marshall Islands (Dr. David I. Blumenstock, Dr. F. R Fosberg and Charles G. Johnson), 618
Reaction of Oxygen Atoms with Hydrogen (M. A. A. Clyne and Dr. B. A. Thrush), 135
Reaction of Phosphorylating Agents with 2-Methyl-Δ^2-Oxazoline (R. Greenhalgh), 829
Reaction (Cross-) between Two Strains of Tobacco Mosaic Virus : Analysis of the (Prof Irving Rappaport), 986
Reaction (Kolbe) : Delayed Gas Evolution from Passive Films formed in the (Prof. B. E. Conway and M. Dzieciuch), 914
Reaction (Mercury-photosensitized), with Tritium Gas : Labelling of Organic Compounds by (Fulvio Cacace, Angelo Guarino and Gabriella Montefinale), 54
Reaction (Transoximase–Oximase) : Glutamic Acid Formation by (Prof. K Yamafuji, S. Hatano and A. Ida), 397
Reactions on Metal Surfaces at High Temperatures (F. T. Barcroft and J. R. Hayden), 133
Reactions of Nitrogen Atoms with Oxygen and with Nitric Oxide : Rates of the (M. A. A. Clyne and Dr. B. A. Thrush), 56
Reactions Involved in the Pyrolysis of *n*-Butane inhibited by Propylene : Nature of the (J H Purnell and C. P. Quinn), 656
Reactions ((*d*,*α*)- and (*d*,*αn*)-), on Natural Tungsten : Excitation Functions of (A. Demildt), 51
Reactions (Gas-Phase), of the Halogens and their Compounds : Mechanisms of the (Faraday Society Informal Discussion on), 275, 447
Reactions (Immunological Cross-) between Salk 'Altered' Monkey Heart Cells and Ehrlich Ascites Carcinoma Cells (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Reactor : New Atomic Energy Authority, 711
Reactor called *Vera* (Versatile Experimental Reactor Assembly) at the Atomic Weapons Research Establishment, Aldermaston, 711
Reactor (Dounreay Fast) : Work of the, 794
Reactor (New), at Winfrith : *Nestor*, a (United Kingdom Atomic Energy Authority), 969
Reactor (Nuclear Fission) : Random Fluctuations in a (L. G. Kemeny and Samaun), 130
Reading Difficulty in English : Spelling Irregularities and (Dr. W. R. Lee), 273
Reagents (Radioactive) · Quantitative Cytochemistry using Directly Applied (Dr. E. A. Barnard and J. Marbrook), 412
Real Matter of Nuclear Energy, *review* by Dr. G. A. Geach, 5
'Real-Time' : A Versatile Method for Short-term Spectrum Analysis in (J. S. Gill), 117
Receptor (*Hydra* Glutathione-) : Action of Glutamic Acid and Glutathione Analogues on the (Howard M. Lenhoff and J. Bovaird), 486
Receptors : Muscarinic (Dr. A. H. Beckett, N. J. Harper, J. W. Clitherow and E Lesser), 671
Rechcigl, Jun., M., and others : Methods for Determining the Rates of Catalase Synthesis and Destruction *In vivo*, 62
Recherche Scientifique dans l'Industrie et l'Agriculture, Institut pour l'Encouragement de la : Rapport Annuel (1959), 113
Recio, Jose Maria, and others : Serum Iron and its Transport Mechanism in the Fowl, 668
Reckel, R. (Scheinberg, S. L., and) : Effects of Œstrogen on Somatic Variation of an Erythrocyte Agglutinogen in Chickens, 295
Recombination through Electron–Electron Collisions (Prof. D. R. Bates and A. E. Kingston), 652
Recombination (Genetic), in Bacteriophage ΦX 174 (Dietrich Pfeifer), 422
Recombination (Genetic), in *Vibrio cholerae* (Dr. K. Bhaskaran and S. S. Iyer), 1030
Recombination (Radiative), in Gallium Phosphide Point-Contact Diodes (Dr. H. C. Gorton, Dr J M Swartz and Dr. C. S Peet), 361
Reconnaissance (Geological), in Victoria Land, Antarctica (B. C. McKelvey and P. N. Webb), 545
Recording and Controlling Expenditure : Methods used by Universities of Contracting and of (University Grants Committee), 427
Recurrent Response Potentials : Photographic Cumulation of (Prof. Lorrin A. Riggs, C. R. Cavonius and Dr. E. Parker Johnson), 383
Recurrent Series (New), in Inbreeding Phenomena (F. A. Marçallo and Prof. N. Freire-Maia), 421
Red Cell Shape : Deformation of, Induced by *Vipera palestinae* Venom *in vivo* (Dr. D. Danon, S. Gitter and M. Rosen), 320
Red-Shift : A Large (R. Minkowski), 713 ; (W. A. Baum), 713
Redbrick · Dry Rot and (Dr. A. P. Rowe), 360
Reduced Fibrinolytic Activity of Atherosclerotic Sera caused by an Increase in Low-density Lipoproteins in Blood (Dr. Nirmal Sarkar), 929
Reductase (Nitrate), in *Neurospora crassa* : An Iron Requirement for a Dissimilatory (G. C. Walker and Dr. D. J D. Nicholas), 141
Reductase Activity (Increased Dihydrofolate), as a Possible Basis of Drug Resistance in Leukaemia (Dr. D. K Misra, Stewart R. Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Reduction of Coenzyme Q by Succinic Acid Dehydrogenase (Prof Józef Heller, Dr. Ludmila Szarkowska and Czeslawa Petryszyn), 578
Reduction of a Single, Labile Disulphide Bond : Separation of Univalent Fragments of Rabbit Antibody by (Prof. A. Nisonoff, G. Markus and F. C. Wissler), 293
Reduction (Enzymatic), of the Yellow Pigment of *Drosophila* (Toshifumi Taira), 231
Reduction (Rapid), of Portal Blood Ammonia (O. W. Wendel and E. M. Brophy), 404
Reece, D. W. : Future of the General Degree, 106
Rees, Dr. A. I. : Appointed I.C.I. Fellow in geophysics in the Department of Geology in the University of Birmingham, 22, 714
Rees, A R. : Effect of High-Temperature Pre-Treatment on the Germination of Oil Palm Seed, 74
Rees, Dr. D. A. (Turvey, J. R., and) · Isolation of L-Galactose-6-sulphate from a Seaweed Polysaccharide, 831
Refined Corn Oil : Inability of, to influence Spontaneous Arteriosclerosis of Old Hens (K. F. Gey and Dr. A. Pletscher), 491
Regeneration (Continuous), of the Dentinal Nerve-Endings (Prof. D. Hattyasy), 72
Registrar General · Statistical Review for 1958, 101
  Studies on Medical and Population Subjects, No. 16, Area of Residence of Mental Hospital Patients, 716
Regulation (Self-) in Living Systems (Symposium at the National Research Council of Canada on), 799
Rehardening of Softened Enamel Surfaces of Human Teeth by Solutions of Calcium Phosphates (Theodore Koulourides, Prof. Heriberto Cueto and Dr. Ward Pigman), 226
Reid, Derek A. : Diseases of Ornamental Plants, *review*, 956
Relations of Intensity of Photosynthesis and Appearance of *Piricularia oryzae* Cav. on the Rice Plant (R. Vámos, F. Zsoldos and I. Petrasovits), 407
Relations (Plant- and Soil-Water) Terminology in (Dr. M. L. McGlashan), 207 ; (Dr. R O. Slatyer and Dr. S. A. Taylor), 208
Relations (Public), and Management (David Finn), *review* by T. H. Hawkins, 433
Relations (Race), and Mental Health (Marie Jahoda), *review* by T. H. Hawkins, 173
Relations (The Water), of Plants (British Ecological Society Symposium on), 970
Relations Offices (Colonial and the Commonwealth) : Future of the, 277
Relationship of Hepatoencephalomyelitis Virus and Reoviruses (Prof. N. F. Stanley), 687
Relationship between High Temperature and Vitamin A Metabolism and the Fertility of Ewes (Margaret Ryle), 104
Relationship of Radiation, Leaf Area Index and Crop Growth-Rate (W. R. Stern and Prof. C. M. Donald), 597
Relationship of the Sarcoplasmic Reticulum to Sarcolemma in Sheep Cardiac Muscle (F. O. Simpson and S. J. Oertelis), 758
Relationship between Urinary Hyaluronidase and Diuresis (Prof. A. G. Ginetzinsky), 235 ; (Dr. G. M. Berlyne), 236
Relationship (Dose-Response), in Radiation Carcinogenesis (Dr. Niels Arley and Reidar Eker), 151
Relationship (Possible), to Favism : Action of *Vicia faba* on Erythrocytes—(Dr. J E. Bowman and Dr D. G. Walker), 555
Relationships between Blood Groups and the Fat Percentage of the Milk in Cattle (Jan Rendel), 408
Relative Efficiencies of Indian Languages (Dr. B. S. Ramakrishna, K. K. Nair, V. N. Chiplunkar, B. S. Atal, V. Ramachandran and R. Subramanian), 614
Relativistic Theory of the Fresnel Drag Coefficient (Prof. P. T. Landsberg), 654
Relativité : Les Principes de la Théorie Électromagnétique et de la (Prof. Marie-Antoinette Tonnelat), *review* by Prof. J. Hamilton, 87
Relativity : Electromagnetism and, *review* by Prof. J. Hamilton, 87
Relaxation (Proton), in Crude Oils (R. J. S. Brown), 387
Release of Calcium-45 from Frog Nerves during Electrical Activity (Prof. K. Koketsu and S. Miyamoto), 402
Release (Enzymic), of Sialic Acid and Inactivation of Human Menopausal Gonadotropin (Dr. René Got and Dr. Roland Bourrillon), 234
Relf, Ernest F. · *Obituary* of Prof. W. J. Duncan, 98
Relief and Drainage of Wales (Dr. Eric H. Brown), *review* by Prof. W G. V. Balchin, 432
Remains (Hominid), in Bed I Olduvai Gorge : Sites yielding (J. Desmond Clark), 903
Remmelts, M., and others : Effect of Radioactive Sulphydryl Compounds on the Oxygen Tension in the Spleen of Mice, 588
Renal Adenomas in the Rat : A Dominant Gene for (Reidar Eker and Jeanne Mossige), 858
Renal Plasma-flow : Conjugation of *p*-Aminohippurate by the Kidney and Effective (Dr B. P. Setchell and E. Blanch), 230
Renal Proximal Tubular Secretion : Dynamics of (Dr. Fredrik Kiil), 927

Rendel, Jan : Relationships between Blood Groups and the Fat Percentage of the Milk in Cattle, 408
Re-organization in the United Kingdom Atomic Energy Authority, 622
Reoviruses : Relationship of Hepatoencephalomyelitis Virus and (Prof. N. F. Stanley), 687
Replication : Implication of Chromosome Structure and, on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation (Eugene P. Cronkite, Samuel W Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Replication of Deoxyribonucleic Acid in Non-dividing Bacteria (Dr. Daisuke Nakada and Dr. Francis J. Ryan), 398
Repression (Ornithine Transcarbamylase) : A Requirement for 2-Thiouracil of 2-Thiouracil-grown *Escherichia coli* under Conditions of (Ada Zamir and Dr. Ruth Ben-Ishai), 922
Repression and De-repression of Enzyme Synthesis as a Possible Explanation of some Aspects of Drug Action (Prof. Louis Shuster), 314
Reproduction in Freshwater Triclads : Environment and (Dr. T. B. Reynoldson), 329
Reproduction in the Great Grey Kangaroo (Phyllis E. Pilton), 984
Reproductive Physiology : Fellowships in (Worcester Foundation for Experimental Biology, Mass.), 970
Reproductive Tract (Female) : Breakdown of Seminal Glycerylphosphorylcholine by Secretions of the (Prof. I. G. White and J C. Wallace), 843
Reptiles (Congo) : Five Less-Common *Salmonella* Serotypes from (Prof. MacDonald Fulton, Philomena Szafran and Matthew M. Lesko), 240
Reptiles and Amphibians in the British Isles : Distribution of (Lieut.-Col. R. H. R. Taylor), 624
Requirement for 2-Thiouracil of 2-Thiouracil-grown *Escherichia coli* under Conditions of Ornithine Transcarbamylase Repression (Ada Zamir and Dr. Ruth Ben-Ishai), 922
Requirement (An Iron), for a Dissimilatory Nitrate Reductase in *Neurospora crassa* (G. C. Walker and Dr. D. J D. Nicholas), 141
Requirement (Phosphate), of Lupins grown as a Pioneer Crop on Culm Measure Soil with Impeded Drainage (S. Larsen and D. Gunary), 691
Requirements (Composition), for Glass Formation in Metallic and Ionic Systems (Prof. M. H. Cohen and D. Turnbull), 131
Research : Application of Interference Microscopy to Problems of (Royal Microscopical Society Symposium on), 714
  Fire (S. H. Clarke), 352
  Natural Rubber (Rubber Research Institute of Malaya and the Government of the Federation of Malaya Conference on), 193
  Scientific, in Belgium, 113
  Space—Proceedings of the First International Space Science Symposium, Nice, 1960 (edited by Dr. Hilde Kallmann Bijl), *review* by Dr. R. L. F. Boyd, 346

Research on the Effects of Radioactivity in the Sea (International Atomic Energy Agency), 877
Research on Mental Health in Britain, 532
Research in Parasitology (Sheila Willmott), 192
Research in the Social Sciences (T. H. Hawkins), 541
Research in the Social Sciences in Industry : Priorities for (A. B. Cherns), 541
Research (Arid Zone), Advisory Committee on, and the World Meteorological Organization : Joint Symposium on Changes of Climate, 361
Research (Cancer) : Immunology and (The Collected Papers of Paul Ehrlich, Vol. 2), *review* by Prof. C. H Browning, 254
Research (Educational), in England and Wales, National Foundation for : Occasional Publication No. 2, Spelling Irregularities and Reading Difficulty in English (Dr. W. R. Lee), 273
Research (Engine), Ministry of Aviation, 272
Research (Fire) Station : New Buildings at the (D. I. Lawson), 105
Research (Medical) : Current (Medical Research Council), 21
Research (Natural History) : International, 623
Research (Nuclear) Co-operative, 878
Research (Parasitological) : Recent Advances in Fields of (Parasitology Group of the Institute of Biology Discussion on), 192
Research (Radio), during 1959 (Prof. W. J. G. Beynon), 539
Research (Scientific) : Use of Film in (Working Party of the Department of Scientific and Industrial Research to consider the), 102
Research (Scientific), in Australia, 190
Research (Scientific), in New Zealand, 370
Research (Scientific), in Schools (Report for 1959-60 of the Royal Society Committee on), 358
Research (Scientific), Air Force Office of : Decisions, Values and Groups, Vol. I, Reports from the First Interdisciplinary Conference in the Behavioral Science Division, held at the University of New Mexico (edited by Dorothy Willner), *review* by Prof. Ll. Wynn Jones, 955
Research (Space) : European Co-operation in, 19
Research (Space) Programme : A Co-operative, 531
Research (Water) Association : Fifth Annual Report (1959-60), 21
Research Corporation Award (1960) awarded to Dr. Rudolf L. Mössbauer by the California Institute of Technology and Research Corporation, 275
Research Development Corporation (National) : Report for 1959-60, 882
Research Development Corporation (National), of India : Sixth Annual Report (1959-60), 878
Research Expenditure on Fisheries, 532
Research Fellowships (Ford Foundation) of the Zoological Society of London awarded to Dr. Peter A. Jewell, Dr. Lorna M. Kellas and D. R S. Kirby, 711
Research Grants 1961 : Studentships, Fellowships and (Department of Scientific and Industrial Research), 361
Research Laboratories (Aeronautical), of the Australian Defence Scientific Service : Annual Report for 1958-59, 103
Research Laboratories (New), of Hilger and Watts, Ltd. (N. J. Goodman), 189
Research Ship : New British Oceanographic, 102
Research and Control Instruments, Ltd. : Conference on X-Ray Analytical Methods, 275
Research and Development, Advisory Council on (Ministry of Power) : Appointment of M. A. L. Banks as a member, 188
Research and Development (Current), in Scientific Documentation, No. 7 (United States National Science Foundation), 185
Resin Particles : Uptake of Small, by the Alimentary Canal of the Calf (J. M Payne and B. F Sansom), 494
Resin-based Coating Materials : Chemical Analysis of (edited by Dr. C. P. A Kappelmeier), *review* by Dr. D. T. Lewis, 175
Reserpine : Levels of Serotonin during Convulsion and the Effect of (Prof. E. M. Gal and P. A. Drewes), 234
Residence of Mental Hospital Patients : Area of (Studies on Medical and Population Subjects, No. 16), (Registrar General), 716
Resistance (Drug), in Leukaemia : Increased Dihydrofolate Reductase Activity as a Possible Basis of (Dr. D. K. Misra, Stewart R Humphreys, Prof. Morris Friedkin, Dr. Abraham Goldin and Elizabeth J. Crawford), 39
Resistance (Radio-) of Sporulating Cells of *Bacillus cereus* : Changes in (Dr. Vladimír Vinter), 589
Resonance Studies (Electron Spin) : Tritium as a Source of Radiation in (Jerzy Kroh, Basil C. Green and Dr. John W. T. Spinks), 655
Resorption (Ovine Foetal), caused by *Toxoplasma gondii* Infection (I. D. Smith), 939
Resources (Natural) : Conservation of, 779
Resources (Scientific and Technical), of British Railways, 607
Respiration : Changes in Mode of, as an Indication of Level of Awareness (Dr. L. Goldie and J. M. Green), 581
Respiration (Cellular) : Inhibition of, by Co-Carcinogenic Fractions of Croton Oil (Dr. A. C. Allison and J. W. Lightbown), 892
Respiratory Cycle : Nervous Activity in relation to the (E. W. Poole), 579
Response of Japanese Quail to Restricted Lighting (Prof. Hans Abplanalp), 942
Response (Dose-) Relationships in Radiation Carcinogenesis (Dr. Niels Arley and Reidar Eker), 151
Response (Horizontal Cell), to Retinal Illumination : Location of the Non-Linearity in (Dr. Richard Fatehchand, Dr Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Response (Pressor), to Guanethedine : Augmentation of the, by Inhibition of Catechol O-Methyltransferase (Dr. D. W. Wylie), 490
Response (Transient-) Techniques : Determination of Heats of Adsorption by (James J. Carberry), 391
Response Potentials (Recurrent) : Photographic Cumulation of (Prof. Lorrin A. Riggs, C. R. Cavonius and Dr. E. Parker Johnson), 383
Responses (Spinal Monosynaptic), from Tenotomized Muscles in Cats : Plastic Changes of (Dr. W Kozak and Dr. R A. Westerman), 753
Responses (Tissue), to Filter Membranes of various Porosities (Prof. R. C. Curran and J. A M. Ager), 1023
Restricted Lighting : Response of Japanese Quail to (Prof. Hans Abplanalp), 942
Restriction (Moderate Caloric) : Prevention of Fatty Liver due to Threonine Deficiency by (Akira Yoshida, Prof Kiyoshi Ashida and Prof A. E. Harper), 917
Retention of Zinc-65 in the Bones of Rats (Dr. D M Taylor), 932
Reticulum (Sarcoplasmic) : Relationship of the, to Sarcolemma in Sheep Cardiac Muscle (F O Simpson and S. J. Oertelis), 758
Reticulum (Thread-like), in Latex from *Hevea brasiliensis* and its relation to Latex Particles (W A. Southorn), 1000
Retinal Correspondency and the Horopter in Anomalous Correspondence (Dr. M C Flom and Prof. F. W Weymouth), 34
Retinal Illumination : Location of the Non-Linearity in Horizontal Cell Response to (Dr Richard Fatehchand, Dr Gunnar Svaetichin, Dr. Genyo Mitarai and Dr. Jorge Villegas), 463
Reversal (Apparent), of Xanthine Oxidase Action in *Chlorella vulgaris* Starved of Nitrogen (Michael K. Bach), 485
Revisions (Proposed), of 'Transplantese' (Dr. P. A. Gorer, Dr. J. F. Loutit and Dr. H. S. Micklem), 1024
Revolution (Copernican) : Origin of the (Dr. J. R. Ravetz), 859
Reynolds, W. N., and others : Aggregation and Dispersal of Radiation Damage in Graphite, 824
Reynoldson, Dr. T. B. : Environment and Reproduction in Freshwater Triclads, 329
Reyssat, M., and others : A Transatlantic Communication Experiment via *Echo* I Satellite, 268
Rheological Measurements : Polymers and the Theory of Numbers—Molecular Weight Distributions from (E. Menefee and W. L. Peticolas), 745
Rhizosphere (Host) : Influence of the, on the Morphogenesis of *Striga* Seedlings (Growth and Morphogenesis of *Striga* Seedlings), (Colin N. Williams), 380
Ribonuclease (Pancreatic) : Use of Snake Venom Phosphodiesterase in place of, for the Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus (Dr. T. O. Diener), 687
Ribonucleic Acid in the Growth of Fern Gametophytes : Protein and (Y Hotta), 455
Ribonucleic Acid Fractions : Composition of various, from Micro-organisms of Different Deoxyribonucleic Acid Composition (Carl R. Woese), 920
Ribonucleic Acids in the Moult Cycle of an Insect (A. Krishnakumaran), 243
Ribonucleic Acids (Liver and Tumour) : Comparative Effects of, on the Normal Liver and the Novikoff Hepatoma Cells of the Rat (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Ribosomes present in Bacteria and Yeast : Nature of the—a Re-Appraisal (T. J Bowen, Dr. S. Dagley, Dr J. Sykes and Dr. D. G Wild), 638
Rice, Prof. W. G., and Mitchener, Dr. James : Histochemical Evidence of 5-Hydroxytryptamine in a Dog Mast Cell Tumour, 767
Rice (*Oryza sativa* Linn.) : Differential Radiosensitivity in, at the Genotypic Level (H. K Shama Rao and K. C. Bora), 762
Rice Plant : Possibility of Fixation of Atmospheric Nitrogen by the (Dr. M. G. R. Hart and Dr. E. H. Roberts), 598
  Relations of Intensity of Photosynthesis and Appearance of *Piricularia oryzae* Cav. on the (R. Vámos, F. Zsoldos and I. Petrasovits), 407
Richards, I. R (Mawdsley, J., and) : Ionospheric Scattering of Satellite Transmissions, 906

Robinson, Dr. L. (Quintarelli, Dr. G., and) : Histochemistry of Human Sublingual Glands, 935
Robinson, P. E. : Root-knot Nematodes and Legume Nodules, 506
Robinson, R , and Smith, Air-Commodore P. : Tyrosyluria in Human Subjects, 323
Robson, Prof. H. N , and others : A Simplified Method for the Study of Chromosomes in Man, 420
Robson, June, and Fenn, P. : Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a Seed Dressing, in the Tissues of the Young Carnation Plant, 501
Robson, Prof. W. : Title of professor emeritus of biochemistry in the University of London conferred on, 188
Rock Carvings at Ewaninga in Central Australia (C. P. Mountford), 103
Rock Shelters of the Lower Murray River (D. J. Mulvaney), 445
Rock Types : Sedimentary, *review* by Dr. F. S Wallis, 257
Rockefeller Institute : Election of Dr. William O. Baker to the Board of Trustees, 22
Rockling (The Northern), in the Clyde Sea Area (T. B. Bagenal), 1028
Rocks : Flow Folding in (Dr Emyr Williams), 474
Rocks (Sedimentary) : Palaeomagnetism in some East Greenland (D. E. T. Bidgood and W. B. Harland), 633
Rodwell, A. W. : Glycerol in *Mycoplasma mycoides*—Unbalanced Growth of *Mycoplasma mycoides* caused by Glycerol Deficiency, 125
Roe, Anne, and others : Quantitative Zoology, revised edition, *review* by Prof. O. W. Richards, 256
Rogers, Dr. Donald : Appointed to the University of London readership in chemical crystallography at the Imperial College of Science and Technology, 188
Rogowski, B. F. W. (Shakeshaft, E. M., and) : References to Scientific Literature on Fire (Fire Offices' Committee, Joint Fire Research Organization, Library Bibliography No. 5, Part 10), 358
Roland-Jones, R. E. : Gas Chromatography (Use of Esters as High-temperature Polar Stationary Phases), 28
Role of Alcohol in the Aetiology of Cirrhosis of the Liver in France (Institut National d'Hygiene, Paris), 804
Role of Biliary Alkaline Phosphatase in the Guinea Pig (Freda Brown, *née* Bowyer), 755
Role of Phospholipids in the Process : Later Stages of Protein Synthesis and the (Dr. G D. Hunter and G. N. Godson), 140
Role of Selenium in relation to Ubiquinone in the Rat (J. Green, E. E. Edwin, A. T. Diplock and J. Bunyan), 748
Role of Tocopherol, Selenium and Antioxidants in the Rat (E. E. Edwin, J. Bunyan, A. T. Diplock and J. Green), 747
Role (The Physiological), of Ketane Bodies (Sir Hans Krebs), 446
Role (Possible), in Photosynthesis : Spectral Characteristics of Aggregated Chlorophyll and its (Seymour Steven Brody and Marcia Brody), 547
Rombold, Sir Algernon : At a meeting of the sponsors of the Delhi Engineering College Trust, 372
Romig, Harry G. (Dodge, Harold F., and) : Sampling Inspection Tables, second edition, *review* by Prof. M. G. Kendall, 259
Rømming, Chr., and others : Organic Halides as Electron Acceptors in Charge Transfer Compounds, 137
Root (Potato) Eelworm in the Canary Islands (R. Chamberlain), 773
Root-knot Nematodes and Legume Nodules (P. E. Robinson), 506
Rooting (Induced) : Use of, in Cytological Studies (D. N. Singh), 420
Roots (Barley) : Rapid Preparation of Fresh Frozen Sections of (Dr. Maurice Fried and Alicelia H. Franklin), 414
Roots (Oat) : Location of Manganese taken up in Short-term Absorption by (E. R. Page), 597
Ropartz, Dr. C , and others : A New Inheritable Property of Human Sera—the InV Factor, 586
Rose, Dr. D C : Appointed director of the Division of Pure Physics of the National Research Council of Canada, 444 ; *erratum*, 797 ; work of, 444
Rose, Dr. Geoffrey : Seasonal Variation in Blood Pressure in Man, 235
Rose Bengal . Distribution and Fate of (Dr. V. Bocci), 584
Rosen, M., and others : Deformation of Red Cell Shape induced by *Vipera palestinae* Venom *in vivo*, 320
Rosenberg, Barbara Hatch, and others : Multi-stranded Deoxyribonucleic Acid as determined by X-Irradiation, 833
Rosenfeld, Prof. L. : The Correspondence of Isaac Newton, *review*, 171
Rosenhain Medal for 1961 of the Institute of Metals awarded to Dr. P. B. Hirsch, 533
Ross, D. B. : Influence of Sodium on the Transport of Magnesium across the Intestinal Wall of the Rat *in vitro*, 840
Rossi, Prof. C., and Bianchi, E. : Diffusion of Small Molecules, 822
Rossiter, J. R. . Trans-Antarctic Expedition, 1955-1958, *review*, 346
Rostherne Mere, Cheshire, as a Nature Reserve, 532
Rot (Dry), and Redbrick (Dr. A. P. Rowe), 360
Rotation Period of the Artificial Satellite $1958\delta 1$ (P. Notni and H. Oleak), 737 , (C. R Faulkner), 738
Rotatory Dispersion (Optical), of the Thrombin-induced Conversion of Fibrinogen to Fibrin Monomer (Prof. C. M. Kay and M M. Marsh), 307
Rotblat, Prof. J. (Lindop, Dr. Patricia J., and) : Shortening of Life and Causes of Death in Mice exposed to a Single Whole-Body Dose of Radiation, 645
Roth, Dr. K. F. : Title of professor of mathematics in the University of London (at University College) conferred on, 188
Rothberg, Dr. Simon, and van Scott, Dr. Eugene J. : Localization of Arginase in Rabbit Skin, 832
Rothschild Prize for Research for 1960 awarded to Prof. Ephraim Katchalski, 447
Rowe, Dr. A. P. : The Problem of Freedom and Efficiency in Universities, 360
  Dry Rot and Redbrick, 360
Rowe, Dr. C. E. : Appointed Caroline Harrold Research Fellow in the Department of Physiology in the University of Birmingham, 22
Roxburgh, J. M., and others : Microbial Production of Carbon Monoxide from Flavonoids, 510
Royal Astronomical Society : Gold Medal awarded to Prof. Herman Zanstra, 188
  Eddington Medal awarded to Prof. Hans A. Bethe, 188
  Election of Prof. W. H. McCrea as president, 880
Royal Australian Chemical Institute (Victoria Branch) : Discussion on Utilization of Water in Australia, 537
Royal Cancer Hospital, London : Title of professor of biophysics as applied to medicine in the University of London (at the Institute of Cancer Research) conferred on Dr. L. F. Lamerton, 22
  Appointment of E. J. Ambrose as reader in physical chemistry at the Institute of Cancer Research, 22
  Appointment of Dr. G. M. Timmis as reader in chemistry at the Institute of Cancer Research, 22
Royal College of Surgeons of England : Title of Sir William Collins professor of anatomy in the University of London (at the Institute of Basic Medical Sciences) conferred on G. W. Causey, 534
Royal Geographical Society : Patron's Medal for 1961 awarded to Mikhail M. Somov, 443
  Founder's Medal for 1961 awarded to John Bartholomew, 443
  Victoria Medal awarded to Prof. W. William-Olsson, 443
  Murchison Grant awarded to Prof. K. M Buchanan, 443
  Back Grant awarded to Dr. Eric H. Brown, 443
  Cuthbert Peek Grant awarded to Martin W. Holdgate, 443
  Gill Memorial awarded to Cuchlaine A. M. King, 443
  Mrs. Patrick Ness Award awarded to R. M. L. Mason and A. R. Hanbury-Tenison, 443
Royal Horticultural Society : Jones–Bateman Cup awarded to A. Gavin Brown, 104
Royal Medals for 1961 of the Royal Geographical Society, 443
Royal Meteorological Society and the Field Studies Council : Meteorological Field Course, 797
Royal Microscopical Society : Symposium on the Application of Interference Microscopy to Problems of Research, 714
Royal Navy : Development of Electrical Engineering in the (Sir Hamish Maclaren), 364
Royal Photographic Society : Symposium on Photography on Expeditions, 880
Royal Society of Canada : Symposium on Evolution—its Science and Doctrine, 1959 (edited by Thomas W. M. Cameron), *review* by Dr. P. G. Fothergill, 340
Royal Society of Edinburgh : Gunning Victoria Jubilee Prize for 1956-60 awarded to Sir Edward Appleton, 534
  Makdougall–Brisbane Prize (1958-60) awarded to Albert G. Long, 876
  Dr. W S. Bruce Memorial Prize (1960) awarded to J. MacDowall, 876
  Bruce–Preller Lecture (1961) to be delivered by Dr. V. A. Eyles, 876
  Election of new Fellows, 876
Royal Society of London : Colour Film entitled South from Chiloé, 188
  Report of the Committee on Scientific Research in Schools for 1959-1960, 358
  Appointment of Prof. R. Couteaux as Royal Society visiting professor for 1962-62, 796
  Election of new Fellows, 966
Royal Society and Nuffield Foundation Commonwealth Bursaries : Awards, 100
Royal Society of Victoria : *Proceedings*, New Series, Vol. 72, Part 2, Rock Shelters of the Lower Murray River (D. J. Mulvaney), 445
Royal Veterinary College, London : Title of reader in veterinary physiology conferred on Dr. F. R. Bell, 534
Royal (Institut), des Sciences Naturelles de Belgique : Mémoires, Deuxième Série, Fasc. 59, Analyse Zoogéographique des Mammifères de l'Iran (Dr. Xavier Misonne), 21

Rubber Research Institute of Malaya and the Government of the Federation of Malaya : Conference on Natural Rubber Research, 193
Rubber (Natural) Research (Rubber Research Institute of Malaya and the Government of the Federation of Malaya Conference on), 193
Rubidium-87 : Hyperfine Splitting of (Dr. L. Essen, E. G. Hope and D. Sutcliffe), 298
Rubus (Genus) : Life-History and Cytogenetics of the (Dr. Gordon Haskell), 713
Rumford Premium of the American Academy of Arts and Sciences awarded to Prof C. H. Townes, 797
Runcorn, Prof. S. K. : Handbook of Geophysics, *review*, 258
Rupture : The Mechanics of (Stress Analysis Group of the Institute of Physics and the Physical Society Conference on), 625
Rushton, Dr. W. A. H. : The Eye, the Brain and Land's Two-Colour Projections, 440
Russell, C., and others : 'Nitric Oxide—and Oxygen Effect' in X-Irradiated *Shigella flexneri*, 851
Russell, T. A. : All about Mangoes, *review*, 784
Russian Geology in Translation, *review* by Prof C. F Davidson, 610
Rust (Black) (Stem), of Wheat : Epidemics of (British Mycological Society Symposium on), 285
Rusts (Stem), of Wheat : Effects of Maleic Hydrazide on the Growth of Leaf and (D. J. Samborski *et al.*), 187
Rutin (Chromatographically Pure) : Isolation of, from Flowers of Elder (Jirí Davídek), 487
Ruttkay-Nedecky, G., and others : Presence in Horse Serum of Two Inhibitors of Avid A2 Influenza Virus Strains, 513
Ryan, Dr. Francis J. (Nakada, Dr. Daisuke, and) : Replication of Deoxyribonucleic Acid in Non-dividing Bacteria, 398
Ryle, Margaret : Relationship between High Temperature and Vitamin A Metabolism and the Fertility of Ewes, 104

SAARNI, Matti, and others : Excretion and Hepatic Storage of 5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58, 764
Saccadic Eye Movements : Subjective Analysis of (Dr J. G. Thomas), 842
Sachs, Dr. Leo, and Medina, Dan : *In vitro* Transformation of Normal Cells by Polyoma Virus, 457
Sadhu, Dr. D. P (Chowdhury, Dr. D. Roy, and) : Rate of Evaporation from Different Regions of the Skin of Indian Zebu Cattle, 491
Sadler, D. H. (edited by) : Transactions of the International Astronomical Union, Vol. 10, Tenth General Assembly, Moscow, 1958, *review* by D. McNally, 175
Safarevic, Prof. I. R. : Elected a Member of the Mathematics Section of the Leopoldina German Academy of Sciences, 273
Safeguarding Health in London, 540
Safflower Seed : Estimation of Oil in (S. H. Pawlowski), 772
Sahara : Tribes of the (Dr. Lloyd Cabot Briggs), *review* by G I. Jones, 782
Sahara Desert . Radioactive Fall-out in Israel resulting from the Nuclear Tests in the (Y. Feige, E. Shalmon, J. Vardi, J. R. Gat (Gutmann), and Y. L. Tokatly), 90
Sahara Nuclear Test Explosions : Deposition of Fission Product Nuclides after Two (Dr. V. Havlovic), 977
Saharan Ethnography, *review* by G. I Jones, 782
Sahni (Birbal) Medal of the Indian Botanical Society awarded to Dr. E. K. Janaki Ammal, 361
Sakai, Dr. Akira : Effect of Polyhydric Alcohols to Frost Hardiness in Plants, 416
Salaman, Dr M. H. : Leukaemia, *review*, 3
Salk 'Altered' Monkey Heart Cells and Ehrlich Ascites Carcinoma Cells : Immunological Cross-Reactions between (Rose M. Johnstone and Dr. Stephen I. Vas), 70
Sall, Dr. Theodore, and others : Plasma Membranes and Mitochondrial Equivalents as Functionally Co-ordinated Structures, 79
Salmonella typhimurium : Absence of the Glucose Effect on the Frequency of Lysogenization in (Patricia Hoffee, Roger Weinberg and Prof. Ellis Englesberg), 160
Salmonella typhimurium Cell : Phenomic Delay in Transduction of (Dr. J. Hubáček), 679
Salmonella Flagellar Protein : A Gene determining Presence or Absence of ε-N-Methyl-Lysine in (Dr. B. A. D Stocker, Dr. M. W. McDonough and Dr. R. P. Ambler), 556
Salmonella Serotypes from Congo Reptiles : Five Less-Common (Prof. MacDonald Fulton, Philomena Szafran and Matthew M. Lesko), 240
Salt (Organic Gold) : Effect of an, on Eaton's Primary Atypical Pneumonia Agent and other Observations (Dr. B. P. Marmion and Gillian M. Goodburn), 247
Salt Solutions of Low Ionic Strength : Properties of Vessel Muscle Proteins extracted with Water or (Prof. L. Laszt), 230
Salts (Quaternary Ammonium) : Specification of Asymmetric Nitrogen Atom—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and (G. Bernáth), 304
Salvage—Waste or Wealth, 103
Salvia splendens : Effect of Temperature Fluctuations on Flowering in (R. M. M. Crawford), 74
Samaun (Kemeny, L. G., and) : Random Fluctuations in a Nuclear Fission Reactor, 130
Samborski, D. J., *et al.* : Effects of Maleic Hydrazide on the Growth of Leaf and Stem Rusts of Wheat, 187
Sampling of Sub-micron Particles for Electron Microscopy (C. E Billings, W. J. Megaw and R. D. Wiffen), 336
Sampling Inspection Tables (Harold F. Dodge and Harry G. Romig), second edition, *review* by Prof. M. G. Kendall, 259
Sanders, Margaret A., and others : Control of Fertility by 6-Azauridine, 1015
Sanderson, D. M. (Casida, Prof. John E., and) : Toxic Hazard from Formulating the Insecticide Dimethoate in Methyl 'Cellosolve', 507
Sanderson, P. H. : Title of reader in medicine in the University of London (at St. Mary's Hospital Medical School) conferred on, 188
Sandler, M., and Spector, R. G. : Effect of Urinary *p*H on 5-Hydroxytryptamine Excretion in the Rat, 838
Sandwith, N. Y. : Fiori delle Ande, *review*, 523
Sanguinarine in Milk . Experimental Transmission of—Detection of a Metabolic Product (Dr Sohrab A. E Hakim, Dr. Valerie Mijovic and Dr. James Walker), 201
Sansom, B. F. (Payne, J. M., and) . Uptake of Small Resin Particles by the Alimentary Canal of the Calf, 494
Sarawak : An Extinct Giant Pangolin and associated Mammals from Niah Cave (Tom Harrisson, D. A. Hooijer and Lord Medway), 166
Sarcolemma in Sheep Cardiac Muscle : Relationship of the Sarcoplasmic Reticulum to (F. O. Simpson and S. J. Oertelis), 758
Sarcoma (Methylcholanthrene), in Rats : Inhibiting Effect of Nicotinamide and Diphosphopyridine Nucleotide on the (M. Matsuyama, A. Maekawa and T. Nagayo), 673
Sarcoplasmic Reticulum : Relationship of the, to Sarcolemma in Sheep Cardiac Muscle (F. O Simpson and S. J. Oertelis), 758
Sargent, III., Thornton, and others : The Psychotomimetic Properties of 3,4,5-Trimethoxyamphetamine, 1011
Sarjant, Prof. R. J. : Western Dependence on Oil, 626
Sarkar, Dr. Nirmal : Reduced Fibrinolytic Activity of Atherosclerotic Sera caused by an Increase in Low-density Lipoproteins in Blood, 929
Sasaki, Satoshi, and others : Bioassay of Ciguatera Toxin, 229
Sasaki, Shoji : Degradative Pathway of L-Leucine in *Proteus vulgaris*, 400
Sastry, P. Seshadri, and others Distribution of Coenzyme Q in Rat Liver Cell Fractions, 577
  Amino-Acid Patterns in Vitamin A-deficient Rats, 660
Satellite (*Echo* I) : A Transatlantic Communication Experiment via (H. Carru, R. Gendrin and M. Reyssat), 268
Satellite 1958δ1 (Artificial) : Rotation Period of the (P. Notni and H. Oleak), 737 ; (C. R. Faulkner), 738
Satellite Programme : British Communications (House of Commons Adjournment Debate on), 276
Satellite Radio Transmissions : Field-Aligned Ionospheric Irregularities and the Scintillation of (D. G. Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Satellite Transmissions : Ionospheric Scattering of (J. Mawdsley and I. R. Richards), 906
  Irregular Fading of (Dr. W. C. Bain), 129
Satô, Yasuo : Normal Mode Interpretation of the Sound Propagation in Whispering Galleries, 475
Satyanaryan, Y. : Impact of Man on the Vegetation of the Humid Tropics (Effects of Shifting Cultivation), 25
Savage, Dr. R. J. G., and others : Geology of the Floor of the Bristol Channel, 51
Saville, John : Agricultural History (Public Opinion and Agricultural Depression, 1880-1900), 368
Savino, Dr. Enrique, and others : Glutamic Oxaloacetic Transaminase Activity in Different Zones of the Ventricular Muscle of the Dog, 315
Sawyer, Prof P. N., and Valmont, I. : Evidence of Active Ion Transport across Large Canine Blood Vessel Walls, 470
Scandium : The Chemistry of Yttrium and (Dr. R. C. Vickery), *review* by Dr. J. S. Anderson, 345
Scandium Metal : Some Properties of (P. G. Mardon, J. L. Nichols, J. H. Pearce and D. M. Poole), 566
Scattering (Ionospheric), of Satellite Transmissions (J. Mawdsley and I. R. Richards), 906
Scent Gland of the Hemipteran *Acanthocephala femorata* : *Trans*-2-Hexenal in the (Prof. Murray S. Blum, Donald D. Crain and Julius B. Chidester), 245
Schachter, M. (edited by) : Polypeptides which affect Smooth Muscles and Blood Vessels—Proceedings of a Symposium held in London, 1959 (Biological Council's Co-ordinating Committee for Symposia on Drug Action Series, Vol. 4), *review* by Prof J H. Gaddum, 257
Schapiro, Shawn, and Stjarne, Lennart : Evidence for the Granular Localization of Posterior Pituitary Hormones, 669
Scheinberg, S L , and Reckel, R. : Effects of Œstrogen on Somatic Variation of an Erythrocyte Agglutinogen in Chickens, 295
Scheuer, Prof Paul J , and others : Bioassay of Ciguatera Toxin, 229
Schiavo, A., and others : Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the Development of Chicken Embryos, 66
Schild, F. : Gas Chromatography (Determination of Response Factors for Compounds of Different Type), 26
Schildkraut, Carl L. (Marmur, Dr. Julius, and) : Growth of Bacteria labelled with Heavy Isotopes for the Isolation of Nucleic Acids, 636
Schizophyllum commune : Origin of Expressed Mutations in (Dr. Stanley Dick and Dr. John R. Raper), 81
Schlichting, Prof H. : Wind Tunnels and Flow Visualization (Aerodynamic Problems of Motor-cars), 109
Schloesing, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Schmalhausen, Prof. I. I. : Elected a Member of the General Biology Section of the Leopoldina German Academy of Sciences, 273
Schmid, Dr. L. : Excretion of Tryptophan Metabolites after Physical Effort, 64
Schmid, Prof Rudi (Ockner, Robert K., and) : Acquired Porphyria in Man and Rat due to Hexachlorobenzene Intoxication, 499
Schnabel, Eugen, and others : Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and its Melanocyte-stimulating and Corticotropin-releasing Activity, 143
Schneiderman, Prof. Howard A. : Appointed professor of biology in Western Reserve University, Cleveland, 357 ; work of, 357
Schofield, J. C. : Changes in Sea-level recorded in New Zealand, 533
Scholarships : State (House of Commons Adjournment Debate on), 19
Scholarships for further study or research in France (French Government), 534
Scholarships and Fellowships (Grants,), for Research on Diseases of the Blood (Lady Tata Memorial Trust), 361
Schonland, Sir Basil : Elected junior pro-chancellor of the University of Southampton, 534
School of Management Studies (To be established by the University of Bristol), 358
School (Junior) : Mathematics in the (J. S. Flavell), 20
School (Summer), at the University of Ghent on the Electrical, Optical and Mechanical Properties of Lattice Defects (sponsored by NATO), 104
School Child : The Health of the—Report of the Chief Medical Officer of the Ministry of Education for 1958 and 1959, 974

Schools : Scientific Research in (Report for 1959-60 of the Royal Society Committee on), 358
Schrecker, A. W., and others : Toxicity and Anti-leukaemic Effectiveness in Mice of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid (Tetrahydroamethopterin), 937
Schreir, Dr. L. L. (Piggott, R. A., and) : Micropitting of Titanium during Anodic Oxidation in Formic Acid, 216
Schrodinger, Prof. Erwin : *Obituary* by Prof. P. A. M. Dirac, 355
Schulert, Dr. Arthur R : Assessment of Dietary Strontium-90 through Urine Assay, 933
Schutte, C. J. H. : The BH_4^- Ion in the Lithium Borohydride Lattice, 745
Schwann, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Schwarzkopf, Dr. P. : Powder Metallurgy (Review of a Half-Century of Modern Powder Metallurgy), 365
Schwarzmann, V., and others : Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a Parental Strain, 1025
Science : History and Philosophy of, in the Commonwealth (Dr. W. Mays), 971
  Space, *review* by Dr. A. Dalgarno, 5
Science in Poland : History of, 103
Science, Australian Academy of (Standing Committee on Spectroscopy). Third Australian Spectroscopy Conference, 714
Science, Indian Institute of : Golden Jubilee Volume, 273
Science, Minister for : Appointment of Denzil Freeth as Parliamentary Secretary to the, 534
Science (British) : Founders of—John Wilkins, Robert Boyle, John Ray, Christopher Wren, Robert Hooke, Isaac Newton (J. G. Crowther), *review* by Dr. W. P. D. Wightman, 259
Science (Corrosion) : Essay Competition on (Society of Chemical Industry), 274
Science (Engineering), at Oxford, 185
Science (Soil), British Society of (Clay Minerals Group of the Mineralogical Society and the) : Joint Discussion on Weathering, 361
Science (Space) Symposium, Nice, 1960 : Proceedings of the First International—Space Research (edited by Dr. Hilde Kallman Bijl), *review* by Dr. R. L. F. Boyd, 346
Science (Western) : Increasing the Effectiveness of (Fondation Universitaire, Brussels), 339
Science Congress (Pacific) : Tenth, 188
Science Masters' Association, and others : Discussion Conference on Science and Education, 534
Science Museum, London : Appointment of J. A. Chaldecott as keeper of the Science Library, 188, 530
  Appointment of G. W. B. Lacey as deputy keeper in the Department of Aeronautics, 188
Science Planning, Development and Co-operation in the Countries of the Middle East and North Africa (Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council Conference on), 362
Science Planning Board, 453
Science Progress, Vol. 49, No. 193, 713
Science and Education, a Policy Statement (Association of Scientific Workers), 453, 517
Science and Education (Association of Scientific Workers, Association of Teachers in Technical Institutions, Association of University Teachers, National Union of Teachers, and Science Masters' Association Discussion Conference on), 534
Science and Freedom, Committee on (Manchester) : Bulletin No. 16, Freedom and Efficiency—Problems of University Administration in Britain and the Commonwealth, 517
Science and the Humanities, 695
Science and Industry—the Problem of Communication (Department of Scientific and Industrial Research National Conference on), 275
  Temperature—its Measurement and Control in (American Institute of Physics, the Instrument Society of America and the United States National Bureau of Standards Symposium on), 22
Science and Technology : Strengthening, 339
Science and Technology, National Lending Library for : Expenditure on the, 622
Science and Technology, National Reference Library for : Adjournment Debate in the House of Commons on the, 968
Science and Technology (Vacuum) : Progress in (edited by A. S. D. Barrett), *review* by Dr. R. O. Jenkins, 867
Science, Technology and the Christian (Prof. C. A. Coulson), (Beckly Social Service Lecture, 1960), *review* by R. Brightman, 173
Sciences, Czechoslovak Academy of : Election of Prof. J. D. Bernal as a member, 714
Sciences, New York Academy of : Election of Dr. Frederick Y. Wiselogle as president, 19
  Election of Sir Edward Dodds, Sir Alfred Lowell, Dr. Giulo Natti, Dr. Franz Buchner and Dr. J. J. Trillat as honorary-life-members, 19
  D. B Steinman Award of 500 dollars awarded to Isidor B. Laskowitz, 19
  A. Cressy Morrison Award of 400 dollars awarded to Dr. Minoru Tsutsui, 19
Sciences, New York Academy of, and the Academy of Medical Sciences of the U.S.S R : Conference on Higher Nervous Activity, 282
Sciences, Polish Academy of : *Quarterly Review of Publications*, 186
Sciences Naturelles de Belgique, Institut Royal des : Mémoires, Deuxième Série, Fasc. 59, Analyse Zoogéographique des Mammifères de l'Iran (Dr. Xavier Misonne), 21
Sciences (Natural), Swiss Society for : One hundred and fortieth Annual Session (Dr. R. C. H. Tanner), 884
Sciences (Social) : Research in the (T. H. Hawkins), 541
Sciences (Social), in Industry : Priorities for Research in the (A. B. Cherns). 541
Sciences (Theology and the), at Birmingham, 101
Scientific Attaché (British), in Paris, 877
Scientific Documentation (Unesco South Asia Scientific Co-operation Office Regional Seminar on), 534
Scientific Documentation : Current Research and Development in, No. 7 (United States National Science Foundation), 185
Scientific Institutions and Scientists in Latin America, Vol. 4, Part 4, Argentina, N–Z (Unesco Science Co-operation Office, Montevideo), 361
Scientific Instruments and Apparatus : Forty-fifth Annual Exhibition of (Institute of Physics and the Physical Society), 535
Scientific Literature on Fire : References to (E. M. Shakeshaft and B. F. W. Rogowski), (Fire Offices' Committee, Joint Fire Research Organization, Library Bibliography No. 5, Part 10), 358
Scientific Progress : Christianity and, *review* by R. Brightman, 173
Scientific Publications : Polish, 186
Scientific Research : Use of Film in (Working Party of the Department of Scientific and Industrial Research to consider the), 102
Scientific Research in Australia, 190
Scientific Research in Belgium, 113
Scientific Research in New Zealand, 370
Scientific Research in Schools (Report for 1959-60 of the Royal Society Committee on), 358
Scientific Research, Air Force Office of : Decisions, Values and Groups, Vol. 1, Reports from the First Interdisciplinary Conference in the Behavioral Science Division, held at the University of New Mexico (edited by Dorothy Willner), *review* by Prof. Ll. Wynn Jones, 955
Scientific Workers, Association of : Science and Education, a Policy Statement, 453, 517
  A National Fuel and Power Policy—a Policy Statement, 626
Scientific Workers, Association of, and others : Discussion Conference on Science and Education, 534
Scientific and Industrial Research, Department of : Working Party to consider the Use of Film in Scientific Research, 102
  Booklet on Waste or Wealth (Clement Brown), 103
  List No. 28, Forthcoming International Scientific and Technical Conferences, 104
  New Buildings at the Fire Research Station (D. I. Lawson), 105
  National Conference on Science and Industry—the Problem of Communication, 275
  D.S I R. Studentships and Fellowships 1961, 361
  D.S.I.R. Research Grants 1961, 361
  Report of the Radio Research Board and the Report of the Director of Radio Research (1959), 539
  The Origin and Evolution of Coal (Dr. P. J Adams), (Geological Survey and Museum), 712
  Grant of £695, for the purchase of a gas chromatograph, and one of £768, for the purchase of an argon chromatograph with flame ionization detector, both for research in the Department of Chemistry, the Queen's University, Belfast, 714
  New Worsted Processing block at the Wool Industries Research Association to be opened by R. G. Menzies, 880
  Open Days at the Road Research Laboratory, 880
  Forest Products Research Bulletin No. 45, The Strength and Properties of Timber (F. H. Armstrong), 975
Scientific and Industrial Research, New Zealand Department of : Report for 1959-60, 370
Scientific and Industrial Research Organization, Australian Commonwealth : Twelfth Annual Report (1959-60), 190
Scientific and Technical Books : Recent, Supp. vi, January 28 ; Supp. viii, February 25 ; Supp. ix, March 25
Scientific and Technical Conferences : Forthcoming International (Department of Scientific and Industrial Research, List No. 28), 104
Scientific and Technical Personnel in American Industry (United States National Science Foundation), 794
Scientific and Technical Resources of British Railways, 607
Scientists (Scientific Institutions and), in Latin America, Vol 4, Part 4, Argentina, N–Z (Unesco Science Co-operation Office, Montevideo), 361
Scientists and Engineers (Women) : Employment of, 253
Scilly (Isles of)· Occurrence of a Species of *Halammohydra* on the (Prof. L. A. Harvey and J. B. J Wells), 944
Scintillation of Satellite Radio Transmissions : Field-Aligned Ionospheric Irregularities and the (D. G. Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Sclareol (^{14}C-), and β-Sitosterol from 2-^{14}C-Mevalonic Acid . Biosynthesis of (Prof. Harold J. Nicholas), 143
Scott, C. G. : Gas Chromatography (Method for investigating the Stability of White Oils), 28
  Gas Chromatography—Definitions and Retention Parameters, 280
Scott, J. E., and others Enhancement of Atomic Absorption in the Flame by Organic Solvents, 830
Scott, R. P. W. : Gas Chromatography (Applications and Technique), 26 ; (Developments in Apparatus and Technique), 27 ; (Theory and Application—Capillary Columns), 27
  Gas Chromatography—Definitions and Retention Parameters, 280
Scottish Field Studies Association : Programme of Courses, 713
Scowen, Dr. E. F. : Appointed to the University of London chair of medicine at St. Bartholomew's Hospital Medical College, 188
Scrapie : Brain Glycogen- and Copper-Levels in Normal Sheep and Sheep affected with (C. le Q. Darcel, R. J. Avery and R B. Carson), 410
Scrimshaw, F. H : Promoted to Deputy Chief Scientific Officer in the Ministry of Aviation, 530 ; work of, 530
Scrivenor, Sir Thomas : Appointed secretary of the Commonwealth Agricultural Bureaux, 714
Scruton, C. : Wind Tunnels and Flow Visualization, 108
Sea : Research on the Effects of Radioactivity in the (International Atomic Energy Agency), 877
Sea, International Council for the Exploration of the : Symposium on Zooplankton Production, 360
Sea-Breeze Front : A Radar Observation of a (Dr. E. Eastwood and G. C. Rider), 978
Sea-Level : Changes in, recorded in New Zealand (J. C. Schofield), 533
Sea-Water Purification Unit based on New Principles (General Electric Co. of America), 969
Sea-Water (Old), at its Bottom : A Second Lake with (Kaare Strøm), 913
Seaborg, Dr. Glenn T. : Appointed chairman of the United States Atomic Energy Commission, 357 ; work of, 357
Seal (Grey) : Status of the (R. S. R. Fitter), 506
Seale, H. P. : Impact of Man on the Vegetation of the Humid Tropics, 24
Sealing : Fluid (British Hydromechanics Research Association International Conference on), 970
Seasonal Variation in Blood Pressure in Man (Dr. Geoffrey Rose), 235
Seaweed Polysaccharide : Isolation of L-Galactose-6-sulphate from a (J. R. Turvey and Dr. D. A. Rees), 831

Second Lake with Old Sea-Water at its Bottom (Kaare Strøm), 913
Secondary Education in India, 451
Secondary (Post-) and Higher Education in Nigeria (Dr. C. T. Mortimer), 95
Secretion (Renal Proximal Tubular) : Dynamics of (Dr. Fredrik Kiil), 927
Secretions of the Female Reproductive Tract : Breakdown of Seminal Glycerylphosphorylcholine by (Prof. I. G. White and J. C. Wallace), 843
Sections (Beryllium Tubes and) : Fabrication of—a New Structural Metal with Unique Properties (Chesterfield Tube Co , Ltd.), 976
Secular Variation of the Flux Density of the Radio Source Cassiopeia A (Dr. J. A. Hogbom and Dr. J. R. Shakeshaft), 561
Sedimentary Petrography : Microscopic (Prof. Albert V. Carozzi), *review* by Dr F. S. Wallis, 257
Sedimentary Rock Types, *review* by Dr. F. S. Wallis, 257
Sedimentary Rocks : Palaeomagnetism in some East Greenland (D E. T. Bidgood and W B. Harland), 633
Seed (Oil Palm) : Effect of High-Temperature and Pre-Treatment on the Germination of (A. R. Rees), 74
Seed (Safflower) : Estimation of Oil in (S. H. Pawlowski), 772
Seed (*Solanum*) . Use of Gibberellin to hasten Germination of (Pauline B. Spicer and Leo O. Dionne), 327
Seed Dressing : Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a, in the Tissues of the Young Carnation Plant (June Robson and P. Fenn), 501
Seed Plants · Anatomy of (Prof. Katherine Esau), *review* by Dr. C. R. Metcalfe, 864
Seedlings (*Striga*) · Growth and Morphogenesis of (Colin N. Williams)—Effect of Light, Gibberellic Acid and Kinetin on Growth and Morphogenesis of *Striga* Seedlings, 378 ; Influence of the Host Rhizosphere on the Morphogenesis of *Striga* Seedlings, 380
Seeds · Modification of Radiation Damage in, by Post Treatment (Dr. W. Klingmuller), 413
Seeds (*Populus alba*) : Injury by Soaking of (Dr. L. Pólya), 159
Segré, Dr. G., and Silberberg, Dr A. Radial Particle Displacements in Poiseuille Flow of Suspensions, 209
Seigle, L. L. (Pranatis, A. L., and): Powder Metallurgy (Sintering of Iron, Copper and Nickel), 366
Seismic Soundings across Antarctica (J. G. D. Pratt), (Trans-Antarctic Expedition, 1955-58, Scientific Reports No. 3), *review* by G. de Q. Robin, 781
Sekariah, P. C., and others : Examination of *Leptospira pomona* by Gel Diffusion, 511
Sekiguchi, Matsuo, and others : Inhibition of Multiplication of Bacteriophage by Actinomycin, 246
Select Committee on Nationalized Industries : Report from the, together with the Proceedings of the Committee, Minutes of Evidence and Appendices—British Railways, 607
Selection Experiment · Developmental Barriers in a (K. C Sondhi), 249
Selective Growth of Bacteria · Chelating Agents for (G. M. Richardson), 78
Selective Medium for the Formation of Ascospores by *Aspergillus nidulans* (Isabel Garcia Acha and Dr Julio R. Villanueva), 328
Selenide (Cadmium), with the Sign of the Polar Axis : X-Ray Correlation of the *A-B* Layer Order of (R. Zare, W. R. Cook, Jun , and L. R. Shiozawa), 217
Selenium in relation to Ubiquinone in the Rat : Role of (J. Green, E. E. Edwin, A. T. Diplock and J. Bunyan), 748
Selenium and Anti-oxidants in the Rat : Role of Tocopherol, (E. E. Edwin, J. Bunyan, A. T. Diplock and J. Green), 747
Self, R. : An Enrichment Trap for Use with Capillary Columns, 223
Self-Regulation in Living Systems (Symposium at the National Research Council of Canada on), 799
Semi-Automatic Methods (Automatic and), in Analysis and Control (Medway College of Technology Symposium and Instrument Exhibition on), 447
Semiconductors : Tunnelling between, 21
Seminal Glycerylphosphorylcholine · Breakdown of, by Secretions of the Female Reproductive Tract (Prof I. G. White and J. C. Wallace), 843
Semple, Prof. J. G. : Future of the General Degree, 107
Semple, Prof. J. G., and Kneebone, G. T. . Algebraic Curves, *review* by Prof. T. A. A. Broadbent, 175
Sensitiveness of Trypsin to Ionizing Radiation : Effect of *p*H on the (Prof. J. A. V. Butler and A. B. Robins), 852
Sensitivity of Micro-organisms : Method of Dissolving Triacetyl-oleandomycin for the Assay of (Dr. J. W. Czekalowski), 752
Sensitization (Active), to Tuberculin with Cells from Tuberculin-sensitized Guinea Pigs (Dr. J. L. Turk), 889
Sensitization (Optical), by Acridine-Orange · Effects of Light and, on Living Bull Spermatozoa (C. van Duijn, jun.), 76
Separation of Purines in Human Urine · Identification of a Compound found during (Dr. Herbert Singer, Arax Gulbenkian, Sigmund E. Lasker and Charles L. Fox, Jun), 671
Separation of Univalent Fragments of Rabbit Antibody by Reduction of a Single, Labile Disulphide Bond (Prof. A. Nisonoff, G Markus and F. C. Wissler), 293
Separation Technique · 'Ligand Exchange', a Novel (Dr. F. Helfferich), 1001
Separation (Gas Chromatographic), of Low-boiling Hydrocarbons using Active Alumina as Support for the Liquid Phase (Dr. I. Halász and E. E. Wegner), 570
Separation (Morphological), of Cytological Races in *Ranunculus ficaria* L. (Dr. V. H. Heywood and Dr. S. Walker), 604
Sequence (Monosaccharide), in *Pneumococcus* Type XIV Polysaccharide (Dr. S A Barker, M. C. Keith and Prof. M. Stacey), 746
Sera (Atherosclerotic) : Reduced Fibrinolytic Activity of, caused by an Increase in Low-density Lipoproteins in Blood (Dr. Nirmal Sarkar), 929
Sera (Human) : A New Inheritable Property of—the InV Factor (Dr. C. Ropartz, Dr. J. Lenoir and Dr. L. Rivat), 586
  Precipitating Factor for Aggregated γ-Globulins in Normal (Dr. A. Taranta, Dr. H. S. Weiss and E C. Franklin), 239
Serological Method for the Determination of Human Chorionic Gonadotrophin : Clinical Application of a (Dr. Sam Brody and Dr. Gun Carlstrom), 841
Serotonin during Convulsion : Levels of, and the Effect of Reserpine (Prof. E. M. Gal and P. A Drewes), 234
Serotypes (*Salmonella*), from Congo Reptiles · Five Less-Common (Prof. MacDonald Fulton, Philomena Szafran and Matthew M. Lesko), 240
Serum (Horse) Presence in, of Two Inhibitors of Avid *A2* Influenza Virus Strains (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Serum (Human) : Nature of Thyroxine-binding Globulin in (Dr. J. R. Tata), 573
Serum (Rat) Amylase : Electrophoretic Behaviour of (Prof. Robert L. McGeachin and Betty Ann Potter), 751
Serum Iron and its Transport Mechanism in the Fowl (Prof Jose Planas, Sisinio de Castro and Jose Maria Recio), 668
Serum Protein Molecule · Influence of the Charge on a, and its Ability to Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes (B J Northover), 574
Serum Proteins (Pathological), and Urinary Proteins A Pyroninophilic Component in (R. E. Ballieux, G. N. Niehaus and Prof. M. T. Jansen), 60
Service with Overseas Governments (Colonial Office), 29
Service to Teachers, 20
Seshadri Sastry, P., and others . Fatty Acid Specificity for the Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in Rats, 482
Setchell, Dr B. P., and Blanch, E. · Conjugation of *p*-Aminohippurate by the Kidney and Effective Renal Plasma-flow, 230
Sethi, B L., and others . Cotton in India, *review* by Prof. S C. Harland, 86

Smith, T. C., and others : Effect of Phentolamine on Body Fat, 405
Smith, W. G. (edited by) Physics and Mathematics (Technical Books-in-Print, Vol. I, No 8), (Hansom Books, Ltd.), 104
Smith, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Smith-Rose, Dr. R. L. : Dr. Eric C. S. Megaw, *review*, 612
Smithies, Dr. F. : Elected a Fellow of the Royal Society of Edinburgh, 876
Smitinand, T. : Impact of Man on the Vegetation of the Humid Tropics (Effects of Shifting Cultivation), 25
Smoke (Tobacco) : Constituents of—an Annotated Bibliography, First Supplement (edited by H. R. Bentley and E G. N. Berry), (Tobacco Manufacturers' Standing Committee, Research Papers No. 3), 453
  Possible Biological Effects of Electrically Charged Particles in (Dr. K. H. Kingdon), 180

Smoke (Tobacco) Research (Dr. W. Carruthers), 453
Smooth Muscles and Blood Vessels : Polypeptides which affect—Proceedings of a Symposium held in London, 1959 (edited by M Schachter), (Biological Council's Co-ordinating Committee for Symposia on Drug Action Series, Vol 4), *review* by Prof. J. H. Gaddum, 257
Smythies, Bertram E. : The Birds of Borneo, *review* by Dr. L. Harrison Matthews, 699
Snake Venom Phosphodiesterase · Use of, in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus (Dr. T. O. Diener), 687
Snowden, Dr. K. U. . Effect of Air Pressure on the Fatigue of Lead and Aluminium, 53
Snyder, Dr. William C., and Alexander, James V. : Perfect Stages of *Fusarium oxysporum* and of *Fusarium solani* f. *pisi* still Unknown, 596
So-called Atypical Macroglobulinaemia : Identification of, as an Atypical Form of β_{2A}-Paraproteinaemia—a New Immunological Entity ? (R. E. Ballieux, Dr. J. W. Imhof and G. H. Niehaus), 768
Soaking of *Populus alba* Seeds : Injury by (Dr. L. Pólya), 159
Sobel, Charles, and others : Evaluation of the Activity of Corticosteroid 11β-Hydroxylase, 1006
Social Sciences : Research in the (T. H. Hawkins), 541
Social Sciences in Industry : Priorities for Research in the (A. B. Cherns), 541
Società Italiana di Fisica : Enrico Fermi International School of Physics, 880
Socrates and the Animals (Dr. Elena Quarelli), translated from the Italian by Kathleen Speight, *review* by B J. G. Maitland, 523
Sodium : Influence of, on the Transport of Magnesium across the Intestinal Wall of the Rat *in vitro* (D. B. Ross), 840
Sodium Chloride Whiskers : Visible Twist on (B. Jeszenszky and E. Hartmann), 213
Sodium Fluxes of a Freshwater Teleost : Action of Neurohypophyseal Hormones on the (Dr. J. Maetz and M. Juien), 152
Sodium Silicate–Ferrous Hydroxide System (Dr. G. Kakabadse and P. Whinfrey), 829
Sodium-deficient Water Cultures : Growth of a Nematode in Tomato Plants grown on (A. F. Bird and P. F. Brownell), 418
Soft Electromagnetic Radiation from Metals : Emission of, by the Impact of High-Energy Protons and Positive Ions (Prof. Rafi Mohammed Chaudhri and Mustaf Yar Khan), 996
Softened Enamel Surfaces of Human Teeth : Rehardening of, by Solutions of Calcium Phosphates (Theodore Koulourides, Prof. Heriberto Cueto and Dr. Ward Pigman), 226
Soil (Culm Measure), with Impeded Drainage : Phosphate Requirement of Lupins grown as a Pioneer Crop on (S. Larsen and D. Gunary), 691
Soil (Egyptian) : Chloramphenicol, a Simultaneous Carbon and Nitrogen Source for a *Streptomyces* sp. from (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775
Soil (Freshly Moistened) : Microbiological Changes in (Dr. E. Griffiths and H. F. Birch), 424
Soil Climate with special reference to the British Isles (Fourth Symposium in Agricultural Meteorology), (University College of Wales, Aberystwyth), 714
Soil Concentrates : Direct Methods of Estimation in the Spectrographic Analysis of Cobalt in (Dr. A. B. Calder), 165
Soil Fauna in relation to Soil Formation and Fertility (Association of Applied Biologists Symposium on), 367
Soil Formation and Fertility : Soil Fauna in relation to (Association of Applied Biologists Symposium on), 367
Soil Phosphate Solubility (S. Larsen and M. N. Court), 164
Soil Physical Conditions affecting Plant Growth (National Vegetable Research Station Association Members' Day), 625
Soil Profile : *C* Horizon of the (D. F. Ball), 688 ; (Dr. S. G. Willimott and D. W. Gilchrist Shirlaw), 689
Soil Profile Development : Glaciation in Wales as related to (Welsh Soils Discussion Group Meeting on), 275
Soil Science, British Society of (Clay Minerals Group of the Mineralogical Society and the) : Joint Discussion on Weathering, 361
Soil-Water Relations : Terminology in Plant- and (Dr. M. L. McGlashan), 207 ; (Dr. R. O. Slatyer and Dr. S. A. Taylor), 208
Soils : Soluble Aluminium in Plants and (S. A. Harris), 513
Soils Discussion Group (Welsh) : Meeting on Glaciation in Wales as related to Soil Profile Development, 275
Sokol, F., and others : Presence in Horse Serum of Two Inhibitors of Avid A2 Influenza Virus Strains, 513
Solanum Seed : Use of Gibberellin to hasten Germination of (Pauline B. Spicer and Leo O. Dionne), 327
Solar Activity during the period November 10-15, 1960 : The Cosmic Ray Flare on November 12, 1960, and (Staff of the Ionosphere and Radio-Astronomy Section of the Netherlands Postal and Telecommunications Services), 438
Solar Flares during the International Geophysical Year : Enhancement of Ionization in the *E*-Layer due to (G. H. Bazzard), 47
Solar Lines in the Infra-Red Spectrum observed from a High-Flying Aircraft : Some (N. D. P. Hughes and Dr. T. S. Moss), 908
Solar Wind and the Gegenschein (E. R. Harrison), 993
Solid-State Physics at Melbourne, 113
Solidago virgaurea : Studies of Climatic Ecotypes in Higher Plants—the Temperature Dependence of Apparent Photosynthesis in Different Populations of (O. Bjorkman, C. Florell and P. Holmgren), 624
Solids : Influence of Chemical Isomerism on the Szilard–Chalmers Processes in (T. Costea and I. Dema), 478
  Time-dependent Tensile Strength of (I. H. Hall), 131
Solids (Inorganic) : Radiation Effects in (Faraday Society General Discussion on), 447
Solignac, J. L. : Wind Tunnels and Flow Visualization, 110
Sollmann (Torald) Award in Pharmacology (Wyeth Laboratories, Philadelphia), 22
Solubility : Soil Phosphate (S. Larsen and M. N. Court), 164
Soluble Aluminium in Plants and Soils (S. A. Harris), 513
Solution : Accurate Determination of Molecular Weights of Unknown Materials in (R. A. Pasternak and Leonard A. Cavanagh), 446
Solution (Deuterium Oxide) : Nucleic Acids in (Y. Kyogoku, M. Tsuboi, T. Shimanouchi and I. Watanabe)—An Infra-red Criterion of the Base Pairing in Nucleic Acid Structure, 120 ; Parallelism of the Hypochromicity at 260 mμ and the Hyperchromicity at 1,685 cm.$^{-1}$ of Nucleic Acids in Deuterium Oxide Solution, 121
Solutions of Calcium Phosphates : Rehardening of Softened Enamel Surfaces of Human Teeth by (Theodore Koulourides, Prof. Heriberto Cuerto and Dr. Ward Pigman), 226
Solutions of Hydrogen Peroxide–Water and Deuterium Peroxide–Heavy Water : Glass Formation in (Robert C. Smith and S. J Wyard), 211
Solutions (Aqueous), of the Cyclic Dipeptides : Production of Pyrazine Derivatives in the Radiolysis of (Mathilde Kland-English and Warren M. Garrison), 302
Solutions (Ethyl Iodide) : Photolysis of (Michael C. L. Gerry and Prof. Gerald B. Porter), 655
Solutions (Macromolecular) : A New Type of Phenomenon of Flow Birefringence in (Shoei Fujishige), 653
Solutions (Salt), of Low Ionic Strength : Properties of Vessel Muscle Proteins extracted with Water or (Prof. L. Laszt), 230
Solvent-induced Infra-Red Frequency Shifts · Dielectric and Dipolar Interaction Theories of (Dr. H. E. Hallam and T. C. Tay), 915
Solvents (Organic) : Enhancement of Atomic Absorption in the Flame by (R. Lockyer, J E. Scott and Susan Slade), 830
Solvents (Water-miscible Organic) : Activation of Cockroach Acetylcholinesterase by (Dr. E. H. Colhoun), 309
Somatic Variation of an Erythrocyte Agglutinogen in Chickens · Effects of Œstrogen on (S. L. Scheinberg and R. Reckel), 295
Somner, Dudley : Haldane of Cloan—his Life and Times, 1856-1928, *review* by R. Brightman, 346
Somov, Mikhail M. : Awarded the Patron's Medal for 1961 of the Royal Geographical Society, 443
Sondhi, K. C. . Developmental Barriers in a Selection Experiment, 249
Sočka, J. : Primary and Initial Effects of Ionizing Radiations (Modification of Radiation Damage), 111
Sound Propagation in Whispering Galleries : Normal Mode Interpretation of the (Yasuo Satô), 475
Soundings (Seismic), across Antarctica (J. G. D. Pratt), (Trans-Antarctic Expedition, 1955–1958, Scientific Reports No. 3), *review* by G. de Q. Robin, 781
Source of Radiation : Tritium as a, in Electron Spin Resonance Studies (Jerzy Kroh, Basil C. Green and Dr. John W. T. Spinks), 655
Source (A Simultaneous Carbon and Nitrogen), for a *Streptomyces* sp. from Egyptian Soil · Chloramphenicol, a (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775
Sources (Possible), of Tartronate Deficiency in Man (Laurence G. Wesson), 147
Sourkes, Prof. T. L., and others : Conversion of DL-*m*-Tyrosine to Dopamine in the Rat, 577
South from Chiloé (Colour Film for hire from the Royal Society), 188
South America : New Species of *Chaetacis* from (Arthur M Chickering), 446
South Asia : Mathematical Education in—Report of the Second Conference on (Tata Institute of Fundamental Research, Bombay, 1960), 273
  Mathematics, in, 273
South Asia Science Co-operation Office (Unesco) : Regional Seminar on Scientific Documentation, 534
South and South-East Asia : Di^a, Js^a and V Blood Groups in (G. H. Vos and Dr. R. L. Kirk), 321
South-East Africa : Biogeography of (Symposium at the University of Natal on), 801
South-East Asia (South and) : Di^a, Js^a and V Blood Groups in (G. H. Vos and Dr. R. L. Kirk), 321
Southern Hemisphere Fall-out and the Meridional Circulation (A. R. Dyer), 905
Southon, H. A. W., and Robertson, D. H. H. : Isolation of *Trypanosoma rhodesiense* from Wild *Glossina palpalis*, 411
Southorn, W. A. : Thread-like Reticulum in Latex from *Hevea brasiliensis* and its relation to Latex Particles, 1000
Sowjetischen Mondrakete *Lunik* II : Bericht uber Optische Beobachtungen anlasslich der Landung der (L. Detre), 186
Soybean Silage (Pulped) : Effects of, on the Milk-yield of Cows (Dr. E. Kurnik, D. Gábos and B. Pozsár), 492
Space : Introduction to (Dr. Lee A. DuBridge), *review* by Dr. A Dalgarno, 5
Space (Outer) : The Condition of (Sir Bernard Lovell), 625
Space Research : European Co-operation in, 19
  Proceedings of the First International Space Science Symposium, Nice, 1960 (edited by Dr. Hilde Kallmann Bijl), *review* by Dr. R. L. F. Boyd, 346
Space Research Programme : A Co-operative, 531
Space Science, *review* by Dr. A. Dalgarno, 5
Space Science Symposium (International), Nice, 1960 : Proceedings of the First—Space Research (edited by Dr. Hilde Kallmann Bijl), *review* by Dr. R. L. F. Boyd, 346
Space Vehicle 1961γ, 530
Space-Charge Currents in Gallium Arsenide (J. W. Allen and R. J. Cherry), 297
Spallanzani, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Spawning Channel : The Robertson Creek (K. C. Lucas), 372 ; (D. Mackinnon), 372
Special Property of the Cell Nucleus : Uptake of Deoxyribonucleic Acid (DNA)—a (Dr. M. Hill), 916
Special Theory of Electromagnetism (B. L. Coleman), 476
Species of *Halammohydra* on the Isles of Scilly : Occurrence of a (Prof. L. A. Harvey and J. B. J. Wells), 944
Species of *Tetranychus* Dufour (Acarina) from Uganda (Dr. D. M. Robinson), 857
Species (New), of *Chaetacis* from South America (Arthur M. Chickering), 446
Species (Tree) : Choice of (Food and Agriculture Organization of the United Nations, Forest Development Paper No. 13), 719
Species (Two), of Termites : Mechanism of Trail-laying in (A. M. Stuart), 419
Species-characterizing Antigens of 'L' and 'ERK' Cells (Dr. R. R A. Coombs, Mary R. Daniel, B. W. Gurner and A. Kelus), 503
Specific Antisera : Determination of the Concentration of Myxoviruses and of some, based on Neuraminidase Activity (Dr. J. Jacobs and Dr. J. N. Walop), 334
Specification of Asymmetric Nitrogen Atom—Application of the Cahn–Ingold–Prelog Nomenclature to some Tertiary Amines and Quaternary Ammonium Salts (G. Bernáth), 304

Specificities (Pharmacological), of Neurones in an Elementary Central Nervous System (Dr. H. Gerschenfeld and Dr. L. Tauc), 924
Specificity (Fatty Acid), for the Esterification of Vitamin A and Cholesterol by Intestinal and Pancreatic Enzymes in Rats (S. K Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Spector, Prof. Elliot : Identification of 3,4,5-Trimethoxyphenylacetic Acid as the Major Metabolite of Mescaline in the Dog, 751
Spector, R. G. (Sandler, M., and) : Effect of Urinary *p*H on 5-Hydroxytryptamine Excretion in the Rat, 838
Spector, W. G , and Willoughby, D. A. : Local Treatment of Experimental Burns with a Monoamine Oxidase Inhibitor, 489
Spectra (Absorption), in the Ultra-violet and Visible Region (edited by Dr. L. Lang, in collaboration with Dr. J Szoke, Dr. G. Varsányi and M Vizesy), *review* by Dr. R. F. Barrow, 347
Spectra (Stellar) : Oscillation Broadening of Lines from Ionized Elements in (Gunnar Eriksen), 651
Spectral Characteristics of Aggregated Chlorophyll and its Possible Role in Photosynthesis (Seymour Steven Brody and Marcia Brody), 547
Spectrographic Analysis of Cobalt in Soil Concentrates : Direct Methods of Estimation in the (Dr. A. B. Calder), 165
Spectrometer for the Far Infra-red (R H. Wright and P. N. Daykin), 212
Spectrophotometer : An Atomic Beam (G. R. Isaak), 373
Spectroscopy Conference : Third Australian (Standing Committee on Spectroscopy of the Australian Academy of Science), 714
Spectroscopy : Molecular (International Union of Pure and Applied Chemistry, the Koninklijke Nederlandse Chemische Vereniging and the Nederlandse Natuurkundige Vereniging fifth European Congress on), 797
Spectrum (Absorption), of Haemin : Effect of Polylysine on the (Dr. G. Blauer), 396
Spectrum (Infra-Red) : Some Solar Lines in the, observed from a High Flying Aircraft (N. D. P Hughes and Dr. T. S. Moss), 908
Spectrum (Ultra-Violet Absorption), of Water (R. M. Golding), 132
Spectrum Analysis (Short-term), in 'Real-Time' . A Versatile Method for (J. S. Gill), 117
Speech : The Perception of (D. E. Broadbent), 528
Spelling Irregularities and Reading Difficulty in English (Dr. W. R. Lee), 273
Spence, Dr. Jack T. : *Obituary* of Dr. Norman Bauer, 184
Spencer, Dr B. : Appointed to the chair of biochemistry at Trinity College, University of Dublin, 18 ; work of, 18
Sperm (Bull) : Absorbance of Feulgen-stained (Dr. Simon Iversen), 684
Spermatozoa (Living Bull) : Effects of Light and Optical Sensitization by Acridine-Orange on (C. van Duijn, jun), 76
Spheres (Yttrium-90) . A Technique for Destruction of the Pineal Body using (Dr. Uno Holmgren and Dr. Gustaf Notter), 773
Spicer, Pauline B , and Dionne, Leo O. : Use of Gibberellin to hasten Germination of *Solanum* Seed, 327
Spiders : European, *review* by Dr. Eric Duffey, 344
Spinal Monosynaptic Responses from Tenotomized Muscles in Cats : Plastic Changes of (Dr. W. Kozak and Dr. R. A. Westerman), 753
Spinks, Dr. John W. T., and others : Tritium as a Source of Radiation in Electron Spin Resonance Studies, 655
Spinnentiere oder Arachnoidea (Araneae), 11, Micryphantidae—Zwergspinnen (Dr. Hermann Wiehle), (Die Tierwelt Deutschlands und der Angrenzenden Meeresteile nach ihren Merkmalen und nach Lebensweise, begrundet von Prof. Dr. Friedrich Dahl, weitergefuhrt von Maria Dahl und Prof. Dr Hans Bischoff, Teil 47), *review* by Dr. Eric Duffey, 344
Spino-Cerebellar Tract (Ventral) : Localization of the Cells of Origin of the (J. I. Hubbard and O. Oscarsson), 157
Spittle Masses (Protective), of Frog Hopper Nymphs : A Method of Dissolving the (Dr. G. F. Howden and A. T. Marshall), 509
Spleen of Mice : Effect of Radioactive Sulphydryl Compounds on the Oxygen Tension in the (Dr. C van der Meer, P. W. Valkenburg and M. Remmelts), 588
Splitting (Hyperfine), of Rubidium-87 (Dr. L. Essen, E. G. Hope and D. Sutcliffe), 298
Spontaneous Arteriosclerosis of Old Hens : Inability of Refined Corn Oil to influence (K. F. Gey and Dr. A. Pletscher), 491
Spontaneous Cytomegalic Inclusion Body Disease involving Lacrimal Glands of Caesarian-derived (so-called) Pathogen-free Rats (Dr. Hans Meier), 534
Spooner, Prof. E. T. C. : Appointed Dean of the London School of Hygiene and Tropical Medicine, 18 ; work of, 18
Sporulating Cells of *Bacillus cereus* : Changes in Radioresistance of (Dr. Vladimir Vinter), 589
Spread-*F* and the Latitude Variation of Occurrence of Whistlers (D. G. Singleton), 215
Springer, G. F. (edited by) : Polysaccharides in Biology—Transactions of the Fourth Conference (Princeton, 1958), *review* by Dr. W. J. Whelan, 256
Spurling, R Glen, and Woodhall, Barnes (edited by) : Neurosurgery, Vol 2 (Medical Department, United States Army, Surgery in World War II), *review* by J. E. A. O'Connell, 344
Spurr, R. T. : Frictional Oscillations, 50
Squilla labadiensis (R. W. Ingle), 360
St. Bartholomew's Hospital Medical School, London : Appointment of Dr. E. F. Scowen to the University of London chair of medicine, 188
  Appointment of Dr R. A. Shooter to the chair of bacteriology, 797
St John's College, Cambridge : Kenneth Craik Research Award, 188
St. Mary's Hospital Medical School, London : Appointment of Dr. R. Creese as reader in physiology, 22
  Title of reader in medicine in the University of London conferred on P. H. Sanderson, 188
  Title of reader in anatomy conferred on Dr A. S. Breathnach, 534
Stability (Thermal), of Bulk Thermosetting Polymers : Method for studying (R W. Warfield), 1002
Stability (Thermal), of $TiOF_2$ (J S. Machin and D. L. Deadmore), 223
Stacey, Prof. M. : Science Planning and Administration in England, 362
Stacey, Prof. M., and others · Enzymic Synthesis of 3-O-α-D-Glucopyranosyl D-Xylose, 138
  Two New Amino-Sugars from an Antigenic Polysaccharide of *Pneumococcus*, 303
  Monosaccharide Sequence in *Pneumococcus* Type XIV Polysaccharide, 746
Stage (Initial), of Cholesterol- or Stilboestrol-induced Atherosclerosis : Fatty Acid Pattern in the Aorta Lipids of Cockerels in the (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Stage (The Pachytene), in Mammalian Oocytes (B. M. Slizynski), 683
Stages (Later), of Protein Synthesis and the Role of Phospholipids in the Process (Dr. G. D. Hunter and G. N. Godson), 140
Stages (Perfect), of *Fusarium oxysporum* and of *Fusarium solani* f. *pisi* still Unknown (Dr. William C. Snyder and James V. Alexander), 596
Stagg, M. S. (Smith, E., and) : Production and Mobility of Point Defects in Titanium and Zirconium, 300
Stain (Vital) : Effects of Ultrasonic Radiation in *Escherichia coli B* using Fluorochrome Acridine Orange as a (S. S. Ranade, V. G. Tatake and K. S. Korgaonkar), 931
Staining Method (A Lipoprotein), for Zone Electrophoresis (Dr. J. Kohn), 312
Standard Ionization Detector Equipment : Gas Chromatographic Analysis of Permanent Gases using (Dr. R. A. Landowne and Dr. S. R. Lipsky), 571
Standardization of Strong Electromagnetic Fields (J. A. Lane and J. E. Pearson), 49
Standards, United States National Bureau of, and others : Symposium on Temperature—its Measurement and Control in Science and Industry, 22
Stanley, Arthur : A Backroom Boy, *review* by Dr R. L. Smith-Rose, 612
Stanley, Prof. N. F : Relationship of Hepatoencephalomyelitis Virus and Reoviruses, 687
Star with High Metal Content : *HD* 101065—a *G*0 (Dr. Antoni Przybylski), 739
Starch (West German Starch Research Station, Detmold, International Conference on), 625
Starch Research Station (West German), Detmold : International Conference on Starch, 625
Stars : Existence of Net Electric Charges on (Dr. Ludwig Oster and Kenelm W. Philip), 43 ; (Prof V. A. Bailey), 43, 995 ; (Prof. Lloyd Motz), 994
State (Experimental Pre-Thrombic), of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet (Prof. B. A. Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
State Scholarships (House of Commons Adjournment Debate on), 19
Statistical Review for 1958 (Registrar General for England and Wales), 101
Statistics at Birkbeck College, London, 443
Status of the Grey Seal (R. S R Fitter), 506
Status and Development of Elm Disease in Britain (T. R. Peace), (Forestry Commission, Bulletin No. 33), 886
Steady Component (Apparent), of the Interplanetary Magnetic Field (Prof. V. A. Bailey), 44
Steel Castings Research Association (British) : Appointment of P. Lambert as head of the Engineering Section, 797
Steinmann (D. B.) Award of 500 dollars of the New York Academy of Sciences awarded to Isidor B. Laskowitz, 19
Stellar Spectra · Oscillation Broadening of Lines from Ionized Elements in (Gunnar Eriksen), 651
Stellar Structure : Hydromagnetics and (K. D. Cole), 31
Stem Rusts of Wheat : Effects of Maleic Hydrazide on the Growth of Leaf and (D. J. Samborski *et al.*), 187
Stem (Black) Rust of Wheat : Epidemics of (British Mycological Society Symposium on), 285
Stems of certain Conifers : Water-Conduction in the (J. Maddern Harris), 678
Stems (Bean) : Metabolism of Carboxyl-^{14}C-labelled 2,4-Dichlorophenoxyacetic Acid by—Heterogeneity of the Ethanol-soluble, Ether-insoluble Products (Michael K Bach and J. Fellig), 763
Stephenson, P. M. (Heastie, H., and) : Upper Winds over the World, Parts 1 and 2 (Air Ministry : Meteorological Office, Geophysical Memoirs No. 103), 543
Stereochemistry of the Succinic Dehydrogenase System (Prof. O. Gawron, A. J. Glaid, T. P. Fondy and M. M. Bechtold), 1004
Stereoisomers of *iso*Leucine: Utilization of the, by *Lactobacillus arabinosus* 17-5 (Dr. Ichiro Chibata, Shigeki Yamada and Hiroshi Ito), 144
Stermitz, Frank R., and Rapoport, Prof. Henry : O-Demethylation as a Biosynthetic Pattern in the Formation of Opium Alkaloids, 310
Stern, W. R , and Donald, Prof. C. M. : Relationship of Radiation, Leaf Area Index and Crop Growth-Rate, 597
Steroid-3β-ol-Dehydrogenase Activity in Foetal Leydig's Cells (Dr. Mikko Niemi and Dr. M. Ikonen), 592
Sterols (Faecal) · An Evaluation of the Use of Digitonin for the Analysis of (Prof. W. W. Wells and Patricia A. Mores), 483
Sterzl, Dr. J. : Effect of some Metabolic Inhibitors on Antibody Formation, 1022
Sterzl, Dr. J., and others : Characteristics of γ-Globulin, lacking Antibody Properties, in New-born Pigs, 1020
Steward, Prof. G. C. . Retirement from the chair of mathematics in the University of Hull, 968 ; work of, 968
Stewart, Prof. W. A. C. New Universities (Independence of the New Institution), 24
Stibbs, Dr. D. W. N. : Elected a Fellow of the Royal Society of Edinburgh, 876
Stilboestrol-Induced Atherosclerosis (Cholesterol- or) : Fatty Acid Pattern in the Aorta Lipids of Cockerels in the Initial Stage of (Dr. Rolf Blomstrand and Dr. Søren Christensen), 376
Stimulate or Inhibit the Phagocytosis of Bacteria by Leucocytes · Influence of the Charge on a Serum Protein Molecule and its Ability to (B. J. Northover), 574
Stimulating Hormones (α- and β-Melanocyte) : Effect of, on the Skin Colour of Man (Prof. Aaron B. Lerner and Dr. Joseph S. McGuire), 176
Stjarne, Lennart (Schapiro, Shawn, and) : Evidence for the Granular Localization of Posterior Pituitary Hormones, 669
Stock, Prof. Aaron H., and Carpenter, Prof. Anna-Mary : *Obituary* of Prof. Maud Menten, 965
Stocken, Dr. L. A. : Primary and Initial Effects of Ionizing Radiations (Immediate Effect of X-Rays on the Metabolism of the Nuclei of Rat Thymocytes), 110
Stocken, Dr. L. A., and others : A 'Dry' Mounting Autoradiographic Technique for the Localization of Water-soluble Compounds, 55

Stocker, Dr. B. A. D., and others : A Gene determining Presence or Absence of ε-N-Methyl-Lysine in *Salmonella* Flagellar Protein, 556
Stomach (Mouse Fore-) : Tumour Promotion by Lime Oil in the (Winifred E. H. Peirce), 497
Stomatopod Crustaceans (New), in West Africa, 360
Stoppani, G., and others : *In vitro* Decarboxylation of Tryptophans by Mammalian Decarboxylase, 483
Storage (Hepatic), of 5,6-Dimethylbenziminazolyl Cobamide Coenzyme labelled with Cobalt-58 . Excretion and (Wolmar Nyberg, Matti Saarni and Dr Ralph Gräsbeck), 764
Stout, Prof A. K. : New Universities (Independence of the New Institution), 24
Stoutemyer, Prof. V. T., and Britt, O. K. : Effect of Temperature and Grafting on Vegetative Growth Phases of Algerian Ivy, 854
Strain (*CBA/Lab*) of Mice : Histocompatible Colour Mutant from (Annie M. Brown and Margaret J. Cook), 1031
Strain (Parental) : Electrophoretic Patterns of Lymph Node Proteins in Hybrid F_1 Mice Irradiated and Treated with Myeloid and Lymphoid Cells from a (V. Schwarzmann, Prof. G. Mathe and J. L. Amiel), 1025
Straining (Fatigue), of Copper Whisker (Dr. Edward Eisner), 534
Strains (Avid *A2* Influenza Virus) : Presence in Horse Serum of Two Inhibitors of (Ol'ga Krizanová-Laučíková, J Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Strains (Two), of Tobacco Mosaic Virus : Analysis of the Cross-Reaction between (Prof. Irving Rappaport), 986
Stratospheric Winds (Equatorial) : Fluctuations in (R. A. Ebdon and R. G. Veryard), 791
Stratton, G. Burder (edited by) : The Zoological Record, Vol 94, Records of Zoological Literature relating chiefly to the Year 1957, *review* by Dr. Edward Hindle, 89
Stratton, Julius A. : Awarded the Faraday Medal of the Institution of Electrical Engineers, 797
Straub, Prof. Josef . Elected a Member of the General Biology Section of the Leopoldina German Academy of Sciences, 273
Streaming of Interstellar Hydrogen in the Vicinity of the Sun (Dr. R. X. McGee, Dr. J. D. Murray and Dr. J. L. Pawsey), 957
Strength (High) Glass (Dr. D. G. Holloway and P. A. P. Hastilow), 385
Strength (Low Ionic) : Properties of Vessel Muscle Proteins extracted with Water or Salt Solutions of (Prof. L. Laszt), 230
Strength (Tensile), of Solids : Time-dependent (I H. Hall), 131
Strength and Properties of Timber (F. H. Armstrong), (Forest Products Research Laboratory, Bulletin No 45), 975
Strengthening Science and Technology, 339
Streptolysin O : Cardiac Effects of, in Rabbits (Prof. S. P. Halbert, R. Bircher and E. Dahle), 232
Streptomyces sp from Egyptian Soil : Chloramphenicol, a Simultaneous Carbon and Nitrogen Source for (Prof. Y. Abd-el-Malek, M. Monib and A. Hazem), 775
Streptomyces aureofaciens Actinophage : The Host-Range of a (R. Weindling, H. D. Tresner and Dr. E. J. Backus), 603
Stressed Bone : Properties of (Prof. C. J. Dreyer), 594
Stride, A. H., and others : Geology of the Floor of the Bristol Channel, 51
Striga Seedlings : Growth and Morphogenesis of (Colin N. Williams)—Effect of Light, Gibberellic Acid and Kinetin on Growth and Morphogenesis of *Striga* Seedlings, 378 ; Influence of the Host Rhizosphere on the Morphogenesis of *Striga* Seedlings, 380
Strom, Prof. G. H. : Wind Tunnels and Flow Visualization, 109
Strøm, Kaare : A Second Lake with Old Sea-Water at its Bottom, 913
Strong Electromagnetic Fields : Standardization of (J. A. Lane and J. E. Pearson), 49
Strontium-90 in Human Diet in the United Kingdom, 1959 (Agricultural Research Council, Radiobiology Laboratory Report No. 3), 191
Strontium-90 in Human Plasma (Dr. G. E. Harrison, Alice Sutton and Dr. W. D'A. Maycock), 324
Strontium-90 in Human Teeth (F. E. Butler), 848
Strontium-90 (Dietary) : Assessment of, through Urine Assay (Dr. Arthur R. Schulert), 933
Strontium-90 and Caesium-137 in Grass and Milk in Finland during 1959 (J. K. Miettinen, O. Paakkola, R. Näsänen, A. Vuorinen and D. Merten), 324
Stroud, D. B. E., and others: Enzymic Synthesis of 3-O-α-D-Glucopyranosyl D-Xylose, 138
Structural Mutations (Prof. H. R. Mahler and Dean Fraser), 948
Structure of Molecules and Crystals : The Nature of the Chemical Bond and the (Prof. Linus Pauling), third edition, *review* by Prof. C. A. Coulson, 3
Structure in Pork Muscle : Rate of Anaerobic Glycolysis versus (J. Wismer-Pedersen and E. J Briskey), 318
Structure and Properties of Thin Films—Proceedings of an International Conference, New York, 1959 (edited by A. Neugebauer, J. B. Newkirk and D. A. Vermilyea), *review* by Dr. J. Ring, 613
Structure and Synthesis of Macromolecules (Biochemical Society Symposium on), 446
Structure (Calcium Fluoride) : Microhardness and other Properties of Magnesium Compounds with the (E R. Petty), 132
Structure (Chromosome), and Replication : Implication of, on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation (Eugene P Cronkite, Samuel W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Structure (Molecular) : Influence of, on the Liquid/Liquid Extraction of the Chloro-Complexes of Gallium and Indium with Aliphatic Ethers (Dr. R. R. Brooks and P. J. Lloyd), 375
Structure (Stellar) : Hydromagnetics and (K. D Cole), 31
Structure (Submolecular), of the Nucleic Acids (Prof. Bernard Pullman and Alberte Pullman), 725
Structures (Crystal), of Organic Compounds (X-Ray Analysis Group of the Institute of Physics and the Physical Society Conference on), 275, 797
Structures (Functionally Co-ordinated) : Plasma Membranes and Mitochondrial Equivalents as (Prof. Stuart Mudd, Dr. Tomio Kawata, John I Payne, Dr. Theodore Sall and Prof. Atsushi Takagi), 79
Stuart, A. M. : Mechanism of Trail-laying in Two Species of Termites, 419
Stubbs, A. R., and others : Geology of the Floor of the Bristol Channel, 51
Stuckenberg, B. : Biogeography of South-East Africa, 802
Student Grants in Great Britain, 19
Student Wastage in Australia, 444
Studentship and Fellowships in Agriculture (Agricultural Research Council), 796
Studentships, Fellowships and Research Grants 1961 (Department of Scientific and Industrial Research), 361
Studies of Climatic Ecotypes in Higher Plants—the Temperature Dependence of Apparent Photosynthesis in Different Populations of *Solidago virgaurea* (O. Bjorkman, C. Florell and P. Holmgren), 624
Studies on Medical and Population Subjects : No. 16, Area of Residence of Mental Hospital Patients (Registrar General), 716
Studies ('Active Centre'), in Trypsin (Teresa Therattil-Antony, M. Bier and F. F. Nord), 809
Studies (Cytological) Use of Induced Rooting in (D. N. Singh), 420
Studies (Electron Spin Resonance) : Tritium as a Source of Radiation in (Jerzy Kroh, Basil C. Green and Dr. John W T Spinks), 655
Studies (Management), School of (To be established by the University of Bristol), 358
Study of Chromosomes in Man : A Simplified Method for the (Dr. M. A. Kinlough, Prof. H. N. Robson and Dr. D L. Hayman), 420
Study of Human Biology, Society for the : Symposia of the, Vol. 3, Human Growth (edited by J. M. Tanner), *review*, 955
Study of Insect Migration : A Turning Point in the (Dr. J S. Kennedy), 785
Study of Tryptophan Biosynthesis : Lability of N-o-Carboxyphenylribosylamine as a Factor in the (Dr Colin H. Doy), 461
Study and Conservation of Nature, International Youth Federation for the : Report for 1959, 623
Studying Nitrogen Fixation in Bacterial Cells and their Extracts : Use of Radioactive Nitrogen in (Dr. D. J. D. Nicholas, Dr. D. J. Silvester and Dr. J. F. Fowler), 634
Studying Thermal Stability of Bulk Thermosetting Polymers : Method for (R. W. Warfield), 1002
Stulberg, Cyril : Biochemistry of Human Tumours (Techniques for Low-Temperature Storage, with maintenance of viability, of Cells grown in Tissue Culture), 627
Sturgeon, Dr. Phillip (Shoden, Dr. Arne, and) : Formation of Haemosiderin and its relation to Ferritin, 846
Subjective Analysis of Saccadic Eye Movements (Dr. J G. Thomas), 842
Subjects (Human) : Tyrosyluria in (R. Robinson and Air-Commodore P. Smith), 323
Subjects (Normal), and in Patients with Partial Gastrectomy : Intestinal Absorption of Vitamin B_{12} and if a Vitamin B_{12}-Peptide Complex in (Dr. G Milhaud), 31
Subjects (Phenylketonuric) : Formation of Hippuric Acid from Phenylalanine labelled with Carbon-14 in (Dr. H.-D. Grümer), 63
Sublimation Rates (Differential), of Light and Tritium-labelled Water (Dr. R. Moore and Dr. E R. Buskirk), 149
Sublingual Glands (Human) : Histochemistry of (Dr. G. Quintarelli and Dr. L. Robinson), 935
Submaxillary Mucin : Bovine (S. Tsuiki, Y. Hashimoto and Dr. W. Pigman), 399
Sub-micron Particles : Sampling of, for Electron Microscopy (C. E. Billings, W. J. Megaw and R. D. Wiffen), 336
Submolecular Structure of the Nucleic Acids (Prof. Bernard Pullman and Alberte Pullman), 725
Subramanian, Prof. C. V. : Appointed to the newly created chair of botany in the University of Rajasthan, Jodhpur, 710 ; work of, 710
Subramanian, R., and others : Relative Efficiencies of Indian Languages, 614
Subsonic and Transonic Gas Dynamics : Mathematical Aspects of (Lipman Bers), *review* by Prof A. T. Price, 865
Substance (Antheridium-inducing), in Ferns : Mode of Action of an (Dr. Ulrich Naf), 900
Succinic Acid Dehydrogenase : Reduction of Coenzyme *Q* by (Prof. Józef Heller, Dr Ludmila Szarkowska and Czeslawa Petryszyn), 578
Succinic Dehydrogenase System : Stereochemistry of the (Prof. O. Gawron, A. J. Glaid, T. P. Fondy and M. M Bechtold), 1004
Sugar-Cane : Physiology of (R. L. Bieleski), 629
Sugars (Two New Amino-), from an Antigenic Polysaccharide of *Pneumococcus* (Dr. S. A. Barker, Dr. J. S. Brimacombe, M. J. How, Prof. M Stacey and Dr. J M. Williams), 303
Sullivan, Emelie, and others : Genetic Control of Foetal and Adult Human Haemoglobin, 467
Sulphated Polysaccharides, *review* by Dr W J Whelan, 256
Sulphonamides : Minimum Rates of Flow in Therapy with (Prof. Eino Nelson), 928
Sulphydryl Compounds (Radioactive) : Effect of, on the Oxygen Tension in the Spleen of Mice (Dr C van der Meer, P. W. Valkenburg and M. Remmelts), 588
Summaria, Louis J. (Mitz, Dr. Milton A., and) : Synthesis of Biologically Active Cellulose Derivatives of Enzymes, 576
Summer School at the University of Ghent on the Electrical, Optical and Mechanical Properties of Lattice Defects (sponsored by NATO), 104
Summerfield, Arthur : Appointed to the chair of psychology at Birkbeck College, London, 188
Sun : Deflexion of Light in the Gravitational Field of the (Dr. N. S. Japolsky), 651
  Streaming of Interstellar Hydrogen in the Vicinity of the (Dr. R. X. McGee, Dr. J. D. Murray and Dr. J. L. Pawsey), 957
Sun is close to the Zenith : Honeybee Communication when the (Dr. D. A T. New, F. R. Burrowes and A. J. Edgar), 155
Sun and Exercise : Effect of Exposure to, on Heat Tolerance Coefficient in Murrah Buffalo Calves (D. S. Bhatnagar and N. C Chaudhary), 844
Supply, Department of (Melbourne) : Annual Report for 1958-59 of the Aeronautical Research Laboratories, 103
Support for the Liquid Phase : Gas Chromatographic Separation of Low-boiling Hydrocarbons using Active Alumina as (Dr. I. Halász and E. E. Wegner), 570
Suppression : Mammary Cancer induced by a Single Feeding of Polynuclear Hydrocarbons, and its (Prof. Charles Huggins, Lorraine C. Grand and Filomena P. Brillantes), 204
Surface Area Measurements : Use of Krypton for (Dr. John M. Thomas), 134
Surface Chemistry : A Text-Book of, *review* by Prof. N. K. Adam, 521
Surface Orientation and Friction of Graphite, Graphitic Carbon and Non-Graphitic Carbon (Dr. J. W. Midgley and D G. Teer), 735
Surface Water Year-Book of Great Britain, 1958-59—Hydrometric Statistics for British Rivers, together with related Rainfalls, for the Year ended 30th September 1959 (Ministry of Housing and Local Government, and Scottish Office), 278

Surfaces : Physical Chemistry of (Prof. Arthur W. Adamson), *review* by Prof. N. K. Adam, 521
Surfaces (Metal) : Photo-Emission from, measured with Geiger Counters (M. A. Conrad and S. Levy), 887
  Reactions on, at High Temperatures (F. T. Barcroft and J. R. Hayden), 133
Surfaces (Softened Enamel), of Human Teeth : Rehardening of, by Solutions of Calcium Phosphates (Theodore Koulourides, Prof. Heriberto Cueto and Dr. Ward Pigman), 226
Surgeons of England, Royal College of : Title of Sir William Collins professor of anatomy in the University of London (at the Institute of Basic Medical Sciences) conferred on G. W. Causey, 534
Surveys in Applied Mathematics, *review* by Prof. A. T. Price, 865
Survival of Cutaneous Homografts after Transplantation of Lymph Nodes immunized against the Host (Dr. J. Vrubel), 853
Survival of Mice after Large Doses of X-Radiation : Influence of Hypothermia on the (L. Mráz and Dr. M. Praslička), 677
Susceptibility of Alfalfa to Winter Crown Rot : β-Glycosidase Activity and Cyanogenesis in the (Dr. N. Colotelo and Dr. E. W. B. Ward), 242
Susceptibility (Greater), to *Mycobacterium johnei* of *C57* Black Mice, when compared with *CBA* and Swiss White Mice (Dr. R. L. Chandler), 602
Suschny, O. (Merten, D., and) : Some Factors Influencing the Food-Chain Transport of Radioactive Materials into Cow's Milk, 806
Suspensions : Radial Particle Displacements in Poiseuille Flow of (Dr. G. Segré and Dr. A. Silberberg), 209
Sutcliffe, D., and others : Hyperfine Splitting of Rubidium-87, 298
Sutherland, Dr. K. L. : Utilization of Water in Australia (A Study of Boiling produced by a Heated Platinum Wire immersed in Water), 538
Sutton, Alice, and others : Strontium-90 in Human Plasma, 324
Svaetichin, Dr. Gunnar, and others : Location of the Non-Linearity in Horizontal Cell Response to Retinal Illumination, 463
Svatos, George F., and others : Oxidation of Chromium(II) Amines by Water, 393
Swanton, W. T. : Gas Chromatography—Definitions and Retention Parameters, 281
Swartz, Dr. J. M., and others : Radiative Recombination in Gallium Phosphide Point-Contact Diodes, 361
Sweat Glands (Apocrine), of the Welsh Mountain Sheep : The Synchronous Discharge of (Dr. John Bligh), 582
Sweet Corn (*Zea mays* var. *saccharata* Bailey): Effect of 6-Methoxybenzoxazolinone on the Growth of *Xanthomonas stewartii* (Erw. Smith) Dowson and its Presence in (N. J. Whitney and C. G. Mortimore), 596
Swiss Society for Natural Sciences : One hundred and fortieth Annual Session (Dr. R. C. H. Tanner), 884
Swiss White Mice : Greater Susceptibility to *Mycobacterium johnei* of *C57* Black Mice when compared with *CBA* and (Dr. R. L. Chandler), 602
Sykes, Dr. J., and others : Nature of the Ribosomes present in Bacteria and Yeast—a Re-Appraisal, 638
Sykes, Prof. L. C. : New Universities (Underlying Principles which should guide a New University), 23 ; (Independence of the New Institution), 24
Sympathetic Nerves : Lack of Uptake of Catecholamines after Chronic Denervation of (Dr. G. Hertting, Dr. J. Axelrod, I. J. Kopin and L. G. Whitby), 66
Synchronous Discharge of Apocrine Sweat Glands of the Welsh Mountain Sheep (Dr. John Bligh), 582
Synchrotron : Acceleration of Deuterons in a (H. R. Shaylor and Dr. P. D. Whitaker), 741
Synecology and Silviculture in Ghana (Dr. Charles J. Taylor), *review* by Dr. E. W. Jones, 700
Synoptic Auroral Maps (Major F. R. Bond and Dr. F. Jacka), 624 ; (G. Weill and S. Huille), 624 ; (P. Doyen), 624
Synthesis : Induced Protein (Prof. Sam M. Beiser and Prof. Stuart W. Tanenbaum), 659
Synthesis of Biologically Active Cellulose Derivatives of Enzymes (Dr. Milton A. Mitz and Louis J. Summaria), 576
Synthesis of Macromolecules : Structure and (Biochemical Society Symposium on), 446
Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and its Melanocyte-stimulating and Corticotropin-releasing Activity (Prof. Choh Hao Li, Eugen Schnabel, David Chung and Tung-bin Lo), 143
Synthesis (Collagen) : Method of (G. B. Gerber and K. I. Altman), 813
Synthesis (Enzymatic), of Poly-β-Hydroxybutyric Acid in Bacteria (Dr. J. M. Merrick and Prof. M. Doudoroff), 890
Synthesis (Enzyme) : Repression and De-repression of, as a Possible Explanation of some Aspects of Drug Action (Prof. Louis Shuster), 314
Synthesis (Enzymic), of 3-O-α-D-Glucopyranosyl D-Xylose (Dr. S. A. Barker, Prof. M. Stacey and D. B. E. Stroud), 138
Synthesis (Enzymic Glucoside), in Locusts (Dr. J. N. Smith and Helen B. Turbert), 600
Synthesis (Fischer–Tropsch) : Ethyl Branching in the (Bernard D. Blaustein, Irving Wender and Robert B. Anderson), 224
Synthesis (Lysine), and Phylogeny of Lower Fungi—some Chytrids versus *Hyphochytrium* (Prof. Henry J. Vogel), 1026
Synthesis (Protein) : Later Stages of, and the Role of Phospholipids in the Process (Dr. G. D. Hunter and G. N. Godson), 140
Synthesis and Destruction *in vivo* (Catalase) : Methods for Determining the Rates of (Dr. V. E. Price, M. Rechcigl, jun., and R. W. Hartley, jun.), 62
Synthesize Protein : Cytology of Cells which (M. S. C. Birbeck and Dr. E. H. Mercer), 558
Synthetic Peptides related to Corticotropin : Adipokinetic Activity of (Dr. M. S. Raben, Ruth Landolt, F. A. Smith, K. Hofmann and H. Yajima), 681
Synthetic Route (A New), to Dialkylphosphinous Chlorides (J. L. Ferron), 916
Syrian Hamster (White ('Partial Albino')) : Induction of Melanotic Tumours in the (Walter C. Quevedo, jun., John M. Cairns, Jean S. Smith, Fred G. Bock and Robert J. Burns), 936
Syski, R. : Introduction to Congestion Theory in Telephone Systems, *review* by Prof. L. S. Goddard, 6
System (Dysfunction of the Physiological Anticoagulating), induced by an Atherogenic Diet : Experimental Pre-Thrombotic State of an Organism resulting from the (Prof. B. A. Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
System (Elementary Central Nervous) : Pharmacological Specificities of Neurones in an (Dr. H. Gerschenfeld and Dr. L. Tauc), 924
System (Hypophysis–Thyroid), in the Rabbit Foetus : Function of the, with regard to Cholesterol Metabolism (J. G. Bearn, H. B. Koerselman and T. R. E. Pilkington), 318
System (Succinic Dehydrogenase) : Stereochemistry of the (Prof. O. Gawron, A. J. Glaid, T. P. Fondy and M. M. Bechtold), 1004
Systems (Indexing) : Interim Report on the Test Programme of an Investigation into the Comparative Efficiency of (Cyril W. Cleverdon), (Aslib Cranfield Research Project), 359
Systems (Living) : Self-Regulation in (Symposium at the National Research Council of Canada on), 799
Systems (Metallic and Ionic) : Composition Requirements for Glass Formation in (Prof. M. H. Cohen and D. Turnbull), 131
Systems (Telephone) : Congestion in, *review* by Prof. L. S. Goddard, 6
  Introduction to Congestion Theory in (R. Syski), *review* by Prof. L. S. Goddard, 6
Sytina, N. P., and others : Experimental Pre-Thrombotic State of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet, 66
Szafran, Philomena, and others : Five Less-Common *Salmonella* Serotypes from Congo Reptiles, 240
Szántó, J., and others : Presence in Horse Serum of Two Inhibitors of Avid A2 Influenza Virus Strains, 513
Szarkowska, Dr. Ludmila, and others : Reduction of Coenzyme *Q* by Succinic Acid Dehydrogenase, 578
Szczepkowski, Tadeusz W., and others : The Metabolic State of Thiosulphate, 1007
Szilard–Chalmers Processes in Solids : Influence of Chemical Isomerism on the (T. Costea and I. Dema), 478
Szoke, Dr. J., and others (edited by Dr. L. Lang, in collaboration with) : Absorption Spectra in the Ultra-violet and Visible Region, *review* by Dr. R. F. Barrow, 347

TABLES : Sampling Inspection (Harold F. Dodge and Harry G. Romig), second edition, *review* by Prof. M. G. Kendall, 259
Taira, Toshifumi : Enzymatic Reduction of the Yellow Pigment of *Drosophila*, 231
Takagaki, G., and others : Glutamic Acid Metabolism in Brain and Liver during Infusion with Ammonia labelled with Nitrogen-15, 326
Takagi, Dr. Atsushi, and others : Plasma Membranes and Mitochondrial Equivalents as Functionally Co-ordinated Structures, 79
Takamiya, Dr. Atusi (Katoh, Dr. Sakae, and) : A New Leaf Copper Protein 'Plastocyanin', a Natural Hill Oxidant, 665
Takhtajan, Prof. Dr. Armen : Die Evolution der Angiospermen, *review* by J. Parkin, 519
Talbot, G., and others : Microbial Production of Carbon Monoxide from Flavonoids, 510
Tanenbaum, Prof. Stuart W. (Beiser, Prof. Sam M., and) : Induced Protein Synthesis, 659
Tanner, J. M. (edited by) : Human Growth, *review*, 955
Tanner, Dr. R. C. H. : Swiss Society for Natural Sciences, 884
Tar (Coal) Components : Origin of some Primary (Dr. M. Vahrman), 136
Taranta, Dr. A., and others : Precipitating Factor for Aggregated γ-Globulins in Normal Human Sera, 239
Tartrate (Potassium) : Use of, for Equilibrium Density-gradient Centrifugation of Animal Viruses (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Tartronate Deficiency in Man : Possible Sources of (Laurence G. Wesson), 149
Tarusoff, B. N. : Primary and Initial Effects of Ionizing Radiations (Concentration of Lipid Peroxides in Tissues of Mice increases with Time after Irradiation), 110 ; (Optimum Oxygen Concentration for Sensitization in the case of Yeast Cells), 111
Tata, Dr. J. R. : Nature of Thyroxine-binding Globulin in Human Serum, 573
Tata Institute of Fundamental Research : Report of the Second Conference on Mathematical Education in South Asia (Bombay, 1960), 273
Tata (Lady) Memorial Trust : Grants, Scholarships and Fellowships for Research on Diseases of the Blood, 361
Tatake, V. G., and others : Effects of Ultrasonic Radiation in *Escherichia coli B* using Fluorochrome Acridine Orange as a Vital Stain, 931
Tatham, P. B. (Gunn, J. S., and) : Diquat as an Arboricide, 808
Taube, Prof. Henry, and others : Oxidation of Chromium(II) Amines by Water, 393
Tauc, Dr. L. (Gerschenfeld, Dr. H., and) : Pharmacological Specificities of Neurones in an Elementary Central Nervous System, 924
Tax, Prof. Sol (edited by) : Evolution after Darwin, Vol. 1, The Evolution of Life—its Origin, History and Future ; Vol. 2, The Evolution of Man—Man, Culture and Society, *review* by Dr. P. G. Fothergill, 340
Taylor, Dr. A. B. : Elected a Fellow of the Royal Society of Edinburgh, 876
Taylor, Dr. C. A. : A Unified Treatment of Modern Optical Theory, *review*, 429
Taylor, Dr. Charles J. : Synecology and Silviculture in Ghana, *review* by Dr. E. W. Jones, 700
Taylor, Dr. C. P. S. : Direct-Current Conductivity of Textiles, Proteins and other Polymers, 388
Taylor, Dr. D. M. : Retention of Zinc-65 in the Bones of Rats, 932
Taylor, Dr. E. L. : Recent Advances in Fields of Parasitological Research, 192
Taylor, Dr. G. : A Bibliographical Index of the British Flora, *review*, 259
Taylor, G. N. : The Total Electron Content of the Ionosphere during the Magnetic Disturbance of November 12-13, 1960, 740
Taylor, Dr. H. M. : Appointed principal of the University College of North Staffordshire, 710 ; work of, 710
Taylor, James A. : The Maritime Uplands of Britain—Inventory and Prospect, 872
Taylor, L. R. : Aggregation, Variance and the Mean, 732
Taylor, Lieut.-Col. R. H. R. : Distribution of Reptiles and Amphibians in the British Isles, 624

Taylor, Dr. S. A. (Slatyer, Dr. R. O., and) : Terminology in Plant- and Soil-Water Relations, 208
Taylor, Dr. S. R. : Distillation of Alkali Elements during Formation of Australite Flanges, 630
Teachers : Service to, 20
  Treasure Chest for (National Union of Teachers), 20
Teachers, National Union of : Treasure Chest for Teachers, 20
  Mathematics in the Junior School (J. S. Flavell), 20
  Annual Conference, 880
Teachers, National Union of, and others : Discussion Conference on Science and Education, 534
Teachers in Technical Institutions, Association of, and others : Discussion Conference on Science and Education, 534
Teachers (University), Association of, and others : Discussion Conference on Science and Education, 534
Teaching Mathematics in the Junior School, 20
Teaching Purposes · Catalogue of Films for (British Universities Film Council), 102
Teaching Undergraduates : Methods of (Appointment of a Committee by the University Grants Committee to study the), 880
Technical Books : Recent Scientific and, Supp. vi, January 28 ; Supp. viii, February 25 ; Supp. ix, March 25
Technical Books-in-Print : Vol. I, No. 8, Physics and Mathematics (edited by W. G. Smith), (Hansom Books, Ltd.), 104
Technical College, Brighton (Automatic Programming Information Centre) : Course in Algol 60, 275
Technical College (Hatfield) : To be renamed Hatfield College of Technology, 533
Technical Conferences (Scientific and) : Forthcoming International (Department of Scientific and Industrial Research, List No. 28), 104
Technical Co-operation in Africa South of the Sahara, Commission for : Symposium on the Quelea, 359
Technical Education : Better Opportunities in (Dr. P. F. R. Venables), 701
Technical Institutions, Association of Teachers in, and others : Discussion Conference on Science and Education, 534
Technical Personnel (Scientific and), in American Industry (United States National Science Foundation), 794
Technical Resources (Scientific and), of British Railways, 607
Technicians in Engineering and Chemical Industries in Britain, 973
Technique for Destruction of the Pineal Body using Yttrium-90 Spheres (Dr. Uno Holmgren and Dr. Gustaf Notter), 773
Technique (Chromatographic), for Autoradiography : Adaptation of a (Dr. R. N. Greenshields), 851
Technique (A 'Dry' Mounting Autoradiographic), for the Localization of Water-soluble Compounds (P. J. Fitzgerald, Margery G. Ord and Dr. L. A. Stocken), 55
Technique (Separation) : 'Ligand Exchange', a Novel (Dr. F. Helfferich), 1001
Techniques : Microchemical (Metropolitan Microchemical Society Symposium on, sponsored by the International Union of Pure and Applied Chemistry), 188
Techniques (Transient-Response) : Determination of Heats of Adsorption by (James J. Carberry), 391
Technology : From Arts and Crafts to, *review* by Prof. R. J. Forbes, 174
  Strengthening Science and, 339
Technology, California Institute of : 1961 James Watt International Medal of the Institution of Mechanical Engineers awarded to Prof. Theodore von Kármán, 361
Technology, California Institute of, and Research Corporation : 1960 Research Corporation Award awarded to Dr. Rudolf L. Mössbauer, 275
Technology, Hatfield College of : Renamed from Hatfield Technical College, 533
Technology, Liverpool College of · Election of Honorary Associates, 446
Technology, Medway College of : Symposium and Instrument Exhibition on Automatic and Semi-Automatic Methods in Analysis and Control, 447
Technology Index : British (Library Association), 969
Technology of Drying Fibrous Materials with particular reference to Leather (Society of Leather Trades' Chemists Symposium on), 188
Technology from the Earliest Times to A.D 1900 : A Short History of (T. K. Derry and Dr. Trevor I. Williams), *review* by Prof. R. J. Forbes, 174
Technology and the Christian : Science, (Prof. C. A. Coulson), (Beckly Social Service Lecture, 1960), *review* by R. Brightman, 173
Technology (Food) : Dictionary of Nutrition and (Dr. Arnold E. Bender), *review* by A. M. Copping, 433
Technology (Modern) : Classical Physics and, *review* by Dr. W. A. Waters, 954
Technology (Science and), National Lending Library for : Expenditure on the, 622
Technology (Science and), National Reference Library for : Adjournment Debate in the House of Commons on the, 968
Technology (Vacuum Science and) : Progress in (edited by A. S. D. Barrett), *review* by Dr. R. O. Jenkins, 867
Teer, D. G. (Midgley, Dr. J. W., and) : Surface Orientation and Friction of Graphite, Graphitic Carbon and Non-Graphitic Carbon, 735
Teeth (Human) : Rehardening of Softened Enamel Surfaces of, by Solutions of Calcium Phosphates (Theodore Koulourides, Prof. Heriberto Cueto and Dr. Ward Pigman), 226
  Strontium-90 in (F. E. Butler), 848
Telecommunication Engineers of India, Institution of : 1960 prize awarded to S. N. Mitra, 447
Teleost (Freshwater) : Action of Neurohypophyseal Hormones on the Sodium Fluxes of a (Dr. J. Maetz and M. Julien), 152
Telephone Service : Post Office (Debate in the House of Lords), 532
Telephone Systems : Congestion in, *review* by Prof. L. S. Goddard, 6
  Introduction to Congestion Theory in (R. Syski), *review* by Prof. L S. Goddard, 6
Television in Education : Broadcasting and, 169
Temperature—its Measurement and Control in Science and Industry (American Institute of Physics, the Instrument Society of America and the United States National Bureau of Standards Symposium on), 22
Temperature in the Middle Ionosphere : A Maximum of (Prof. O. Burkard), 474
Temperature Coefficient of Endodiurnal Leaf Movements in *Phaseolus* (Franz-Josef Leinweber), 1028
Temperature Dependence of Apparent Photosynthesis in Different Populations of *Solidago virgaurea* : Studies of Climatic Ecotypes in Higher Plants—the (O Bjorkman, C. Florell and P. Holmgren), 624
Temperature Fluctuation (Diurnal), and Genetic Variance in *Drosophila* Populations (J. A Beardmore), 162
Temperature Fluctuations : Effect of, on Flowering in *Salvia splendens* (R. M. M. Crawford), 75
Temperature and Grafting . Effect of, on Vegetative Growth Phases of Algerian Ivy (Prof. V. T. Stoutemyer and O. K. Britt), 854
Temperature (High-) and Pre-Treatment : Effect of, on the Germination of Oil Palm Seed (A R. Rees), 74
Temperature (High), and Vitamin A Metabolism : Relationship between, and the Fertility of Ewes (Margaret Ryle), 104
Temperature (Low-) Injury in Lovegrass (*Eragrostis curvula* (Schrad) Nees), (J. H. Leigh), 415
Temperatures (High) : Reactions on Metal Surfaces at (F. T. Barcroft and J. R. Hayden), 133
Temperatures (Low) : Anomalous Conductivity and Lorenz Parameter in Dilute Silver–Manganese Alloys at (Dr. M. S. R Chari), 824
  Slugs at (Dr. Kenneth Mellanby), 944
Tendencies (Psychomotor Perseverative) : Measurement of (Prof. S. D. Porteus and A. L. Diamond), 691
Tenotomized Muscles in Cats : Plastic Changes of Spinal Monosynaptic Responses from (Dr. W. Kozak and Dr. R. A Westerman), 753
Tensile Strength of Solids : Time-dependent (I. H. Hall), 131
Tension (Oxygen), in the Spleen of Mice : Effect of Radioactive Sulphydryl Compounds on the (Dr. C. van der Meer, P. W. Valkenburg and M. Remmelts), 588
Terminology : Haemoglobins, Myoglobins and Erythrocruorins—a Proposal for Modifying the Present (Dr. Malcolm H. Smith), 225
Terminology in Plant- and Soil- Water Relations (Dr. M. L. McGlashan), 207 ; (Dr. R. O. Slatyer and Dr. S. A. Taylor), 208
Termites : Mechanism of Trail-laying in Two Species of (A. M. Stuart), 419
Territories (The Under-developed), of the World, 951
Territory (African) : Wild Life in an (Dr. F. Fraser Darling), *review* by Prof. W. H. Pearsall, 783
Tertiary Amines and Quaternary Ammonium Salts : Specification of Asymmetric Nitrogen Atom—Application of the Cahn–Ingold–Prelog Nomenclature to some (G. Bernáth), 304
Test (Discriminatory), for Thyroid Activity in Fish : The Conversion Ratio as a (C. P. Hickman, jun.), 1012
Test Blocks (Toxicity) : A Method of Obtaining Uniform Distribution of Wood Preservatives in (D. N. R. Smith and R. Cockcroft), 163
Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus : Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the (Dr. T. O. Diener), 687
Tests (Nuclear) : Observations of Fall-out in India during the Period of Cessation of (K. G. Vohra and V. S. Bhatnagar), 286
Tests (Nuclear), in the Sahara Desert : Radioactive Fall-out in Israel resulting from the (Y. Flege, E. Shalmon, J. Vardi, J. R. Gat (Gutmann), and Y. L. Tokatly), 90
Tetraacetic Acid (Iron–Ethylenediamine) : Absorption and Breakdown of, by Tomato Plants (Dr. D. G. Hill-Cottingham and C. P. Lloyd-Jones), 312
Tetrachloride (Carbon) : Inhibition of Experimental Cirrhosis by, following Treatment with Aminoacetonitrile (Dr. L. Fiume and Prof. G. Favilli), 71
Tetraethyl Lead in Petrol : A Rapid Method for the Determination of Tetramethyl Lead and (Dr. J. Van Rysselberge and R. Leysen), 478
Tetrahydroamethopterin (4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid) : Toxicity and Antileukaemic Effectiveness in Mice of (Dr. J. A. R. Mead, J. M. Venditti, A. W. Schrecker, Dr. A. Goldin and R. L. Kisliuk), 937
Tetramethyl Lead and Tetraethyl Lead in Petrol : A Rapid Method for the Determination of (Dr. J. Van Rysselberge and R. Leysen), 478
Tetranychus Dufour (Acarina) from Uganda : A Species of (Dr. D. M. Robinson), 857
Tetraphosphate (Adenosine) : Enzymatic Dephosphorylation of (Prof. Claude Liébecq, Kazimierz Jaroszewicz and Annette Lallemand), 661
Textile Research Association (Bombay) : Textile Research Institute of the (Dr. C. Nanjundayya), 450
Textile Research Institute of the Bombay Textile Research Association (Dr. C. Nanjundayya), 450
Textiles, Proteins and other Polymers : Direct-Current Conductivity of (Dr. C. P. S. Taylor), 388
Teyler Essay Competition, 714
Thallium : Apparent Geochemical Association of Bismuth and (Dr. R. R. Brooks), 910
Theology and the Sciences at Birmingham, 101
Theoretical Biology : Journal of, Vol. I, No. 1, 879
Theoretical Considerations in the Ultra-violet Irradiation of Micro-organisms (Dr. C. W. Hiatt), 678
Théorie Électromagnétique et de la Relativité : Les Principes de la (Prof. Marie-Antoinette Tonnelat), *review* by Prof. J. Hamilton, 87
Theories (Dielectric and Dipolar Interaction), of Solvent-induced Infra-Red Frequency Shifts (Dr. H. E. Hallam and T. C. Ray), 915
Theories (Rival), of Cosmology, a Symposium and Discussion of Modern Theories of the Structure of the Universe (Prof H. Bondi, Dr. W. B. Bonnor, Dr. R. A. Lyttleton and Dr. G. J Whitrow), *review* by J. B. Alexander, 867
Theory : Homotopy (Sze-Tsen Hu), *review* by Prof. T. A. A. Broadbent, 433
Theory of Banach Algebras, *review* by Dr. R. G. Cooke, 612
Theory of the Deformation and Fracture of Body-centred Cubic Transition Metals (A. A. Johnson), 826
Theory of Numbers : Polymers and the—Molecular Weight Distributions from Rheological Measurements (E. Menefee and W. L. Peticolas), 745
Theory of the Visual Threshold (V. Treisman), 1031
Theory (Congestion), in Telephone Systems : Introduction to (R. Syski), *review* by Prof L. S. Goddard, 6
Theory (Dissociation), of Aluminium Monobromide (Dr R. F. Barrow), 480
Theory (General), of Banach Algebras (Prof. Charles E. Rickart), *review* by Dr. R. G. Cooke, 612
Theory (Kinetic), of Gases, *review* by Dr. D. J. Millen, 783
Theory (Kinetic), of Gases : Elements of the (Prof. E. A. Guggenheim), *review* by Dr. D. J. Millen, 783

Theory (Modern Optical) : A Unified Treatment of, *review* by Dr. C. A. Taylor, 429
Theory (The Relativistic), of the Fresnel Drag Coefficient (Prof. P. T. Landsberg), 654
Theory (The Special), of Electromagnetism (B. L. Coleman), 476
Therapeutic Applications of Beams of Negative π-Mesons : The Possibility of (Dr. P H. Fowler and Dr. D. H. Perkins), 524
Therapeutics : Modern Armamentarium of, *review* by Prof. F. Bergel, 699
Therapy with Sulphonamides : Minimum Rates of Flow in (Prof Eino Nelson), 928
Therattil-Antony, Teresa, and others : 'Active Centre' Studies in Trypsin, 809
Thermal Energy : Affinity of Organic Compounds fo Free Electrons with—its Possible Significance in Biology (Dr. J. E Lovelock), 729
Thermal Etching : Evidence of Phase Changes in Zirconia from (P. E. Evans and G Wildsmith), 569
Thermal Initiation of Explosives · Memory Effect in the (Dr Werner R. Hess and Dr. Rugus C. Ling), 288
Thermal Stability of Bulk Thermosetting Polymers : Method for studying (R. W. Warfield), 1002
Thermal Stability of $TiOF_2$ (J. S. Machin and D L. Deadmore), 223
Thermionic Generator : A New (Prof D Gabor), 868
Thermodynamic Data : Publication of Calorimetric and, 454
Thermosetting Polymers : Method for studying Thermal Stability of Bulk (R. W. Warfield), 1002
Thick White of the Hen's Egg : Weissenberg Effect in the (Dr. H. G. Muller), 213
Thin Films : Structure and Properties of—Proceedings of an International Conference, New York, 1959 (edited by A. Neugebauer, J. B. Newkirk and D. A. Vermilyea), *review* by Dr J. Ring, 613
Thioglycolic Acid : Ethylene Production by Cytoplasmic Particles from Apple and Tomato Fruits in the Presence of Thiomalic and (Dr. M. Lieberman and Dr. C. C. Craft), 243
Thiol Compounds . Ninhydrin Assay in the Presence of (John R. Whitaker), 662
Thiomalic and Thioglycolic Acid : Ethylene Production by Cytoplasmic Particles from Apple and Tomato Fruits in the Presence of (Dr. M. Lieberman and Dr. C. C. Craft), 243
Thiosulphate : The Metabolic State of (Tadeusz W. Szczepkowski, Prof. Boleslaw Skarzyński and Miroslawa Weber), 1007
2-Thiouracail : A Requirement for, of 2-Thiouracil-grown *Escherichia coli* under Conditions of Ornithine Transcarbamylase Repression (Ada Zamir and Dr Ruth Ben-Ishai), 922
2-Thiouracil-grown *Escherichia coli* : A Requirement for 2-Thiouracil of, under Conditions of Ornithine Transcarbamylase Repression (Ada Zamir and Dr. Ruth Ben-Ishai), 922
Third Party Liability in the Field of Nuclear Energy : Text of the Convention on (Organization for European Economic Co-operation, European Nuclear Energy Agency), 444
Thom, Prof. A. : Retirement from the chair of engineering science at the University of Oxford, 185 ; work of, 185
Thomas, G M. (Sheret, M. A , and) : Auroral Observations at Halley Bay, Antarctica, during 1959, 826
Thomas, Dr. J. A., and others : Field-Aligned Ionospheric Irregularities and the Scintillation of Satellite Radio Transmissions, 30
Thomas, Dr. J. G : Subjective Analysis of Saccadic Eye Movements, 842
Thomas, Dr. John M. · Use of Krypton for Surface Area Measurements, 134
Thomas, L. C (Pattle, R E , and) : Lipoprotein Composition of the Film lining the Lung, 844
Thomas, Roderick G : Promotion of Leaf Growth by Short Days in the Short-Day Plant *Chenopodium amaranticolor*, 771
Thompson (Mary Clark) Medal of the United States National Academy of Sciences awarded to Dr. Norman Dennis Newell, 880
Thompson (Silvanus) Memorial Lecture of the British Institute of Radiology (Sir Bernard Lovell), 625
Thomson, Dr. A. M., and Hytten, Dr F. : Calorie Balance in Man (Calorie Requirements in Pregnancy), 537
Thomson, Dr. D : History of Western Ideas, *review*, 520
Thomson, J R. : Some New Intermetallic Compounds of Thorium of the Type Th_7X_3, 217
Thomson, Sir Landsborough : The Popular Handbook of Rarer British Birds, *review*, 7
Thorium of the Type Th_7X_3 : Some New Intermetallic Compounds of (J. R. Thomson), 217
Thorpe, Dr. I. G. · Epidemics of Black (Stem) Rust of Wheat, 285
Thorpe, Dr. W. H. : Biology, Psychology and Belief (Fourteenth Eddington Memorial Lecture), 445
Thread-like Reticulum in Latex from *Hevea brasiliensis* and its relation to Latex Particles (W. A. Southorn), 1000
Threonine Deficiency · Prevention of Fatty Liver due to, by Moderate Caloric Restriction (Akira Yoshida, Prof. Kiyoshi Ashida and Prof. A. E Harper), 917
Threshold of Hearing : British Normal (L. S. Whittle and D. W. Robinson), 617
Threshold (Visual) : Theory of the (V. Treisman), 1031
Thrombin-induced Conversion of Fibrinogen to Fibrin Monomer : Optical Rotatory Dispersion of the (Prof C. M. Kay and M. M. Marsh), 307
Thrombotic State (Experimental Pre-), of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet (Prof B A Kudrjashov, G. G. Bazasian, N. P. Sytina and G. V. Andreenko), 67
Thrower, P. A., and others : Aggregation and Dispersal of Radiation Damage in Graphite, 824
Thrush, Dr. B. A. (Clyne, M. A. A., and) · Rates of the Reactions of Nitrogen Atoms with Oxygen and with Nitric Oxide, 56
  Reaction of Oxygen Atoms with Hydrogen, 135
Thymidine (Tritiated) : Implication of Chromosome Structure and Replication on Hazard of, and the Interpretation of Data on Cell Proliferation (Eugene P. Cronkite, Samuel W. Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Thymus Nucleoprotein : Labilization of Deoxyribonucleic Acid in, after Whole-body Irradiation (Dr Ulrich Hagen), 361
Thyroid Activity in Fish : The Conversion Ratio as a Discriminatory Test for (C. P. Hickman, Jun), 1012
Thyroid Function · Mucopolysaccharides and (Prof. St. Krompecher. B. Fornet, G. Balogh, E. H. Oláh and M. B. László), 670
Thyroid Function and Mucopolysaccharide (Hexosamine)-Level : Experimental Data concerning the Connexion between (Prof. St. Krompecher, Cs. Hadházy, G. Berencsi, E. H. Oláh and M. B. László), 670
Thyroid (Hypophysis–) System in the Rabbit Foetus : Function of the, with regard to Cholesterol Metabolism (J. G. Bearn, H. B. Koerselman and T. R E. Pilkington), 318
Thyroxine : Effects of Pantothenic Acid (Calcium Pantothenate) and of, on the Development of Chicken Embryos (Prof. C. Vacca, G. V. Pelagalli and A. Schiavo), 66
Thyroxine-binding Globulin in Human Serum : Nature of (Dr. J. R. Tata), 573
Tibiotarsi (Embryonic Chick), *in vitro* : L-Glutamine and the Growth of (Dr. J. D. Biggers), 1016
Tide (Lunar), in the F_2 Layer of the Ionosphere near the Geomagnetic Equator (R. G. Rastogi), 214
Tides at Shackleton, Weddell Sea (J. G. D. Pratt), (Trans-Antarctic Expedition, 1955-1958, Scientific Reports, No. 4), *review* by J. R. Rossiter, 346
Tierwelt Deutschlands und der Angrenzenden Meeresteile nach ihren Merkmalen und nach ihrer Lebensweise (begrundet von Prof. Dr. Friedrich Dahl ; weitergefuhrt von Maria Dahl und Prof. Dr. Hans Bischoff), Teil 47, Spinnentiere oder Arachnoidea (Araneae), 11, Micryphantidae–Zwergspinnen (Dr. Hermann Wiehle), *review* by Dr. Eric Duffey, 344
Tilley, Prof. C. E. : Retirement from the professorship of mineralogy and petrology in the University of Cambridge, 793 ; work of, 793
Timber : The Strength and Properties of (F. H. Armstrong), (Forest Products Research Laboratory, Bulletin No. 45), 975
Time of Cosmic Ray Increases : Ionospheric Disturbance at the (C. Collins and D. H. Jelly), 128
Time' ('Real-) : A Versatile Method for Short-term Spectrum Analysis in (J. S. Gill), 117
Time-dependent Tensile Strength of Solids (I. H. Hall), 131
Timmis, Dr. G. M. : Appointed reader in chemistry at the Institute of Cancer Research, Royal Cancer Hospital, London, 22
Tissue (Homogenized Homologous Lung), mixed with Freund's Adjuvant : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with (Prof N. Allegretti and B. Vitale), 673
Tissue (Neural), and Pulmonary Lesions in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant (Prof. N. Allegretti and B. Vitale), 673
Tissue Changes (Myocardial), associated with Rigor Mortis (Piero Gallo), 114
Tissue Preparations : A Simple Paper Chromatographic Method for Determination of Amino-Acid Activation Profiles in (Dr. Alexandra von der Decken), 145
Tissue Responses to Filter Membranes of various Porosities (Prof. R. C. Curran and J. A. M. Ager), 1023
Tissues : Estimation of Volatile Anaesthetics in, by Gas Chromatography (Dr. R. A. Butler and Dr. D. W. Hill), 488
Tissues of the Young Carnation Plant : Distribution of Phenyl Mercuric Chloride labelled with Mercury-203, applied as a Seed Dressing, in the (June Robson and P. Fenn), 501
Tissues (Normal), of the *C3H* Mouse : Fluorescence and Haemolytic Activity of Tumours and (Dr. Eric Ponder and Ruth V. Ponder), 643
Titanium : Micropitting of, during Anodic Oxidation in Formic Acid (R. A. Piggott and Dr. L. L. Schreir), 216
$TiOF_2$: Thermal Stability of (J. S. Machin and D. L. Deadmore), 223
Titanium and Zirconium : Production and Mobility of Point Defects in (E. Smith and M S. Stagg), 300
Titrimetric Analysis : Elementary (Dr. A. M. G. Macdonald), *review* by Dr. D. T. Lewis, 7
Tobacco Manufacturers' Standing Committee : Report for the Year 1959-60, 453
  Research Papers No. 3, The Constituents of Tobacco Smoke, an Annotated Bibliography, First Supplement (edited by H. R. Bentley and E. G. N. Berry), 453
Tobacco Mosaic Virus : Analysis of the Cross-Reaction between Two Strains of (Prof. Irving Rappaport), 986
  Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from (Dr. T. O. Diener), 687
Tobacco Smoke : Constituents of—an Annotated Bibliography, First Supplement (edited by H. R. Bentley and E. G. N. Berry), (Tobacco Manufacturers' Standing Committee, Research Papers No. 3), 453
  Possible Biological Effects of Electrically Charged Particles in (Dr. K. H. Kingdon), 180
Tobacco Smoke Research (Dr. W. Carruthers), 453
Tobias, K. : Primary and Initial Effects of Ionizing Radiations (Interference with Intracellular Structures), 110 ; (Determination of 'Target Sizes' was impossible even for Isolated Pure Proteins), 111
Tocopherol, Selenium and Anti-oxidants in the Rat : Role of (E. E. Edwin, J. Bunyan, A. T. Diplock and J. Green), 747
Tocopherol, Ubiquinones and Ubichromenols in Yeasts and Mushrooms (A. T. Diplock, J. Green, E. E. Edwin and J. Bunyan), 749
Tokatly, Y. L., and others : Radioactive Fall-out in Israel resulting from the Nuclear Tests in the Sahara Desert, 90
Tod, Sir Alan : Elected an Honorary Associate of the City of Liverpool College of Technology, 446
Tolerance : Immunological (Prof. P. B. Medawar), 14
Tolerance to Skin Grafts in F_1 *C57Bl* Inbred Mice : Transfer of (Anna Skowron-Cendrzak), 595
Tolerance (Heat) Coefficient in Murrah Buffalo Calves : Effect of Exposure to Sun and Exercise on (D. S. Bhatnagar and N. C. Chaudhary), 844
Tolerance (Host) : Acquisition of Graft versus (Dr. J. K. Dineen), 680
Tomato Fruits (Apple and) : Ethylene Production by Cytoplasmic Particles from, in the Presence of Thiomalic and Thioglycolic Acid (Dr. M. Lieberman and Dr. C. C. Craft), 243
Tomato Plants : Absorption and Breakdown of Iron–Ethylenediamine Tetraacetic Acid by (Dr. D. G. Hill-Cottingham and C. P. Lloyd-Jones), 312
Tomato Plants grown on Sodium-deficient Water Cultures : Growth of a Nematode in (A. F. Bird and P. F. Brownell), 418
Tonnelat, Prof. Marie-Antoinette : Les Principes de la Théorie Électromagnétique et de la Relativité, *review* by Prof. J. Hamilton, 87
Tortuosity in Porous Media (Dr. Philip B. Lorenz), 386
Total Cytochrome Oxidase Activity and its relation to Basal and Maximal Metabolism (Dr. Ladislav Jánsky), 921

Total Electron Content of the Ionosphere during the Magnetic Disturbance of November 12-13, 1960 (G N. Taylor), 740
Townes, Prof. C. H. : Awarded the Rumford Premium of the American Academy of Arts and Sciences, 797
Toxic Chemicals and Wild Life, 878
Toxic Hazard from Formulating the Insecticide Dimethoate in Methyl 'Cellosolve' (Prof. John E Casida and D. M. Sanderson), 507
Toxicity Test Blocks : A Method of Obtaining Uniform Distribution of Wood Preservatives in (D. N. R. Smith and R. Cockcroft), 163
Toxicity and Anti-leukaemic Effectiveness in Mice of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroylglutamic Acid (Tetrahydroamethopterin), (Dr. J. A. R. Mead, J M. Venditti, A. W. Schrecker, Dr. A. Goldin and R. L. Kisliuk), 937
Toxin (Ciguatera) : Bioassay of (Albert H. Banner, Satoshi Sasaki, Philip Helfrich, Charles B. Alender and Prof Paul J. Scheuer), 229
Toxoplasma gondii Infection : Ovine Foetal Resorption caused by (I. D. Smith), 939
Tradition (Western Intellectual), from Leonardo to Hegel (Dr. J. Bronowski and Dr. Bruce Mazlish), *review* by Dr D Thomson, 520
Trail-laying : Mechanism of, in Two Species of Termites (A. M. Stuart), 419
Training Engineering Graduates, 542
Training of Graduates—a Report of the Joint Committee on Practical Training in the Electrical Engineering Industry, revised re-issue (Institution of Electrical Engineers), 542
Training (Practical), in the Electrical Engineering Industry : The Training of Graduates—a Report of the Joint Committee on, revised re-issue (Institution of Electrical Engineers), 542
Tranchant, J. : Gas Chromatography (Use of Gas-Solid Chromatography for the Qualitative and Quantitative Analysis of Mixtures containing Nitrogen Oxides), 28
Trans-Antarctic Expedition, 1955-58 : Scientific Reports, No. 4, Tides at Shackleton, Weddell Sea (J. G D. Pratt), *review* by J. R. Rossiter, 346
  Scientific Reports No. 2, A Gravity Traverse of Antarctica (J. G. D. Pratt) ; Scientific Reports No. 3, Seismic Soundings across Antarctica (J. G. D. Pratt), *review* by G. de Q Robin, 781
Trans-2-Hexenal in the Scent Gland of the Hemipteran *Acanthocephala femorata* (Prof. Murray S. Blum, Ronald D. Crain and Julius B. Chidester), 245
Transaminase Activity (Glutamic Oxaloacetic), in Different Zones of the Ventricular Muscle of the Dog (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr Enrique Savino and Dr. Manuel René Malinow), 315
Transatlantic Communication Experiment via *Echo* I Satellite (H. Carru, R. Gendrin and M. Reyssat), 268
Transatom (New International Information Office established in Brussels by Euratom, the United States Atomic Energy Commission and the United Kingdom Atomic Energy Authority), 623
Transatom Bulletin : Monthly publication of information concerning Translations of Nuclear Literature, 102 ; No. 1, 623
Transcarbamylase Repression (Ornithine) : A Requirement for 2-Thiouracil of 2-Thiouracil-grown *Escherichia coli* under Conditions of (Ada Zamir and Dr. Ruth Ben-Ishai), 922
Transduction of *Salmonella typhimurium* Cell : Phenomic Delay in (Dr. J. Hubáček), 679
Transfer of Tolerance to Skin Grafts in F_1 C57Bl Inbred Mice (Anna Skowron-Cendrzak), 595
Transfer (Charge) Compounds : Organic Halides as Electron Acceptors in (T. Bjorvatten, Prof. O. Hassel and Chr. Rømming), 137
Transfer (Heat), from a Hot Wire to an Insulating Liquid : Influence of an Electric Field upon the (Dr. P. Keith Watson), 563
Transferrin in Normal Cerebrospinal Fluid (Dr. Jørgen Clausen and Troels Munkner), 60
Transferrin Types (Haptoglobin and), in the Kuru Region of Australian New Guinea (Prof. J H. Bennett, C. O. Auricht, A. J. Gray, Dr. R. L. Kirk and L. Y. C. Lai), 68
Transferrins of Two Tropical Populations : Haptoglobins and (Dr. B. S. Blumberg and Zora Gentile), 897
Transform : The Convolution, *review* by Prof. T. A. A. Broadbent, 700
Transformation (*In vitro*) of Normal Cells by Polyoma Virus (Dr Leo Sachs and Dan Medina), 457
Transient-Response Techniques : Determination of Heats of Adsorption by (James J. Carberry), 391
Transition Metals (Body-centred Cubic) : Theory of the Deformation and Fracture of (A. A Johnson), 826
Translation : Automatic (D. Yu Panov), translated from the Russian by R Kisch ; edited by A. J. Mitchell, *review* by Dr. A. D. Booth, 784
  Automatic Language (Prof. Anthony G. Oettinger), *review* by Dr. A. D. Booth, 784
  Russian Geology in, *review* by Prof. C. F. Davidson, 610
Translations : Information on, 623
Transmissible Drug-resistance : Elimination of, by Treatment with Acriflavin (Prof. S Mitsuhashi, K. Harada and M. Kameda), 947
Transmission (Experimental), of Sanguinarine in Milk—Detection of a Metabolic Product (Dr. Sohrab A. E. Hakim, Dr Valerie Mijović and Dr. James Walker), 201
Transmissions (Satellite) : Ionospheric Scattering of (J. Mawdsley and I. R. Richards), 906
  Irregular Fading of (Dr. W. C. Bain), 129
Transmissions (Satellite Radio) : Field-Aligned Ionospheric Irregularities and the Scintillation of (D. G. Singleton, G. J. E. Lynch and Dr. J. A. Thomas), 30
Transonic Gas Dynamics : Mathematical Aspects of Subsonic and (Lipman Bers), *review* by Prof. A. T. Price, 865
Transoximase-Oximase Reaction : Glutamic Acid Formation by (Prof. K. Yamafuji, S. Hatano and A. Ida), 397
Transplantation of Lymph Nodes immunized against the Host : Survival of Cutaneous Homografts after (Dr. J. Vrubel), 853
Transplantation Antigens : Nucleic Acids as (Dr. André Castermans), 504
'Transplantese' : Proposed Revisions of (Dr. P. A. Gorer, Dr. J. F. Loutit and Dr. H. S. Micklem), 1024
Transport of Magnesium across the Intestinal Wall of the Rat *in vitro* : Influence of Sodium on the (D. B. Ross), 840
Transport of Phosphate into the Erythrocyte (Dr. A. Zipursky and Dr. L. G Israels), 1013
Transport (Active Ion), across Large Canine Blood Vessel Walls : Evidence of (Prof. P. N. Sawyer and I. Valmont), 470
Transport (Food-Chain), of Radioactive Materials into Cow's Milk : Some Factors Influencing the (D. Merten and O. Suschny), 806
Transport (London) : New Laboratory of (A. T. Wilford), 448
Transport Mechanism in the Fowl : Serum Iron and its (Prof. Jose Planas, Sisinio de Castro and Jose Maria Recio), 668
Transvaal Museum : *Bulletin* of the, No. 5, 796
Trap (An Enrichment), for Use with Capillary Columns (R. Self), 223
Trapped Primary Product of Photosynthesis in Green Plants (Alexander Müller and Dr. H. T. Witt), 944
Traverse (Gravity), of Antarctica (J. G. D. Pratt), (Trans-Antarctic Expedition, 1955-1958, Scientific Reports No. 2), *review* by G. de Q. Robin, 781
Treasure Chest for Teachers (National Union of Teachers), 20
Treatment with Acriflavin : Elimination of Transmissible Drug-resistance by (Prof S Mitsuhashi, K. Harada and M Kameda), 947
Treatment with Aminoacetonitrile Inhibition of Experimental Cirrhosis by Carbon Tetrachloride following (Dr. L. Fiume and Prof. G. Favilli), 71
Treatment (Local), of Experimental Burns with a Monoamine Oxidase Inhibitor (W. G. Spector and D. A. Willoughby), 489
Treatment (Post) : Modification of Radiation Damage in Seeds by (Dr. W. Klingmuller), 413
Treatment (Pre-) : Effect of High-Temperature and, on the Germination of Oil Palm Seed (A. R. Rees), 74
Treatment (A Unified), of Modern Optical Theory, *review* by Dr. C. A. Taylor, 429
Tree Species : Choice of (Food and Agriculture Organization of the United Nations, Forest Development Paper No. 13), 719
Trees (Avocado) : Isolation of D-Glycero-D-galacto-heptitol from the Wound Exudate of (J. K. N. Jones and R. A. Wall), 746
Trees (Forest), of Ghana : Vegetation and, *review* by Dr. E. W. Jones, 700
Treisman, M. : Theory of the Visual Threshold, 1031
Tresner, H D., and others : The Host-Range of a *Streptomyces aureofaciens* Actinophage, 603
Triacetyl-oleandomycin : Method of Dissolving, for the Assay of Sensitivity of Micro-organisms (Dr. J. W. Czekalowski), 752
Triassic Period in Siberia : Direction of the Geomagnetic Field during the (Dr. E. R. Deutsch and N. D. Watkins), 543
Tribes of the Sahara (Dr. Lloyd Cabot Briggs), *review* by G. I. Jones, 782
Trichloroacetic Acid : Binding of, by Protein (Dr. F. H. Grimbleby and H. A. Ntailianas), 835
Triclads (Freshwater) : Environment and Reproduction in (Dr. T. B. Reynoldson), 329
Trillat, Dr. J. J. : Elected to honorary life-membership of the New York Academy of Sciences, 19
3,4,5-Trimethoxyamphetamine : The Psychotomimetic Properties of (Alexander T Shulgin, Sterling Bunnell and Thornton Sargent, III), 1011
3,4,5-Trimethoxyphenylacetic Acid as the Major Metabolite of Mescaline in the Dog : Identification of (Prof. Elliot Spector), 751
Trinity College, Dublin : Appointment of Dr. B. Spencer to the chair of biochemistry, 18
Triplet Bands of Carbon Monoxide—the System $e^3\Sigma^-$-$a^3\Pi$ (Dr. R. F. Barrow), 480
Tritiated Thymidine : Implication of Chromosome Structure and Replication on Hazard of, and the Interpretation of Data on Cell Proliferation (Eugene P. Cronkite, Samuel W Glasshouse, Dr. George Brecher and Victor P. Bond), 153
Tritium as a Source of Radiation in Electron Spin Resonance Studies (Jerzy Kroh, Basil C. Green and Dr. John W. T Spinks), 655
Tritium-labelled Inulin in the Kidney Autoradiographical Detection of (J. Gayer, E H Graul and H Hundeshagen), 500
Tritium-labelled Water (Light and) : Differential Sublimation Rates of (Dr. R Moore and Dr. E. R Buskirk), 149
Tritium Gas : Labelling of Organic Compounds by Mercury-photosensitized Reaction with (Fulvio Cacace, Angelo Guarino and Gabriella Montefinale), 54
Tropical Animal Ecology : Nuffield Unit of, 276
Tropical Diseases, Carmichael Hospital for (Calcutta School of Tropical Medicine and the) : Joint Annual Report for 1958-59, 359
Tropical Ecology, International Society for : *Bulletin* of the, 285
Tropical Medicine, Calcutta School of, and the Carmichael Hospital for Tropical Diseases : Joint Annual Report for 1958-59, 359
Tropical Populations : Haptoglobins and Transferrins of Two (Dr. B. S. Blumberg and Zora Gentile), 897
Tropics (Humid) : Impact of Man on the Vegetation of the (Unesco South East Asia Science Co-operation Office Symposium on), 24
Trypanosoma rhodesiense : Isolation of, from Wild *Glossina palpalis* (H. A. W. Southon and D. H. H. Robertson), 411
Trypanosome Flagella : Organization of Function in (Dr. P J Walker), 1017
Trypsin : Action of, on Bence-Jones Protein Derivatives (Dr. Umberto Ferrini and Dr. Romano Zito), 485
  'Active Centre' Studies in (Teresa Therattil-Antony, M. Bier and F. F. Nord), 809
  Effect of *p*H on the Sensitiveness of, to Ionizing Radiation (Prof. J. A. V. Butler and A. B. Robins), 852
Tryptophan Biosynthesis : Lability of N-o-Carboxyphenylribosylamine as a Factor in the Study of (Dr. Colin H. Doy), 461
Tryptophan Metabolites : Excretion of, after Physical Effort (Dr L. Schmid), 64
Tryptophans : *In vitro* Decarboxylation of, by Mammalian Decarboxylase (Dr. V. Erspamer, Dr. A. Glasser, C. Pasini and G. Stoppani), 483
Tsuboi, M., and others : Nucleic Acids in Deuterium Oxide Solution—An Infra-red Criterion of the Base Pairing in Nucleic Acid Structure, 120 ; Parallelism of the Hypochromicity at 260 $m\mu$ and the Hyperchromicity at 1,685 $cm.^{-1}$ of Nucleic Acids in Deuterium Oxide Solution, 121
Tsuiki, S., and others : Bovine Submaxillary Mucin, 399
Tsutsui, Dr. Minoru : Awarded the A. Cressy Morrison Award of 400 dollars of the New York Academy of Sciences, 19
Tuberculin : Active Sensitization to, with Cells from Tuberculin-sensitized Guinea Pigs (Dr. J. L. Turk), 889
Tuberculin-sensitized Guinea Pigs : Active Sensitization to Tuberculin with Cells from (Dr. J. L. Turk), 889
Tubes and Sections (Beryllium) : Fabrication of—a New Structural Metal with Unique Properties (Chesterfield Tube Co., Ltd.), 976

Tubular Secretion (Renal Proximal) : Dynamics of (Dr. Fredrik Kill), 927
Tuček, Dr. S., and others : Distribution of Acetylcholine and Cholinesterase in the Heart of White Rats, 923
Tucker, Elizabeth M. : An Attempt to produce Haemolytic Disease in Lambs, 847
Tumour (Dog Mast Cell) : Histochemical Evidence of 5-Hydroxytryptamine in a (Prof. W. G. Rice and Dr. James Mitchener), 767
Tumour Interactions : Host (Henry Ford Hospital, Detroit, International Symposium on), 534
Tumour-Promotion by Lime Oil in the Mouse Forestomach (Winifred E. H. Peirce), 497
Tumour Ribonucleic Acids (Liver and) : Comparative Effects of, on the Normal Liver and the Novikoff Hepatoma Cells of the Rat (Dr. S. DeCarvalho and Dr. H. J. Rand), 815
Tumours (Human) : Biochemistry of (Biochemistry Committee of the Cancer Chemotherapy National Service Center, National Cancer Institute and the United States Public Health Service International Conference on), 627
Tumours (Melanotic) : Induction of, in the White ('Partial Albino') Syrian Hamster (Walter C. Quevedo, Jun., John M. Cairns, Jean A. Smith, Fred G. Bock and Robert J. Burns), 936
Tumours and Normal Tissues of the *C3H* Mouse : Fluorescence and Haemolytic Activity of (Dr Eric Ponder and Ruth V. Ponder), 643
Tungsten (Natural) : Excitation Functions of (*d*,*α*)- and (*d*,*αn*)- Reactions on (A. Demildt), 51
Tungsten (Zerovalent Vanadium, Chromium, Molybdenum and) : Complexes of, with a Ditertiary Phosphine (Dr. J. Chatt and H. R. Watson), 1003
Tunnelling between Semiconductors, 21
Tunnels (Wind), and Flow Visualization (Fluid Dynamics Panel of AGARD Technical Sessions at Istanbul), 108
Tunstall Laboratory of 'Shell' Research : Appointment of Dr. C. G. Hunter as director, 625
Turbert, Helen B. (Smith, Dr. J. N., and) : Enzymic Glucoside Synthesis in Locusts, 600
Turnbull, D. (Cohen, Prof. M. H , and) : Composition Requirements for Glass Formation in Metallic and Ionic Systems, 131
Turk, Dr J. L. : Active Sensitization to Tuberculin with Cells from Tuberculin-sensitized Guinea Pigs, 889
Turnbull, Prof. H W. (edited by) : The Correspondence of Isaac Newton, Vol. 2, 1676-1687, *review* by Prof. L. Rosenfeld, 171
Turner, B. L., and others : Canavanine in Leguminosae, 360
Turner, R. C., and others : Naturally Occurring Alpha-Activity of Drinking Water, 348
Turning Point in the Study of Insect Migration (Dr. J. S. Kennedy), 785
Turvey, J. R., and Rees, Dr D. A. : Isolation of L-Galactose-6-sulphate from a Seaweed Polysaccharide, 831
Tutin, Prof. T. G. : An Anatomy of Grasses, *review*, 865
Twist (Visible), on Sodium Chloride Whiskers (B. Jeszenszky and E. Hartmann), 213
Two-Colour Projections (Land's) : The Eye, the Brain and (Dr. W. A. H. Rushton), 440
Two Inhibitors of Avid A2 Influenza Virus Strains : Presence in Horse Serum of (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Two New Haemoglobin Variants in a Very Young Human Embryo (Dr. E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496
Two Sahara Nuclear Test Explosions · Deposition of Fission Product Nuclides after (Dr. V. Havlovic), 977
Two Species of Termites : Mechanism of Trail-laying in (A. M. Stuart), 419
Two Strains of Tobacco Mosaic Virus : Analysis of the Cross-Reaction between (Prof. Irving Rappaport), 986
Two Tropical Populations · Haptoglobins and Transferrins of (Dr. B. S. Blumberg and Zora Gentile), 897
Tyndall, and others : Microbiology—Historical Contributions from 1776 to 1908 by (edited by Raymond N. Doetsch), *review* by W. H. Dowdeswell, 175
Type (A New), of Phenomenon of Flow Birefringence in Macromolecular Solutions (Shoei Fujishige), 653
Types (Haptoglobin and Transferrin), in the Kuru Region of Australian New Guinea (Prof. J. H. Bennett, C. O. Auricht, A. J. Gray, Dr. R. L. Kirk and L. Y. C. Lai), 68
Types (New), of Metal–Ligand Polymers : Pyrazine–Metal Halide Complexes—(Dr. A. B P. Lever, Dr J. Lewis and Prof. R. S. Nyholm), 58
Typhoon Effects on Jaluit Atoll in the Marshall Islands : A Re-Survey of (Dr. David I. Blumenstock, Dr. F. R Fosberg and Charles G. Johnson), 618
DL-*m*-Tyrosine : Conversion of, to Dopamine in the Rat (Prof. T. L. Sourkes, G. F. Murphy and A. Rabinovitch), 577
Tyrosyluria in Human Subjects (R. Robinson and Air-Commodore P. Smith), 323
Tyrrell, Dr. D. A. J. (Parsons, Rosemary, and) : A Plaque Method for Assaying some Viruses isolated from Common Colds, 640

UBBELOHDE, Prof A. R., and Lewis, F. A. : Graphite and its Crystal Compounds, *review* by Dr. G. E. Bacon, 522
chromenol-like Lipid Constituent of Bakers' Yeast : An Unidentified (E. E. Edwin, J. Green, A T. Diplock and J. Bunyan), 750
Ubichromenols in Yeasts and Mushrooms : Tocopherol, Ubiquinones and (A. T. Diplock, J. Green, E. E Edwin and J. Bunyan), 749
Ubiquinone in the Rat : Role of Selenium in relation to (J. Green, E. E. Edwin, A. T. Diplock and J. Bunyan), 748
Ubiquinones and Ubichromenols in Yeasts and Mushrooms : Tocopherol, (A. T Diplock, J Green, E E Edwin and J. Bunyan), 749
Uganda : A Species of *Tetranychus* Dufour (Acarina) from (Dr. D. M. Robinson), 857
Ultrasonic Radiation : Effects of, in *Escherichia coli B* using Fluorochrome Acridine Orange as a Vital Stain (S. S. Ranade, V. G. Tatake and K. S. Korgaonkar), 931
Ultra-Violet Irradiation of Micro-organisms : Theoretical Considerations in the (Dr. C. W. Hiatt), 678
Ultra-Violet and Visible Region : Absorption Spectra in the (edited by Dr. L. Lang, in collaboration with Dr. J. Szoke, Dr. G. Varsányi and M. Vizesy), *review* by Dr. R. F. Barrow, 347
Ultra-Violet Absorption Spectrum of Water (R. M. Golding), 132
Unbalanced Growth of *Mycoplasma mycoides* caused by Glycerol Deficiency (Glycerol in *Mycoplasma mycoides*), (A. W. Rodwell), 125
Under-developed Territories of the World, 951
Undergraduates : Methods of Teaching (Appointment of a Committee by the University Grants Committee to study the), 880
Underground Nuclear Explosions : Research on the Detection and Identification of (United Kingdom Atomic Energy Authority), 445
Understanding (International), British Society for : Annual Report for 1960, 103
Unesco : Kalinga Prize awarded to Prof. Ritchie Calder, 880
Unesco Science Co-operation Office of the Middle East and the United Arab Republic Science Council : Conference on Science Planning, Development and Co-operation in the Countries of the Middle East and North Africa, 362
Unesco Science Co-operation Office, Montevideo · Scientific Institutions and Scientists in Latin America, Vol. 4, Part 4, Argentina, N–Z, 361
Unesco South Asia Science Co-operation Office : Regional Seminar on Scientific Documentation, 534
Unesco South East Asia Science Co-operation Office : Symposium on the Impact of Man on the Vegetation of the Humid Tropics, 24
Unexpected Effect of Attention in Peripheral Vision (B. Babington Smith), 776
Ungarischen Akademie der Wissenschaften : Mitteilungen der Sternwarte, Nr. 45, Bericht uber Optische Beobachtungen anlässlich der Landung der Sowjetischen Mondrakete *Lunik* II (L Detre), 186
Unidentified Ubichromenol-like Lipid Constituent of Bakers' Yeast (E. E. Edwin, J. Green, A. T. Diplock and J. Bunyan), 750
Unified Treatment of Modern Optical Theory, *review* by Dr. C. A. Taylor, 429
Uniform Distribution of Wood Preservatives in Toxicity Test Blocks : A Method of Obtaining (D N R. Smith and R. Cockcroft), 163
Unique Iron Porphyrin Prosthetic Group : A New Haemoprotein with a, isolated from Human Erythrocytes (Dr. Martin Morrison), 765
United Arab Republic Science Council (Unesco Science Co-operation Office of the Middle East and the) : Conference on Science Planning, Development and Co-operation in the Countries of the Middle East and North Africa, 362
United Kingdom : Strontium-90 in Human Diet in the, 1959 (Agricultural Research Council, Radiobiology Laboratory Report No. 3), 191
United Kingdom, Conference of Universities of the : Discussion on New Universities, 23
United Kingdom Atomic Energy Authority : Research on the Detection and Identification of Underground Nuclear Explosions, 445
  Re-organization in the, 622
  New Low-power Reactor called *Vera* (Versatile Experimental Reactor Assembly) at the Atomic Weapons Research Establishment, Aldermaston, 711
  Nestor, a New Reactor at Winfrith, 969
United Kingdom Atomic Energy Authority, and others : To collect and disseminate information concerning Translations of Nuclear Literature, 102
  Establishment in Brussels of a new International Information Office called Transatom, 623
United Nations International Conference on the Peaceful Uses of Atomic Energy : Proceedings of the Second (Geneva, 1958), Vol. 3, Processing of Raw Materials, *review* by Dr. A. R. Burkin, 87
United Nations (Food and Agriculture Organization) : Report of an Expert Committee on Radioactive Materials in Food and Agriculture, 712
  Forest Development Paper No. 13, Choice of Tree Species, 719
United Nations (World Health Organization) : Monograph Series No. 45, Differential Diagnosis of Yaws (Dr. C. J. Hackett and Dr. L. J. A. Loewenthal), 187
  Technical Report Series No. 203, Expert Committee on Poliomyelitis, Third Report, 542
United States : Higher Education in the (Dr. J. B. Conant), 803
  The Lichen Flora of the (Bruce Fink), second printing, *review* by Dr. R. W. G Dennis, 7
United States Air Force (Geophysics Research Directorate) : Handbook of Geophysics, revised edition, *review* by Prof S. K. Runcorn, 258
United States Army (Medical Department) : Surgery in World War II—Neurosurgery, Vol. 2 (edited by R. Glen Spurling and Barnes Woodhall), *review* by J E. A. O'Connell, 344
United States Atomic Energy Commission : Appointment of Dr. Glenn T. Seaborg as chairman, 357
United States Atomic Energy Commission, and others : To collect and disseminate information concerning Translations of Nuclear Literature, 102
  Establishment in Brussels of a new International Information Office called Transatom, 623
United States Department of Health, Education and Welfare : Public Health Service, Publication No. 761, Activities of the National Institutes of Health in the Field of Gerontology—Research Grant and Training Projects Active on January 31, 1960, and Intramural Research Projects carried on during Calendar Year 1959, 21
United States Department of Labour (Bureau of Labour Statistics) : Scientific and Technical Personnel in American Industry (United States National Science Foundation), 794
United States National Academy of Sciences : Mary Clark Thompson Medal awarded to Dr. Norman Dennis Newell, 880
  Jessie Stevenson Kovalenko Medal awarded to Dr. Karl F. Meyer, 970
United States National Bureau of Standards, and others : Symposium on Temperature—its Measurement and Control in Science and Industry, 22
United States National Institutes of Health : Activities in the Field of Gerontology—Research Grant and Training Projects Active on January 31, 1960, and Intramural Research Projects carried on during Calendar Year 1959 (United States Department of Health, Education and Welfare—Public Health Service, Publication No. 761), 21

- United States National Science Foundation *Current Research and Development in Scientific Documentation*, No. 7, 185
  - Appointment of Dr. Christopher E. Barthel, jun , to the Office of Special International Programmes, 625
  - Scientific and Technical Personnel in American Industry (Bureau of Labour Statistics of the Department of Labour), 794
- United States Public Health Service, and others : International Conference on the Biochemistry of Human Tumours, 627
- Univalent Fragments of Rabbit Antibody : Separation of, by Reduction of a Single, Labile Disulphide Bond (Prof. A Nisonoff, G. Markus and F. C. Wissler), 293
- Universi-isole : Le Nebulose e gli (Giorgio Abetti e Margherita Hack), *review* by J. B. Alexander, 867
- Universitaire (Fondation), Brussels : Increasing the Effectiveness of Western Science, 339
- Universities : Australian (Sir Eric Ashby), 434
  - Building Contracts for, 444
  - Methods used by, of Contracting and of Recording and Controlling Expenditure (University Grants Committee), 427
  - New (Conference of Universities of the United Kingdom, Discussion on), 23
  - The Problem of Freedom and Efficiency in (Dr A. P Rowe), 360
- Universities of the British Commonwealth, Association of : Report for 1959-60, 795
- Universities of the United Kingdom, Conference of Discussion on New Universities, 23
- Universities (British) : Future of the General Degree in (Prof. F C Frank), 106
- Universities (British) Film Council : Catalogue of Films for Teaching Purposes, 102
- Universities (Home) Conference : Discussion on the Future of the General Degree, 106
- Universities Federation for Animal Welfare : Easter Congress, 625
- University of Australia (National) : Appointment of Dr. B. H. Neumann to the newly established chair of mathematics, 185
- University of Birmingham : Appointment of G. R Izaak as research associate in nuclear physics, 22
  - Appointment of Dr. C. F. Wells as lecturer in the Department of Chemistry, 22
  - Appointment of Dr. F. Bakhtar as lecturer in the Department of Mechanical Engineering, 22
  - Appointment of R. H. Hollier as Tube Investments Senior Research Fellow in the Department of Engineering Production, 22
  - Appointment of J. W. Fortey as lecturer in the Department of Civil Engineering, 22, 714
  - Appointment of D E. N. Davies as Associated Television Fellow in the Department of Electrical Engineering, 22, 714
  - Appointment of B. Henderson as William Gibbins Research Fellow in the Department of Physical Metallurgy, 22, 714
  - Appointment of Dr. A I. Rees as I.C.I. Fellow in Geophysics, in the Department of Geology, 22, 714
  - Appointment of Dr. C. E. Rowe as Caroline Harrold Research Fellow in the Department of Physiology, 22
  - Establishment of a second chair in theology, 101
  - Grant of 440,000 dollars from the Ford Foundation, to support a programme of research in the Department of Anatomy into the reproductive physiology of monkeys, 533
  - Title of first assistant to the chair of pathology conferred on Dr. D. B. Brewer, 797
  - Appointment of Dr M. Z. Atassi as Research Fellow in the Department of Chemistry, 797
  - Appointment of Dr. D. A. Smith as lecturer in the Department of Microbiology, 797
  - Appointment of M. J. Hamlin as lecturer in the Department of Civil Engineering, 797
  - Appointment of Dr. B. Cockayne as lecturer in the Department of Physical Metallurgy, 797
  - Thirty-first Annual Report of the Research Committee (1959-60), 797
- University of Birmingham Chemical Engineering Society (Graduate Section), and the Graduates and Students Section of the Midlands Centre of the Institution of Chemical Engineers : Symposium on Computers for Chemical Engineers, 534
- University of Bristol : Establishment of a School of Management Studies, 358
- University of Calcutta : Appointment of Dr. S M Sircar as Sir Rashbehari Ghosh professor of botany, 357
- University of Cambridge : Kenneth Craik Research Award of St. John's College, 188
  - Retirement of Prof. C. E Tilley from the chair of mineralogy and petrology, 793
  - Appointment of Prof. W. A Deer as professor of mineralogy and petrology, 793
- University of Dublin : Appointment of Dr. B Spencer to the chair of biochemistry at Trinity College, 18
- University of Edinburgh . Appointment of Dr. T. D. Patten as lecturer in engineering, 22
  - Appointment of D C Malcolm as lecturer in forestry, 22
  - Appointment of Dr. J. L. Holmes and Dr. A. J. Charlson as I C.I. Research Fellow, 22
- University of Ghent : Summer School on the Electrical, Optical and Mechanical Properties of Lattice Defects (sponsored by NATO), 104
- University of Hull : Retirement of Prof. G. C. Steward from the chair of mathematics, 968
  - Appointment of Dr. W. H. Cockcroft to the chair of pure mathematics, 968
  - Appointment of Dr. N. B. Slater to the newly created chair of applied mathematics, 968
- University of London : Appointment of Prof. E. T. C Spooner as Dean of the London School of Hygiene and Tropical Medicine, 18
  - Appointment of Prof. D. G Evans, to the University chair of bacteriology at the London School of Hygiene and Tropical Medicine, 18
  - Title of professor of physical anthropology in the University (at University College) conferred on Dr. N. A. Barnicot, 22
  - Title of professor of biophysics as applied to medicine in the University (at the Institute of Cancer Research, Royal Cancer Hospital) conferred on Dr. L. F. Lamerton, 22
  - Title of reader in astronomy in the University (at University College) conferred on Dr. R H. Garstang, 22
  - Title of reader in geology in the University (at University College) conferred on Dr. M. K. Wells, 22
  - Appointment of Dr. M. D. Milne to the University chair of medicine at Westminster Medical School, 22
  - Appointment of Dr. F. A. Goldsworthy as reader in applied mathematics at Queen Mary College, 22; Inability to accept the appointment, 188
  - Appointment of E J. Ambrose as reader in physical chemistry at the Institute of Cancer Research, Royal Cancer Hospital, 22
  - Appointment of Dr. R. Creese as reader in physiology at St. Mary's Hospital Medical School, 22
  - Appointment of Dr. L Miles Jackman as reader in organic chemistry at the Imperial College of Science and Technology, 22
  - Appointment of M. J. Way as reader in applied entomology at the Imperial College of Science and Technology, 22
  - Appointment of Dr. G. M. Timmis as reader in chemistry at the Institute of Cancer Research, Royal Cancer Hospital, 22
  - Appointment of Dr. C. R. Webb as reader in mechanical engineering at Queen Mary College, 22
  - Appointment of Dr. H. I. Winner as reader in bacteriology at Charing Cross Hospital Medical School, 22
  - Appointment of Dr. D. R. Cox to the University chair of statistics at Birkbeck College, 188, 443
  - Appointment of Dr. E. F. Scowen to the University chair of medicine at St. Bartholomew's Hospital Medical College, 188
  - Appointment of Arthur Summerfield to the chair of psychology at Birkbeck College, 188
  - Appointment of Dr Donald Rogers to the University readership in chemical crystallography at the Imperial College of Science and Technology, 188
  - Title of professor of mathematics in the University (at University College) conferred on Dr. K. F. Roth, 188
  - Title of reader in medicine in the University (at St. Mary's Hospital Medical School) conferred on P. H. Sanderson, 188
  - Title of professor emeritus of biochemistry in the University conferred on Prof. W. Robson, 188
  - Title of reader in mathematics in the University (at King's College) conferred on Dr. F. A. E Pirani, 188
  - Title of reader in mathematics in the University (at the Imperial College of Science and Technology) conferred on Dr. S. Raimes, 188
  - Course on Elementary Plasticity, at the Imperial College of Science and Technology, 447
  - Title of Sir William Collins professor of anatomy in the University (at the Institute of Basic Medical Sciences) conferred on G. W. Causey, 534
  - Title of reader in veterinary physiology (at the Royal Veterinary College) conferred on Dr F. R. Bell, 534
  - Title of reader in anatomy (at St. Mary's Hospital Medical School) conferred on Dr. A. S. Breathnach, 534
  - Title of reader in geography (at University College) conferred on Dr E. H. Brown, 534
  - Title of reader in clinical rheology (at the Postgraduate Medical School of London) conferred on D. G. Melrose, 534
  - Title of reader in chemical engineering (at University College) conferred on Dr. J. W. Millin, 534
  - Postgraduate Course at the Imperial College of Science and Technology on Engineering Aspects of Lubrication, 624
  - Retirement of Prof. R. Ogilvie Buchanan from a chair of geography at the London School of Economics and Political Science, 710
  - Appointment of Dr. Emrys Jones to a chair of geography at the London School of Economics and Political Science, 710
  - International Congress on Metallic Corrosion, at the Imperial College of Science and Technology, 713
  - Appointment of Dr. F. F. Heymann to the University readership in physics at University College, 714
  - Appointment of Dr J. Lewis to the University readership in chemistry at University College, 714
  - Appointment of Dr. R. A. Shooter to the chair of bacteriology in St. Bartholomew's Hospital Medical College, 797
  - Appointment of L. H. Hamlyn to the University readership in histology at University College, 797
  - Title of reader in physics in the University (at Queen Mary College) conferred on Dr R. O. Davies, 797
- University (McGill) : Research Groups and Weather Observatory responsible for the meteorology carried out at the University supplemented by a Department of Meteorology, 447
- University of Manchester : Title of Langworthy professor of physics granted to Prof. B. H. Flowers, 797
  - Appointment of Dr. E. B. Paul to a chair of physics, 797, 876
  - Appointment of Dr. H. E. Hall to a chair of physics, 797, 877
  - Appointment of Dr. J. Hoenig as reader in psychiatry, 797
  - Appointment of Dr M F Lappert as senior lecturer in chemistry, 797
  - Appointment of Dr. J. F. Adams as a reader in mathematics, 797
- University of Natal : Symposium on the Biogeography of South-East Africa, 801
- University of Oxford : Retirement of Prof A. Thom from the chair of engineering science, 185
  - Appointment of Dr. D W. Holder to the chair of engineering science, 185
- University of Rajasthan, Jodhpur : Appointment of Prof C. V. Subramanian to the newly created chair of botany, 710
- University of Sheffield . Appointment of A. Usher as lecturer in forensic medicine, 447
  - Appointment of H. Merskey as lecturer in psychiatry, 447
  - Appointment of Dr. S. C. R. Dennis as senior lecturer in applied mathematics, 714
  - Appointment of Dr. R. C. Hewson-Brown as lecturer in applied mathematics, 714
  - Appointment of Dr. D. S. Dugdale to a Speedicut Research Fellowship in mechanical engineering, 714
  - Appointment of J Beech to a United Steel Companies' Fellowship in metallurgy, 714
  - Appointment of D. H. Warrington to a J. H. Andrew Fellowship in metallurgy, 714
  - Appointment of A. Mitchell to a C. H. Desch Fellowship, 714

University of Southampton : Election of Sir Basil Schonland as junior pro-chancellor, 534
University of Wales : Appointment of Dr. J. D. Weston as professor of pure mathematics in the University College of Swansea, 447, 622
  Course in Chemical Engineering, at the University College of Swansea, 447
  Appointment of Dr. J. D. Lever to the chair of anatomy in the University College of South Wales and Monmouthshire, Cardiff, 531
  Retirement of Prof R Wilson as head of the Department of Pure Mathematics in the University College of Swansea, 622
  Fourth Symposium in Agricultural Meteorology (Soil Climate with special reference to the British Isles) at University College, Aberystwyth), 714
  Appointment of Dr H K. M Lloyd to the chair of metallurgy in the University College of South Wales and Monmouthshire, Cardiff, 797
University (Western Reserve), Cleveland . Appointment of Prof. Marcus Singer as Henry Willson Payne professor of anatomy, 357
  Appointment of Prof. Howard A Schneiderman as professor of biology, 357
University (Yale) . Annual Report for 1960 of the Peabody Museum of Natural History, 186
University of York Appointment of Lord James of Rusholme as first vice-chancellor, 625
University Administration in Britain and the Commonwealth Freedom and Efficiency—Problems of (Committee on Science and Freedom, Manchester, Bulletin No. 16), 517
University Administration in Great Britain, 517
University Building Development : Control of, 427
University College, Aberystwyth : Fourth *Symposium in Agricultural* Meteorology (Soil Climate with special reference to the British Isles), 714
University College, London : Title of professor of physical anthropology in the University of London conferred on Dr. N. A. Barnicot, 22
  Title of reader in astronomy in the University of London conferred on Dr. R. H. Garstang, 22
  Title of reader in geology in the University of London conferred on Dr. M K. Wells, 22
  Title of professor of mathematics in the University of London conferred on Dr. K. F Roth, 188
  Title of reader in geography conferred on Dr E. H Brown, 544
  Title of reader in chemical engineering conferred on Dr. J. W. Mullin, 534
  Appointment of Dr F. F. Heymann to the University of London readership in physics, 714
  Appointment of Dr. *J. Lewis* to the *University of London readership* in chemistry, 714
  Appointment of L. H. Hamlyn to the University of London readership in histology, 797
University College of North Staffordshire : Appointment of Dr H. M. Taylor as principal, 710
  Grant of £20,000 from the Nuffield Foundation, for the purpose of setting up and maintaining a special library, to be known as the Nuffield Library, 714
University College of South Wales and Monmouthshire, Cardiff Appointment of Dr. J D. Lever to the chair of anatomy, 531
  Appointment of Dr. H. K. M. Lloyd to the chair of metallurgy, 797
University College, Swansea : Appointment of Dr J. D. Weston as professor of pure mathematics, 447, 622
  Course in Chemical Engineering, 447
  Retirement of Prof. R. Wilson as head of the Department of Pure Mathematics, 622
University Grants Committee : Returns from Universities and University Colleges *in receipt of Treasury* Grant, Academic Year 1958-1959, 107
  Methods used by Universities of Contracting and of Recording and Controlling Expenditure, 427
  Appointment of a Committee to study Methods of Teaching Undergraduates, 880
University Teachers, Association of, and others : Discussion Conference on Science and Education, 534
Unknowing : The Cloud of, *review* by Prof R. J. C. Atkinson, 610
Unknown : Perfect Stages of *Fusarium oxysporum* and of *Fusarium solani* f. *pisi* still (Dr. William C. Snyder and James V. Alexander), 596
Unknown Materials in Solution : Accurate Determination of Molecular Weights of (R. A Pasternak and Leonard A Cavanagh), 446
Unusual Feature of the Fusion Welding of Niobium to Vanadium (R. D. Johnston and L. W. Derry), 52
Unusual Properties : A New Anthelmintic with (A W. J. Broome and *N. Greenhalgh*), 59
Uplands (The Maritime), of Britain—Inventory and Prospect (James A. Taylor), 872
Upper Limit for Interstellar Millicycle Gravitational Radiation (Dr. Robert L. Forward, David Zipoy, Prof J. Weber, Stewart Smith and Prof. Hugo Benioff), 473
Upper Winds over the World (H. Heastie and P M. Stephenson), Parts 1 and 2 (Air *Ministry : Meteorological Office, Geophysical Memoirs* No. 103), 543
Uptake of Catecholamines after Chronic Denervation of Sympathic Nerves : Lack of (Dr. G Hertting, Dr J. Axelrod, I. J. Kopin and L G Whitby), 66
Uptake of Deoxyribonucleic Acid (DNA)—a Special Property of the Cell Nucleus (Dr. M. Hill), 916
Uptake of *Small Resin Particles by the Alimentary Canal of the Calf (J. M.* Payne and B. F Sansom), 494
Urease *from* Jack Bean · High-Yield Crystallization of (Dr Kiyomichi Hanabusa), 551
Uridine Diphosphate-Glucose · Chemical Oxidation of, to Uridine Diphosphate-Glucuronic Acid (Dr. Bernard Jacobson and Dr. Eugene A. Davidson), 663
Uridine Diphosphate-Glucuronic Acid · Chemical Oxidation of *Uridine* Diphosphate-Glucose to (Dr Bernard Jacobson and Dr. Eugene A. *Davidson*), 663
Urinary Hyaluronidase and Diuresis · Relationship between (Prof. A. G. Ginetzinsky), 235 ; (Dr. G M. Berlyne), 236
Urinary pH : Effect of, on 5-Hydroxytryptamine Excretion in the Rat (M. Sandler and R. G Spector), 838
Urinary Proteins · A Pyroninophilic Component in Pathological Serum Proteins and (*R.* E. Ballieux, G. N. Niehaus and *Prof. M.* T. Jansen), 60
Urine · Use of the Mercury Drop Electrode Method for Direct Evaluation of *Minute Amounts of* Lead *in* (Prof. Wiktor Kemula and Zenon Kublik), 57
Urine (Human) : Identification of a Compound found during Separation of Purines in (Dr. Herbert Singer, Arax Gulbenkian, Sigmund E. Lasker and Charles L. Fox, jun), 671
Urine Assay : Assessment of Dietary Strontium-90 through (Dr Arthur R. Schulert), 933
Use with Capillary Columns : An Enrichment Trap *for (R. Self)*, 223
Use of Digitonin for the Analysis of Faecal Sterols : An Evaluation of the (*Prof.* W. W. Wells and Patricia A. Mores), 483
Use of Film in Scientific Research (Working Party of the Department of Scientific and Industrial Research to consider the), 102
Use of Gibberellin to hasten Germination of *Solanum* Seed (Pauline B. Spicer and Leo O Dionne), 327
Use of Induced Rooting in Cytological Studies (D N. Singh), 420
Use of Krypton for Surface Area Measurements (Dr. John M. Thomas), 134
Use of the Mercury Drop Electrode Method for Direct Evaluation of Minute Amounts of Lead in Urine (Prof. Wiktor Kemula and Zenon Kublik), 57
Use of Polyethylene Glycol in Biology (Dr. J. H. Fraser), 241
Use of Potassium Tartrate for Equilibrium Density-gradient Centrifugation of Animal Viruses (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Use of Radioactive Nitrogen in Studying Nitrogen Fixation *in Bacterial Cells* and their Extracts (Dr. D. J. D. Nicholas, Dr. D J. Silvester and Dr. J F *Fowler*), 634
Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus (Dr. T O. Diener), 687
User Experience of Large-Scale Industrial Vacuum Plant (Institution of Mechanical Engineers Symposium on), 275
Uses (Peaceful), of Atomic Energy Proceedings of the Second United Nations International *Conference on the (Geneva, 1958), Vol.* 3, Processing of Raw Materials, *review* by Dr A. R. Burkin, 87
Usher, A. · Appointed lecturer in forensic medicine at the University of Sheffield, 447
U.S S.R. : The Geology of the (Academician D. V. Nalivkin), translated from the Russian by Dr. S. I. Tomkeieff, *review* by Prof. C. F. Davidson, 610
U.S.S.R. Academy of Medical Sciences (New York Academy of Sciences and the) : Conference on Higher Nervous Activity, 282
U.S.S.R Academy of Sciences : International Symposium on Primary and *Initial Effects of Ionizing Radiations*, 110
Utilization of the Stereoisomers of *iso*Leucine by *Lactobacillus arabinosus* 17-5 (Dr. Ichiro Chibata, Shigeki Yamada and Hiroshi Ito), 144
Utilization of Water in Australia (Victoria Branch of the Royal Australian Chemical Institute Discussion on), 537

VACCA, Prof C., and others : Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the Development of Chicken Embryos, 66
Vacuum : Versatility of, *review* by Dr. R. O. Jenkins, 867
Vacuum Furnace (Induction-heated) : Elimination of a Glow Discharge in an (John E. Fagel), 212
Vacuum Physics : Measurement of Pressure in (W. W. Forrest), 476
Vacuum Plant : User Experience of Large-Scale Industrial (Institution of *Mechanical Engineers Symposium on*), 275
Vacuum Science and Technology : Progress in (edited by A. S D Barrett), *review* by Dr. R. O. Jenkins, 867
Vagotomy of Erythrocytosis induced by Hypoxaemia : Prevention of (Dr. D. F. J. Halmagyi and H J. H. Colebatch), 757
Vahrman, Dr. M. : Origin of some Primary Coal Tar Components, 136
Valentine, A. B. B. : New Laboratory of London Transport opened by, 448
Valkenburg, *P.* W., and others : *Effect of Radioactive Sulphydryl* Compounds on the Oxygen Tension in the Spleen of Mice, 588
Valmont, I. (*Sawyer, Prof. P. N.*, and) : Evidence of Active Ion Transport across Large Canine Blood Vessel Walls, 470
Value (Calorific), of Gaseous Fuels, *review* by R. J. H. Banks, 255
Values and Groups : Decisions, Vol 1, Reports from the First Interdisciplinary Conference in the Behavioral Science Division of the Air Force Office of Scientific Research, held at the University of New Mexico (edited by Dorothy Willner), *review* by Prof. Ll. Wynn Jones, 955
Vámos, R., and others : Relations of Intensity of Photosynthesis and Appearance of *Piricularia oryzae* Cav. on the Rice Plant, 407
van Buren, C. E. (Hirsch, H. H., and) : Powder Metallurgy (Hydrostatic Pressing of Powder), 366
van Duijn, jun., C. · Effects of Light and Optical Sensitization by Acridine-Orange on Living Bull Spermatozoa, 76
van Oss, Dr. C. J , and others : Anticomplementary Action of Aspirin, 147
van Rest, E. D. : *Obituary* of E C Fieller, 271
Van Rysselberge, Dr J., and Leysen, R. : A Rapid Method for the Determination of Tetramethyl Lead and Tetraethyl Lead in Petrol, 478
van Scott, Dr. Eugene J. (Rothberg, Dr. Simon, and) : Localization of Arginase in Rabbit Skin, 832
Van Velsen, R. J , and Crowley, Dr. N. C. : Centrosema Mosaic, a Plant Virus Disease transmitted by both Aphids and Plant Bugs, 858
van den Ban, A. W. : Advising the Farmer (Research on Advisory Methods in the Netherlands), 883
van der *Craats, F. : Gas Chromatography* (The Flame Ionization Detector), 26 ; (Determination of Response Factors for Compounds of Different Type), 26
van der Meer, Dr. C., and others : Effect of Radioactive Sulphydryl Compounds on the Oxygen Tension in the Spleen of Mice, 588
van der Waerden, Prof. B L.· Elected a Member of the Mathematics Section of the Leopoldina German Academy of Sciences, 273
Vanadium : *An Unusual Feature of the Fusion Welding of Niobium to* (R. D. Johnston and L. W. Derry), 52
Vanadium, Chromium, Molybdenum and Tungsten (Zerovalent) · Complexes of, with a Ditertiary Phosphine (Dr. J. Chatt and H. R. Watson), 1003
Vapour : Etch Patterns on Cadmium Crystals grown from (Joy George), 743

Vapour (Inhaled Radioactive Water) : Absorption of (J. B. West and C. T. Dollery), 588
Vardi, J., and others : Radioactive Fall-out in Israel resulting from the Nuclear Tests in the Sahara Desert, 90
Varga, István, and others : Isolation and some Properties of the Phages of *B. cereus* NRRL 569, 161
Variance (Genetic), in *Drosophila* Populations : Diurnal Temperature Fluctuation and (J. A. Beardmore), 162
Variants (Two New Haemoglobin), in a Very Young Human Embryo (Dr. E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496
Variation of Elasticity along Single Microfibrils of Bacterial Cellulose (J. Ross Colvin), 1029
Variation and the Mean : Aggregation, (L. R. Taylor), 732
Variation (Latitude), of Occurrence of Whistlers : Spread-*F* and the (D. G. Singleton), 215
Variation (Seasonal), in Blood Pressure in Man (Dr. Geoffrey Rose), 235
Variation (Secular), of the Flux Density of the Radio Source Cassiopeia A (Dr. J. A. Hogbom and Dr. J. R. Shakeshaft), 561
Variation (Somatic), of an Erythrocyte Agglutinogen in Chickens : Effects of Œstrogen on (S. L. Scheinberg and R. Reckel), 295
Varsányi, Dr. G., and others (edited by Dr. L. Lang, in collaboration with) : Absorption Spectra in the Ultra-violet and Visible Region, *review* by Dr. R. F. Barrow, 347
Vas, Dr. Stephen I. (Johnstone, Rose M., and) : Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and Ehrlich Ascites Carcinoma Cells, 70
Vegetable Research Station Association (National) : Members' Day (Soil Physical Conditions affecting Plant Growth), 625
Vegetation of the Humid Tropics : Impact of Man on the (Unesco South East Asia Science Co-operation Office Symposium on), 24
Vegetation and Forest Trees of Ghana, *review* by Dr. E. W. Jones, 700
Vegetative Growth Phases of Algerian Ivy : Effect of Temperature and Grafting on (Prof. V. T. Stoutemyer and O. K. Britt), 854
Venables, Dr. P. F. R. : Better Opportunities in Technical Education, 701
Venditti, J. M., and others : Toxicity and Anti-leukaemic Effectiveness in Mice of 4-Amino-4-deoxy-N^{10}-methyl-5,6,7,8-tetrahydropteroyl-glutamic Acid (Tetrahydroamethopterin), 937
Venom (Bee) : Immunity of Bee Keepers to some Constituents of—Phospholipase-A Antibodies (A. H. Mohammed and M. M. A. El Karemi), 837
Venom (Snake) Phosphodiesterase : Use of, in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from Tobacco Mosaic Virus (Dr. T. O. Diener), 687
Venom (*Vipera palestinae*), *in vivo* : Deformation of Red Cell Shape induced by (Dr. D. Danon, S. Gitter and M. Rosen), 320
Ventral Spino-Cerebellar Tract : Localization of the Cells of Origin of the (J. I. Hubbard and O. Oscarsson), 157
Ventricular Muscle of the Dog : Glutamic Oxaloacetic Transaminase Activity in Different Zones of the (Dr. Alvaro L. Gimeno, Dr. Martha A. Fernández de Gimeno, Dr. Enrique Savino and Dr. Manuel René Malinow), 315
Vera (Versatile Experimental Reactor Assembly) : New Low-power Reactor at the Atomic Weapons Research Establishment, Aldermaston, 171
Vermilyea, D. A., and others (edited by) : Structure and Properties of Thin Films—Proceedings of an International Conference, New York, 1959, *review* by Dr. J. Ring, 613
Verruca vulgaris : Morphological Characterization of the Virus of the Human Common Wart (M. G. Williams, A. F. Howatson and J. D. Almeida), 895
Versatile Method for Short-term Spectrum Analysis in 'Real-Time' (J. S. Gill), 117
Versatility of Vacuum, *review* by Dr. R. O. Jenkins, 867
Vertebrate Locomotion (Zoological Society of London Symposiumon), 97
Vertrees, Dr. Kenneth M. (Pearson, Dr. Howard A., and) : Site of Binding of Chromium-51 to Haemoglobin, 1019
Very Young Human Embryo : Two New Haemoglobin Variants in a (Dr. E. R. Huehns, Dr. F. V. Flynn, Elizabeth A. Butler and Dr. G. H. Beaven), 496
Veryard, R. G. (Ebdon, R. A., and) : Fluctuations in Equatorial Stratospheric Winds, 791
Vessel Muscle Proteins extracted with Water or Salt Solutions of Low Ionic Strength : Properties of (Prof. L. Laszt), 230
Veterinary College (Royal), London : Title of reader in veterinary physiology conferred on Dr. F. R. Bell, 534
Vibration Frequency and Ionization Potential—Halide Molecules (S. S. Mitra), 914
Vibrationally Excited Nitric Oxide produced in the Flash Photolysis of Nitrosyl Chloride (Dr. N. Basco and Prof. R. G. W. Norrish), 455
Vibrio El Tor : Lecithin-splitting Enzyme of (Sankar Mitra and G. C. Chatterjee), 837
Vibrio choleroe : Genetic Recombination in (Dr. K. Bhaskaran and S. S. Iyer), 1030
Vicia faba : Action of, on Erythrocytes—Possible Relationship to Favism (Dr. J. E. Bowman and Dr. D. G. Walker), 555
Vicinity of the Sun : Streaming of Interstellar Hydrogen in the (Dr. R. X. McGee, Dr. J. D. Murray and Dr. J. L. Pawsey), 957
Vickery, Dr. R. C. : The Chemistry of Yttrium and Scandium, *review* by Dr. J. S. Anderson, 345
Victoria, Royal Society of : *Proceedings*, New Series, Vol. 72, Part 2, Rock Shelters of the Lower Murray River (D. J. Mulvaney), 445
Victoria Land, Antarctica : Geological Reconnaissance in (B. C. McKelvey and P. N. Webb), 545
Victoria Medal of the Royal Geographical Society awarded to Prof. W. William-Olsson, 443
Victoria (Lake) Phytoplankton : Growth of, in Enriched Cultures (Dr. John H. Evans), 417
Villanueva, Dr. Julio R. (Acha, Isabel Garcia, and) : A Selective Medium for the Formation of Ascospores by *Aspergillus nidulans*, 328
Villegas, Dr. Jorge, and others : Location of the Non-Linearity in Horizontal Cell Response to Retinal Illumination, 463
Vincent, Dr. E. A. : Awarded the Wollaston Fund for 1961 of the Geological Society of London, 100
Vincent, J. : Biogeography of South-East Africa, 802
Vinci, Alfonso : Fiori delle Ande, *review* by N. Y. Sandwith, 523
Vinter, Dr. Vladimir : Changes in Radio-resistance of Sporulating Cells of *Bacillus cereus*, 589
Vipera palestinae Venom *in vivo* : Deformation of Red Cell Shape induced by (Dr. D. Danon, S. Gitter and M. Rosen), 320
Viral Nucleic Acids (Infectious) : Blood Nucleases and (Roger M. Herriott, John H. Connolly and Shanta Gupta), 817
Virus of the Human Common Wart (*Verruca vulgaris*) : Morphological Characterization of the (M. G. Williams, A. F. Howatson and J. D. Almeida), 895
Virus (African Horse-Sickness) : Haemagglutination and Haemagglutination-Inhibition with (Korshed M. Pavri), 249
Virus (Avid A2 Influenza) Strains : Presence in Horse Serum of Two Inhibitors of (Ol'ga Krizanová-Laučíková, J. Szántó, Dagmar Kočišková, G. Ruttkay-Nedecky and F. Sokol), 513
Virus (Hepatoencephalomyelitis), and Reoviruses : Relationship of (Prof. N. F. Stanley), 687
Virus (Influenza) : Inhibition of the Multiplication of, by Aniline Derivatives of the Francis Inhibitor (Dr. I. Hollós), 553
Virus (A New), isolated from Culicine Mosquitoes (B. M. McIntosh, R. H. Kokernot and H. E. Paterson), 274
Virus (Polyoma) : *In vitro* Transformation of Normal Cells by (Dr. Leo Sachs and Dan Medina), 457
Virus (Tobacco Mosaic) : Analysis of the Cross-Reaction between Two Strains of (Prof. Irving Rappaport), 986
    Use of Snake Venom Phosphodiesterase in place of Pancreatic Ribonuclease for the Testing of Nucleic Acid Preparations from (Dr. T. O. Diener), 687
Virus Disease (Plant), transmitted by both Aphids and Plant Bugs : Centrosema Mosaic, a (R. J. Van Velsen and Dr. N. C. Crowley), 858
Viruses Isolated from Common Colds : A Plaque Method for Assaying some (Rosemary Parsons and Dr. D. A. J. Tyrrell), 640
Viruses (Animal) : Use of Potassium Tartrate for Equilibrium Density-gradient Centrifugation of (Prof. J. F. McCrea, Richard S. Epstein and William H. Barry), 220
Viruses and Plant Diseases (Dr. L. O. Kunkel), 630 ; (Dr. Karl Maramorosch), 630
Viscosity of Water : Effect of Dissolved Air on the (W. A. Caw and R. G. Wylie), 995
Visible Region (Ultra-violet and) : Absorption Spectra in the (edited by Dr. L. Lang, in collaboration with Dr. J. Szoke, Dr. G. Varsányi and M. Vizesy), *review* by Dr. R. F. Barrow, 347
Visible Twist on Sodium Chloride Whiskers (B. Jeszenszky and E. Hartmann), 213
Vision (Peripheral) : An Unexpected Effect of Attention in (B. Babington Smith), 776
Vistas in Free-Radical Chemistry (edited by Dr. W. A. Waters), *review* by Dr. A. B. Callear, 433
Visual Threshold : Theory of the (V. Treisman), 1031
Visualization (Flow) : Wind Tunnels and (Fluid Dynamics Panel of AGARD Technical Sessions at Istanbul), 108
Vital Stain : Effects of Ultrasonic Radiation in *Escherichia coli B* using Fluorochrome Acridine Orange as a (S. S. Ranade, V. G. Tatake and K. S. Korgaonkar), 931
Vitale, B. (Allegretti, Prof. N., and) : Neural Tissue and Pulmonary Lesions in Normal and Irradiated Rats injected with Homogenized Homologous Lung Tissue mixed with Freund's Adjuvant, 673
Vitamin A Metabolism : Relationship between High Temperature and, and the Fertility of Ewes (Margaret Ryle), 104
Vitamin A-deficient Rats : Amino-Acid Patterns in (P. Malathi, P. Seshadri Sastry and Dr. J. Ganguly), 660
Vitamin A and Cholesterol : Fatty Acid Specificity for the Esterification of, by Intestinal and Pancreatic Enzymes in Rats (S. K. Murthy, S. Mahadevan, P. Seshadri Sastry and Dr. J. Ganguly), 482
Vitamin B_{12} : Applicability of Hydroxocobalamin as a Long-acting (Prof. G. B. J. Glass, H. R. Skeggs, Dr. D. H. Lee, Dr. E. L. Jones and W. W. Hardy), 138
    Intestinal Absorption of, and of a Vitamin B_{12}-Peptide Complex in Normal Subjects and in Patients with Partial Gastrectomy (Dr. G. Milhaud), 31
Vitamin B_{12}-Peptide Complex : Intestinal Absorption of Vitamin B_{12} and of a, in Normal Subjects and in Patients with Partial Gastrectomy (Dr. G. Milhaud), 31
Vithayathil, Dr. J. (Gabor, Prof. D., and) : The Bartele Arc, 821
Vizesy, M., and others (edited by Dr. L. Lang, in collaboration with) : Absorption Spectra in the Ultra-violet and Visible Region, *review* by Dr. R. F. Barrow, 347
Vlček, Dr. A. A. : Polarographic Behaviour of Chromium–Dipyridyl Complexes, 393
Vlk, Dr. J., and others : Distribution of Acetylcholine and Cholinesterase in the Heart of White Rats, 923
Vogel, Prof. Henry J. : Lysine Synthesis and Phylogeny of Lower Fungi—some Chytrids versus *Hyphochytrium*, 1026
Vohra, K. G., and Bhatnagar, V. S. : Observations of Fall-out in India during the Period of Cessation of Nuclear Tests, 286
Volatile Anaesthetics in Tissues : Estimation of, by Gas Chromatography (Dr. R. A. Butler and Dr. D. W. Hill), 488
von Kármán, Prof. Theodore : Awarded the 1961 James Watt International Medal of the Institution of Mechanical Engineers, 361
von der Decken, Dr. Alexandra : A Simple Paper Chromatographic Method for Determination of Amino-Acid Activation Profiles in Tissue Preparations, 145
Vos, G. H., and Kirk, Dr. R. L. : Di^a, Js^a and V Blood Groups in South and South-East Asia, 321
Vratny, Dr. Frederick : Interactions of NO_2–N_2O_4 and Niobium Dioxide (NbO_2), 479

EDUCATING THE WHOLE MAN

IN his address as 'special visitor' at the commemoration day ceremonies of the Imperial College of Science and Technology, Sir Cyril Hinshelwood once again affirmed his disbelief in the 'two cultures'. He thinks instead that there are simply two attitudes, and that it is the business of universities to encourage the right attitude. Addressing more particularly the younger part of his audience, he proceeded to outline constructively what he meant by the right attitude and how it could be developed.

It is interesting to set Sir Cyril's address beside Sir Mark Oliphant's Frank Tate Memorial Lecture on science and ethics recently delivered at the University of Melbourne and published in the quarterly *Overland*. Sir Mark began by referring to Sir Charles Snow's Rede Lecture, and while he himself is disposed to admit the existence of a gulf between two cultures, he was no less forthright than Sir Cyril in condemning the educational methods that are responsible for perpetuating such a gulf between the scientific disciplines and the humanities. In Australia, there are, Sir Mark said, continual and confused complaints of falling standards in the teaching of science in schools, due to the difficulty in obtaining the services of good science masters ; and the catastrophic result, he said, of the determination of Asian nations to become technologically industrialized in the minimum of time is apparent to all who have examined the schools and universities in those countries. The educational processes through which men pass, from the kindergarten to the university, deliberately preserve the schism in Western culture, and it often seemed to Sir Mark that there is a conspiracy among educationists to create and widen a gap between the two aspects of our culture.

Sir Mark Oliphant thinks that, unfortunately, those who strive most assiduously to make this chasm unbridgeable are the humanists, who continue to fight a rearguard action against science instead of endeavouring to change it into a full and satisfying part of cultural education, such as Sir Cyril Hinshelwood and Sir Eric Ashby, for example, have claimed that it can be. Scientists, on the other hand, Sir Mark believes, are largely either indifferent towards the humanities or are openly contemptuous of what they regard as the imprecision, the paucity of new ideas, and the accumulation and regurgitation of information. In consequence, for example, the philosopher may ignore the great wealth of precisely recorded experience which is science, while those in the faculties of science, technology and medicine are denied the questioning of the basis of their system of natural knowledge which a study of philosophy can contribute.

Sir Mark recognizes the grave threats to the continued existence of mankind which have come from scientific and technological advance ; but though he points out that most of our beliefs and the attitudes which arise from them will not stand up to careful or inspired analysis, and that a completely rational world is neither a possibility nor a desirable state of affairs, he does not, like Prof. C. A. Coulson in his Beckley Lecture, pursue this to its conclusion. Nevertheless, like Prof. Coulson, he recognizes that only through education can we hope to convey to every man some understanding of science and the way it advances, so that he has some idea of the forces which shape his life and his destiny ; and, again like Prof. Coulson, he comes down emphatically in support of making science as much a part of universal education as history or English, so that pupils accept the necessity of knowing something of the structure of the universe as readily as they accept the need for some knowledge of the geography of the world. With proper understanding of this greatest single problem in teaching and the boldness to tackle it experimentally, in whatever ways seem promising, Sir Mark believes the chasm between our two cultures could disappear in a single generation.

Here accordingly, though he began by seeking a rapid bridge of the gap, Sir Mark's thought approaches that of Sir Cyril Hinshelwood, and he believes, too, that science can, and should, be taught in such a way that even those who follow primarily totally different courses have enough knowledge to be sensible about, and sensitive to, the needs of the rapidly changing world in which they live. He does not, however, believe that education about science and the scientific point of view for the ordinary man and woman can be the same as education in science for the budding man of science, but that a totally different approach is required ; and though he makes some important suggestions, on the whole his analysis is scarcely as penetrating as that of Sir Cyril Hinshelwood or Prof. Coulson. If science is to be taught as a general cultural subject in primary and secondary schools, knowledge of Nature, he urges, must be presented as a unity, and it is essential to preserve to the full the questioning, eager approach to the world which is natural in children, making it the very bedrock of the inquiry into Nature which a course in science should be. Every statement of fact should be justified by the evidence, and the real significance of the 'laws' of science, as reasonable approximations, to be discarded as better concepts are born, must be woven into all discussion of them.

Sir Mark points out, too, how science, taught in this way, displaying the contributions which all nations have made to the advancement of science, can help to dispel some of the illusions which feed nationalism : the idea that no knowledge can be secret, but that it only becomes knowledge when shared with and tested by others, is a lesson to be learnt as early as possible. Attacking the illusion that science is a second-rate discipline, he observes very pertinently that the number of scientists is now great enough for them to form a general cross-section of the community, and that among them accordingly will be found the same fraction with the ability to lead, in industry or in government, as among those whose specialized knowledge is in law, history, the classics, economics or commerce. Perhaps a larger proportion of scientists is seriously concerned for the present well-being and the future of mankind, because they appreciate more clearly the realities of nuclear warfare, the nature of the population explosion which threatens our standards of living, and the subtle dangers of man's continuing interference with Nature.

It is essential that man should face up to all the grave responsibilities involved now that the biological future is in his hands, with the increasing effects of the extremely rapid development of ideas and knowledge on the evolution of his social systems, his problems of education and his religion. Sir Mark agrees with Anatol Rapoport that there exist in science ethical principles which are inherent in its pursuit and that there is something universally satisfying about the scientific point of view, particularly as it affects man's relation to his environment. The keystone of science is the pursuit of truth, and Sir Mark maintains in conclusion that the pursuit of knowledge is in no way incompatible with the preservation of human dignity, of the eternal values of art and literature, or with the ethical principles which must govern men's lives. Indeed, science has positive contributions to make to all human activities, and can uphold the basis of value judgments at a time when the religious authority for these is disintegrating.

That last proposition may be debatable, but nevertheless in his conclusion Sir Mark comes very close to both Sir Cyril Hinshelwood and Prof. Coulson, particularly when he pleads for re-thinking the whole basis of education, so that science and its relations with man may permeate the whole fabric of teaching and thus, as sufficient understanding of science and knowledge of its content becomes a natural part of the preparation of every man and woman for life, repair the rift existing between science and other forms of human culture. In his address at the Imperial College of Science and Technology, however, Sir Cyril Hinshelwood laid much less stress on formal teaching, though he agreed that there might be an optimum arrangement of the formal syllabus. The really essential thing is that what is studied at the university should become part of life and should be handled in such a way as to achieve this. The formal teaching, he said, is only a small part of what a university provides, and if the tone and atmosphere of a university are right, general reading, discussion, conversation and argument provide a good deal of the breadth which, as well as depth, is desirable in the educated man. In developing his argument that besides depth, or intensity of experience and technical proficiency, the educated man should seek first of all a broad vision of how his own subject fits into the scheme of things—and that the varied ways in which the painter, the historian, the biologist or the physicist looks at the world, all represent attempts to come to grips with the reality about us—Sir Cyril, by implication, refuted much that Dr. A. P. Rowe advocated about practices and changes in British universities in a recent broadcast talk, "Dry Rot and Redbrick", and which he has also expanded in an article, "The Problem of Freedom and Efficiency in Universities" in *Science and Freedom* for October. Sir Cyril was concerned quite clearly with the average student, not just with the *élite*, and with the teaching which should be given them; and though there is substance in the charges that there is too little scholarship, much trivial research and much waste of public money, Sir Cyril was not concerned directly with these questions. He was concerned that the student should receive a worthy education, and his conception of university teaching is the antithesis of Dr. Rowe's rejection of any idea of a broad education and his suggestion that research should be relegated to research institutes.

Sir Cyril Hinshelwood's reasoned exposition of his conception of the humane or liberal approach deserves careful study. He is convinced that while subjects will wax and wane in importance, and methods be introduced and superseded, there will always be the need to find some satisfaction and understanding in a broad view of the world, and in acquiring the expert skill by which somewhere the student can in due course make an effective contribution. Moreover, it is because he sees the relation of student and teacher in a university as one of partnership, of a guide, rather than oracle, that he maintains teaching and research must remain closely interlinked. In research new knowledge comes into being, and academic studies become part of real life. Work in the laboratory, he observed, with its hopes and disappointments, its difficult decisions when to continue and when to cut losses, its subtle dependence on human relations, is an education in life which the arts scarcely parallel. Finally, he rejected explicitly the idea that research should be concentrated in central institutes devoted solely to that end as likely to imperil the creative attitude, the sense of responsibility and involvement which are developed in the right university atmosphere.

Developing this theme, Sir Cyril pointed out that what we study, whether literature or science, is not part of life and is therefore not humane. How we study is part of life and therefore is humane, and he argued further that the right attitude to all affairs is fostered by the practice of the right approach to our subjects of study. The strenuous effort to see a subject in its true and wide perspective cultivates sanity of judgment in much broader fields. Independent thought, critical assessment of supposed authorities, and sharing of responsibility with our teachers for the views we adopt, engender a healthy mistrust of political pundits and foster the spirit of resistance to the endless petty tyrannies which beset modern life. In words which are echoed in the lectures by Sir Mark Oliphant and Prof. Coulson, Sir Cyril suggests that the need in science to reach one's ends by exacting and precise techniques, whether mathematical or experimental, is a great corrective of the tendency to airy generalization, which is another weakness of the modern world; also that the independent, constructive and, in however modest a degree, creative approach to a subject is the best guarantee that those who have passed through a great scientific school will contribute their full share to the direction and inspiration of industry and public life.

While, therefore, Sir Cyril clearly does not accept much of Dr. Rowe's argument about research and teaching, his address is not a defence of either trivial research or inferior teaching. Rather he calls for teaching of the highest quality, as well as for much independent and critical thinking about methods as well as the content of courses. It may well be that some administrative changes will be needed before ideas such as those outlined by Sir Cyril Hinshelwood and Sir Mark Oliphant are acceptable; further, some changes in the relations between the universities and the schools will be necessary. The changes, however, are not of the kind which Dr. Rowe suggests, and will require much more constructive thought before their shape can be determined. This is one further subject to which attention will no doubt be given when the promised inquiry into higher education is launched; meanwhile, Sir Cyril Hinshelwood and Sir Mark Oliphant have indicated some lines for further thinking and inquiry as well as for profitable experiment.

PAULING'S CHEMICAL BOND

The Nature of the Chemical Bond and the Structure of Molecules and Crystals

An Introduction to Modern Structural Chemistry. By Prof. Linus Pauling. Third edition. (The George Fisher Baker Non-resident Lectureship in Chemistry at Cornell University.) Pp. xx+644. (Ithaca, New York: Cornell University Press; London: Oxford University Press, 1960.) 60*s.* net.

WHEN the first edition of this book was published in 1939 it was immediately recognized as a classic: for many chemists it became a sort of professional bible. I recall clearly my own sense of breathless astonishment at the scale, the self-confidence, the brilliance and certainty of the author's ideas. For the first time the theory of the chemical bond became a unified and homogeneous, sustained theme. Prof. Pauling rightly received his Nobel Prize for being so largely responsible for this.

Now the third edition is in our hands. It is larger, though many of the older pages survive with little alteration. Inevitably some changes were needed in such matters as bond-energies and bond-lengths, to allow for better experimental information now available. But the author has added new material, notably on his order-length relation for resonating bonds, on his theory of metals (here he has carried almost alone the weight of battle against the physicists), and on the new and interesting electron-deficient compounds (of which the bridged molecule of diborane is the simplest example). We should be grateful for all this, particularly in the discussion of metallic bonding and the metallic radii of atoms. Some of us may even be tempted to smile quietly at the new pages devoted to the defence of resonance as being no more 'idealistic' than any other theory of chemical bonding. This is a barbed shaft, aimed in a particular direction; and it hits its mark.

There is no doubt but that this new edition will carry the influence of Linus Pauling a stage further. Yet it is impossible—after twenty-two years use of the earlier edition—not to recognize that the book's very success is a pointer to at least one present weakness. For in order to achieve so wonderful a unification of chemistry, Prof. Pauling was almost forced to adopt just one line of description. This is the description first introduced by Heitler and London in 1927, and extended (very largely) by Pauling himself. We call it the familiar valence-bond, or electron-pair, theory. But what he has not done is to provide a really good critique of this theory, or any sufficiently generous reference to the theory's chief rival, the molecular-orbital theory of Hund, Mulliken and Lennard-Jones.

Let me illustrate both of these points. In the first place, very few people who read the pages here devoted to the relation between the dipole moment of a diatomic molecule and the description of its electronic structure in terms of covalent-ionic resonance will gain any idea of the extreme delicacy which attends any calculation or interpretation of molecular dipole moments. An example of the second criticism occurs in the discussion of the new molecular 'sandwich' molecules such as ferrocene. If the valence bond method is adopted, there are no less than 560 structures to be considered. In nickelocene there are 4,100. Pauling starts his account of this latter compound: "With the assumption that the 4,100 structures have equal weight. . .". Some reference really ought to have been made to the fact that in systems like this, and in a large part of the chemistry of inorganic complexes, the molecular-orbital description is vastly simpler, devoid of sweeping assumptions and easier to visualize. There will be many others as well as myself who regret that ligand field theory is dismissed in just over one page.

Yet these limitations in the book are almost inevitable if the author's theme is to remain as grand and monolithic as the structure of the book demands. If the reader can be kept occasionally reminded that there are alternative ways of thinking about the nature of the chemical bond, he can turn to this new "Nature of the Chemical Bond" and experience all the exhilaration and thrill that come from being in the presence of a master of the art of exposition, a man with an immense knowledge of chemistry and passion for it; and whose influence will remain for so long as wave-mechanical ideas continue to provide our best tool for getting to the heart of the structure of molecules and crystals. C. A. COULSON

LEUKÆMIA

Leukæmia

Research and Clinical Practice. By F. G. J. Hayhoe. Pp. viii+335+28 plates. (London: J. and A. Churchill, Ltd., 1960.) 80*s.* net.

DR. HAYHOE is to be congratulated. His review of one of the widest and most varied fields of practical and experimental medicine is not only remarkably comprehensive but also readable. Each chapter covers a logically delineated region. Difficult questions are not avoided, but a reader fairly new to the subject will not feel choked by incompatible observations or rival theories. Even when discussing subjects to which he has made important original contributions, such as the cytochemistry of the leukæmic cell, Dr. Hayhoe has maintained a critical detachment. The chapter on this subject is one of the most valuable in the book.

There are many other excellent chapters. Outstanding are the critical reviews (Chapter 3) of existing statistical evidence for an increase in incidence of leukæmia in recent years, and for differences in incidence between different countries and races, and the clear account (Chapter 7) of the confusing subject of antigenicity and immunology of the leukæmic cell.

Dr. Hayhoe has surveyed the literature issued up to about the end of 1958. In some fields advances since then have been far-reaching, and I think he would probably modify one or two of his statements to-day. For example, he regards the question whether those conditions variously known as 'homologous', 'runt', and 'wasting' disease are due to a graft-antihost or a host-antigraft reaction as still open (pp. 52-54, and 153). Recent evidence (summarized, for example, in an article by Kaplan and Smithers[1]) leaves little doubt that they are caused by the former.

The statement on p. 61 that "In all this work on leukæmia transmission by filterable agents the type of leukæmia involved has been lymphocytic" is based, I think, on a misconception of the nature of the tumour-filtrate-induced leukæmia of Graffi[2]. Dr. Hayhoe refers to it (p. 60) as lymphocytic, but Graffi and his colleagues describe it as a chloroleukæmia of myeloid type, and others who have examined his material agree. The other possible exception to Dr. Hayhoe's rule, the condition described by Friend[3], is a doubtful case: it is now considered to be of mixed origin[4].

An interesting recent development in this field is reported by Gross[5]. He has observed the induction of myeloid leukæmia, by a filterable agent which usually produces lymphoid leukæmia, in mice protected against the latter disease by thymectomy. It is now clear that leukæmias of myeloid, lymphatic, and perhaps other types may all be transmissible by cell-free agents.

The question of the relation between the so-called 'polyoma' agent (which produces both sarcomata and carcinomata in various organs of mice and other animals inoculated soon after birth) and the leukæmogenic agent, with which it is often associated, has also been considerably clarified since the book was written. The former is a typical virus, producing cytopathic effects in tissue culture, and agglutinating red cells, and differs in many ways from the latter, which is so far recognizable with certainty only by its leukæmogenic effects. As might be expected in such a fertile field of research, other important advances have been made since Dr. Hayhoe closed his survey. For example, analysis of the role of the thymus in filterable agent-induced leukæmia[6-8], and the isolation of a filterable leukæmogenic agent from X-ray-induced leukæmia[9,10] promise exciting future developments in our understanding of this dreaded disease. To these and other investigations Dr. Hayhoe has provided an excellent introduction.

The clinical sections of this book are concise and lucid, and his account of the depressing failures of therapy is relieved by painstaking evaluation of those measures which can reduce distress and occasionally prolong life. The beautiful plates, both coloured drawings and black-and-white photomicrographs, are well chosen, and the excellent plan is adopted of introducing the same plates in several groupings to illustrate different aspects of the conditions described.

The book will be found on the shelves of physicians and laboratory workers for many years to come, and one, at least, of the latter hopes that it will help each group to understand what the other is doing.

FORAGE CONSERVATION

The Conservation of Grass and Forage Crops

By Prof. Stephen J. Watson and Dr. Michael J. Nash. Second enlarged edition. Pp. xiv+758. (Edinburgh and London: Oliver and Boyd, Ltd., 1960.) 84*s*. net.

GRASSLAND and other forages grown for animal feeding provide the basis of livestock industries throughout the world and within most farming systems that involve livestock. Under British conditions, grassland herbage as grazed by the ruminant animal provides the cheapest and in many ways the best method of feeding cattle and sheep. However skilful the management of grass, conservation of the summer surplus will always be required to maintain animals during winter. Since 1940 the British farmer has learnt how to extend his annual grazing season, and this has coincided with a greatly increased level of animal production. Thus, although the winter feeding period is now considerably shorter than a quarter century ago, the need for conservation of grass and other forages is as important and as vital as ever it was. Indeed the need for preserving grass when its quality is at maximum was never more vital to our livestock husbandry systems.

It is therefore a most opportune time for the publication of this book by Prof. S. J. Watson and Dr. M. J. Nash. The new volume offers an enlarged and re-written edition of Prof. Watson's earlier edition published in 1939. Since that time the volume of additional work dealing with fodder conservation has been staggering; but this has served to confirm and to clarify many of the underlying principles of conservation which were broadly known two decades ago. In the earlier edition Prof. Watson had made what was perhaps the first widely embracing attempt to review the experimental work of pre-war days; now he and his collaborator have skilfully collated the work on fodder conservation since that time. This second edition is an authoritative compilation of a massive amount of experimental and practical evidence from all over the world. As such it is bound to be accepted as a book of reference and is likely to remain a classic for a very long time to come.

The traditional methods of fodder conservation as hay or silage have notorious defects: the unreliability of hay in most climates and the serious loss of nutrients normal to both hay and silage as conserved to-day. There has been much controversy as to the relative merits of hay and silage; the authors point out that hay and silage are not competitive but are complementary foodstuffs. The staggering feature which every practical farmer as well as technician should note and ponder on is the huge loss of nutrients that takes place annually during the processes of fodder conservation. The authors show that losses of starch equivalent normal in haymaking under reasonably good conditions are on average as high as 42 per cent; this level is only reduced to 35 per cent by barn drying and the use of other modern techniques.

The losses in silage-making are also high; for example, the summary of data from a large number of experiments shows that while losses in dry matter may be no more than one-sixth, the loss in starch equivalent is more than one-fourth while the losses in digestible true protein exceed one-half. These data are from experimental records; one may properly surmise that the losses encountered during silage preservation on the average farm are greatly in excess of the figures quoted from carefully conducted experiments. The most striking feature in most of our conservation practices is the astounding loss of nutrients which appears to occur. This fact surely adds emphasis to the plea made by the authors (in their preface) for a more complete study than hitherto of the fundamental chemical and biological changes which occur during the process of fodder conservation.

The book is well produced and well edited. The subject index is reasonably adequate and there is a most valuable index of authors occupying some fifty pages towards the end of the book. This is a book of reference which should find a place in every library as well as on the private bookshelf of all those interested in feeding farm animals.

William Davies

SPACE SCIENCE

Introduction to Space

By Dr. Lee A. DuBridge. Pp. xii+93. (New York: Columbia University Press; London: Oxford University Press, 1960.) 20*s*. net.

THE George B. Pegram lectureship is awarded annually to an individual who has made outstanding contributions to modern society. The first recipient was Dr. L. A. DuBridge, president of the California Institute of Technology, who gave four lectures on space science, now published as a book.

The first lecture, entitled "Attaining a Space Orbit", consists of a brief history of American rocket development, followed by a discussion of the technological difficulties involved in placing a satellite in orbit. It includes a simple description of the basic parameters which characterize a selected orbit, and this lecture is perhaps the best of the four.

The second lecture discusses the value of satellites and rockets as observing stations, together with the problems encountered in conveying the results of the observations back to the ground. The author remarks on the difficulty of recovering packages from satellites and suggests we should let future generations struggle with the problem, a pessimism confounded by events shortly after the book was sent to press. The lecture contains a rapid survey of phenomena occurring in space which satellite observations should help to clarify, but it is little more than a catalogue, too superficial for the scientist and too technical for the non-scientist.

The last two lectures are devoted to, respectively, the solar system and the universe, each taking about twenty pages. The lecture on the solar system lists some facts about the Moon and the planets (though Saturn is dismissed with the remark that it will bear a closer look) and mentions some of the problems associated with landing on the Moon, Mars and Venus. The lecture on the universe is more interesting, and the author succeeds in compressing a large amount of material into a few pages without lapsing into unintelligibility.

The book is intended to provide a broad picture for the non-scientist of the use of rockets and satellites in adding to our understanding of the physics of space. As such it is successful within the limitations imposed by its length of ninety pages, and it can be recommended to all those prepared to tolerate occasional maltreatment of the English language. The book contains some good photographs of the major planets.

A. Dalgarno

THE REAL MATTER OF NUCLEAR ENERGY

Metallurgy and Fuels

Vol. 2. Edited by H. M. Finniston and J. P. Howe. (Progress in Nuclear Energy, Series 5). Pp. ix+653. (London and New York: Pergamon Press, 1959.) 147*s*. net.

ANY attempt to collect into one source and to review a large part of the flood of publications on nuclear energy must now arouse gratitude, and unless it is very badly done it must be valuable to workers now overwhelmed by the enormous amount of literature on this subject. "Progress in Nuclear Energy" is a series, now well established, of reviews in volumes each covering a particular field. Volume 2 of "Metallurgy and Fuels" surveys in forty-one chapters work done between the first International Conference on the Peaceful Uses of Atomic Energy at Geneva in 1955 and the end of 1957, on basic materials of nuclear energy and on problems in physical metallurgy arising in the field. Materials considered are uranium, thorium, magnesium and its alloys, plutonium, zirconium, beryllium, control materials, and uranium and thorium oxides. Work on several types of fuel-element is reported. Subjects in physical metallurgy include constitutional work on alloys of nuclear fuel metals; transformation kinetics in uranium alloys and effects of irradiation on matter.

The standard of the reviews in this large volume of 631 pages is generally very high, although one or two fall rather far below the others and the value of publishing these may be doubted. They vary very much in length, in the breadth of field covered and in the detail of reporting: it is not clear whether there was editorial policy on this last point, or whether it was left to authors to choose how each would handle his subject. Weber reviews recent progress in the fabrication and application of dispersion fuel-elements in a long (62 pages) and very well-documented paper, the value and importance of which is at once made clear by the list of 82 publications considered. Grainger covers the important work on elements for gas-cooled reactors with authority in a short but very informative and careful chapter. Typical of shorter chapters on very specialized subjects are Corzine's three-page report on the induction melting of thorium and the chapter by Antill, Butler and Barnes on the electrolytic purification of uranium : each of these appears to be based on only one or two publications and also on material not previously published. The wisdom of publishing material for the first time, if indeed this is occurring, would seem to be open to question. Kroll's statement on the production of uranium billets in Belgium from African ore is interesting, but appears without any references to reports containing details of the work he presents so tersely.

Three very useful chapters present in a non-critical way alloy constitutional diagrams of systems containing plutonium, uranium or thorium. Other reviews tend clearly to present the author's opinion on matters not yet settled. This is, perhaps, inevitable and to those who know the authors it may be valuable, but it might be helpful to have editorial guidance as to the policy followed in some cases.

Work in some of the fields reviewed has been continued. The Second International Conference on the Peaceful Uses of Atomic Energy in 1958 led to the publication of an enormous amount of work on nuclear materials which, it is promised, will be reported in another volume in this "Progress in Nuclear Energy" series. It is indeed valuable that the volume under review collects in one book the scattered information available just before so much new material was published as one event.

It is a pity that the price of this volume (£7 7*s.*) is high enough to discourage many workers in the field from buying their own copies. In a collection of quick surveys of the position in parts of the field this might not be very important, but many authoritative parts of this book would be valuable for frequent reference.

It is to be hoped that further volumes in this series on "Metallurgy and Fuels" will appear regularly and that the high standard of the present volume will be maintained.

G. A. Geach

CONGESTION IN TELEPHONE SYSTEMS

Introduction to Congestion Theory in Telephone Systems

By R. Syski. Chapter 2 by N. H. G. Morris. Pp. xvi + 742 + 14 plates. (Edinburgh and London: Oliver and Boyd, Ltd., 1960. Published for Automatic Telephone and Electric Company Limited.) 105*s.* net.

Most engineers and many mathematicians remember with respect the book, "Probability and its Engineering Uses", by T. C. Fry, published in 1928. This pioneering text paved the way for a wide appreciation, in the practical world of technology, of the concepts of mathematical probability and its applications. Now, after thirty years, a worthy successor to Fry's book has appeared. It will undoubtedly become the standard reference for telephone engineers who have occasion to study congestion in the treatment of design problems. But it will become more than this. The book by Mr. Syski, while it contains several chapters dealing specifically with telephone matters, is the first really comprehensive account in book form of the theory of queueing. It is a well-integrated text and includes an account of practically all the ideas which have proved capable of mathematical development in this field during recent decades. Thus, it is likely to become something of a standard work on queueing theory for teachers and students in the field of operations research and, more generally, in institutions where the applied mathematics courses include the topics of probability and stochastic processes.

After an introductory chapter, and one discussing the constructional details of telephone systems, there is a chapter of about fifty pages on probability theory. The latter is well written and may be properly understood by mathematicians. But there seems to be some doubt as to whether the telephone engineer will make much of the rather abstract mathematical formulation. Sample spaces and an introduction to operations with sets may be all right. But the introduction of measure and of Borel spaces will probably prove to be difficult for the engineer unless he has pursued mathematics to an unusual degree. There are nice accounts of random variables, distribution functions and conditional probability, and a feature of the exposition is the wealth of illustrative examples. The account of stochastic processes again seems rather 'highbrow' for the engineer.

The next two chapters are concerned with traffic characteristics and loss systems. Included are introductions to renewal processes generally, and the birth and death process. Waiting systems are treated in a chapter of about one hundred pages and both single- and many- channel systems are studied. These include the systems $M/M/r$, $M/D/r$, $M/G/r$, $GI/M/r$ and $GI/G/r$. Congestion in systems with limited availability is studied in the next chapter, and then there is a chapter on link systems. Some of the most interesting results of recent research are discussed in the chapter on special systems. These results relate to the busy periods, various forms of priority and servicing, early departures, finite queues and queues in series, and to special problems such as the clustering effect, intensity fluctuations, and hunting problems. This chapter should be of special interest to the student starting on research in the theory of queueing. The last chapter deals with some problems special to telephone exchanges.

It is interesting to compare the flavour or atmosphere of this book with that of the earlier book by Fry. Both are heavily mathematical. But the remarkable difference is in the degree of abstraction. Syski has certainly demonstrated that what is called 'abstraction' in mathematics has invaded parts of the subject which are of the greatest application. There is no justification for pursuing mathematical abstraction for its own sake. But, on the other hand, this feature of modern mathematics has become an essential part of the tools needed in various applied fields. We cannot avoid it ; and, one corollary appears to be the necessity for training engineers to a higher level of abstraction than traditional courses contemplate.

L. S. Goddard

The Popular Handbook of Rarer British Birds

By P. A. D. Hollom. Pp. xiv+133+40 plates. (London: H. F. and G. Witherby, Ltd., 1960.) 37*s.* 6*d.*

THIS useful book supplements the "Popular Handbook of British Birds" (1952), edited by Mr. P. A. D. Hollom, which excluded species that had been recorded in the British Isles on less than a dozen occasions. Both works are based on the five volumes of the authoritative "Handbook of British Birds" (1938-41) by H. F. Witherby and others, and although much detail is necessarily omitted they include information of more recent date. The latter feature is especially noticeable in this instance, as accounts and illustrations are given of some thirty species which were not included in the original work at all, having been added to the British list in the intervening two decades.

Many of the new birds are vagrants from America, others from Asia or from southern Europe. Some of them represent groups which found no place in earlier books on British birds—frigate-birds, vireos, New World warblers, New World orioles, tanagers and American sparrows. Several of the newcomers have already been reported more than once, and there are further records of others previously on the list, thanks to the activity of our coastal bird-observatories and the expertise of our field workers. Many of the species are thus likely to come to notice again, and a hand-book covering this aspect of British ornithology is very welcome. The information given for each species is in convenient form, covering identification in some detail and with briefer notes on habits, British occurrences and general distribution. The colour plates not available from the original work are by D. M. Reid-Henry and Peter Scott. LANDSBOROUGH THOMSON

Elementary Titrimetric Analysis

By Dr. A. M. G. Macdonald. Pp. viii+133. (London: Butterworths Scientific Publications, 1960.) 12*s.* 6*d.*

THIS book deals exclusively with titrimetric procedures, and although it has been written primarily for students in schools and junior technical colleges, it also deals in an informative manner with the application of redox titrations and the use of complexanes in titrimetry, and these chapters would be well worth the attention of somewhat more advanced students.

The chemical purist might quarrel with Dr. Macdonald's definition of the gram equivalent weight of the acid as the weight which "furnishes one gram of hydrogen ion", and might prefer the more exact definition which would relate to '1·008 gm. of hydrogen ion'. Indeed, the 1957 "Table of Atomic Weights" given at the end of the book quotes atomic weights to three decimal places, and the student might often ponder as to why the gram equivalent weight of sulphuric acid is given as 49 and not as 49·041.

The reviewer also feels that some chapters could have been presented in a clearer manner to the student if diagrammatic illustrations were used; for example, in the chapter on oxidation potentials, a sketch of a redox electrode with salt bridge to a calomel electrode would have been most informative.

These points are, however, minor criticisms, for the book is well balanced and introduces the student gradually to the more difficult exercises of volumetric quantitative analysis. The general descriptions of indicator applications, hydrogen ion concentration, etc., are considered to be completely adequate for the average student, and the theoretical implications have been clearly and concisely described.

In this context the book will prove valuable not only to the student, but also to the teacher of chemistry who has to present the subject of titrimetric analysis to his classes in a manner which makes the theoretical implications easily comprehensible, and the practical exercises suggested are well balanced and cover a wide and useful range of analytical procedures. D. T. LEWIS

Life's Long Journey

By Kenneth Walker. Pp. 191. (London: Victor Gollancz, Ltd., 1960.) 21*s.* net.

THE aim of Dr. Kenneth Walker's latest book is to show that mechanistic views of life are long outdated, and that the universe is essentially spiritual in essence. To arrive at his ultimate conclusion that "it is to religion . . . that man will have to turn for help if he is to evolve any further", Walker roundly assails all neo-Darwinians as well as those who condition our minds by too much science.

The book is unsatisfactory in many respects. Few people will accept Walker's disarming prefatory note that his amateur acqaintance with biology makes him in some way more fitted to interpret its main hypothesis than those who have studied more deeply. His interpretations of Darwin's theory of natural selection do not always represent the views of the progenitor. Dogmatic reiteration of the purposefulness of life does not necessarily make life more purposeful, and is scarcely in keeping with a scientific mode of thinking. The mystical references to Eastern religions as sources of revelation to those to whom the mysteries are vouchsafed are unlikely to console those who profess Western faiths, and who read that "we live in a post-Christian age and an age in which economic man has been allowed to usurp the rights of the whole man". Walker's wish was that this book would help many to look again at the meaning of life; it is unfortunate that its appeal will, for the most, be to those whose minds are already made up. T. H. HAWKINS

The Lichen Flora of the United States

By Bruce Fink. Second printing. Pp. xii+426+47 plates. (Ann Arbor: University of Michigan Press; London: Angus and Robertson, Ltd., 1960.) 12.50 dollars; 50*s.*

THIS is an exact copy of the original edition published in 1935, even to such obvious errors as the transposition of captions on Plate 42. Unfortunately, the erratum slip issued with the former volume has not been reproduced. It seems a pity the opportunity was not taken to rewrite the accounts of such genera as have been revised in North America during the past quarter century, but to do so would doubtless have led to a somewhat uneven treatment of the flora as a whole. Naturalists in the United States will be glad to have this convenient basic summary of their lichen flora once more available. R. W. G. DENNIS

CALENDAR OF CENTENARIES, 1961

JANUARY

4 *Hales, Stephen* (1677–1761), English clergyman who carried out fundamental researches in plant and animal physiology and was awarded the Copley Medal of the Royal Society in 1739.

8 *Clegg, Samuel* (1781–1861), English gas engineer, pioneer in gas lighting.

12 *Baldwin, James Mark* (1861–1934), American philosopher and psychologist.

17 *Hall, Sir James* (1761–1832), Scottish geologist who carried out laboratory experiments to investigate and illustrate geological phenomena.

18 *Goldschmidt, Hans* (1861–1923), German chemist whose name is associated with the thermit process for the reduction of metallic oxides.

22 *Bacon, Francis* (1561–1626), English philosopher whose works include the "New Atlantis" in which is described a model college for the experimental study of Nature.

22 *Tiedemann, Friedrich* (1781–1861), German physiologist and anatomist.

FEBRUARY

15 *Whitehead, Alfred North* (1861–1947), English mathematician and philosopher.

15 *Guillaume, Charles Edouard* (1861–1938), Swiss physicist, awarded the Nobel Prize for Physics in 1920 for his work on nickel–steel alloys.

24 *Santorio, Santorio* (1561–1636), Italian physician and physiologist, author of the medical classic, "Ars de Statica Medicina" (1614).

APRIL

6 *Giesecke, Karl Ludwig* (1761–1833), German mineralogist who travelled extensively in Greenland and located the unique occurrence of cryolite there.

8 *Peurbach, Georg* (1423–61), professor of astronomy in Vienna who revived observational astronomy in western Europe.

MAY

3 *Vallisnieri, Antonio* (1661–1730), Italian physician and naturalist who made valuable observations on fossils and the origin of springs.

13 *Fitton, William Henry* (1780–1861), Irish physician and geologist, author of an important memoir on the strata below the Chalk in south-east England.

14 *Simpson, Thomas* (1710–61), English mathematician, author of a number of mathematical books.

16 *Henslow, John Stevens* (1796–1861), professor first of mineralogy, then of botany, at Cambridge, who nominated Charles Darwin as naturalist for the voyage of the *Beagle*.

JUNE

7 *Rennie, John* (1761–1821), Scottish civil engineer, constructor of canals, bridges and harbours.

18 *Hodgkinson, Eaton* (1789–1861), English civil engineer, noted for his researches on the strength of materials.

24 *Gregory, David* (1661–1708), Scottish mathematician, who, as professor of mathematics in Edinburgh, gave the first public lectures on the Newtonian theory.

29 *Mayo, William James* (1861–1939), American surgeon who, jointly with his father and brother, founded the Mayo Clinic, Rochester, Minnesota.

30 *Hopkins, Sir Frederick Gowland* (1861–1947), English biochemist who received (jointly with C. Eijkman) the Nobel Prize for Medicine and Physiology in 1920.

JULY

8 *Thomson, Sir John Arthur* (1861–1933), Scottish biologist, author of many technical and popular works.

AUGUST

8 *Bateson, William* (1861–1926), English biologist who carried out an extensive investigation of the laws of variation and heredity.

10 *Wright, Sir Almroth Edward* (1861–1947), English bacteriologist and pioneer of vaccine therapy.

SEPTEMBER

8 *Belidor, Bernard Forest de* (1693–1761), French military engineer, author of works on engineering and hydraulics.

17 *Bose, Georg Mathias* (1710–61), German natural philosopher who carried out many experiments with static electricity, some of which he described in a poem, "Die Elektricität" (1744).

19 (or 9) *Musschenbroek, Pieter van* (1692–1761), Dutch physicist who invented a pyrometer and who was concerned with the discovery of the Leyden jar.

24 *Pitiscus, Bartholomaeus* (1561–1613), German mathematician who prepared an early work on trigonometry.

OCTOBER

13 *Cubitt, Sir William* (1785–1861), English civil engineer, responsible for the construction of important docks and canals.

NOVEMBER

7 *Sherrington, Sir Charles Scott* (1861–1952), English physiologist, awarded the Nobel Prize for Medicine and Physiology in 1932 (jointly with E. D. Adrian) for researches on the nervous system.

30 *Dollond, John* (1706–61), English optician, who received the Copley Medal of the Royal Society for his work on achromatic lenses.

30 *Tennant, Smithson* (1761–1815), English chemist, discoverer of osmium and iridium.

DECEMBER

17 *Kennelly, Arthur Edwin* (1861–1939), American physicist who independently predicted the existence of the Heaviside layer.

24 *Pons, Jean Louis* (1761–1831), French astronomer who discovered more than thirty comets.

25 *Gregor, William* (1761–1817), English chemist and mineralogist, discoverer of titanium.

INTERNATIONAL GEOPHYSICAL CALENDAR FOR 1961

THE accompanying International Geophysical Calendar 1961 indicates some special days and intervals for special attention for geophysical experiments and analysis. It serves to encourage world-wide co-ordination of observation or analysis of those geophysical phenomena which vary significantly during the course of a year. These phenomena are mainly in the scientific disciplines dealing with the Earth's atmosphere. In some experiments, such as the routine measuring of variations of the Earth's magnetic field, the observing and analysis programmes at observatories are carried out at a uniform level throughout the year; in these cases the Calendar is not needed. However, in many other experiments (for example, rocket experiments), it is not practical or meaningful to carry out the same programme on each and every day. Here the Calendar can provide a useful mechanism for co-ordination. Experimenters will know that their colleagues in other laboratories and in other disciplines will tend also to carry out experiments on the days or intervals marked on the Calendar. In this way, results of experiments may be more easily and usefully compared.

In some scientific fields, international scientific organizations have made specific recommendations for programmes to be done on days or intervals marked on the Calendar. In others, the arrangements are informal or self-evident. Some examples are given below, along with the criteria for selection of dates.

Copies of the Calendar can be obtained from the Secretary-General, U.R.S.I., 7 Place Emile Danco, Brussels 18.

Regular World Days

These are three consecutive days each month. They always come in the middle or just after the middle of the month, and include where possible the times of equinox and solstice. They come in the middle of the week—Tuesday, Wednesday and Thursday. The groups of Regular World Days are evenly spaced through the year so far as it is practical. They include wherever possible days of solar eclipse and meteor showers. One Regular World Day each month (always Wednesday) is designated the Regular World Day of highest priority.

The Regular World Days are intended for experiments or observational programmes or analysis programmes which as a practical matter can be done only about 10 per cent of the time and should be spaced through the year. Further, it is suggested that whenever there are no special reasons for selecting some other days, the Regular World Days be used for unusual or special experiments. This applies perhaps particularly to scientific fields in atmospheric geophysics, including aspects of cosmic rays, meteorology, airglow, ionosphere, geomagnetism, aeronomy. Examples in ionospheric physics are: oblique incidence pulse transmission and reception; absorption measurements by pulse reflexion technique; extended observing schedule for whistlers and very low-frequency emissions; vertical-sounding observing schedule faster than normal; more detailed reduction of vertical-sounding ionograms by f-plot, h'-plot, etc.; hourly reduction from ionograms of F-region true height parameters hc and qc.

The Regular World Days with highest priority are for work which can be undertaken for only one day each month. All the foregoing examples apply if the rate of three days per month is not necessary or proves to be too heavy. A specific example is the recommended programme for 1959 and onwards of exchange of copies of original ionograms in ionospheric vertical sounding work, made by the International Scientific Radio Union–International Geophysical Year (URSI–AGI) Committee; this recommends that ionograms for the highest priority Regular World Day each month (and also one disturbed period each year) be sent to World Data Centres for interchange.

Regular World Intervals

These are ten consecutive days in each quarter year, selected to include the three Regular World Days of the month and also the times of the equinox or solstice. If possible, they include days of solar eclipses and meteor showers. The selectors have also tried to avoid week-end days and in addition holidays which are widely observed.

The Regular World Intervals are intended for experiments which for practical reasons cannot be carried on continuously, but for which statistics of seasonal variations are especially needed. Ionospheric drift and high-atmosphere wind measurements are two examples. Schedules for interchange of sample detailed data in several disciplines have made use of the Regular World Intervals. In some network observational programmes, both the Regular World Intervals and the Regular World Days are used, in order to get the variations throughout the year but with improved statistics at the equinoxes and solstices.

World Meteorological Intervals

The World Meteorological Intervals are ten consecutive days each quarter year, but displaced one month from the equinoxes and solstices. They are intended to cover the times of marked seasonal change in certain meteorological phenomena which tend to come about a month after the equinoxes and solstices. They have been chosen through the World Meteorological Organization and the Committee on Space Research of the International Council of Scientific Unions as the period from the 16th to the 25th of January, April, July and October, with January and October designated by the Committee on Space Research as the more important ones.

The World Meteorological Intervals now are primarily periods for carrying out synoptic meteorological rocket programmes, with stations obtaining atmospheric profiles up to 50 km. or more, at least once daily during the ten-day intervals. These Intervals have also been used during and since the International Geographical Year for balloon sounding programmes either with special instruments or launchings to unusually high balloon altitudes.

⑰ Regular World Day (RWD)

⑱ RWD with highest priority

$\underline{21}$ Day with unusual meteor shower activity

$\boxed{15}$ Day of solar eclipse

16 17 18 19... World Meteorological Interval (WMI)

14 15 16 17... Regular World Interval (RWI)

(12 13 14 15...) International Rocket Week (IRW)

Notes : (*) WMI in January and October considered most important

(†) Feb. 15, 1961 : RWD with highest priority

International Rocket Weeks

These have been chosen for 1961 by the Committee on Space Research as (1) February 12–18 and (2) July 16–22. The first includes the time of the total solar eclipse of February 15 and is intended for study of solar effects. The second was selected for study of (northern hemisphere) summer atmospheric structure.

The International Rocket Weeks provide two periods during the year when rocket studies of the atmosphere and of the Sun will be on as nearly a synoptic basis as is possible at this stage of the science and technology. More detailed recommendations by Working Group 2 of the Committee on Space Research (chairman, J. Bartels) appear in the *COSPAR Information Bulletin*.

Other Special Days

The 1961 Calendar marks the days of solar eclipses —February 15 (total) and August 11 (annular). Some special programmes may be expected to be carried out in appropriate parts of the world to study eclipse effects on the Earth's atmosphere. It is especially important that the record of solar activity during and near the times of eclipses be as full as possible. Many observatories interested in solar activity issue specially detailed reports of their observations on eclipse days to assist the interpretation of the geophysical efforts. Ionospheric stations generally increase their observing programmes on eclipse days even if the magnitude of eclipse at their position is small.

Also shown on the 1961 Calendar are days when the activity of meteor showers is unusually high. Geophysicists using meteor techniques often intensify their observing programmes on these days. Attention is also directed to these days in case ionization produced by meteors may account for unusual effects in other geophysical experiments.

Special Intervals not appearing on 1961 Calendar

The International Geophysical Calendar marks only those dates which can be selected a long time in advance, either by general agreement or, in the case of eclipses and meteor showers, by reliable long-term prediction. Periods of great magnetic, auroral and ionospheric disturbance are also of great geophysical interest and world-wide co-ordination of observation is clearly desirable. This is also done under the auspices of the International World Day Service, in close collaboration with the International Scientific Radio Union Central Committee on URSI-grams, in the programme for the immediate designation of 'Geophysical Alerts' and for selection on a current basis of Special World Intervals (SWI). Arrangements for receipt of such information by telegram or radio broadcast can be made, as may be practical, with one of the solar-geophysical Regional Warning Centres, the telegraphic addresses of which are: (Western Hemisphere) AGIWARN WASHINGTON (U.S.A.); (Western Pacific) AGI KOKUBUNJI (Japan); (Eurasia) NIZMIR MOSCOW (U.S.S.R.); (Western Europe) either IONOSPHARE DARMSTADT (GFR) or GENTELABO PARIS (France) or AGI NEDERHORSTDENBERG (Netherlands). The meteorological telecommunications network co-ordinated by the World Meteorological Organization carries such information once daily soon after 1600 U.T. Descriptions of the Geophysical Alerts and Special World Intervals plan can be obtained from these Centres or from the Secretary of the International World Day Service. Many geophysical stations increase their programmes or carry on special experiments during disturbed periods; the Geophysical Alert and Special World Intervals programme serves to co-ordinate this on a world-wide basis and is especially useful for stations not near the auroral zones, where the beginning of a major disturbance may not be immediately apparent from local observations.

The International World Day Service, in close collaboration with the Central Committee on URSI-grams, also fosters arrangements for prompt notification of major solar flare events which have important and sometimes long-lasting geophysical effects. These notifications are also done through the Regional Warning Centres.

Calendar Records

A summary record of significant solar and geophysical events is being prepared as a Calendar Record for the International Geophysical Year period and also for 1959. This work is now under the auspices of the International World Day Service. If these volumes prove to serve a useful purpose, similar Calendar Records may be compiled for 1960 and 1961.

The International World Day Service was established in 1958 by the International Council of Scientific Unions and is administered by the International Scientific Radio Union, 7 Place Emile Danco, Brussels 18, Belgium. Its Steering Committee consists of A. H. Shapley (International Scientific Radio Union), M. Nicolet (International Union of Geodesy and Geophysics), and J. F. Denisse (International Astronomical Union), with R. Coutrez (International Scientific Radio Union) as secretary. It obtains nominal support from the Federation of Astronomical and Geophysical Services of the International Council of Scientific Unions. Mr. Shapley, National Bureau of Standards, Boulder Laboratories, Boulder, Colorado, U.S.A., serves as spokesman for the International World Day Service and its correspondent to other groups of the International Council such as the International Committee of Geophysics and the Committee on Space Research.

The International Geophysical Calendar for 1961 has been drawn up by A. H. Shapley and J. V. Lincoln in consultation with the International Scientific Radio Union, the International Union of Geodesy and Geophysics and the International Astronomical Union, both directly and through the International Committee on Geophysics and the Committee on Space Research. Recommendations also have come from representatives of the World Meteorological Organization and from interested individual scientists. A similar Calendar was issued for 1960 along the lines of the calendars for the International Geophysical Year and the International Geophysical Co-operation 1959 issued under the auspices of the Special Committee of the International Council of Scientific Unions for the International Geophysical Year, and described in the International Geophysical Year Instruction Manual for World Days and Communications, *IGY Annals*, VII (Pergamon Press, 1959).

A. H. SHAPLEY

A NEW METHOD FOR DATING ANCIENT GLASS

By ROBERT H. BRILL and HARRISON P. HOOD

The Corning Museum of Glass, Corning Glass Center, Corning, New York

THE majority of glasses surviving from most historical periods have soda-lime-silica or potash-lime-silica compositions. Glasses with these compositions, similar to some in use to-day, are usually regarded as substances of considerable chemical durability in comparison with many other materials; that is, they are resistant to extensive chemical attack except under unusual or extremely corrosive conditions. Actually, however, even in rather mild chemical environments, glasses of this kind, particularly those having high soda or potash content, are subject to a slow chemical deterioration in the presence of water. The accumulated effect of this slow but persistent hydrolytic attack may be readily seen during a visit to any museum displaying a collection of archæological objects of glass which have been weathered because of burial in soil or exposure to the elements for long periods of time.

Weathering effects on glass appear most often in the form of crusts of decomposition products and show a remarkable variability in appearance resulting from variations in chemical composition and weathering conditions. A number of investigators[1–6], beginning with Brewster in 1863, have made microscope studies of these weathering crusts and have noted that in cross-section the crusts can often be resolved into fine laminar structures. The individual layers of these structures range in thickness from about 0·3μ to perhaps 15μ, and are responsible, through interference phenomena[3], for the striking and colourful iridescence so familiar in archæological specimens of glass.

Most of the work done to date has been largely phenomenological, but it has been suggested that the laminar structures are the result of a mechanism similar to that producing Liesegang rings[6,7]. An alternative explanation, however, may be deduced from the realization that the weathering crusts on archæological objects of glass have been formed over extended periods of time and that the appearance of minute individual layers might be a reflexion of some periodic or cyclical change which was imposed during the long time of exposure. For example, seasonal variations in temperature or alternating periods of rainy and dry seasons might be responsible for the lamination effects. Since such phenomena occur in yearly cycles, the exciting possibility arises of dating archæological specimens of glass with extreme accuracy simply by counting the number of individual layers comprising weathering crusts. This possibility is strengthened by our experiences with the leaching of borosilicate glasses involved in the production of 'Vycor' brand glass. When leaching is carried on under very carefully controlled constant conditions, perfectly clear non-laminar sections an inch in thickness are readily obtained. However, every small change in temperature or concentration of the bath during leaching records the event permanently with a discontinuity of refractive index in the leached specimen.

Table 1

Sample	Date based on archæological evidence	Excavation date	Layers counted	Date calculated for onset of weathering

In order to test this hypothesis of 'seasonal growth' and explore the dating possibilities, samples were taken from a number of glass objects which had been submerged or buried for known time-intervals. These samples were mounted in plastic, polished, and observed in cross-section under a microscope. The number of individual layers within complete weathering crusts was counted. Typical results are shown in Table 1.

The values reported in Table 1 are averages computed from several independent counts on replicate mountings along with estimated maximum and minimum values. By subtracting the number of layers counted from the known dates of excavation, dates were obtained representing the years when weathering started. The agreement of the dates calculated and those known from archæological evidence is indeed sufficient to substantiate that, for these samples at least, the decomposition proceeded according to a seasonal schedule.

It is reasonable, therefore, to assume that within the limitations to be mentioned below, it is possible to determine total times of exposure to weathering conditions for other glass objects by this counting technique. The results in Table 1 present a rather strong case for the applicability of the method to the Colonial glasses studied, and the date determined for the Sardis fragment leads one to believe that it should be useful for dating more ancient glasses as well. The precision of ± 10 years (at an estimated 90 per cent confidence-level) for a number of counts on duplicate mountings of this sample emphasizes the potential accuracy of the technique. The case is not quite so convincing, however, for the Nishapur samples, because they unfortunately cannot be as precisely dated by archæological evidence, and one is, therefore, not certain as to what accuracy has been achieved. There is a need for further work on samples of more ancient origin and such work is being continued at this laboratory.

Although the mechanism of the hydrolytic attack of glass has not been completely elucidated, it almost certainly involves a selective leaching of 'the more soluble ingredients', principally the alkali metal oxides, leaving a hydrated residue of high silica content. On the basis of the results of this investigation, it seems reasonable to postulate that any appreciable and prolonged variation in temperature or availability of water seems to be accompanied by an irreversible change in the structural state of the siliceous residue. This structural change apparently persists even after the original conditions are restored, thus forming a discrete individual layer. Since the layer formed is porous, water may diffuse through from the surroundings during the next 'active' cycle and renew the hydrolytic attack on the body of the remaining glass.

In short, the total extent of weathering must have a complicated dependence on composition, temperature, time and chemical factors such as pH ; but the number of individual fine layers appears to depend only on the number of extended temperature cycles or moist – dry cycles experienced, that is, on the number of years of exposure to the elements.

It is not the case, of course, that every sample of archæological glass can be dated satisfactorily by this method. To begin with, the weathering layer must have been preserved intact, a requirement which unfortunately is not met by the majority of fragments available for study. In addition, the conditions of burial must have contained a yearly cyclical factor such as those mentioned above, and the glass itself must be of a composition which confers relative instability towards hydrolytic attack. Among the many objects examined were pieces with crusts of such fragility that they could not be mounted and polished without damaging the laminar structure. This was especially noticeable in Roman glasses. However, with improved techniques of sample preparation, this method of dating may be extended to many more objects. More refined methods of manipulation should also reduce the errors inherent in the counting procedure, for it is on occasion difficult to distinguish individual layers. This is the major source of experimental difficulty encountered and accounts largely for the ranges of uncertainty included in the reported values.

It should be emphasized that this technique does not yield a date of manufacture or use, but rather a date at which the weathering process apparently started. To be useful as a dating technique, it must be further assumed that the weathering process started at the time of burial or submersion. Among the objects included in Table 1, one instance was found where this condition was not fully met. This sample, *J*–4, a fragment of window glass from Jamestown, showed a curious but not uncommon type of decomposition which did not proceed uniformly from the surface of the fragment, but rather proceeded sporadically from randomly located nuclei on the surface, forming cone-shaped intrusions into the body of the glass. These intrusions or 'plugs' have laminar structures which could be counted, but yielded different dates. It is quite evident that all these plugs did not start growing at the same time, but rather that various induction periods lapsed before growth started at some nuclei. The 'oldest' plug found indicated a starting date of 1669. It is most probable that this date represents a date of burial closely coinciding with the date the building was razed. An alternative interpretation might be that the 1669 date refers to a date when the glass was still incorporated as part of a window, thus being exposed to weathering conditions for some years before burial in the soil. Because of the archæological data, the first interpretation seems preferable, although the range of probable error around the 1669 date would make either position tenable.

Perhaps the most important aspect of this investigation is that this method may provide the archæologist with a simple and exceedingly accurate means for dating archæological sites where suitable fragments of glass are found.

Work will be continued at this laboratory on the refinement of experimental procedures for this method, the extension of the method to other archæological materials and on the extraction of climatological data from the layer patterns. When further data have been collected on additional ancient glass samples, the findings will be published in the *Journal of Glass Studies*.

We thank Mr. Paul N. Perrot and Dr. Axel von Saldern, director and curator of The Corning Museum of Glass, for their assistance and encouragement during the course of this work.

Description of Samples

The samples designated with the letter *J* in Table 1 were supplied by Mr. J. Paul Hudson, museum curator at Colonial National Historical Park, Jamestown, Virginia. His descriptions of the samples follow :

J–5. Base from English wine bottle, 1775–81 period. Found inside the hull of a British ship at the bottom of the York River, off shore from Yorktown, Virginia, in 1935. The ship was sunk during the siege of Yorktown in 1781. *J*–4. Small piece of window glass from the First State House at Jamestown, built about 1639, burned or razed about 1670. The fragment was found in damp soil in 1935. It had probably been buried in the soil about 1670. *J*–6. Neck fragment from an English wine bottle of the 1660–75 period. Unearthed in damp soil near a brick foundation of a Jamestown house, 1650–75 period. It appears that the fragment had been buried in the soil from about 1675 until 1935. *J*–2. Neck fragment from a Dutch gin or spirit bottle of the 1600–40 period. Found in water in a Jamestown well in 1956, in association with artefacts of the 1600–40 period.

Pl–1 is a fragment of a small medicine bottle of the sort in common use during the seventeenth century. It was uncovered during the excavation of the site of the Joseph Howland House at Rocky Nook, Kingston, Massachusetts, in 1959. Mr. Harry Schnabel, supervisor of archæology at Plimoth Plantation in Plymouth, Massachusetts, has associated the west cellar of this building, where the fragment was found, with a period of occupation beginning in 1676. *PR*–5 was taken from the neck of a wine bottle recovered during a dredging operation in 1959 at Port Royal. Mr. C. Bernard Lewis, director of the Institute of Jamaica in Kingston, Jamaica, supplied this bottle, which has been presumed to have been submerged since the earthquake of 1692, when a portion of the city of Port Royal sank below the surface of the sea. *SA*–2, another bottle fragment, was salvaged from a shipwreck off Bermuda by Mr. Mendel Peterson, of the Department of Armed Forces History at the Smithsonian Institution. Mr. Peterson believes that the preponderance of evidence points to this wreck being the remains of the Spanish ship *San Antonio* sunk in 1621, but that a possibility exists that it could be the *Vega* sunk in 1639. *N*–4, *N*–9 and *N*–11 are from the collection of the Corning Museum of Glass. They are Islamic specimens said to have been excavated about 1950 in Nishapur, Iran, at the sites Imam-Zadeh (Ghazi-Abad), Deh-Sheikh and Torb-Abad. The best available estimates for dates of manufacture are those listed in the table. Sample *S*–1 b, is a small lump of glass excavated in 1960 near the House of Bronzes at the site of the ancient city of Sardis in Turkey. Prof. George Hanfmann of the Fogg Museum believes that this building was constructed some time between the late third and early seventh centuries A.D., and that it was destroyed in about A.D. 616.

IMMUNOLOGICAL TOLERANCE*

By PROF. P. B. MEDAWAR, F.R.S.
University College, London

'IMMUNOLOGICAL tolerance' may be described as a state of indifference or non-reactivity towards a substance that would normally be expected to excite an immunological response. The term first came to be used in the context of tissue transplantation immunity, that is, of the form of immunity that usually prohibits the grafting of tissues between individuals of different genetic make-up; and it was used to refer only to a non-reactivity caused by exposing animals to antigenic stimuli before they were old enough to undertake an immunological response. For example, if living cells from a mouse of strain *CBA* are injected into an adult mouse of strain *A*, the *CBA* cells will be destroyed by an immunological process, and the *A*-line mouse that received them will destroy any later graft of the same origin with the speed to be expected of an animal immunologically forearmed. But if the *CBA* cells are injected into a fœtal or new-born *A*-line mouse, they are accepted; more than that, the *A*-line mouse, when it grows up, will accept any later graft from a *CBA* donor as if it were its own. I shall begin by using the term immunological tolerance in the rather restricted sense that is illustrated by this experiment, and shall discuss its more general usage later on.

The experiment I have just described[1] can be thought of as an artificial reproduction of an astonishing natural curiosity, the phenomenon of red-cell chimerism in certain dizygotic twins. The blood systems of twin cattle before birth are not sharply distinct from each other, as they are in most other twins; instead, the blood systems make anastomoses with each other, with the effect that the twins can indulge in a prolonged exchange of blood before birth. In 1945, R. D. Owen[2] made the remarkable discovery that most twin cattle are born with, and may retain throughout life, a stable mixture—not necessarily a fifty-fifty mixture—of each other's red cells; it followed, then, that the twin cattle must have exchanged red-cell precursors and not merely red cells in their mutual transfusion before birth. This is the first example of the phenomenon we came to call immunological tolerance; the red cells could not have 'adapted' themselves to their strange environment, because they were in fact identified as native or foreign by those very antigenic properties which, had an adaptation occurred, must necessarily have been transformed. A few years later R. E. Billingham and I[3], with the help of three members of the scientific staff of the Agricultural Research Council, showed that most dizygotic cattle twins would accept skin grafts from each other, and that this mutual tolerance was specific, for skin transplanted from third parties was cast off in the expected fashion. We did not set out with the idea in mind of studying the immunological consequences of the phenomenon described by Owen; on the contrary, we had been goaded by Dr. H. P. Donald into trying to devise a foolproof method of distinguishing monozygotic from dizygotic twins, an enterprise that seemed reasonable enough against the rather thorough background of knowledge we already possessed about the behaviour of skin grafts in experimental animals[4]. It was F. M. Burnet and F. Fenner[5] who first read a general significance into Owen's discovery and who wove it into a general hypothesis of the immunological response which counted the phenomenon of tolerance among its theoretical consequences.

In the outcome, it proved impossible to distinguish between the two kinds of twins by skin grafting; but the causal connexion between Owen's phenomenon and our own was obvious, and we were now confident of our ability to make adult animals accept tissue homografts by reproducing in the laboratory the very state of affairs that had come about by natural accident in twin cattle. Billingham, L. Brent and I eventually succeeded in doing so, and our first report on the matter was published in 1953 [1]. In the meantime, M. Hašek[6], working against an entirely different conceptual background, had reproduced Owen's phenomenon in chickens by the ingenious method of making a deliberate synchorial parabiosis between chick embryos in the shell. At hatching the parabionts separated, and from now on they were incapable of making antibodies against each other's red cells, or, as later work showed[7], of rejecting grafts of each other's skin. It is now known that chimerism can occur naturally, though rarely, in twin sheep, and more rarely still in twin human beings[8]; in twin chickens it is probably the general rule. That chimerism should occur in man is clear proof that the principle of tolerance applies to human beings as well as to laboratory animals, and human chimeric twins can accept grafts of each other's skin[9].

* Substance of Nobel Lecture delivered in Stockholm on December 12, 1960.

Some Properties of the Tolerant State

The main points that emerged from our analysis of the tolerant state were these. In the first place, tolerance must be due to an alteration of the host, not to an antigenic adaptation of the grafted cells, for grafts newly transplanted in adult life have no opportunity to adapt themselves, and the descendants of the cells injected into fœtal or new-born animals can be shown by N. A. Mitchison's methods to retain their antigenic power[10]. Once established, the state of tolerance is systemic; if one part of the body will tolerate a foreign graft, so will another; we found no evidence that a tolerated graft builds up a privileged position for itself within its own lymphatic territory. The stimulus that is responsible for instating tolerance is an antigenic stimulus—one which, had it been applied to older animals, would have caused them to become sensitive or immune. A plural stimulus can induce plural tolerance; the donor will usually contain several important antigens that are lacking in the recipient, and long-lasting tolerance must imply tolerance of them all. The state of tolerance is specific in the sense that it will discriminate between one individual and another, for an animal made tolerant of grafts from one individual will not accept grafts from a second individual unrelated to the first; but it will not discriminate between one tissue and another from the same donor. The injection of leucocytes or lymphoid cells can confer tolerance of skin grafts, for example; and later work has shown that the same is true of grafts of thyroid tissue, ovary, kidney and adrenal gland. These various tissues do indeed differ in their antigenic make-up, but not, apparently, in respect of antigens that play an important part in transplantation immunity. If leucocytes lacked some important antigen present in skin, it is difficult to see how they could confer tolerance of skin; and P. L. Krohn, using more direct and more critical methods, has found it impossible to distinguish between the antigenic make-up, so far as it governs their transplantability, of ovary and skin[11].

Tolerance can be brought promptly and permanently to an end by an experimental device which combines certain principles established by N. A. Mitchison and M. W. Chase. Consider the model experiment described at the beginning of this article, and imagine an *A*-line mouse which is tolerant of *CBA* tissue and which carries a *CBA* skin graft as outward evidence that it is so. The tolerated *CBA* graft can be destroyed within a week by injecting into its host lymphoid cells from *A*-line mice which have reacted on and rejected *CBA* tissues in the expected fashion. A less spectacular but in some ways more informative variant of this 'adoptive immunization' is to inject the tolerant mouse with lymphoid cells from *A*-line mice that have *not* been sensitized beforehand by *CBA* tissues. Here, too, though much more slowly, the tolerant state is brought to an end. The inference we drew from this experiment—and nothing has occurred since to make us question it—was that tolerance is due to a central failure of the mechanism of immunological response and not to some intercession at a peripheral level.

There is one important question about tolerance which the experimental system I have been describing is very ill-equipped to answer: Does the maintenance of the tolerant state depend on the continuing presence of the antigen that provoked it? When living cells are used to procure tolerance they survive into adult life and therefore maintain a chronic antigenic stimulus. But is it necessary that they should do so? So far as transplantation immunity is concerned, no completely confident answer can be given until the antigens that excite it can be extracted in a sufficiently potent form; but with 'tolerance' of foreign proteins and red cells, it does indeed seem that antigen must continue to be present, even though in quantities below the threshold of direct estimation, if a fully non-reactive state is to be maintained[12]. This is one of the most important single pieces of evidence that must be taken into consideration when devising hypotheses to account for tolerance, and it points to the clear distinction that must be drawn between the dosages of antigen necessary on one hand to instate tolerance, and on the other hand to maintain it. Much else is still uncertain—for example, the significance to be attached to the 'partially tolerant' state. Tolerance is not an all-or-nothing phenomenon: every degree of tolerance is to be found, from that which allows a graft to live just perceptibly longer than would be expected of it in a normal animal to that in which the graft is permanently accepted by and incorporated into its host. Is an animal partially tolerant because all its reactive cells are almost completely debilitated, or because, while most of them are completely out of action, a minority retain full possession of their powers?

Tolerance and Runt Disease

It has been the experience of all laboratories that tolerance is most easily procured by injecting lymphoid cells into immature animals. This is not because lymphoid cells are in themselves more strongly antigenic than others—there is evidence that they are not so—but probably because they are distributed throughout the body of the animal into which they are injected. This should make them adept at producing tolerance; an animal can be immune when only a minority of the cells that are competent to do so are reacting immunologically, but cannot be tolerant unless the very great majority of them are not. Unfortunately, the lymphoid cells used to induce tolerance are immunologically qualified to attack the tissues of their host, with consequences that were first revealed by Billingham and Brent[10] and, in a somewhat different form, by M. Simonsen[13]. The injection of foreign adult lymphoid cells into new-born mice of an unrelated strain gives rise to a fatal or chronic illness, 'runt disease', marked by retardation of growth and widespread damage to the host's lymphoid tissue. Its discoverers have proved beyond question that runt disease is immunological in origin. So far as it concerns mice, the clear recognition of runt disease had to await the development of a technique for injecting new-born mice intravenously[14]; until that had been done, there was every inducement to believe that death or stunting was due to accidental damage caused by injecting cells into mice *in utero*. Runt disease or splenomegaly (one of its earlier symptoms) provides a test of the immunological competence of cells, and lends itself to exact studies of their immunological capabilities; perhaps the most important discovery that can be credited to it is of the presence of an immunologically competent cell in peripheral blood. The aspect of runt disease which concerns us here is its relationship to tolerance. A state of tolerance must obviously abet the onset and probably the progress of runt disease, because if adult lymphoid cells are to attack the tissues of the animal into which they are injected they must live long enough to be able to do so. The frequency with which runt disease was associated with the induction of tolerance gave rise to the suspicion that tolerance might itself be a pathological condition. Might not the adult lymphoid cells used to procure it simply exterminate the developing lymphoid cells of the host and take their place? This cannot be so. Tolerance unaccompanied by any symptom of runt disease is produced by the injection of embryonic cells or by a natural or artificial parabiosis between embryos, and it leads here to a stable chimerism in which native and foreign cells seem to coexist without the one ousting the other. It can be produced, moreover, by adult lymphoid cells which, though antigenically foreign to their hosts, are for simple genetic reasons incapable of attacking them. The experiment described at the beginning is in fact best carried out by injecting, not adult *CBA* lymphoid cells, but adult lymphoid cells from a first generation hybrid between mice of strains *A* and *CBA*. By and large there seems no reason to believe that tolerance can be explained in terms of cellular competition and replacement.

Other Forms of Immunological Non-reactivity

The antigenic substances I have so far had in mind are 'foreign' only in the sense that they derive from other members of their recipients' species. Tolerance of more remotely foreign cellular antigens is more difficult but certainly not impossible to achieve. But even if we confine the concept to the reactions that take place within the compass of a species, it is clear that tolerance can be induced by antigens belonging to more than one chemical class and may extend to more than one modality of response. A tolerant animal fails not only to engage in the 'cellular' type of response we associate with the reaction against homografts of skin; it fails equally to make humoral antibodies—for example, *iso*hæmagglutinins; and the antibodies that fail to make an appearance include those of so-called 'natural' occurrence (for example, human anti-*A* or anti-*B*) as well as those that appear only in response to deliberate immunization. It is not surprising, then, that many authors[15] should have found that a state not yet formally distinguishable from tolerance should be brought about by the injection of purified protein antigens into young animals.

Even in this wider sense tolerance is by no means the only kind of specific immunological non-reactivity[16]. L. D. Felton described and named the phenomenon of 'immunological paralysis' in 1949. Felton showed that adult mice could be immunized and therefore protected against otherwise lethal doses of living pneumococci by the injection of 0·5 μgm. of a pneumococcal polysaccharide of the appropriate antigenic type. But, so far from conferring resistance, the injection of larger doses (500 μgm., for example) abolished it, for the mice became vulnerable to pneumococcal infection and could now no longer be protected against it by an injection of the smaller dose. An analogous phenomenon was discovered by F. J. Dixon and P. H. Maurer when they showed that large doses of soluble protein antigens failed to excite a response from adult rabbits. The foreign protein disappeared from the circulation at just the rate that would be expected if no antibodies against it had been formed. At one time most of us believed that immunological paralysis could not be classified as an essential non-reactivity. Antibodies were probably formed, we believed, but were promptly bound by antigen present in vast excess. But the most recent work, notably from A. H. Coons's laboratory, makes this interpretation rather doubtful, for refined methods have so far failed to reveal that any immunological reaction is afoot. These observations have given rise to the hope that paralysis and tolerance of soluble antigens may be indistinguishable phenomena. The problem now to be decided is whether or not the inception of tolerance in the narrower sense depends on some quantitatively distinctive property of immature lymphoid cells. Are embryonic cells specially easy to paralyse, for example, or, what comes to the same thing, is it specially difficult to make adult cells tolerant? I know that work bearing on this problem is in progress in Coons's and Mitchison's laboratories. For many reasons—one of them the need to distinguish between the doses of antigen needed for the inception and the maintenance of the unresponsive state—the problem is by no means so easy to tackle as might appear at first sight. It is a matter of some importance that a quantitative study of the same kind should be made of tolerance of foreign tissue grafts. If I may refer once again to the experiment described at the beginning, we can be sure that an adult *A*-line mouse will not be made tolerant of *CBA* tissues by the injection into it of a proportionate multiple of the number of *CBA* cells that would have sufficed if their recipient had been newly born; but we still do not know whether a disproportionately large number of *CBA* cells might not confer tolerance on a mouse, say, ten days old. However, the possibility that tolerance and paralysis are no more than quantitatively distinguishable, if even that, makes it more urgent than ever before to prepare the antigens that excite transplantation immunity in an adequately potent form.

Two other forms of non-reactivity should be mentioned. One is the specific tolerance of tissue grafts which may be conferred upon a totally irradiated mouse the hæmatopoietic tissues of which have been restored by an injection of foreign bone-marrow cells. J. F. Loutit has suggested that the phenomenon is akin to tolerance in the narrower sense defined by our own experiments, but here, too, the analogy with immunological paralysis is not far to seek. Curiously enough, the encouragingly long survivals of kidney homografts reported by our surgical colleagues in Boston and Paris[17] have been brought about by the use of rather lower doses of whole-body irradiation than experience with mice might have tempted one to regard as essential. Perhaps the behaviour of inbred and homozygous mice is not the best theoretical guide to what may be expected of animals so obstinately heterozygous as human beings. Is it possible that 'radiation induced tolerance' might be easier to secure when the mouse donors are hybrids of type X/Y and the recipients hybrids of type Y/Z? This model is also unrealistic, but more akin in principle to the genetic situation that human beings confront us with in real life.

Finally—I have put it last because it is the least easy to classify, though it might turn out to be the paradigm of all such phenomena—I must mention the inhibition of drug allergy described by M. W. Chase and M. Sulzberger[17]. Guinea pigs fed by mouth with, for example, picryl chloride, no longer develop a cutaneous hypersensitivity of the delayed type on the application of that substance to the skin. Analysis has shown that this, too, is an essential non-reactivity. Many of us nourish the hope that a similar principle might be turned to good account in transplantation immunity, if it should prove possible to prepare a 'haptenized' derivative of the antigens that cause it to come about.

Biological Significance

Tolerance is a natural phenomenon, though its natural occurrence among chimeric twins may be something of an oddity. Has it any wider zoological significance?

The immunological defences of the body are directed against foreign matter. It is not at all common for an animal to react on the native ingredients of its own body. Burnet was the first to realize that this is not a state of affairs to be taken for granted, but something that calls for a special explanation; and it was his attempt to explain it that led him to predict that antigens which impinged upon an animal sufficiently early in its life should come to be accepted as if they were its own. Now that tolerance is an established fact we may turn his argument the other way about. Tolerance is ideally well qualified to provide a built-in natural safeguard against the danger that an animal might be sensitized or immunized by the constituents of its own body, and this may turn out to be its biological *raison d'être*[18]. If this argument is true, then the only substances capable of exciting auto-immune reactions should be those which never normally have access to centres of immunological response, so that the body has no opportunity to learn to tolerate them. I do not know of any evidence that contradicts this inference.

Tolerance makes one think anew about the special relationship that holds between a mammalian mother and its unborn young. There are hints in the literature that a mammalian infant may be specially tolerant of antigens of maternal origin, and evidence of such a relationship should be found more readily among human beings than elsewhere; for unlike rats and mice we have a long gestation period, and unlike sheep and cattle our fœtal membranes are permeable by at least some molecules as large as proteins. Yet it seems most unlikely that maternally induced tolerance should be of regular or well-defined occurrence. The permeation of the fœtus by foreign antigens gaining access through the mother might weaken its resistance in later life to infectious disease (we may recall here the significance read by Burnet and Fenner into Traub's observations on lymphocytic choriomeningitis[5]). This is only one among half a dozen reasons why traffic between maternal and fœtal circulations should be under very close control. The occurrence of runt disease makes it, of course, unthinkable that the barrier between mother and fœtus should be easily penetrable by anything so large as maternal cells.

Theories of Tolerance

Burnet and I have agreed on a division of labour which absolves me from speculating on the causes of the various kinds of essential non-reactivity I have described. Tolerance, like the secondary response, and the nature of immunological 'memory', has become something of a testing ground for theories of the immune response. It must be said that the occurrence of tolerance does not yet follow from any hypothesis of the nature of the immune response that has been verified by *independent* means. Far too much is still uncertain. We do not yet know whether any one antibody-forming cell is potentially capable of making any antibody within the organism's immunological repertoire or whether the competence of any one such cell is restricted to a sub-class of the reactions that can be engaged in by the organism considered as a whole. We do not yet know whether the act of synthesis undertaken by an antibody-forming cell is strictly and specifically underwritten by the cell's genetic make-up or whether, in J. Lederberg's terminology, the instructions that govern that act of synthesis are imparted by the antigen itself. If it should be true that the antigen does no more than choose between one set of pre-existing instructions and another, we still do not know whether those instructions are already present in the zygote and therefore part of the legacy of its descendants, or whether they must be added to (by mutation, necessarily) during the course of growth. Finally, we do not even know whether the antitheses as I have put them are wisely so put or not. But it is the study of tolerance that has raised these questions in a specially urgent form[19], and which, in due course, will make an important contribution to their answers.

NEWS and VIEWS

New Year Honours

THE following names of scientists and others associated with scientific and related work appear in the New Year Honours list :

Baron : Sir Alexander Fleck, chairman of the Advisory Council on Research and Development, Ministry of Power, and of the Nuclear Safety Advisory Committee, for public services.

C.H. : The Earl of Limerick, chairman of the Medical Research Council.

Knights : Dr. Christopher H. Andrewes, deputy director, National Institute for Medical Research ; Prof. Alfred C. B. Lovell, professor of radio astronomy, University of Manchester, and director of the Jodrell Bank Experimental Station ; Alexander Oppenheim, vice-chancellor of the University of Malaya ; John N. Ritchie, chief veterinary officer, Ministry of Agriculture, Fisheries and Food ; Dr. Alan H. Wilson, a deputy chairman and managing director of Courtaulds, Ltd. ; Prof. Brian W. Windeyer, professor of radiology, University of London, dean of Middlesex Hospital Medical School ; Dr. Alfred E. R. White, of Toorak, Victoria, Australia, for philanthropic services to the advancement of culture and the development of medical research.

C.B. : H. A. Sargeaunt, deputy chief scientist, War Office ; W. H. Stephens, director-general of ballistic missiles, Ministry of Aviation.

C.M.G. : W. F. Searle, chief statistician, Colonial Office ; Prof. S. Sunderland, professor of anatomy, University of Melbourne, chairman of the National Radiation Advisory Committee ; Prof. A. D. Trendall, master of University House and deputy vice-chancellor, Australian National University, Canberra

C.B.E. : J. B. Alexander, director of the Geological Survey, Federation of Malaya ; G. Burdon, engineer surveyor-in-chief, Marine Division, Ministry of Transport ; J. Cook, director of agriculture, Sarawak ; Dr. E. H. Derrick, deputy director, Institute of Medical Research, State of Queensland ; G. C. I. Gardiner, technical director, De Havilland Aircraft Co., Ltd. ; Prof. R. B. Green, emeritus professor of anatomy, and lately dean of medicine, King's College, University of Durham ; W. A. Grinsted, director of the West Indies Meteorological Service ; Prof. C. H. Stuart-Harris, professor of medicine, University of Sheffield ; G. K. B. Hay, formerly director of agriculture, State of Western Australia ; Dr. G. A. C. Herklots, principal of the Imperial College of Tropical Agriculture, West Indies ; F. T. Ingham, lately director of Geological Surveys, Cyprus ; Dr. D. Dilwyn John, director of the National Museum of Wales, Cardiff ; R. H. Jones, chief electrical engineer, Crown Agents for Oversea Governments and Administrations ; C. E. T. Mann, formerly director, Rubber Research Institute of Malaya ; W. J. M. Menzies, member of the Advisory Committee on Fishery Research ; Prof. J. C. Mitcheson, professor of mining, University of London (Imperial College, Royal School of Mines) ; Prof. J. A. Manché, vice-chancellor and rector magnificus of the Royal University of Malta ; E. F. Newley, deputy director, Atomic Weapons Research Establishment, Aldermaston ; A. A. Rubbra, technical director, Rolls-Royce, Ltd. ; G. C. Turner, a principal actuary, Government Actuary's Department ; E. J. Vaughan, a deputy chief scientific officer, Admiralty ; G. E. Watts, principal, Brighton Technical College ; Prof. A. W. Williams, professor of medicine, Makerere College, Uganda ; H. Woods, H.M. deputy chief inspector of factories, Ministry of Labour.

Biochemistry at Trinity College, Dublin : Prof. B. Spencer

DR. BRIAN SPENCER has been appointed to the chair of biochemistry at the University of Dublin, established in place of the chair held for his life-time by the late Dr. W. R. Fearon (obituary, see *Nature*, 185, 283 ; 1960). Dr. Spencer studied at the University of Liverpool and was awarded a B.Sc. with first-class honours in biochemistry in 1948, and a Ph.D in 1950 following postgraduate work with Prof. R. T. Williams at Liverpool and St. Mary's Hospital Medical School. Later, he joined the staff of the Department of Physiology, University College of South Wales and Monmouthshire, Cardiff, and in 1956 transferred to a newly created Department of Biochemistry under Prof. John Pryde. In 1956–57, Dr. Spencer spent a year's leave of absence working on biochemical cytology with Dr. E. V. Cowdry at Washington University Medical School, St. Louis. Dr. Spencer developed an interest in sulphate esters during his postgraduate work in the field of detoxication, and at Cardiff he became well known for his work on sulphatases and on sulphate ester synthesis. In recent years he has extended his interests to the biochemistry of epithelia and teratogenesis.

Bacteriology at the London School of Hygiene and Tropical Medicine : Prof. E. T. C. Spooner

PROF. E. T. C. SPOONER recently gave up the chair of bacteriology at the London School of Hygiene and Tropical Medicine to become full-time dean of the School. He was educated at Epsom, St. Bartholomew's Hospital and Clare College, Cambridge, where he gained a Foundation Scholarship, and was elected a Fellow in 1929. Apart from two years as a Commonwealth Fellow at Harvard (1929–31), he spent the best part of twenty years at Cambridge as tutor, and as demonstrator and lecturer under H. R. Dean in the Department of Pathology. Many probably expected him to live and die a Cambridge don. In 1947, however, he was called to the chair at the London School of Hygiene and Tropical Medicine, which he has held until the present time. His contributions lie within the field of virus diseases, including dog distemper and mumps, and of tetanus and other anærobe infections and of hospital cross-infection. During the Second World War he held a temporary commission and visited the Middle East to advise about hepatitis and other problems. His importance to medicine has particularly been that of the wise counsellor. He was a member of the Medical Research Council from 1953 until 1957 and has been a much valued member of a number of its committees From 1949–55 he was editor of the *Journal of Hygiene*.

Prof. D. G. Evans, F.R.S.

DAVID GWYNNE EVANS has been appointed to succeed Prof. Spooner in the University chair. He is a science graduate of the University of Manchester. He began work on bacteriology in Manchester under Prof. H. B. Maitland in 1934, devoting particular attention to whooping cough. His best-known work is in the field of whooping cough—the antigens of *Haemophilus pertussis* and their relation to immunity. In 1940 he joined Percival Hartley in the Division of Biological Standards at the National Institute of Medical Research at Hampstead, where he worked on the standardization of toxins, especially those of gas gangrene. In 1947 he returned to Manchester to become a reader in Maitland's department. In 1955 he returned to the National Institute at Hampstead when it became urgently necessary to devise means for ensuring the safety and potency of poliomyelitis vaccines. This, coming at the time of the "Cutter incident", was a difficult task; we owe much to Evans and his colleagues for the fact that the British polio vaccines are second to none. In 1958 he succeeded Miles, taking charge of the Biological Standards Division. The value of his work was recognized a year ago when he was elected a Fellow of the Royal Society.

The New York Academy of Sciences : President

Dr. Frederick Y. Wiselogle, assistant director in charge of chemical research in the Squibb Institute for Medical Research, New Brunswick, has been elected president of the New York Academy of Sciences. During 1948 Dr. Wiselogle was awarded the Presidential Certificate of Merit for his work on anti-malarial drugs.

New Honorary Life-Members

The following were elected to honorary life-membership of the Academy: Sir Edward Dodds, Courtauld professor of biochemistry, University of London; Sir Alfred Lovell, professor of radio-astronomy, University of Manchester, and director of the Jodrell Bank Experimental Station; Dr. Giulo Natti, director of the Institute of Industrial Chemistry, Polytechnic Institute of Milan; Dr. Franz Buchner, director of the Pathological Institute, University of Freiburg; Dr. J. J. Trillat, director of research at the National Centre for Scientific Research, Paris. The total number of honorary life-members in the Academy is limited to 100. With the election of these five, the total number of honorary life-members of the New York Academy of Sciences is now 85.

Awards

Isidor B. Laskowitz, 284 Eastern Parkway, Brooklyn, has been awarded the D. B. Steinman Award of 500 dollars for his description of a new concept for a simple landing aircraft incorporating high speed, stability and vertical take-off without the use of rotors. Dr. Minoru Tsutsui, of the New York University College of Engineering Research Division, has been awarded the A. Cressy Morrison Award of 400 dollars for his description of the principles governing coupling of molecules through stoichiometric and catalytic activity.

European Co-operation in Space Research

In reply to a question in the House of Commons on December 12, the Parliamentary Secretary to the Ministry of Aviation, Mr. G. Rippon, said, on behalf of the Minister for Science, that recent negotiations in Geneva had led to the signature by ten countries, namely, Belgium, Denmark, France, Great Britain, Italy, the Netherlands, Norway, Sweden, Switzerland and Spain, of an agreement setting up a Preparatory Commission to study the possibility of establishing a European organization for co-operation in space research. The Geneva Conference expressed the hope that the Preparatory Commission would consider the closest possible co-operation between any organization which might later be formed for space research in Europe and any collaborative organization between European States for the development of a launcher. Mr. Rippon added that Britain would keep in close touch about the matter with the Commonwealth and particularly with Australia.

Student Grants in Great Britain

In a written answer in the House of Commons on December 19, the Secretary of State for Scotland, Mr. J. S. Maclay, said that the revised scale of parental contributions for university students announced by the Minister of Education on December 1 would come into force in Scotland in October 1961, and would apply to university students, students at colleges of education and students taking advanced courses in colleges of further education. It is the Government's intention to have the new rates of maintenance allowances in operation not later than October 1962, but an interim improvement of Scottish allowances will be made in October 1961. Mr. Maclay said he would consult the local authority associations about the complex problems involved in putting these arrangements into effect, and also about the small number of further education students taking shorter courses with lower entrance qualifications who would not be covered by these arrangements. The Government also proposes to accept the Anderson Committee's recommendations that no deductions should be made from grants from public funds in respect of an award holder's personal income, including income from scholarships and prizes, up to £100 a year, and that there should be no restriction on the student's freedom of choice of any university in Great Britain.

In replying for the Government in an adjournment debate on State scholarships in the House of Commons on December 21, the Parliamentary Secretary to the Ministry of Education, Mr. K. Thompson, pointed out that the acceptance of the Anderson Committee's recommendation, that a student who obtained a pass in a minimum of two subjects at Advanced Level in a General Certificate of Education examination and was accepted by a university for a place should qualify for an award, should make a separate system of awards to ameliorate financial hardship unnecessary. Under the new system, the financial basis of the State scholarship system is removed. Moreover, the State scholars are not by any means the only honours students in the universities, and he believes that the incentive to get a place in a university in an increasingly competitive field will itself provide a stimulus to students to give of their best in their sixth-form days. The Government is now ready for discussions with the responsible authorities of the universities and colleges to see how far the new arrangements could help to ameliorate the ill-effects of the pressures which such competition imposes on sixth-form curricula, and is seeking opinions on some proposals advanced by the Secondary Schools Examinations Council. Mr. Thompson said that under the new system, benefactors might be encouraged to offer prizes at more of the civic universities, and this might help to diminish the attraction of Oxford and Cambridge for the best students. Further, while it is proposed that the technical State scholarships should disappear, the Government proposes to retain the mature State scholarships, mainly in their present form. He agreed with Mr. Irvine White that there are real advantages in British students following courses at colleges in other parts of the Commonwealth, and said it is hoped before long to announce a successful outcome to discussions with local authorities on Commonwealth scholarships and the tenure of awards in Commonwealth universities.

Service to Teachers

FROM time to time there has appeared in the columns of *The Schoolmaster*, the journal of the National Union of Teachers, a feature article entitled "Treasure Chest for Teachers". The purpose of this feature has been to offer information about associations of an educational nature, various embassies, consulates, and industrial organizations which are willing to supply certain services and teaching material free or at reduced rates for the use of schools and training colleges. From the number of inquiries about this material received at the headquarters of the National Union of Teachers and the organizations concerned, it became apparent that teachers and school librarians, in primary and secondary schools as well as in training colleges, were finding the feature sufficiently useful for it to be re-issued in permanent form. The National Union of Teachers has now issued the material as a booklet to all engaged in education who may find it useful (Pp. 94. London: Schoolmasters Publishing Co. 1960. 3*s*.).

Endorsed Certificates in Biology

RESULTS of examinations for endorsed certificates in biology are reported in the *Institute of Biology Journal* (7, No. 4; October 1960). In 1960, 106 candidates sat for examinations for the endorsed certificates at Ordinary Level. The examinations were taken in eleven colleges and 63 people were successful. The higher endorsed certificate papers were taken in seven colleges by 25 candidates, of whom 23 were awarded certificates. The technical colleges participating were Acton, Belfast, Bristol, Brunel, Cambridge, Ewell, Guildford, Heriot-Watt (Edinburgh), High Wycombe, Nottingham and Paisley (West of Scotland). Courses are now established at Stockport and Norwich City College.

Teaching Mathematics in the Junior School

MANY primary school teachers and lecturers who teach mathematical methods in training colleges and university education departments will welcome a recent publication by the National Union of Teachers (Mathematics in the Junior School. By J. S. Flavell. Pp. 28. London: National Union of Teachers, 1960). With the primary aim of making work understandable and so enabling the child to think, the booklet examines in detail the following fundamentals of a course outlined by Flavell: understanding of basic mathematical ideas, particularly number, quantity, size, notation and positional value; understanding of the meaning and significance of the fundamental operations of mathematics—addition and subtraction, etc.; the significance of zero; translation: this includes the ability to record in suitable form numerical relationships, the ability to translate from figure to word and *vice versa*, simple mathematical facts, statements and complete sentences (equations); generalization in mathematics; background, cultural studies of the growth through history of number ideas and practices, and of evolution of units of all kinds.

Journal of the International Union of Pure and Applied Chemistry

FOR many years now, decisions and recommendations made by the International Union of Pure and Applied Chemistry, particularly those on nomenclature, have been disseminated in the journals of participant countries. While this procedure has been reasonably satisfactory, the need for a more suitable medium of publication of these and other less-widely appreciated commission reports has become increasingly felt. At Paris in 1957 a Publications Committee was appointed to investigate the situation, and in 1959, at Munich, the Council decided to bring all its publications together in its own *Journal* under the guidance of an editorial advisory board. Because of the inevitable heterogeneity of the subject-matter to appear between the covers of this one journal, an arrangement was made whereby separate papers could be made available in pamphlet or book form. This first issue is largely concerned with publication of the proceedings of the symposium on "Radioactivation Analysis" held in Vienna during 1959, but also contains notes on the organization and functions of the International Union of Pure and Applied Chemistry and several reports. These reports describe: recommended standards for the microdetermination of carbon and hydrogen; the calibration of wave-length and photometric scales for non-recording spectrophotometers; the standardization of pH and related terminology; terminology of scales of working in microanalysis; terminology for use in relation to precision balances; preliminary recommendations on nomenclature and presentation of data in gas chromatography. Further issues are to deal *inter alia* with: dissociation constants for organic acids in aqueous solution; proceedings of the symposium on "Thermodynamics" (Firtzens-Wattens, 1959); proceedings of the symposium on "Tolerated Limits of Toxic Substances in Industry" (Prague, 1959). While one cannot but deplore the ever-increasing spate of scientific journals, the decision of the International Union to produce its own official journal should receive wide approval. It should be of great value to all chemists, and this first issue reveals that the *Journal* will indeed attract serious attention. It is understood that the *Journal* will be published at irregular intervals but will comprise four issues per volume. The subscription-rate is £6 per volume While no decision is announced, it would appear that the usual trilingual presentation in English, French or German is to be observed.

Bernice P. Bishop Museum, Hawaii

THE annual reports of many museums have recently been entirely re-cast, and in many instances are highly attractive and form interesting reading. The report for 1959 of the Bernice P. Bishop Museum, Honolulu, Hawaii, is entitled "Prelude to a Plan" and is an excellent example of the 'new look' in such statements (Pp. 32. Honolulu, Hawaii: Bernice P. Bishop Museum, 1960). The year was a prelude to a five-year plan for the whole Museum and covered such diverse aspects as the construction of a planetarium observatory, the inauguration of the Pacific Science Information Centre, and a retirement and annuity plan for the staff. The report shows clearly how the combined efforts of trustees, staff, volunteers and friends at home and abroad have carried the Museum through its seventieth year of service. The report is well illustrated with appropriate photographs of activities in the Museum.

The Water Research Association

THE period (1959–60) covered by the fifth annual report of the Water Research Association forms a milestone in the development of the organization for two reasons—it is the first year during which a grant has been received from the Department of Scientific and Industrial Research, and it is the last full year which the Association will spend in temporary accommodation at Redhill before moving to new laboratories at Medmenham (Pp. 24+4 plates. Redhill: The Water Research Association, 1960). A large part of the progress report of the Research Division, included with the Association's report, is concerned with laboratory experiments on factors affecting coagulation of suspended matter in water. At Medmenham, where a supply of water drawn from the Thames is available, it will be possible to carry out field trials on improved coagulation processes resulting from the laboratory work.

Problems of Ageing

BECAUSE little is known about the biological phenomenon of ageing and because of the problems which result from the increasing number of older people in the population, the U.S. National Institutes of Health have set up special programmes to stimulate and support research in all health-related aspects of ageing. As part of the research carried on within its own organization, the National Institutes of Health are conducting investigations into ageing in the Gerontology Branch of the National Heart Institute, located at the Baltimore City Hospitals in Baltimore, Maryland, and in the Section of Ageing of the National Institute of Mental Health, located in the Clinical Centre at Bethesda, Maryland. Within the research and training grant activity of the National Institutes of Health, there are many projects bearing directly on problems of ageing, ranging from investigations at the molecular level to investigations at the social level. Work on chronic disease in relation to the ageing process falls between these two extremes.

The Centre for Ageing Research, a component of the Division of General Medical Sciences, fosters additional investigations of all kinds of problems in ageing which are related to health. In addition to the research projects, both intra-mural and extra-mural, which are directly concerned with problems of the ageing process or ageing people, much of the research carried on or supported by the National Institutes of Health has an indirect or secondary bearing on problems of ageing. A booklet has now been prepared giving details of all the projects supported by the National Institutes of Health which have direct or indirect bearing on ageing (U.S. Dept. of Health, Education and Welfare: Public Health Service. Publication No. 761: Activities of the National Institutes of Health in the Field of Gerontology—Research Grant and Training Projects Active on January 31, 1960, and Intramural Research Projects carried on during calendar year 1959 (Washington, D.C.: Government Printing Office. Pp. v+41. 30 cents).

Current Medical Research

A VALUABLE document by the Medical Research Council contains reprints of the articles submitted by the Medical Research Council to Parliament for the year 1958–59 ("Current Medical Research". Pp. v + 56. (London: H.M. Stationery Office, 1960.) 3*s.* 6*d.* net). The subjects considered include the following: occupation and coronary heart disease; studies on the chemotherapy of tuberculosis in East Africa and India; clean air in operating theatres; human population genetics; chromosome abnormalities and disease in man; new applications of electron microscopy; the structure of viruses; the structure of muscle in relation to the mechanism of contraction; interferon: the prospects for an anti-viral agent in man; the arthropod-borne viruses; the plasma kinins and some factors in the problem of inattention.

Zoology of Persia

IT is, perhaps, surprising that the zoology of Persia is very imperfectly known: the country appears to have been neglected by Western zoological explorers, who have passed it by in concentrating on more distant lands to the east. A recent paper by Dr. Xavier Misonne describes the topography of Iran and the distribution of its mammalian fauna (Institut Royal des Sciences Naturelles de Belgique. Mémoires. Deuxième Série, Fasc. 59: Analyse Zoogéographique des Mammifères de l'Iran. Pp. 157+3 planches. Bruxelles: Institut Royal des Sciences Naturelles Belgique, 1960). Dr. Misonne was fortunate in being able to participate in the field investigations on the problem of plague transmission sponsored by the World Health Organization. These were particularly concerned with the distribution and biology of the rodents of the genus *Meriones*, to which the author gives special attention. As a result of several visits to the country, Dr. Misonne is able to give a comprehensive account of the distribution and ecology of the mammalian fauna, but he specifically disclaims that his work attempts a systematic revision of the Iranian species. His paper is illustrated with numerous distribution maps and several well-produced plates.

Tunnelling between Semiconductors

THE laboratories of both A. D. Little (Cambridge, Mass.) and the General Electric Company (Schenectady) have extended (*Phys. Rev. Letters*, 5, 461, 464; 1960) the latter's recent work on tunnelling at low temperature through a very thin insulator between two metals (*Phys. Rev. Letters*, 5, 147; 1960) down to temperatures at which both metals are superconducting. They prepared metal–insulator–metal sandwiches by evaporating a thin film of aluminium (transition temperature (T_c) of 1·2° K.) on to glass, exposing it to air to produce an oxide film about 20 Å. in thickness, and superimposing an evaporated layer of a second superconductor such as lead (transition temperature of 7·2° K.) or indium (transition temperature of 3·4° K.). The relationship between current (I) passed and voltage (V) applied across the sandwich then assumes particular interest below 1·2° K. at voltages around 1 mV., having a region for which dI/dV is negative—reminiscent of an Esaki (tunnel) diode for a voltage $\sim 0{\cdot}2$ V. Analysis of the relationship has enabled estimates to be made of the distribution of states of electrons in the super-

R 323

conductors, and of the small energy-gap which modern theory postulates as a characteristic of superconductors; values of the gap of 4·3 kT_c and 3·6 kT_c are quoted for lead and indium, respectively. The region of negative resistance disappears when either metal of the sandwich is taken above its transition temperature; an applied magnetic field, by its control of T_c, can therefore modify the I/V relationship, and at 1° K. the current passed by one sandwich for an applied voltage of 0·2 mV. could be changed by a factor of 10^5. These effects thus make possible active devices capable of amplifying, and of acting as bi-stable switches.

The Torald Sollmann Award in Pharmacology

WYETH Laboratories of Philadelphia have established the Torald Sollmann Award in Pharmacology to commemorate the pioneer work in the United States of Dr. Torald Sollmann in the fields of pharmacological investigation and education. The Torald Sollmann Award consists of 2,500 dollars and a medal, and will be awarded for significant contemporary contribution to the advancement and extension of knowledge in the field of pharmacology. The Award is open to all scientists working in the field of pharmacology including, but not limited to, individuals from academic institutions, foundations, government and industrial and research organizations, regardless of age, sex or nationality. It will be given for originality and uniqueness of approach as well as development of the new concepts, theories and techniques which constitute a definite, mature and significant contribution to the extension and advancement of contemporary pharmacological knowledge. Not more than one Award will be made annually. Nominations for the Award must be submitted to the secretary of the Society (who is at present Prof. R. M. Featherstone, Department of Pharmacology, University of California, San Francisco 22) to be forwarded to the Chairman of the Torald Sollmann Award Committee not later than January 15 of each year to be eligible for consideration for an Award during the ensuing year. The first Award will be made at the 1961 autumn meeting of the Society in Rochester.

University News: Birmingham

THE following appointments have recently been made: G. R. Izaak, to be research associate in nuclear physics in the Department of Physics; Dr. C. F. Wells, to be lecturer in the Department of Chemistry; Dr. F. Bakhtar, to be lecturer in the Department of Mechanical Engineering; R. H. Hollier, to be Tube Investments Senior Research Fellow in the Department of Engineering Production; Mr. J. W. Fortey, to be lecturer in the Department of Civil Engineering; Mr. D. E. N. Davies, to be Associated Television Fellow in the Department of Electrical Engineering, Mr. B. Henderson, to be William Gibbins Research Fellow in the Department of Physical Metallurgy; Dr A. J. Rees, to be Imperial Chemical Industries Fellow in Geophysics, in the Department of Geology; Dr. C. E. Rowe, to be Caroline Harrold Research Fellow in the Department of Physiology

Edinburgh

THE following have been appointed to lectureships: Dr. T. D. Patten (engineering) and Mr D. C Malcolm (forestry). Dr. J. L. Holmes and Dr. A. J. Charlson have been appointed Imperial Chemical Industries Research Fellows for three years.

London

TITLES of professor in the University of London have been conferred on Dr. N. A. Barnicot (physical anthropology), in respect of his post at University College; Dr. L. F. Lamerton (biophysics as applied to medicine), in respect of his post at the Institute of Cancer Research: Royal Cancer Hospital. Titles of reader in the University of London have been conferred on Dr. R. H. Garstang (astronomy), in respect of his post at University College; Dr. M. K. Wells (geology), in respect of his post at University College. Dr. M. D. Milne, lecturer at the Postgraduate Medical School of London, has been appointed to the University chair of medicine tenable at Westminster Medical School.

The following appointments to readerships have been announced: Dr. F. A. Goldsworthy (applied mathematics), tenable at Queen Mary College as from January 1, 1961; Mr. E. J. Ambrose (physical chemistry), tenable at the Institute of Cancer Research: Royal Cancer Hospital; Dr. R. Creese (physiology), tenable at St. Mary's Hospital Medical School; Dr. L Miles Jackman (organic chemistry), tenable at the Imperial College of Science and Technology; Mr. M. J. Way (applied entomology), tenable at the Imperial College of Science and Technology; Dr. G. M. Timmis (chemistry), in respect of the post held by him at the Institute of Cancer Research: Royal Cancer Hospital; Dr. C. R. Webb (mechanical engineering), in respect of the post held by him at Queen Mary College: Dr. H. I. Winner (bacteriology), in respect of the post held by him at Charing Cross Hospital Medical School.

Announcements

SIR CYRIL HINSHELWOOD, Dr. Lee's professor of chemistry in the University of Oxford and past president of the Royal Society, has been awarded the Medal for 1961 of the Society of Chemical Industry. The Medal, a senior award of the Society, is presented every two years for conspicuous services to applied chemistry by research, discovery, invention or improvements.

DR. WILLIAM O. BAKER, vice-president of research at the Bell Telephone Laboratories, has been elected to the Board of Trustees of the Rockefeller Institute. Dr. Baker is also chairman of the National Science Information Council.

THE five hundred and seventy-seventh meeting of the American Mathematical Society will be held at Hunter College, New York, N.Y., on February 25 Further information can be obtained from Everett Pitcher, American Mathematical Society, 190 Hope Street, Providence 6, Rhode Island.

A SYMPOSIUM on "Temperature—its Measurement and Control in Science and Industry" is being jointly sponsored by the American Institute of Physics, the Instrument Society of America and the National Bureau of Standards. The symposium will be held at Columbus, Ohio, during March 27–31. Further information can be obtained from V. W. Sikora, Instrument Society of America, 313 Sixth Avenue, Pittsburgh 22, Pennsylvania.

THE FORM OF NEW UNIVERSITIES IN BRITAIN

THE second session of the Conference of Universities of the United Kingdom, held in London on December 10, discussed the problem of "New Universities".

In the first half of the present century the growth of the number of university students has been comparatively slow in Britain, and the creation of new university institutions has depended largely on local initiative and finance. The university colleges have had to depend mainly on students from their immediate region, and their academic staff have had to work to the curricula and examinations of their parent, the University of London.

In the past few years the situation has been radically transformed; the establishment of the University College of North Staffordshire, with frankly experimental ideas, set the tone, and considerations of national prestige, the popular demand arising from new prosperity, and the demands of industry and defence have all contributed to a change whereby new institutions can be established with almost 100 per cent State aid for buildings, equipment and salaries, and institutions which will be free to plan and control their own courses and which will be free to experiment as boldly as they wish. These institutions are receiving abounding goodwill and assistance, from the University Grants Committee, local authorities, industry, other cultural institutions, the general public and the staffs of existing universities through the Association of University Teachers.

The two main addresses of the conference had a contrasting form, that of Mr. J. S. Fulton, principal of the University College of Sussex, dealing with the solutions of the problems of siting, staffing, curricula and policy as they were being worked out in practice and planning, and that of Prof. L. C. Sykes, of the University of Leicester, who spoke of the underlying principles which should guide a new university.

Mr. Fulton presented three main topics for discussion, namely, siting, size and function. The first topic appeared to offer two solutions, apart from considerations of population distribution: either the new university should be placed in some town like York, where there are already many other cultural institutions, or in some area with few in the hope that it would become the focus of cultural growth. Size would depend on two considerations: a minimum number of teachers to cover essential subjects would be 300, with a staff–student ratio of 1 to 10; this would give a minimum student body of 3,000. The maximum number would depend on the extent to which teaching methods and residential provision would offset the social disadvantages of larger numbers. Mr. Fulton thought that new institutions should grow rapidly, and he hoped that Sussex would reach 3,000 in ten years.

Mr. Fulton said that the growth of the student population and the new careers open to graduates require a new approach to teaching; he asked if courses devoted primarily to the development of scholars are necessarily appropriate to the 'new student'. At Sussex they are planning courses on lines which owe something to the experience of North Staffordshire. The courses in science have yet to be planned in detail, but in arts they are proposing a combination of an introductory first-year course with an intensive study of a subject in, not a department, but a 'school'. At first there are to be schools of European studies, English studies and social studies, to be followed with a school of international studies. In science, they are considering following the Cambridge pattern, with two main subjects examined at the end of three years, with subjects like the history or philosophy of science, with a further year in one subject for specialists. He hoped to see the development of courses that would link the faculties, biology with psychology or sociology with applied science.

Finally, Mr. Fulton said that he considered teaching should be based on some kind of tutorial system, which creates a close personal relationship between the teacher and the student.

There was much agreement in principle in the second address, by Prof. Sykes; but he also raised matters which provided much of the framework for the discussion which followed.

Education as a preparation for life rather than primarily as a professional training should be the aim of a new university, and to achieve this the university should devote energy to preparing the student's mind to use his course before he left school This should be done through parents and teachers, as well as by means of mass media.

The problems of teaching for the citizens of the 'Affluent Society', who need more to control technology than to develop it, would depend on the attitude of mind of teachers. Teaching must no longer take second place in the interest of the academic staff, and research must no longer be the main criterion of academic worth. Successful teaching would depend in part on the creation of a community of learning in which domestic, architectural and landscape planning would be important, and in part on the development of a close personal relationship between the student and the teacher through forms of tutorial teaching. In the discussion that followed, these points were taken up by the Archbishop of York, Dr. Ramsay, who saw the aim of new universities as being the promotion of new knowledge as the prerequisite of the training of the imagination and the creation of a wholeness of understanding.

The question of the priority of teaching over research was a matter about which the conference disagreed, and both Prof. W. F. K. Wynne-Jones, of Durham, and Prof. P. J. Hilton, of Birmingham, argued that successful teaching depends on research, and that the two are not necessarily competing but complementary.

Another topic raised by Prof. Sykes which was widely discussed was that of the full participation of all the academic staff in the governing of the institution. He stated that if policy affects all, all should participate in its creation and that full information is the basis of loyalty.

This point was taken up in discussion by Prof. J. M. Cameron, of Leeds, who spoke of the importance of popular sovereignty and the dangers of oligarchy. Mr. T. G. Miller, of North Staffordshire, and Mr. H. Maddick, of the Association of University Teachers, supported these arguments, and the former urged the ending of the distinction between 'professorial' and 'non-professorial' teachers.

The problem of the independence of the new institution was raised by Prof. Sykes, and he emphasized the need for local financial and other support. In this he was supported with evidence by Prof. A. K. Stout, of Sydney, and Prof. J. E. Corry, the vice-principal of Queen's University, Ontario, both of whom dealt with some of the problems of political control. A reassurance was offered on this matter by Viscount Mackintosh of Halifax, who described the wide range of support given to Norwich by the University Grants Committee, by the general public, and by industry, commerce and the arts in the counties of Norfolk and Suffolk.

In contrast to the ideas of Mr. Fulton and in support of the thesis of Prof. Sykes, Prof. W. A. C. Stewart, of the University College of North Staffordshire, suggested that slow growth might in fact be the prerequisite of the development of successful inter-disciplinary courses, and he pointed out that his institution now has 800 students after ten years growth.

The sense of the conference was—it had no formal resolutions or conclusions—that education in the 'new universities' should be liberal rather than technical in the narrow sense, and should educate the whole man, or woman, for life rather than for a career.

IMPACT OF MAN ON THE VEGETATION OF THE HUMID TROPICS

An enterprising and successful symposium, convened by the Unesco South East Asia Science Co-operation Office, was held at Goroka, New Guinea, during September. It was brought to fruition through the generous hospitality of the Administration of Papua and the Territory of New Guinea and the unremitting efforts of J. S. Womersley, chief of the Division of Botany, Department of Forests, Lae. Thirty delegates attended from Australia, India, Indonesia, Malaya, Philippines, Sarawak, Singapore, Thailand, Great Britain, the United States, the Territory of Papua and New Guinea, and the South Pacific Commission. There were also twelve observers from the Territory, among whom Mr. H. P. Seale, district commissioner of the Eastern Highlands, was elected president of the symposium. Delegates arrived at Port Moresby, and on September 14 they were taken by charter-plane across the high mountains to Goroka at an altitude of 5,000 ft. Any doubts about the suitability of the site were soon dispelled by the comfort of the Goroka Hotel and the warm welcome from the district commissioner. In these inspiring surroundings, old in their display of the effects of early man in the valleys and on the mountain-sides, befitting the topic of the symposium, and new in the post-war growth of the administrative centre, a vigorous speech from the assistant administrator, Dr. J. T. Gunther, on behalf of the administrator, Brigadier D. M. Cleland, inaugurated the symposium. It was time, he said, to end not only the wars of man on man, but of man on beasts, and of man on vegetation. He struck a theme which forced itself into the chief recommendation of the meeting. The grandeur of Nature, the poverty of man, and the ideal of human rights surged into the panorama, for the object of the symposium was to bring together agriculturists, botanists, foresters, administrators, anthropologists and geographers in South East Asia and tropical Oceania.

Thirty-six papers had been presented and duplicated for previous study, and an efficient secretariat, brought from Port Moresby, reported the discussions in full. First, the physical and human backgrounds of the humid tropics were considered. Illness prevented Prof. W. A. R. Wikramateleke (Singapore) from giving the opening discourse, and in his place the aspects of climatology were presented by Prof. J. M. Blaut (Yale University), of soils and substrata by Dr. F. R. Fosberg (National Research Council, Washington), and of vegetation by myself. Prof. W. R. Geddes (University of Sydney) followed with a sympathetic approach to the human background, based particularly on his researches in Indo-China and Sarawak; he emphasized the 'c' in Unesco as the all-important socio-cultural element of human community and, indeed, the mark of man. The second topic, on the selection and cultivation of foods by early man, was introduced by Dr. J. Barrau (South Pacific Commission). He explained how early man was a practical geneticist selecting by taboo which prevented misappropriation and loss of valuable plants, thereby preserving the better yielders in the multitude of wild variety; the procedure was in striking contrast with the tendency to exterminate the valuable beasts. He was directing his studies to the problem of the bread-fruit tree, so widely cultivated in great variety, yet so obviously wild in New Guinea and the Melanesian islands. This important plant, too massive for interpretation in the herbarium, had to be studied in the arboretum, on which task he was bent. The problem of the sweet potato, chased by the peoples of New Guinea from valley to valley in almost maniacal destruction of the forest, raised considerable doubt on its supposed American origin. Fosberg presented his ideas on the origin of the coco-nut as a cultigen, the ancestral form of which botanists had not yet adequately contemplated. Mr. G. P. Keleny (Port Moresby) gave a detailed account of the basic food-crops of New Guinea. Dr. M. J. Meggitt (University of Sydney) explained his work on the native agricultural methods of the Western Highlands, showing the readiness with which new food-crops may be taken up. Mr. W. L. Conroy (Department of Agriculture, New Guinea), in comparing the effects of indigenous agriculture on soil-erosion and soil-deterioration with those of land-slides in forested country, considered that the damage supposed to be caused by deforestation might well be exaggerated. He instanced the value of *Casuarina* in re-afforestation and soil-renewal in the Highlands. Dr. E. Quisumbing (Manila) related how the War had caused many new food-plants to be taken up in the Philippines.

Thirdly came the prolonged discussion on the effects of fire. To most delegates the Highlands presented endless deforestation followed by grassland and incessant burning. They were grateful to Mr. C. F. W. Julius (Port Moresby) for his careful analysis of native land-rights and usage in explanation of this scenery. Achieved in the first place by finger-nails, sticks and stones, and now accelerated by trenching tools, knives and matchets, with a wanton love of burning for fun, yet there was little evidence in New Guinea of deterioration into desert conditions. Nevertheless, the question was raised whether the replacement of forest by grassland caused a lower rainfall, such as certainly followed the wake of the gold-dredging in the Bulolo district. The discussion revealed the abundance of observation, the thicket of conjecture, and the lack of scientific inquiry.

Fourthly, in an able discourse on grasslands, Dr. W. Bryan (Brisbane) opened the session on the effects of grazing by the domestic animals of early man. New Guinea was a great contrast to Africa. Deforestation led to grasslands, but the absence of any indigenous grazing animals was reflected even in the reluctance among natives to adopt cattle-farming. Though all became grass under native agriculture, there was so little flesh. Anthropologists joined with agriculturists in presenting this problem of induced pastoralism, extending into tropical Oceania, as a concern for Unesco. A remarkable paper on the status of the pig in New Guinea was read by Julius on behalf of Mr. T. Aitcheson (Port Moresby).

Fifthly, the effects of shifting cultivation on the vegetation of the humid tropics were considered. Mr. J. A. R. Anderson (Sarawak) described the carefully planned experiment on regeneration of cleared areas which was in progress in Sarawak. Contributions were made by Dr. I. Y. Carey (Malaya) on the methods of the Temiar people, by T. Smitinand (Thailand), E. Quisumbing (Philippines), Y. Satyanaryan (India) and D. J. Kingston (Port Moresby). What had been an economical cycle for soil-regeneration seemed now in all countries to be becoming uneconomical as increasing population shortened the fallow-period through the demand for more land in use. It was much regretted that no observer from the Food and Agriculture Organization had been able to attend this meeting.

Sixthly, there was a discussion on the nature of secondary plant-communities arising from the activity of early man. Fosberg introduced the subject with a general review of such communities. Dr. R. G. Robbins (Canberra) outlined the results of his researches on the New Guinea grasslands; the full publication of this work will be most instructive. Mr. J. J. Havel (Rabaul) gave two valuable papers on his experimental approach to forest regeneration in eastern New Guinea. Mr. E. C. G. Gray described the remarkably efficient sylviculture of mangrove-forest developed on their own by the natives in the Gulf of Papua.

Lastly, the social and economic aspects of early man's action on the forests were considered. Mrs. K. V. Bailey described the dire effects of over-population in the denuded limestone country of Java. Keleny described the land-use patterns in Java. Dr. I. Polunin (Singapore) discussed the aspects of human health and disease under conditions of shifting cultivation which tend to prevent intensification of parasitic attack.

This symposium touched on many vast problems, requiring the attention of both pure and applied science. The delegates were, indeed, grateful to Mr. L. Mattsson, director of the Unesco South East Asia Science Co-operation Office, for his help in enabling them to escape from their isolation in this huge region, to join in such fertile discussion, and to formulate in a set of resolutions to Unesco what they considered to be the most urgent matters for investigation. Herein they were assisted in no small measure by the hospitality of the Administration which had arranged two magnificent excursions by air and land-rover to enable them to see the natural vegetation, the grand mountain scenery, the happy native peoples and, indeed, the fine work of the Administration itself in the Highlands of the Territory. We flew in the early morning around Mt. Wilhelm (15,400 ft.) and its alpine slopes, glacial valleys, and many peaks in a cloudless sky. We picnicked in *Nothofagus* forests. We were the guests of the beautiful township of Kundiava in the Upper Chimbu. We visited the property of the Halstrom Fauna Trust at Nondugl, where birds-of-paradise are bred—and what an ornithological field-station it would make. Mr. Womersley took the botanists to Kainantu, whence they visited the agricultural station at Aiyura on the way to the scenic junction of the Ramu and Markham valleys, and they were taken along the great Markham valley in a spectacular flight to their destination at Lae. Dr. Meggitt took the anthropologists and geographers to the northern district of Madang. Some of us stayed on in the busy verdant town of Lae on the shore of the Huon Gulf and enjoyed the beautiful Botanic Garden, which is under the direction of Mr. Womersley. It was a delight to find this seat of learning. Started on August 1, 1949, from a waste of wild sugar-cane, it now covers some 120 acres of lawns, flower-beds, plant-houses, woodland, and wooded streams. The new office and herbarium, which are planned, will be the Mecca of Melanesian botany, and the next ten years should see the perfection of the first. Here, several of us, from different lands, walked and talked, consolidating our views on the symposium; as Fosberg sagely remarked, a requisite of a delegate to such a pioneering conference should be his ability to stay a while and contribute to the knowledge of the country.

The eight resolutions concerning South East Asia and Tropical Oceania directed to Unesco dealt with the needs for: (1) the study of secondary plant-communities produced by human disturbance of the tropical forest; (2) the promotion of ethnobotany; (3) the effects of alien civilization on primitive peoples; (4) the study of the vegetation of limestone formations, so susceptible to destruction by fire and other causes; (5) the urgent need for programmes of consideration of natural resources; (6) the study of root physiology in the furtherance of soil science; (7) research into the socio-economic adaptation of recently contacted native people; (8) the convening of another symposium within the region of the South East Asia Science Co-operation Office in view of the stimulus given already to scientific and cultural understanding by the previous ones.

E. J. H. CORNER

GAS CHROMATOGRAPHY

THE third international symposium on "Gas Chromatography" to be organized by the Gas Chromatography Discussion Group, this time in conjunction with the Society for Analytical Chemistry, was held at Edinburgh during June 8–10. More than 560 delegates attended the meeting, of whom more than 160 were from overseas. Three excellent receptions provided by the Organizing Committee, the Lord Provost of Edinburgh and the British Petroleum Co. were held in the evenings. Other items that added interest to the meeting were an instrument exhibition showing recent developments in commercial gas-chromatographic equipment, and visits to local industries arranged for the Saturday following the symposium.

The symposium was divided into three sections, Apparatus and Technique, Theory and Application, and General Applications, each being introduced by a well-known authority in the field. Preprints of the twenty-nine papers read were issued to delegates before the meeting, so authors had to point out only the highlights in their papers, thus giving more time for discussion. The full proceedings, edited by R. P. W. Scott, will be published by Butterworths Scientific Publications later.

The symposium began with a welcoming address by Prof. E. L. Hirst, of the University of Edinburgh, who described the impact chromatography had made on research in recent years. Dr. A. T. James, chairman of the Gas Chromatography Discussion Group, gave the opening address, outlining some of the more significant lines of research being currently followed. A report on the recent activities of the East German Working Group was read by Mr. H. P. Angele.

In the introductory lecture to the first session, "Applications and Technique", R. P. W. Scott pointed out areas where there was still much controversy among gas chromatographers. He emphasized the need for further work on column design, detectors and recording methods to improve both the speed and accuracy of quantitative analysis.

The recent very sensitive hydrogen flame and argon ionization detectors were the subject of the first session. L. Onkiehong and D. H. Desty reported investigations carried out on the flame ionization detector to determine the optimum design and operating conditions. Both concluded that the construction of the detector was not too critical except where the highest sensitivity is required. Similar results were found by R. C. Condon, who in addition compared the two ionization detectors. J. E. Lovelock investigated the design and operating parameters of the family of argon detectors. The triode detector, the most recently introduced, has a sensitivity of 10^{-14} gm./sec., about a hundred times better than that reported for the flame ionization detector. The sensitivity of all the argon detectors was found to be considerably reduced by the presence of trace amounts of hydrogen, nitrogen, oxygen, carbon dioxide and water in the argon. A comparison of integral and differential ionization detectors was made by S. Matousek.

Most of the discussion following the papers centred around the flame ionization detector. Many workers gave details of their own particular design, and it appeared that thick-walled jets which remained cool were preferable to those that glowed at red heat. F. van der Craats described how the linearity of the detector could be improved by using a cage rather than a disk as the upper electrode, and D. H. Desty stated that a small increase in sensitivity could be obtained by the addition of argon, nitrogen or oxygen to the hydrogen supply.

A disadvantage of the hydrogen flame-ionization over the argon detector is that an expensive impedance converter must be used to measure the low ionization currents produced. L. Onkiehong suggested that it may be possible to overcome this by the use of an a.c. polarizing potential (~ 100 c.p.s.) applied between the jet and a third electrode situated between the jet and collector. By this means a pulsed d.c. signal would be obtained at the collector which could be amplified by conventional methods. J. F. Smith gave details of an inexpensive amplifier using a cathode follower that was adequate where the highest sensitivity was not required.

An important feature not given sufficient attention by the majority of workers investigating detector performance was the determination of response factors for compounds of different type, to see whether any correlation exists between response and molecular structure. Difficulties in obtaining low known concentrations of vapours may be partly responsible for this, and the method for obtaining accurate concentrations down to 10^{-8} molar described by D. H. Desty should enable fuller work to be carried out in the future. Although no simple correlations were found in the papers read, in the discussion R. C. Condon pointed out that for the series of halogen compounds mono-, di- and tri-chloromethane the response of the flame ionization detector was proportional to the amount of hydrogen in the molecule, and F. Schild had found that the weight response for a number of oxygenated compounds was proportional to the product of the peak area and molecular weight. Both H. M. McNair and F. van der Craats compared the response factors that they had determined for hydrocarbons with those obtained by D. H. Desty and L. Onkiehong. A wide variation in relative response factors was apparent, and it may well be that these factors depend very much on the design and conditions under which the detector is operated.

The question of detectors of low concentrations of permanent gases arose, and T. B. Kent described how by using argon containing a few p.p.m. of acetylene as carrier gas concentrations of permanent gases in the p.p.m. region could be detected by the decrease in background signal produced. The use of the gas-discharge tube for the determination of small concentrations of impurity gases in argon was the subject of a paper read by B. Riley, and several industrial applications for an instrument of this type were outlined.

Following the discussion on detectors, attention turned to other developments in apparatus and technique. J. Boeke described the use of a modified form of frontal analysis in which the sample is continuously introduced into the column considerably diluted in an inert carrier gas, and gave details of a detector arrangement that enabled curves approaching differential rather than the usual integral records to be obtained. I. Halasz described an integrator based on a new principle having a count-rate of 1·8 million pulses per minute for a full-scale recorder deflexion and which may be adjusted to correct automatically for the calibration factor of the substance detected. A comparatively inexpensive high-speed recording system, using a long-persistence cathode-ray oscilloscope, was described by R. P. W. Scott, and its value for recording fast separations illustrated by several traces showing separations carried out in less than 1 min.

The next section, "Theory and Application", was introduced by M. J. E. Golay, who discussed the relative importance of resistance to mass transfer in the liquid and gas phases with packed and capillary columns. He described how it should be possible to obtain lower height equivalent to a theoretical plate values by increasing the surface area of capillary columns without increasing the distance across which the solute molecules have to diffuse. This could be achieved by covering the inner wall of a capillary column with a finely divided clay before coating, and the improvement was demonstrated by showing a peak obtained for benzene before and after treating a column in this manner.

Capillary columns were the subject of the first two papers in this section, and investigations of the important operating and design features for achieving high efficiencies and high speed of analysis were reported by R. P. W. Scott and A. Goldup. Both discussed the effect of column diameter, film thickness and carrier gas on the height equivalent to a theoretical plate linear gas velocity curve and compared experimental results with those predicted by the Golay theory. R. P. W. Scott was able, by using carrier gases of different diffusivities, to show experimentally that, in accord with theory, the contribution from resistance to mass transfer in the gas phase to the total height equivalent to a theoretical plate was greater than that due to mass transfer in the liquid phase for solutes that are well retained. In general, a fair agreement between theory and experiment was found at gas velocities corresponding to the minimum height-equivalent to a theoretical plate, but at higher velocities the agreement was less satisfactory. M. A. Khan suggested that this may be due to the absence in the Golay equation of a term accounting for interfacial resistance between the gas and liquid phases, and reported that he had recently published a note[1] discussing this effect.

Examples of the efficiency and speeds of analysis achieved on capillary columns were reported by A. Goldup. Using a 600-ft. glass column, an efficiency of 300,000 plates had been obtained for a well-retained solute, and the separation of sixteen out of a blend of seventeen octane isomers was given as an illustration of the resolution attainable. The potentialities of capillary columns for high-speed analysis were demonstrated by chromatograms obtained using a recording system having a time constant of only a few milliseconds, which showed the separation of a blend of nine heptane isomers in 58 sec. and a simple four-component blend in 1 sec. C. P. Quinn presented equations derived theoretically defining the best conditions to achieve the minimum time of analysis and supported these with experimental data. The basic premise of using linear gas velocities higher than the optimum was criticized by J. H. Knox.

In the first of the two remaining papers of the morning session S. J. Hawkes discussed factors which limit the maximum operating temperature of stationary phases. Valuable data on several stationary phases were given, and in addition the use of substituted borazoles at high temperatures was suggested.

Structural analysis of hydrocarbons by capillary gas chromatography in connexion with the methylene insertion reaction was the subject of a paper presented by M. C. Simmons. The author described how by simply treating paraffin hydrocarbons with diazomethane under ultra-violet irradiation a mixture of homologues of one higher carbon number could be obtained, and illustrated the value of this for obtaining retention volume data on inaccessible hydrocarbons. For example, retention volume results had been obtained for nineteen branched nonanes from six readily available octanes. One particularly interesting separation reported by the author was that of the diasterioisomers of 2,3,4-trimethylhexane. In the discussion that followed, J. F. Smith described the separation of an alcohol and a sulphide into *meso-* and *dl*-forms by gas chromatography.

Progress on large-scale preparative columns was also reported at the symposium. F. H. Huytens described how the loss in efficiency observed with preparative columns of large diameter could be attributed mainly to column packing. By carefully filling columns so that radial diffusion is large and axial diffusion small, height equivalent to a theoretical plate value of 2 mm. could be obtained with 3-in. diameter columns capable of handling samples up to 1 gm. The use of preparative scale chromatography for examining complex organic materials was reported by T. Johns.

Details of an apparatus for obtaining accurate retention volume data were given in a paper presented by E. R. Adlard. Specific retention volumes for *cyclo*hexane and benzene on dinonylphthalate at temperatures from 48° to 110° C. were used to determine excess partial molar thermodynamic functions. For both systems investigated the excess partial molar entropies were found to be the predominant cause of the departure from ideality. In an interesting contribution to the discussion, J. C. Winters described some results obtained by R. L. Martin in which marked changes in the specific retention volume for hydrocarbons on polar stationary phases had been observed. To account for this, R. L. Martin had suggested that adsorption of the solute on the surface of the stationary phase contributes to the retention of the solute as well as solution in the stationary phase, and had shown that the former becomes of increasing importance as the percentage of stationary phase decreases.

The final papers presented in the section "Theory and Application" were by C. G. S. Phillips and his co-workers. They described the use of transition metal complexes and saturated solutions containing free undissolved tri-*o*-thymotide as stationary phases. The latter compound is of particular interest since it forms inclusion compounds with molecules of restricted width. By comparing retention data obtained for tri-*o*-thymotide with that for di-*o*-thymotide which does not form such complexes it was shown that the former selectively retards straight-chain compounds. The application of complexes of this type to give a separation according to molecular shape appears to be a most promising extension of gas chromatography.

The final day, devoted to "General Applications" of gas chromatography, was introduced by A. I. M. Keulemans, who described some of the results, using chromothermography, obtained by Prof. A. A. Zhoukhovitsky in the U.S.S.R., By passing a ring furnace along the column during elution of the components it is possible to obtain symmetrical peaks using gas–solid chromatography at high sample concentrations. The technique enables samples of wide boiling-range to be examined, and has the added advantage that the temperature gradient and speed of the furnace offer additional parameters for controlling the separation.

The morning session was concerned mainly with the gas chromatography of inorganic compounds. Following a paper by G. Freiser describing the separation of the volatile chlorides of tin, titanium, niobium and tantalum at 200° C. on a 'Chromosorb' column coated with squalane, A. I. M. Keulemans mentioned that he had also separated volatile metal chlorides on an aluminium chloride-coated carbon column at temperatures up to 350° C. Both W. W. Brandt and J. Janak reported separating metals in the form of their acetylacetonates.

The chromatography of corrosive inorganic halogen compounds was the subject of two papers. T. R. Phillips employed a polytetrafluoroethylene capillary column coated with 'Kel–F' oils to separate mixtures of hydrogen fluoride, chlorine and chlorine trifluoride. A hydrogen-flame ionization detector, in which a platinum ring was maintained at red heat in the lower edge of the flame, was found suitable for detecting such inorganic compounds. Details of an apparatus incorporating a katherometer and automatic sampling valve, developed over a number of years for the analysis of plant streams containing highly reactive inorganic halide vapours, were given in a paper by G. Iveson.

Many other new and interesting applications of gas chromatography were described. J. Tranchant gave some results on the use of gas–solid chromatography for the qualitative and quantitative analysis of mixtures containing nitrogen oxides, and D. W. Hill described the application of gas chromatography to anæsthetic research. An illustration of how detailed information on gasolines may be obtained by a combination of liquid–solid and gas–liquid chromatography was illustrated by a number of chromatograms in a paper presented by S. T. Griffiths. C. G. Scott gave details of a method for investigating the stability of white oils. The oxidation products of low molecular weight are eluted with a stream of nitrogen, condensed in special traps and examined chromatographically.

In a discussion in which retention volume data were mentioned, J. F. Smith outlined a useful practical method for expressing all retention volume data relative to one standard 'theoretical' nonane.

In connexion with work on compounds of high molecular weight, J. Janak described how the composition of non-volatile materials could be investigated by the gas-chromatographic analysis of their pyrolitic products. The use of esters as high-temperature polar stationary phases for examining products encountered in polymer production was discussed by R. E. Roland-Jones, and two materials, polyethylene glycol adipate and ethylene glycol distearate, were found suitable for use at 250° C. C. G. Scott stated that he had been able to elute hydrocarbons containing up to fifty carbon atoms using alumina modified by treatment with alkali metal hydroxides as the column packing.

In the final paper of the meeting, G. R. Boreham described an apparatus suitable for fuel-gas analysis, which had as a special feature a multicell thermal conductivity cell that enables four columns to be operated in series with a detector at the outlet of each.

The meeting ended with an excellent summing up of the symposium by C. S. G. Phillips and a closing address by R. C. Chirnside, president of the Society for Analytical Chemistry.

A. GOLDUP

ION EXCHANGE

ON December 2, the Permutit Co., Ltd., demonstrated a new film entitled "An Introduction to Ion Exchange". The programme was introduced by Mr. Walters, who gave a brief outline of the development and uses of ion exchange procedures, mentioning in particular the preparation of acid-resistant anion exchange resins. The film, which is in colour, commences by illustrating some of the uses of ion-exchange resins, including the production of potable water from sea water. On the molecular scale, the structure of polystyrene-based cation and anion exchangers is demonstrated using conventional atomic models, with the exchange process simply illustrated. On the macroscopic scale, the hydrophilic nature of dehydrated resin beads is shown by wetting them, followed by observation of the resultant swelling.

The three main operations of ion-exchange are then examined: (*a*) *Separation*. Here two coloured organic ions in solution are allowed to flow through a resin column. While the blue concentrates in a narrow band near the top of the column, the red is less strongly held, forming a wider band which could be eluted. (*b*) *Substitution*. The effect of passing a solution of potassium permanganate through a resin column in the chromate form is shown by a change in the colour of the solution from purple to yellow. (*c*) *Removal*. In this case a solution of a salt with two coloured ions, copper dichromate, is allowed to flow through a mixed-bed exchanger, resulting in the production of colourless 'de-ionized' water.

The exchange process is followed in more detail by a combination of demonstrations using copper dichromate and animated diagrams of sections through a resin bead in a flowing solution. A final survey of industrial aspects of water treatment completes the film.

Colour cinematography is an ideal medium for showing ion-exchange experiments, and in this sense the film is entirely successful. Nevertheless, although an attempt is made to discuss the mechanism of ion-exchange, a more critical and scientific approach would have been desirable. In particular, specific examples, in which the equilibria involved were considered in terms of quantitative data, would have been valuable. Perhaps the most elegant use of ion-exchange is in the separation of the lanthanide and actinide elements. This aspect is almost completely ignored. Again, although emphasis is laid on the low conductivity of 'de-ionized' water, particularly by comparison with distilled water, an indication that the conductivity of laboratory distilled water is due almost entirely to dissolved carbon dioxide and ammonia would not have been out of place. Further, the 'de-ionized' water contains significant quantities of organic impurities, some of them surface-active and not detected by conductivity measurements. The film will certainly appeal to many potential users of ion exchange; whether it will appeal to students and research workers remains to be seen. "An Introduction to Ion Exchange" is a 16-mm. film with an optical sound track, and runs for 27 min. It is available on free loan to learned societies, colleges and schools, industrial associations, etc.: applications should be sent to the Permutit Co., Ltd., Permutit House, Gunnersbury Avenue, London, W.4.

SERVICE WITH OVERSEAS GOVERNMENTS

NEW arrangements for service with overseas governments are detailed in a White Paper issued by the Secretary of State for the Colonies*. For reasons indicated in an appendix, the British Government has rejected as impracticable the idea of an Overseas Service based on the United Kingdom. Such a Service would not solve the problem of the future prospects of members of the Overseas Civil Service, but the Government is examining the feasibility of establishing a Commonwealth Advisory and Technical Service as suggested by the Select Committee on Estimates. Under the new arrangements the Government will assume full responsibility for the cost of the inducement element, which is a necessary part of the emoluments of most expatriate officers, and a fresh review of the emoluments of the officers concerned will be necessary in many territories. For purposes of United Kingdom taxation, the additional pension payable to an expatriate officer, which stems from the inducement allowance, will be treated in the same way as existing pension, and the cost of that part of the pension will be borne by the Government. The Government will pay education and children's allowances similar to those payable to members of the Home Civil Service posted overseas, and will also meet half the passage costs required to enable children being educated outside the territory in which an officer is serving to visit their parents, or to be visited by their mother, once a year. The Government has also contributed to some compensation schemes now in force for loss of career on premature retirement, or taken account of their cost in considering what further financial assistance should be given, and for future schemes will share the cost equally with overseas Governments.

The scheme will come into effect in most territories on April 1, 1961, and will cover up to 21,000 pensionable and contract officers overseas at a cost to the British Government of £12–£16 million a year. Besides all existing Colonies and dependencies, it will be offered to Nigeria, Sierra Leone and Singapore, and to Northern Rhodesia and Nyasaland, but not to the Bahamas, Bermuda, Brunei and Hong Kong, where, for several reasons, this form of help is not regarded as appropriate, at least for the time being. The arrangements have been developed after consultation with overseas governments and staff associations and they are complementary to plans being vigorously pursued for staffing the public services by local officers in the territories concerned. The White Paper also emphasizes the value of overseas officers in technical assistance schemes, and a high-level technical assistance working party has been set up under Foreign Office chairmanship as a means of exchanging information and experience between departments and organizations engaged in technical assistance work. A sub-committee of this body will co-ordinate the recruitment activities of the Government for technical assistance posts, and the fullest consideration will be given to retiring and retired members of the Overseas Civil Service for all suitable vacancies. It is also proposed to give greater publicity to the Overseas Services Resettlement Bureau, which has already placed more than 1,000 of the 1,710 officers registered with it from July 1957 to mid-October 1960; it is pointed out that the Bureau could prove a very valuable source of man-power to industry and commerce, particularly to export industries seeking men and women with long and detailed knowledge of overseas territories.

As regards the future, the proportion of candidates appointed on contract terms through the Colonial Office has increased markedly in recent years and such appointments now constitute the great majority. Wherever possible the British Government plans to obtain recruits on loan from government departments, public corporations and local authorities, so that individuals can be certain of resuming their previous employment on returning to the United Kingdom. It is also hoped that individual service overseas will be accepted as an asset both to the employer and employee, and that employers will co-operate in facilitating the release of those able and willing to serve overseas and in re-absorbing them on their return.

Further to the above, the Colonial Office has now issued the report of the Public Services Conference held in London during March 1–10, 1960, to exchange information on measures taken or projected to build up local civil services in the African territories, which was initially a confidential document for consideration by the governments represented at the conference*. All, however, have since agreed that it should be published, and it has now been issued by the Colonial Office.

The agenda covered the general pooling of experience and a comparison of the measures adopted; a review of the facilities for secondary and university education, including a comparison of scholarships schemes, training programmes; the exchange of information; the impact of localization on serving overseas officers; and the staffing problems which arise from the development of ministerial systems. The report makes no specific recommendations for governments to adopt, but indicates the important problems and the lines on which they might be tackled, leaving it for each government to reach its own decision after examining the report in the light of its own local conditions.

---

* Colonial Office. Service with Overseas Governments. Pp. 22 (Cmnd. 1193.) (London: H.M. Stationery Office, 1960.) 1s. 3d. net.

* Colonial Office. Report of the Public Services Conference held in the Colonial Office, London, 1st to 10th March, 1960. Pp. iii+25. (Colonial No 347.) (London: H.M. Stationery Office, 1960.) 3s. 6d. net

The report suggests that each government should make a general review of the whole range of problems arising from the need to staff the local civil service increasingly with local people and that standing arrangements should be made to keep under consideration the policy as it develops. Discussing the provision of sufficient numbers of educated men and women, the need to provide secondary and higher education before satisfying all the needs of primary education was emphasized at the conference, and it was urged that the balance of secondary and higher educational systems should be planned on the basis of regular authoritative surveys of the estimated needs for educated man-power undertaken by really first-class experienced persons. As regards courses of training in the United Kingdom, which in 1959 provided for some 2,300 places, more than half of which were taken by local Civil Service officers, the Colonial Office stated that it was very ready to consider the provision of new courses or *ad hoc* training attachments to meet the requirements of overseas governments. In regard to the training of technicians and especially the training of supervisors in technical work, the conference agreed that no good answer had yet been found to the problem of training supervisors rapidly, and that there was no real substitute for experience on the job. The Colonial Office agreed to undertake the preparation of periodical reports directing attention to any new developments of interest or importance, including lists of subjects for which courses were run by overseas governments, the first such report to be prepared in about 18 months. In discussing the special staffing problems which arise from the development of the ministerial system and, in particular, its bearing on the tripartite relation between minister, permanent secretary and heads of departments, stress was laid on the importance of enabling professional officers to contribute fully in the formulation of policy and of respecting their professional integrity. It was also agreed that the professional branch of the Service should have the primary say in assessing the qualifications of the professional staff and their deployment. It also recognized that it was essential to build up proper administrative backing for the professional work, and in particular to ensure good staff relations with professional officers in the field when establishment work was undertaken by administrative and executive officers at headquarters.

FIELD-ALIGNED IONOSPHERIC IRREGULARITIES AND THE SCINTILLATION OF SATELLITE RADIO TRANSMISSIONS

By D. G. SINGLETON, G. J. E. LYNCH and Dr. J. A. THOMAS

Department of Physics, University of Queensland, Brisbane

MANY investigations have been made of the nature of the signals received from artificial Earth satellites[1]. These have shown that the amplitude of the signals may vary as the result of one or more of the following four causes: (*a*) modulation of the satellite's transmitter; (*b*) rotation of the satellite antenna relative to the receiving antenna; (*c*) Faraday fading; (*a*) fading resulting from propagation through an irregular ionosphere. Suitable instrumentation can usually remove the results of cause (*a*), while causes (*b*) and (*c*) together give rise to a regular fading component with a period of several seconds[2] and can thus be recognized easily. The rapid and random fading is attributed to irregularities in the ionosphere, much the same mechanism being involved as is considered to be associated with the scintillation of radio stars.

Radio-star scintillations have been shown to be due to the passage of the radiation from the extra-terrestrial source through an ionosphere which has clouds of enhanced ionization embedded in it[3]. Further, these clouds have been shown to have dimensions of the order of a kilometre and to be elongated along the direction of the Earth's magnetic field[4]. There is considerable evidence, from ground-based radar investigations[5] of the ionosphere, which also points to the existence of such field-aligned irregularities. Recently, Rush and Colin[6] have considered the effect this anisotropy of the irregularities has on their ability to produce scintillations. They came to the conclusion that for propagation approximately along the field lines the scintillation activity normally associated with irregular diffraction by the irregular medium should be increased because of the possibility of radiation which traverses two completely different paths reaching the receiver. The first of these paths is the direct one; the second is via grazing reflexion from the field-aligned irregularities. The geometry which they considered applies to parallel radiation from an extra-terrestrial source, but a similar effect would be expected to occur when the source is rather closer to the Earth's surface.

Observations of the radio transmissions of satellite 1959 Iota-1 (*Explorer VII*) made at Brisbane (dip. 57°) during the months of July, August and September 1960, have been analysed in an attempt to establish the existence of this effect. The satellite takes approximately 8 min. to pass over the station and a scintillation index (fading amplitude/mean level) determined from the random fading component was allotted to each half minute of this period. From the known elements of the orbit it was possible to calculate, for each traverse, the time when the satellite passed through the observer's magnetic meridian plane. The scintillation index for the ½-min. containing this time was then normalized according to the

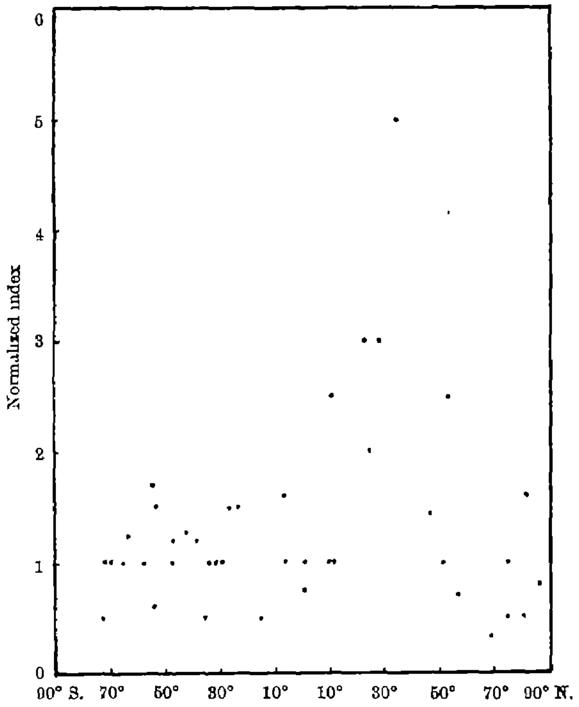

Fig. 1

general level of the scintillation index over the whole traverse. This was done to remove the diurnal and seasonal variations of scintillation activity.

A plot of the normalized scintillation index versus the zenith angle of the satellite as it passes through the magnetic meridian plane is shown in Fig. 1. If the scintillation activity is independent of the direction of propagation through the ionosphere, the points on this plot should be randomly distributed about a horizontal line, corresponding to a normalized index of one. While this is found to be generally true, the normalized index increases markedly over the range of zenith angles of 10°–55° to the north, being a maximum of 5 at 33°. This value of zenith angle in the magnetic-meridian plane corresponds to propagation along the field lines. The mean normalized index of the set of points in Fig. 1 is 1·33 with a standard deviation of 0·87. Consequently the observation at 33° is four standard deviations removed from the mean and thus constitutes an event, the probability of the occurrence of which by chance is 1 in 10^4. The two points corresponding to a normalized index of 3 are two standard deviations away from the mean, and the probability of their being chance events is 1 in 50.

Increases in scintillation index are occasionally observed when the satellite is at points outside the magnetic meridian plane. An analysis of all index increases above the general level has therefore been made to see if the increases associated with propagation approximately along the field lines are any different from the others. The number of increases for the various values of normalized index are listed in Table 1. Two of the three occasions when the normalized index is between 3 and 3·4 correspond to propagation approximately along the field lines, while the event corresponding to a normalized index of 5 corresponds to propagation exactly along the field lines. Thus the interesting points in Fig. 1 involving zenith angles 10°–50° to the magnetic north correspond to larger increases in scintillation index than observed for other directions.

Table 1

Normalized index	2–2·4	2·5–2·9	3–3·4	3·5–3·9	4–4·4	4·5–4·9	5–5·4
No. of increases	13	6	3				1

It should also be pointed out here that no evidence of a change in scintillation-rate was found to be associated with propagation along the field lines.

While this evidence is somewhat fragmentary it would appear that the scintillation activity associated with propagation along the lines of the Earth's magnetic field is more pronounced than scintillation activity associated with other directions of propagation through the ionosphere. This result supports the suggestion of Rush and Colin[6] that other workers in this field should examine observations already made in order to verify the existence of this effect, which may prove to be a valuable tool in the study of the form of ionospheric irregularities.

Work on this and other aspects of the association of the scintillation of satellite signals with ionospheric irregularities is proceeding and will be reported more fully elsewhere.

This work has been sponsored by the Electronics Research Directorate of the Air Force Cambridge Research Center, Air Research and Development Command, under contract No. AF 64(500)–9.

HYDROMAGNETICS AND STELLAR STRUCTURE

By K. D. COLE

Antarctic Division, Department of External Affairs, Melbourne

IT is generally agreed that the microscopic processes of absorption and emission of electromagnetic radiation play a part in determining the macroscopic structure of gaseous stars. Thus the equation of hydrostatic equilibrium of a spherically symmetrical distribution of matter in radiative equilibrium is[1]:

$$\frac{d}{dR}(p_g + p_r) = -\frac{GM(R)\rho}{R^2} \qquad (1)$$

where p_g is the gas pressure, p_r the radiation pressure, G the universal constant of gravitation, $M(R)$ the mass internal to radius R, and ρ the density.

Now the emission and absorption of hydromagnetic radiation is a process usually on a macroscopic scale, and therefore will play a part in determining the structure of magnetic stars on a larger scale. Thus in determining equilibrium structure on this large scale, the radiation pressure in equation (1) should be written as the sum of electromagnetic radiation pressure and hydromagnetic radiation pressure. (In the absence of a magnetic field model, the latter is here assumed to be isotropic.) That is :

$$p_r = p_{er} + p_{hr} \qquad (2)$$

Let us consider, for example, the special case of the Sun. It is thought[2] that many features visible on the solar disk (for example, sunspots, flares, prominences) are manifestations of magnetic energy transmitted outwards from the Sun's inner regions. Further, movements and structure in the inner solar corona suggest that hydromagnetic energy may be both absorbed and generated there. Certainly solar-generated magnetic disturbance is observed at the Earth, suggesting that the Sun is luminous at hydromagnetic frequencies. Yet the Sun in all its visible parts preserves a gross constancy of structure. These things may be reconcilable through the concept of gross equilibrium under the influence of not only electromagnetic but also hydromagnetic radiation pressure. This is embodied in equations (1) and (2).

In the interior of the Sun p_{er} and p_{hr} may be of comparable importance. In the solar corona, however, p_{hr} should dominate. (Available data suggest that radiation pressures in optical and radio frequencies have negligible effects on gross movement in the corona.) Thus on the assumption of gross hydrostatic equilibrium the description of the solar corona (considered to be permeated with magnetic field (H)) under hydromagnetic radiative equilibrium is given by :

$$\frac{\mathrm{d}}{\mathrm{d}R}(p_g + p_{hr}) = -\frac{GM(R)\rho}{R^2} \qquad (3)$$

By analogy with the theory of electromagnetic radiative equilibrium :

$$\frac{\mathrm{d}p_{hr}}{\mathrm{d}R} = -\frac{K_h L(R)\rho}{4\pi V_A R^2} \qquad (4)$$

and

$$\mathrm{d}L(R) = 4\pi R^2 \rho \varepsilon_h \mathrm{d}R \qquad (5)$$

where : $L(R)$ = flux of hydromagnetic energy through concentric sphere of radius R ; K_h = coefficient of hydromagnetic opacity ; $V_A = H/\sqrt{4\pi\rho}$, the Alfvén speed ; ε_h = hydromagnetic emissivity per unit mass.

The equation (3) differs from that of Chapman[3] and Parker[4] for hydrostatic equilibrium in the solar corona which is :

$$\frac{\mathrm{d}p_g}{\mathrm{d}R} = -\frac{GM(R)\rho}{R^2} \qquad (6)$$

Because of the nature of the solution of equation (6), Parker was led to the belief that the solar corona is expanding subject to the equation :

$$\rho v \frac{\mathrm{d}v}{\mathrm{d}R} = -\frac{\mathrm{d}p_g}{\mathrm{d}R} - \frac{GM(R)\rho}{R^2} \qquad (7)$$

Equations (3) and (7) have one feature in common, namely, that they both imply a radial flux of momentum. Equation (7) implies in addition the radial movement of matter. It would seem that equation (3) offers a solution to the difficulties inherent in the solution of equation (6) without recourse to equation (7).

Quantitative argument against the use of equation (7) to describe the solar corona is as follows. First, it neglects altogether the effect of magnetic fields close to the Sun (say, within 2 solar radii) on any attempted expansion. This can only be justified if the kinetic energy density is very much greater than the magnetic energy density there. Assuming a density at the base of the corona of 2×10^8 protons per cm.^{3} and an outward velocity of 100 km./sec. the former is about 10^{-2} ergs per cm.^{3}. Such an energy density is exceeded by magnetic field of only one gauss. Larger fields than this may abound in the lower corona (cf. ref. 5). Parker considers magnetic fields only in the regions of interplanetary space where their energy density is already negligible compared to the kinetic energy density predicted by his model. Thus magnetic fields at the base of the corona may inhibit the expansion attributed to it.

Secondly, the inner corona is known to contain magnetic fields and to manifest movements which are not well correlated throughout the whole region. Let us delineate this inner region by a sphere D (of radius α) concentric with the Sun. α may be a few solar radii. Let us suppose that hydromagnetic waves are generated at the surface of D and emitted outwards into the surrounding medium which is traversed either by the solar magnetic field or an interplanetary field. The outward flow of momentum due to such emission could cause sufficient reaction on D to inhibit its expansion. Thus (if α is 2 solar radii) $2 \cdot 8 \times 10^6$ protons per cm.^{3} there[6], moving outward at 100 km./sec., would represent an outward momentum flux of about 10^{-4} erg/cm.^{3} at the surface of D. This may be inhibited by the reaction to outwardly propagated hydromagnetic waves for which the flux of momentum (F) is given by $\frac{(\Delta H)^2}{8\pi}\frac{V_A^2}{c^2}$, where ΔH is the disturbance magnetic field. Putting H = 10 gauss and ΔH = 1 gauss, $F \approx 10^{-4}$ erg/cm.^{3} on the surface of D. Of course, such hydromagnetic radiation reaction would occur in a continuous fashion all through the inner corona and may inhibit altogether the expansion of the solar corona which is inevitable on Parker's model.

In view of these criticisms, I consider it is not proved that outstreaming of coronal gas to distances of astronomical units[4] is a general condition of the Sun. However, the generation of outward-travelling hydromagnetic waves in the inner corona would seem to be an inevitable consequence of the interaction of momentum and magnetic fields there, both of which are observed to be of the utmost complexity. Moreover these waves, the wave-lengths of which may exceed the dimensions of the Earth, can cause corpuscular bombardment of the Earth and comets. A theory of solar-generated geomagnetic disturbance and auroras based on the propagation of hydromagnetic waves all the way from the Sun has been initiated earlier[7-10].

An experimental test to decide between Parker's expansion model[4] and the above hydromagnetic model of the solar corona may be provided by observation of hydrogen spectra in the night glow. On Parker's model one would expect a permanent red Doppler shift in H_α of about 10 Å., while on the hydromagnetic model one would expect only Doppler broadening of variable amounts. Shklovsky[11] reports that Prokudina's observations of H_α in the night glow showed a Doppler broadening of no more than 2 Å. However, the observation should be repeated with a design to distinguish the above two models. Of course, the contribution to hydrogen line intensities by the geocorona would have to be eliminated perhaps by a space-probe or satellite experiment.

The establishment of the usefulness of equation (3) in studying the solar corona would be strong support for the incorporation of equation (2) in the study of stellar structure in general.

INTESTINAL ABSORPTION OF VITAMIN B_{12} AND OF A VITAMIN B_{12}-PEPTIDE COMPLEX IN NORMAL SUBJECTS AND IN PATIENTS WITH PARTIAL GASTRECTOMY

By Dr. G. MILHAUD

Institut Pasteur, Paris

THE partially gastrectomized patient seemed to provide adequate conditions to elaborate a test for the detection of minor impairment in intestinal vitamin B_{12} absorption, as well as to compare the absorbability of different vitamin B_{12} preparations.

Work on the behaviour of partially gastrectomized patients has led to conflicting results. Glass *et al.*[1], using surface scintillation counting of the liver after oral administration of the radioactive vitamin[2], found a decrease in radioactivity uptake by the liver in 7 out of 8 patients. More recently, Brodin *et al.*[3], using the Schilling test[4], reported a normal urinary excretion of radioactive vitamin B_{12} in 30 patients; only 4 patients had low excretion values. This would indicate the existence of a minor impairment, which I wished to demonstrate clearly. Furthermore, I compared the absorption, in normal patients as well as in partially gastrectomized patients, of crystalline vitamin B_{12} and of the vitamin B_{12}-peptide complex, isolated from a microbial fermentation.

The radioactive test had therefore to be modified to enable me to measure the amount of vitamin B_{12} absorbed by the intestine after the ingestion of a dose large enough to saturate the absorption system, for example, 10 µgm. This dose is present in a normal diet, and is certainly too small to involve a diffusion mechanism during the absorption process, which has been postulated to explain the absorption after feeding with large oral doses.

Labelled vitamin B_{12} is obtained from a culture of *Propionibacterium freudenreichii* in a medium containing cobalt-60. The labelled vitamin B_{12}-peptide complex is prepared by exchange in an acid medium with unlabelled peptide complex or by addition of the labelled vitamin B_{12} to a solution of the peptide.

1 µgm. of labelled vitamin is injected intravenously into the patient and the surface counting of the liver is recorded with a scintillation counter 2, 4, 6 days afterwards. During this time-interval, there is no appreciable excretion of radioactivity and the surface counting of the liver remains practically constant from the fourth to the thirtieth day. This measurement is used as a standard for the calculation of the amount of vitamin B_{12} or vitamin B_{12}-peptide absorbed by the intestine after oral administration. Then a known amount of vitamin B_{12} of given specific radioactivity is given by mouth and a new surface counting is made. The counts corresponding to each administration add to the previous counting.

The amount of absorbed vitamin B_{12} is given by the formula:

$$\underset{(\mu\text{gm.})}{x} = \frac{N-n}{n} \cdot \frac{R_s}{r_s} \qquad \text{(I)}$$

where N is surface counting of the liver after the oral dose, n is surface counting of the liver after intravenous injection, R_s is specific radioactivity of the injected vitamin B_{12}, r_s is specific radioactivity of the ingested vitamin B_{12}.

The percentage absorption is equal to $\frac{x}{a} \times 100$ (II),

where a is oral dose of vitamin B_{12} in µgm.

To estimate intestinal absorption, Glass[1,2] measures the liver radioactivity after an oral dose of 0·5–1 µgm. of labelled vitamin B_{12} and he expresses the results in counts/min. over the abdominal background. If he gives the amount of vitamin B_{12} absorbed, he uses formula (I), where N and n are equal to the surface counting of the liver diminished from the surface counting of the spleen, as some radioactivity is uniformly spread over the abdomen.

From Fig. 1, it is clear that the counting over the liver (A) includes the liver radioactivity plus the radioactivity of the abdomen; furthermore, the surface counting of the spleen (B) includes also some of the radioactivity present in A. The importance of this additional radioactivity can be assessed by a third measurement at C, which is symmetrical to B

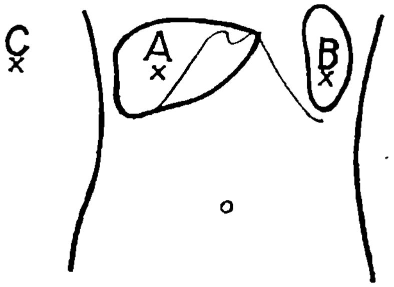

Fig. 1. Schematic representation of the abdominal projection of the liver and spleen

in respect to A and where the additional radioactivity originating from A is the same as at B. The radioactivity of the liver surface is, therefore:

$$N = N_1 - (N_2 - N_3),$$

where N_1 is radioactivity at A, N_2 is radioactivity at B, N_3 is radioactivity at C.

Experimentally, N_3 is of the order of 15 per cent of N_1.

(1) *Normal subjects.* Table 1 gives the results relative to the amount of vitamin B_{12} absorbed after an oral dose of 10 µgm.

Table 1. ABSORPTION OF VITAMIN B_{12} IN NORMAL SUBJECTS

Case	Sex	Age (yr.)	Absorption (µgm.)
1	F	32	2·5
2	M	44	4
3	M	35	5
4	M	55	4·2
			Mean 3·9

Therefore, under normal conditions, about 4 µgm. of vitamin B_{12} are absorbed after an oral dose of 10 µgm. This amount is higher than that found by Glass[5]; according to him, the amount of absorbed vitamin B_{12} is about 1 µgm. for oral doses varying from 2 to 50 µgm. My results agree with that of Reizenstein and Nyberg[6], who found 3 ± 0·9 µgm. of vitamin B_{12} retained after ingestions varying from 4 to 50 µgm.

(2) *Partially gastrectomized patients.* The results concerning 5 patients are reported in Table 2.

The intestinal absorption of vitamin B_{12} is well below normal in partially gastrectomized patients (45 per cent of the amount absorbed by the normal subject).

(3) *Absorption of a vitamin B_{12}-peptide complex.* I gave orally an amount of the labelled vitamin B_{12}-peptide complex equivalent to 10 µgm. of vitamin B_{12} to the same normal subjects as well as to the same partially gastrectomized patients. The results are shown in Table 3 in µgm. of vitamin B_{12} absorbed.

Table 2. ABSORPTION OF VITAMIN B_{12} IN PARTIALLY GASTRECTOMIZED PATIENTS

Case	Sex	Age (yr.)	Absorption (µgm.)
5	M	66	2·1
6	F	44	2·7
7	M	65	1·4
8	M	50	1·0
9	M	69	1·5
			Mean 1·8

Table 3. ABSORPTION OF THE VITAMIN B_{12}-PEPTIDE COMPLEX

Case	Normal subjects Absorption (µgm.)	Case	Partially gastrectomized patients Absorption (µgm.)
1	2·65	5	4·7
2	4	6	3·2
3	6·5	7	3·8
4	3·7	8	2·2
		9	4·7
	Mean 4·2		Mean 3·6

From Table 3, it is apparent that in the normal subject there is no difference in absorption between the vitamin B_{12}-peptide complex and vitamin B_{12} itself. In the partially gastrectomized patients, intestinal absorption of the vitamin B_{12}-peptide is twice as high as that of vitamin B_{12} and the quantity absorbed has reverted to normal values.

It is thus shown, using adequate testing conditions (10 µgm. of labelled vitamin B_{12} for the oral dose and a modified surface liver counting), that intestinal absorption of vitamin B_{12} is impaired in the partially gastrectomized patient. The vitamin B_{12}-peptide complex, isolated by Heathcote and Mooney[7], can restore completely the absorption. According to these findings, the partially gastrectomized patient is well suited to test the factors involved in vitamin B_{12} absorption.

I am indebted to Dr. Heathcote for the vitamin B_{12}-peptide complex.

RETINAL CORRESPONDENCY AND THE HOROPTER IN ANOMALOUS CORRESPONDENCE

By DR. M. C. FLOM and PROF. F. W. WEYMOUTH*
School of Optometry, University of California, Berkeley

VISUAL direction is of particular interest because of its remarkable delicacy and its important contribution to space perception. It rests primarily on the organization of the retinas one to the other, and both to that of the visual cortex. With continuous bifixation on a small object, it is possible to position in space a number of object-points (conventionally in a horizontal plane) such that each is seen in the same direction from the observer when viewed alternately by the eyes. This group of points constitutes one type of empirical horopter, the identical-visual-direction horopter. Study of the horopter curve has led to greater understanding of the normal organization of corresponding areas between the two retinas. In this system the centres of the two foveas correspond; moreover, one eye's temporal retinal elements (connecting neuroanatomically with cells in the ipsilateral occipital cortex) correspond with nasal retinal elements of the other eye (which connect with cortical cells in the same hemisphere).

---

* Emeritus professor of physiology, Stanford University.

But the nature of anomalous retinal correspondence remains an enigma. In this form of retinal correspondence, found in many persons with strabismus ('crossed eye'), the two foveas do not correspond; instead, the fovea of one eye functionally corresponds with an extra-foveal point in the other retina. Thus, there is the curious implication that pairs of corresponding retinal points can be associated between opposite occipital hemispheres. With anomalous correspondence in esotropia, for example, certain retinal points nasal to the fovea of a deviated (right) eye and connecting with the contralateral (left) occipital cortex would be functionally corresponding with nasal retinal elements of the other eye which lead to the contralateral (right) cortex. Whether there can be correspondence between opposite occipital hemispheres depends on whether there is a horopter in anomalous retinal correspondence.

Verhoeff[1] claims there is no retinal correspondency in anomalous correspondence. However, most experimentalists intuitively believe that a horopter should be demonstrable. Although there has been an occasional paper discussing the matter, we have been unable to learn of an investigation in which the horopter has been demonstrated in anomalous correspondence. Halldén[2], who succeeded in obtaining a two-point horopter in the course of studying another feature of anomalous correspondence, noted that, " . . . in cases of anomalous correspondence investigation of the horopter is attended by very considerable difficulties". Ogle[3], who has probably had more experience with the horopter than any other researcher, remarked on the horopter in subjects with strabismus, " . . . my experience is a most frustrating one: the subjects are so indefinite as to what or how they see . . .". In spite of a lack of published reports, the indication is that investigations have been attempted, but without success.

After several years work we have been able to obtain the empirical longitudinal horopter in anomalous correspondence[4]. In this first article we wish to report only on the experimental procedure and method of analysis which we have found to be applicable in either strabismus or normal binocular vision.

The criterion of identical visual direction is used. The apparatus (Fig. 1) consists of a frame arranged in a frontoparallel plane which may be used at fixation distances of 75 cm.–6 m. An upper section contains several vertically oriented 'Plexiglass' rods which may be placed as much as 75 cm. to either side of the central fixation point; a lower section contains a cable and scale about 3 m. in length along which a mobile rod may be moved by the observer. The rods (½ in. diam., 9 in. long) are painted on one end and on the side opposite the observer. A 2·2-V., 0·25-amp. 'bullseye' bulb is placed in contact with the unpainted end of each rod. The lower mobile rod and a selected fixed rod above are alternatively illuminated at a rate adjusted for vivid perception of apparent movement (2–4 c.p.s.). Fixation is continuously maintained on a central red spot (2 mm. diam.) that is optically imaged in the middle of a ¼-in. gap between the upper and lower rods. A large sheet of 'Polaroid' filter (*HN* 34 linear polarizer) is placed with axis 45° in front of the upper rods; another sheet with axis 135° is placed before the lower rod. The head is fixed by means of a mouth-bite. 'Polaroid' filters appropriately oriented before the eyes make an illuminated upper rod visible only to the fixating (dominant) eye and the lower rod visible only to its fellow. While fixating the central red spot, the observer moves the lower rod by means of a pair of synchronous ('Selsyn') motors until the apparent movement between the alternately illuminated rods is purely vertical (that is, no lateral component in the movement is seen). The identical-visual-direction setting is greatly aided by the appearance at this point of a unique 'pouring effect' or 'piston effect'. The position of the lower rod with respect to the fixation point is read from a scale behind the rod holder.

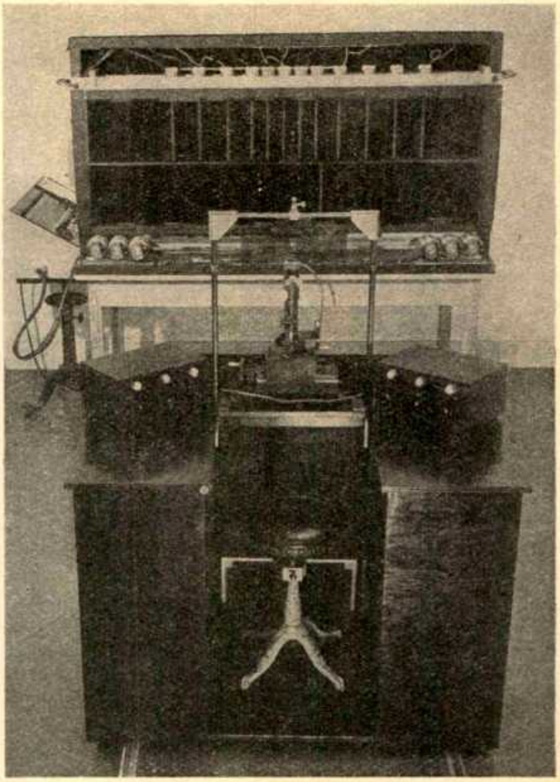

Fig. 1. The horopter apparatus

The mean setting of the lower mobile rod together with the position of the corresponding upper rod specifies a point on the horopter that lies in the visual plane. In a system of rectangular co-ordinates with the origin at the mid-point between the entrance pupil centres, x equals $a(T_L + T_R)/(2a + T_L - T_R)$ (Eq. 1), and y equals $2ab/(2a + T_L - T_R)$ (Eq. 2) where $2a$ is the interpupillary distance, b is the fixation distance, and T_L and T_R are the rod settings for the left and right eyes, respectively. The aggregate of the spatial points for which data have been obtained gives the empirical identical-visual-direction horopter.

The longitudinal angles α_L and α_R subtended respectively at the left and right eyes by the fixation point and one horopter point are obtained from the equations: $\tan\alpha_L = bT_L/(b^2 + a^2 + aT_L) = (bx - ay + ab)/(ax + by + a^2)$ (Eq. 3), and $\tan\alpha_R = bT_R/(b^2 + a^2 - aT_R) = (bx + ay - ab)/(- ax + by + a^2)$ (Eq. 4).

Ogle[5,6] has shown that for subjects with normal binocular vision the empirical horopter is satisfactorily described by a conic the skew of which, R_0, and curvature, H, at the fixation point are obtained from an analytical plot of data which are fitted to the equation $\tan\alpha_R/\tan\alpha_L = R_0 + H\tan\alpha_R$ (Eq. 5). For simplicity Ogle's mathematical model is based on the assumption that the angular separation between the fixation point and a central point on the horopter would be small compared with angle α, and that the fixation disparity responsible for this would be equal in the two eyes. We have found Ogle's model applicable in normal binocular vision, but quite inadequate for analysis of the horopter in strabismus. This is not surprising since the horopter in strabismus should be expected often to miss the fixation point by a rather large angular amount (equivalent to the 'subjective angle'). In fact, in strabismus with normal correspondence the horopter should (and our experiments indicate that it does) pass through the point of intersection of the visual axes. For this reason, as well as the fact that in strabismus the 'turning' is not equal in the two eyes but rather is confined to one eye (at a time), it became apparent to us that a new mathematical model was needed for analysis of the horopter in strabismus.

Our mathematical model includes a constant F which denotes the tangent of the angular displacement of the horopter from the fixation point, a constant M which denotes the skew of the horopter with respect to an objective fronto-parallel plane of the observer, and a constant C which denotes the curvature of the horopter where it crosses the visual axis of the fixating eye. The equation which relates these constants in a form comparable to Ogle's[6] is $U = \tan\alpha_m/\tan\alpha_f = (F/\tan\alpha_f) + M + C \tan\alpha_f$ (Eq. 6), where α_f is the longitudinal angle subtended at the fixating or dominant eye by the fixed rod and the fixation point, and α_m is the corresponding angle subtended at the other eye by the mobile rod and the fixation point. F is zero when the horopter passes through the fixation point; it is positive for eso- and negative for exo-fixation disparity when the right eye is fixating, and the reverse for left eye fixation. M is a measure of the relative magnification of the images in the two eyes. When M is greater than unity, the image is larger for the eye viewing the fixed rods; when less than unity, the image for this eye is the smaller. C represents the deviation of the empirical horopter from the theoretical curve that would result from all longitudinal angles being equal. With exact bifixation, this theoretical curve is the Vieth–Müller circle and the deviation of the empirical horopter from it is the Hering–Hillebrand deviation. The constant C is a measure of the relative asymmetry in the distribution of corresponding retinal points in the two eyes. With the right eye fixating, C is positive when the horopter has greater curvature than the theoretical curve, and negative when it has less curvature than the theoretical curve, or when it is convex toward the eyes; with left eye fixation the signs are reversed.

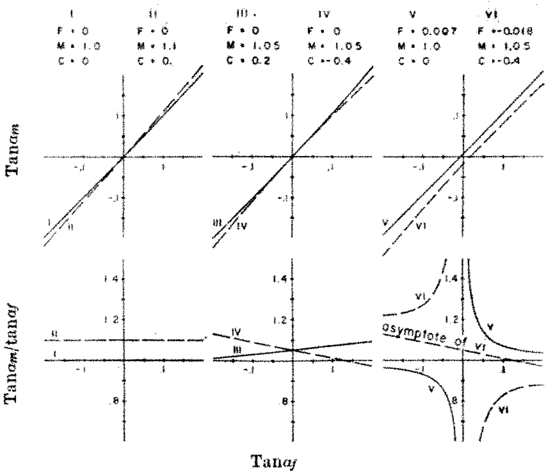

Fig. 2. Bottom, plot of $\tan\alpha_m/\tan\alpha_f = (F/\tan\alpha_f) + M + C \tan\alpha_f$ is comparable to Ogle's (refs. 5 and 6) well-known analysis of horopter data. Simple transformation gives $\tan\alpha_m = F + M \tan\alpha_f + C \tan^2\alpha_f$ (top). The constants F (displacement of horopter from fixation point), M (horopter skew), and C (horopter curvature) are the same in both plots

When F is not zero the plot of Eq. 6 is a hyperbola (Fig. 2, bottom), one asymptote being essentially the ordinate axis, the second asymptote being a straight line with the formula $U = M + C \tan\alpha_f$ (Eq. 7). This straight line becomes the entire curve (a degenerate hyperbola) when F equals zero. In either case the slope of this line gives the curvature of the horopter and M, the ordinate intercept, gives its skew. The hyperbola becomes asymptotic to the ordinate axis in quadrants I and III when F is positive, and II and IV when F is negative. The larger the absolute value of F, the greater is the eccentricity of the hyperbola.

To solve for the constants F, M and C, we have found it more convenient to use the transformed equation (Eq. 8) $\tan\alpha_m = F + M \tan\alpha_f + C \tan^2\alpha_f$. The plot of this equation is a parabola (Fig. 2, top). In this plot, F is the ordinate intercept, M is the slope, and C represents the curvature.

In our model the equation for the spatial plot of the horopter is a third-order polynomial in x and y which is difficult to use in fitting a curve to the data. It is simpler to use instead a pair of parametric equations.

The present experimental apparatus and mathematical analysis may be applied to a wider range of ocular conditions than was formerly possible, yielding comparable constants for the horopter in normal binocular vision, strabismus, and anomalous retinal correspondence. The functional relationship between the two retinas in anomalous correspondence will be reported in a subsequent communication.

This investigation was supported in part by a research grant (No. *B*-2442) from the National Institute of Neurological Diseases and Blindness, U.S. Public Health Service.

EFFECT OF CORTISONE AND RELATED COMPOUNDS ON THE BIOGENESIS OF CARTILAGE

By Dr. M. W. WHITEHOUSE* and Dr. J. W. LASH†

Departments of Biochemistry and Anatomy, School of Medicine, University of Pennsylvania

ADMINISTRATION of cortisone to whole animals has been shown to produce the following effects in connective tissue, including bone and cartilage: (1) Reduction in the metachromatic staining of the 'ground substances', mast cells and matrix of bone and cartilage. (2) Reduced uptake of radiosulphate ($^{35}SO_4^{2-}$) by connective tissues. These investigations, primarily associated with the names of Layton, Dziewiatkowski, Schiller and Asboe-Hansen, have been reviewed recently[1].

It must be stressed that such effects (and those described in this article) are only obtained with relatively high (pharmacological) doses of cortisone and are probably of little physiological significance. They assume greater significance when considered in relation to the undesirable side reactions attending the clinical use of cortisone, hydrocortisone and more potent chemical modifications of these hormones, as anti-inflammatory agents and for treatment of the 'collagen diseases'.

Since connective tissue is rich in mucopolysaccharide sulphates (heparin, chondroitin sulphates, keratosulphate, heparitin sulphates, etc.), it is generally concluded that cortisone depresses the overall production of sulphated polysaccharides in these tissues. This conclusion is scarcely justified by the above evidence alone, concerned as it is only with the metabolism of the sulphate groups (responsible for the metachromasia) of the connective tissue polysaccharides.

Boström and his co-workers[2,3] found that addition of cortisone depressed the incorporation of radiosulphate into slices of costal cartilage suspended in a Krebs–Ringer solution. Under these conditions and in the absence of added glucose and amino-acids, there was no significant synthesis of the polymeric components of cartilage. Boström concluded that cortisone reduced the activity of an enzyme reaction which promoted an exchange between the sulphate groups of the cartilage polysaccharides and the inorganic radiosulphate of the medium.

Other investigations[4] have indicated that cortisone has little effect on sulphate metabolism in the mucin-secreting cells of the gastro-intestinal tract. The mucins formed here contain ester sulphate, associated with the viscous polymeric constituents (mucosubstances). Once synthesized, the mucins are extruded into the gut and, being extracellular, are unlikely to enter into further enzymic exchange reactions with inorganic sulphate. By contrast the polymeric ester sulphates contained in connective tissues, though extracellular, are in more intimate association with the enzymes of cells than are components of extruded mucins. They are thus able to participate in sulphate exchange reactions which may be sensitive to cortisone.

We have now studied the effects of a number of steroid hormones and drugs which exhibit glucocorticoid and anti-inflammatory activities on the biogenesis of cartilage in tissue culture. For comparison, we also observed the effects of some non-steroid anti-flammatory agents upon this system *in vitro*.

Advantages of Tissue Culture

Under suitable conditions, cartilage may be induced to form *de novo* from chick embryonic somites[5]. Using this system, it is possible to study biogenesis of cartilage and its constituents[6]. Cartilage begins to form on the fourth day of culture, following induction. Measurements made at this time and in the subsequent three days primarily record the biogenesis of the cartilage constituents rather than any 'turn-over' of such constituents. Whole animal studies or *in vitro* studies with excised tissues from other than early embryonic sources usually record the sum of the synthetic and degradative processes. The biogenesis of a tissue component may be distinguished, however, from any subsequent turnover when it is first formed *de novo*, as in early stages of tissue cultures which are undergoing morphological and biochemical differentiation.

A further advantage of tissue culture studies is that topical effects of an applied drug or hormone may be readily observed. Such effects will not normally be the consequences of metabolism of the active principle or of mediation through other principles (for example, pituitary-adrenal axis), as they might be *in vivo*. Furthermore, any effects observed will probably be due to the actual concentration of drug or hormone present, added in known amounts to the tissue cultures. Losses and dilutions due to elimination, catabolism or storage in extracellular compartments will be reduced to an experimental minimum.

Methods

Three-day-old chick embryonic somites, when excised and placed in culture, form primarily mesenchymal tissues. If cultured in the presence of spinal cord or notochord, however, nodules of hyaline cartilage are formed[5].

Cartilage formation was therefore induced by placing somites and notochord together on lens paper floating above 1 ml. of nutrient medium (horse serum-embryo extract-balanced salt solution) which also contained $Na_2{}^{35}SO_4$ (5 microcuries)[6]. Added steroids (final concentration, $1 \cdot 5 \times 10^{-4}$ *M*) were emulsified with polyoxyethylene sorbitan monolaurate ('Tween 20'). Equivalent amounts of 'Tween' (800 μgm./ml.) were added to the control cultures. A minimum of ten cultures with each drug or hormone and ten control cultures were set up simultaneously. All cultures were maintained in a humid atmosphere at 37° C. for 6–8 days. The formed cartilage was removed and extracted successively with potassium chloride (made alkaline with potassium carbonate) and then with dilute potassium hydroxide. These extracts contain more than 90 per cent of the chondroitin sulphate present in the cartilage. Little or no keratosulphate was synthesized by this newly formed cartilage[6]. Sulphate ions were

(*d*) chondroitin sulphate(s) extracted from bovine trachea. (Ionophoresis at 23° on Whatman 3 *MM* paper 0·2 *M* sodium borate, *p*H 8·6, 4 hr., with potential gradient of 12 V./cm. Metachromasia was detected by immersion in 0·15 per cent (w/v) thionine in 65 per cent (v/v) ethanol, acidified with 0·1 per cent (v/v) acetic acid. Excess stain was removed with 95 per cent ethanol)

removed by prolonged dialysis of the extracts, after the additions of non-radioactive sodium sulphate. Aliquots were dried, and incorporated sulphur-35 measured by direct counting. The uronic acid content of these dialysed extracts was measured colorimetrically using the carbazole–sulphuric acid reactions[7]. Full experimental details have been given elsewhere[6].

Results with Cortisone and Hydrocortisone

Both these hormones severely depressed the growth of cartilage as observed microscopically. The uptake of radiosulphate into the chondroitin sulphate fraction was also much reduced. However, the amount of non-dialysable uronic acid found in extracts from cartilage grown in the presence of these hormones was not significantly less than that present in extracts of the control cultures (Table 1).

When extracts from the cortisone and hydrocortisone-treated cultures were examined by paper ionophoresis (Fig. 1) it was found that the principal metachromatic component had a lower ionophoretic mobility than mixtures of chondroitin sulphates *A* and *C* extracted from animal cartilage (bovine nasal septa, trachea, chicken costal cartilage, elasmobranch endoskeleton, etc.), but corresponded in mobility to a chemically desulphated[8] preparation of chondroitin sulphate *A* (containing about 2 per cent residual ester sulphate). Extracts from control cultures contained as their principal metachromatic components, chondroitin sulphate(s) with ionophoretic mobilities almost identical with authentic specimens from animal cartilage (15 per cent ester sulphate).

These analytical findings suggest that cortisone and hydrocortisone do not primarily affect the biosynthesis of the polysaccharide portion (chondroitin) of the chondroitin sulphate (containing glucuronic acid and N-acetylgalactosamine) but that they do influence its subsequent sulphation.

Table 1. EFFECT OF SOME HORMONES AND DRUGS ON (*a*) THE INCORPORATION OF RADIOSULPHATE INTO CHONDROITIN SULPHATES (*s*) AND ON (*b*) THE NON-DIALYSABLE URONIC ACID FRACTION EXTRACTED FROM CARTILAGE FORMED *de novo* IN TISSUE CULTURE

Prednisone	10		26
Prednisolone	3 × 10	80	0

* Controls were assigned a value of 100

The deoxyribonucleic acid contents of both the cultures treated with hydrocortisone (or prednisone) and of the control cultures increased by only 30 per cent during the period required for cartilage-formation. The effects of hydrocortisone cannot therefore be explained simply as an inhibition of cell multiplication and loss of viability during this period. This was also directly demonstrated by experiments in which somites and notochord were exposed to hydrocortisone for various intervals less than the four days required for the appearance of normal cartilage in control cultures. When the tissues were afterwards transferred to hydrocortisone-free growth medium, they recovered their capacity to make normal cartilage, took up radiosulphate and formed metachromatic material with the same ionophoretic mobility as chondroitin sulphate.

The following considerations would seem to eliminate one further explanation of our analytical results, namely, that the steroid hormones are activating an enzyme system (chondrosulphatase) which removes ester sulphate from initially formed chondroitin sulphates. Though sought, such a chondrosulphatase has never been described in mammals. Chondrosulphatases have only been reported to be present in some bacteria and certain molluscs[9,10]. When normal cultures were grown in the radiosulphate medium for 5–8 days and afterwards transferred to a medium containing no $^{35}SO_4^{2-}$, the rate of loss of incorporated radioactivity due to subsequent turnover and exchange of the ester sulphate groups was not affected by the presence of cortisone or hydrocortisone in this second medium. The result seems to exclude an activation of any chondrosulphatase enzymes present in the cartilage cultures by these steroids.

Adrenocorticotrophic hormone had no effect on cartilage formation in this system, as might be expected if it is the adrenal corticoids themselves which are pharmacologically active. Other steroid hormones (deoxycorticosterone, progesterone, testosterone, corticosterone) were without measurable effect on chondrogenesis.

Results with Some Synthetic Glucocorticoids

The following compounds were tested: prednisone (Δ^1-cortisone) and prednisolone (Δ^1-hydrocortisone) (Merck, Sharp and Dohme); the 6α-methyl derivative of cortisone, hydrocortisone, prednisone and prednisolone (Upjohn Co.); the 9α-fluoro and 9α-fluoro, 16α-hydroxy derivatives of hydrocortisone and prednisolone (E. R. Squibb and Sons).

All these, with the exception of 6α-methylprednisolone (Medrol), depressed cartilage and chondroitin sulphate synthesis at concentrations of 1·5 × 10^{-4} *M*. They were nearly all as potent as hydrocortisone. In some instances, for example, with prednisolone, 16α-hydroxy-9α-fluorohydrocortisone, they were more active as inhibitors of chondrogenesis. Their inhibitory effects generally paralleled their relative anti-inflammatory properties[11]. Insufficient determinations were made with each drug to assess accurately their relative potencies.

As with cortisone or hydrocortisone, the sulphation rather than the biosynthesis of (unsulphated) chondroitin was primarily inhibited.

Results with some Non-steroid Anti-inflammatory Agents

Potassium salicylate at high concentrations ($1 \cdot 5 \times 10^{-3}$ *M*) greatly depressed chondrogenesis and was remarkably specific in its action. Its close chemical analogues, potassium benzoate and potassium thiosalicylate, were quite without effect at this concentration. Boström and Månsson[2] have previously reported the cortisone-like effect of salicylate on the sulphate exchange reaction in cartilage slices *in vitro*. Further analyses indicated that, as with cortisone, sulphation but not the biosynthesis of the chondroitin was chiefly affected.

Phenylbutazone and cinchophene at concentrations of 3×10^{-4} *M* had no detectable action on chondrogenesis *in vitro*.

Discussion and Conclusions

Cortisone, hydrocortisone and their chemical analogues apparently inhibit the formation of acid mucopolysaccharides in connective tissue, primarily by inhibiting the sulphation of the pre-formed polysaccharide. Hvidberg and Jensen[12] have recently shown that cortisone administration leads to loss of metachromasia and water content in the polysaccharide fraction of mouse skin. After cortisone treatment the average molecular weight of this mixture of polysaccharides was 20 per cent lower than in the controls, but the amino-sugar content was unchanged. These findings suggest that cortisone likewise inhibits sulphation, but not the synthesis, of the polysaccharide portion of polysaccharides *in vivo*. Failure to form normal amounts of the acidic macromolecule (for example, chondriotin sulphate) would in turn affect deposition and orientation of the basic collagen-like proteins of connective tissue. Other properties depending on the presence and maintenance of the acidic sulphate groups on a structural component (serving as natural cation exchanges) such as retention, deposition or movement of ions and water, would also be grossly influenced by cortisone treatment.

Recent work on the biosynthesis of chondroitin sulphates[13–15] indicates that sulphation of chondroitin only occurs at a very late stage in the overall biosynthetic sequence. Incorporation of inorganic sulphate into, and subsequent polymerization of, hexose sulphates seems to be excluded as a major biosynthetic process. Sulphate ions are activated for metabolism by reaction with adenosine triphosphate to form adenosine-3′-phosphate-5′-phosphosulphate (PAPS)[15]. PAPS is formed by extracts of costal cartilage[17], liver[16,18] and hen oviduct[14], which also contain enzymes which will transfer the sulphate group from PAPS to chondroitin and partially sulphated chondroitin[13–15]. We have failed to find any direct inhibition by hydrocortisone or prednisolone ($10^{-4}M$) of PAPS formation or of the transfer of sulphate from PAPS to phenolic acceptors by soluble enzymes from rat liver[18], intestinal mucosa or kidney[19].

The one tissue where cortisone can usefully be applied clinically to suppress inflammation, the eye, normally contains in the cornea significant amounts of unsulphated chondroitin (25 per cent of the total polysaccharides) as a structural component[20]. Is it mere coincidence that in this tissue, where inhibition of sulphation would have the least consequence, cortisone has such a beneficial effect in arresting inflammation and so little undesirable side effect? Here, there would be in essence, anti-inflammatory activity without anti-sulphation activity. This desirable end is found otherwise only with certain non-steroid drugs, for example, phenylbutazone.

We are much indebted to Dr. Karl Meyer for a sample of chondroitin and to Drs. Robert H. Levin, Mary A. Scheri, Josef Fried and John A. Bauer, for supplying the drugs mentioned. This work was supported by grants from the National Institutes of Health (U.S. Public Health Service) and the Helen Hay Whitney Foundation.

INCREASED DIHYDROFOLATE REDUCTASE ACTIVITY AS A POSSIBLE BASIS OF DRUG RESISTANCE IN LEUKÆMIA

By Dr. D. K. MISRA, STEWART R. HUMPHREYS, Prof. MORRIS FRIEDKIN,
Dr. ABRAHAM GOLDIN and ELIZABETH J. CRAWFORD

Department of Pharmacology, Tufts University School of Medicine, Boston, Massachusetts, and
Laboratory of Chemical Pharmacology, National Cancer Institute, Bethesda, Maryland

LEUKÆMIC cells initially sensitive to the action of folic acid analogues develop resistance to inhibition by these drugs[1]. It has been suggested that the decreased efficacy of the antifolates may be due in part to the increased capacity of resistant cells to reduce folic acid compounds to the coenzymatically active tetrahydro-forms[2–6]. This theory is attractive since the antifolates are known to be extremely effective inhibitors of the enzyme system which catalyses the reduction of folic acid to tetrahydrofolic acid[7–10].

In the present investigation dihydrofolate reductase activity has been estimated in tissues of mice with

Table 1. SUB-LINES OF MOUSE LYMPHOID LEUKÆMIA *L*1210 USED IN THIS WORK

All sub-lines were carried in hybrid male mice (*BALB/c An* × *DBA/2J*) F_1. (Referred to commonly as *CDBA*)

8-**Aza-guanine resistant**	8-Aza-guanine treatment of *L*1210	58	none	none	14

antifolate-sensitive and antifolate-resistant sub-lines of mouse lymphoid leukæmia *L*1210. Marked increases of enzyme activity have been found in resistant cells grown for many generations in the absence of the antifolates. The implications of high enzyme-levels are discussed not only in relation to the emergence of resistant cells but also to possible utilization of this activity to achieve lethal synthesis with new kinds of folic acid antagonists.

During investigations on the influence of chemotherapeutic agents against systemic lymphoid leukæmia (*L*1210) in mice, various antifolate-resistant sublines were developed. A summary of information on these sublines is given in Table 1. In addition to the antifolate-resistant sub-lines, an 8-azaguanine variant of leukæmia *L*1210 was also studied. It had been produced by treatment with 8-azaguanine over a number of generations[14]. This variant is cross-resistant to 6-mercaptopurine and shows increased sensitivity to amethopterin[14].

The tissues used were obtained from normal 12-week-old *CDBA* male mice and from mice of the same cross implanted with various lines of antifolate-sensitive and antifolate-resistant lymphoid leukæmia. The tumour tissue was solid tumour which grew at the site of implantation. 8–11 days after inoculation the mice were killed, and the tissues were removed and quick-frozen in beakers submerged in solid carbon dioxide and acetone. One part of frozen tissue (usually the combined material from several animals, Table 2) was homogenized in a Waring Blendor with ten parts of acetone at −20°, collected on a paper filter, washed three times with cold acetone and finally dried at room temperature *in vacuo*. The powders were stored *in vacuo* at 2–4°. Extracts were prepared by mixing one part of acetone powder with ten parts of 0·05 *M* potassium phosphate buffer *p*H 7·5–0·01 *M* 2-mercaptoethanol for 15 min. at 0° and then centrifuging at 10,000 r.p.m. at 4° for 45 min. The supernatant fluid was used for the enzyme assays.

The enzymatic oxidation of reduced triphosphopyridine nucleotide by dihydrofolate was determined by measuring the decrease in absorbance at 340 mμ over a 5-min. period[15]. The complete incubation mixture consisted of 3·0 ml. of 0·05 *M* potassium phosphate buffer *p*H 7·5–0·01 *M* mercaptoethanol, 0·1 μmole of dihydrofolic acid (prepared by reduction of folic acid with sodium dithionite[16]), 0·2 μmole of reduced triphosphopyridine nucleotide and 50 μl. of enzyme extract. The number of millimicromoles of dihydrofolate reduced was calculated from the decrease of absorbance at $\lambda = 340$ mμ on the basis of $\Delta\varepsilon = 11{,}270$ due to the combined decrease of $\Delta\varepsilon = 6{,}220$ (reduced triphosphopyridine nucleotide oxidized to triphosphopyridine nucleotide) plus $\Delta\varepsilon = 5{,}050$ (dihydrofolate reduced to tetrahydrofolate). Protein content was determined by the method of Lowry *et al.*[17]. Each value was corrected for a minor change in absorbance which occurred in the absence of dihydrofolic acid.

The enzyme activity data are summarized in Table 3. A comparison of dihydrofolate reductase activities in the solid tumours which had grown at the site of implantation of leukæmic cells reveals the following: *M46R* (sub-line of *L*1210 which had developed resistance to amethopterin) had four times the activity of the sensitive *L*1210. *M66–3R* (sub-line of *L*1210 which had developed resistance to dichloroamethopterin) showed no increase in activity over that of the sensitive *L*1210. However, *C82A* (sub-line of *L*1210 made doubly resistant to amethopterin and dichloroamethopterin) had more than 29 times the activity of the original sensitive line. Thus when two closely related folic acid antagonists were used in sequence to develop a sub-line of leukæmia which was doubly resistant to both drugs, leukæmic cells emerged with very high levels of dihydrofolate reductase activity. Enzyme induction was probably not involved since high levels of enzyme were maintained in resistant cells grown for many generations in the absence of antifolate.

The enzyme activities of spleens of leukæmic animals were essentially the same as those obtained with the solid tumours. On invasion by leukæmic cells the spleen increased from a normal average weight of 0·1 gm. to 0·5 gm. Thus approximately 80 per cent of the spleen may have consisted of leukæmic cells. The assumption here would be that the leukæmic process had not caused in addition the entrance or proliferation of normal cells. After invasion by leukæmic cells the spleen, which normally

* In five assays the activity was almost zero.
† Average of two assays.

had very little if any dihydrofolate reductase, exhibited markedly increased enzyme activity of the same order as that observed for tumour.

The infiltration of the liver by leukæmic cells, although not as extensive as in the spleen, was also accompanied by an increase of dihydrofolate reductase activity. Again the pattern of activities of the various sub-lines paralleled the tumour activities. If it is assumed that the increased weight of the livers from leukæmic mice (Table 2) is caused by infiltration of leukæmic cells having the same enzyme activity as the cells of the solid tumour, then it is possible to calculate the approximate enzyme activity which can be expected in various samples of leukæmic liver. For *M*46*R* liver the predicted value obtained in this manner was 106 as compared with an actual value of 113 (Table 3). For *C*82*A* liver the predicted and observed values were 544 and 413 respectively.

Attempts to explain the phenomenon of resistance should be tempered with the realization that knowledge of the biochemical basis of resistance gained by study of one type of cell may not be applicable to other kinds of cells. It has been suggested that the major factor in the development of resistant *S. faecalis* is the reduction in the permeability of the bacterial cell to the antifolates[18]. The occurrence of such a change in leukæmic cells has not been definitively established. Aronow has attributed the resistance of mouse fibroblast cells grown in tissue culture to possible changes in enzymes concerned with tetrahydrofolic acid utilization[19].

Table 4. INHIBITORY EFFECTS OF THREE ANTIFOLATES ON DIHYDROFOLATE REDUCTASE ACTIVITIES OF SENSITIVE AND RESISTANT LEUKÆMIAS

Source of enzyme	Uninhibited enzyme	Enzyme + aminopterin $1{\cdot}0 \times 10^{-8}$ *M*	Enzyme + amethopterin $0{\cdot}5 \times 10^{-8}$ *M*	Enzyme + dichloroamethopterin $0{\cdot}25 \times 10^{-8}$ *M*
Normal liver	38	12	18	15
*L*1210 spleen	38	10	11	11
Azaguanine-resistant spleen	43	11	11	12

Amethopterin-resistant spleen, *M*46*R*	106	65	58	83
Amethopterin and dichloroamethopterin-resistant spleen, *C*82*A*	800	700	650	645

Twenty μl. of enzyme extract and 2 16 μl. of inhibitor in 2 per cent sodium carbonate (final concentration of antifolate is shown in the table) were pipetted into 1·0 ml. of 0·05 *M* potassium phosphate buffer, *p*H 7·5, 0·01 *M* 2-mercaptoethanol and incubated at 34° for 3 min. Then 0·07 μmole of reduced triphosphopyridine nucleotide and 0·02 μmole of dihydrofolic acid were added. All activities are expressed as decrease of absorbancy at 340 mμ in 5 min. All values are corrected for optical density changes which occur in absence of dihydrofolic acid and have been multiplied by 1,000 for greater ease of comparison. The 5-min. values for *C*82*A* enzyme are based on optical density changes obtained during the first minute of incubation because the high activity leads to rapid depletion of the substrate

The experimental approach itself could conceivably influence the way a cell becomes resistant to a drug. As emphasized by Nichol and Welch[18], whereas bacterial cells or neoplastic cells grown in tissue culture can be exposed to high concentrations of an antagonist in the test-tube, leukæmic cells in mice can be exposed only to a concentration of drug that can be tolerated by other tissues of the host.

If the inhibition of leukæmic cell growth by amethopterin is due mainly to the inhibition of dihydrofolate reductase, the simplest explanation of resistance would be either an increase of the enzyme or a decrease in permeability to the drug or both. So long as drug-levels *in vivo* are maintained at low levels and cell permeability is not limiting, leukæmic cells with high dihydrofolate reductase activity should have a better chance to survive than cells with low dihydrofolate reductase activity. It is easy to demonstrate with cell-free extracts *in vitro*, where permeability does not play a part, how high levels of dihydrofolate reductase could help to explain resistance. For example, despite inhibition by amethopterin at a concentration of $0{\cdot}5 \times 10^{-8}$ *M*, there was more dihydrofolate reductase activity left in the inhibited enzyme preparation from resistant leukæmic cells than in the uninhibited extracts of sensitive *L*1210 cells (Table 4). This difference cannot be attributed to a change in affinity of drug with enzyme since preliminary kinetic studies with enzyme extracts from sensitive *L*1210 and resistant *C*82*A* spleens indicate that the K_I values with amethopterin for both enzymes are approximately the same, 5×10^{-11} *M*. Recently, Hakala *et al.*[20] and Fischer[21] have reported that amethopterin-resistant cells grown in tissue culture have markedly increased levels of folic acid reductase with no change in drug-enzyme affinity.

If the main site of amethopterin-binding in tissue is the enzyme it inhibits[20–24], and drug ingress is not limiting, then a high extracellular concentration of the drug (relative to the very low dissociation constant of enzyme-inhibitor complex) should result in cells with completely inhibited enzyme. One would expect on this basis alone that leukæmic cells with high enzyme-levels such as in *C*82*A* would sweep up the drug to a point of complete inhibition. In this situation cells with a genetic capacity to produce more enzyme would not necessarily be favoured during a period of selection of drug-resistant cells. Amethopterin at a daily optimal dose-level of 1·0 mgm. per kgm. effectively prolongs the life-span of mice with advanced leukæmia[25]. This dose is equivalent to a calculated peak-level (assuming uniform distribution) in the tissues of 2×10^{-6} *M*, a concentration which should be more than enough to inhibit completely dihydrofolate reductase activity in extracts.

The data in Table 5 show that within 4 hr. after injection of various antifolates into leukæmic mice, the dihydrofolate reductase-levels of the doubly resistant sub-line *C*82*A* tissue were much above the enzyme activity of sensitive cells. During this period the drugs had obviously been absorbed from the site

* Data from Table 3 for comparison.

Antifolates were dissolved in 2 per cent sodium bicarbonate and administered subcutaneously in the axillary region. Four hr. later the mice were killed, tissues removed and assayed as described elsewhere in this article.

of subcutaneous injection, since in a control experiment the enzyme activity was almost abolished in tissues of mice implanted with the antifolate-sensitive azaguanine-resistant variant of *L*1210.

It is concluded that although increased dihydrofolate reductase activity may be an important factor in the development of resistance in the mouse leukæmia sub-lines, equally as important may be a limitation on the entry of the antifolates into the leukæmic cell. That increased dihydrofolate reductase activity cannot be the sole basis of resistance is apparent from our work with the sub-line *M*66-3*R* which had become resistant to dichloroamethopterin without a change of enzyme-level (Table 3). This, however, may be a unique situation associated with certain puzzling properties of the interesting dichloro-derivative.

Experiments with mice show that the optimal therapeutic dose of dichloroamethopterin is approximately 100 times that of amethopterin[26]; yet on the basis of our enzyme work, dichloroamethopterin is approximately 3–4 times as potent a dihydrofolate reductase inhibitor as aminopterin (Table 4). This may be due to a permeability barrier in the leukæmic cell wall to dichloroamethopterin. It is also of interest to point out that cells that had become resistant to amethopterin still showed some sensitivity to dichloroamethopterin. Another example of the uniqueness of dichloroamethopterin is that it produced apparent 'cures' in the mouse leukæmia system whereas aminopterin and amethopterin merely prolong the life-span of leukæmic mice[26]. 'Cured' mice develop an immunity to re-inoculation with fresh leukæmic material[12]. Dichloroamethopterin, despite its similarities to amethopterin, that is, inhibition of dihydrofolate reductase and reversal of its actions in animals with citrovorum factor[26], may owe its therapeutic efficacy to some other locus of action, perhaps the blocking of folic acid entry into cells.

If the resistance in human leukæmia can be shown to be comparable to that found in our work on mouse leukæmia, that is, a marked increase of dihydrofolate reductase occurring in leukæmic cells that have developed resistance to antifolates, then analogues of folic acid which act quite differently from aminopterin or amethopterin should be synthesized. The analogue should have the following properties: rather than inhibiting dihydrofolate reductase, it would act as a substrate for the enzyme. In its oxidized form it should be non-toxic and need not be effective against leukæmic cells that are sensitive to the action of amethopterin. The new agent after reduction should then be capable of inhibiting various reactions involving tetrahydrofolic acid. For example one might seek for a tetrahydrofolate analogue which inhibits the biosynthesis of thymidylic acid, methionine or purines. According to this reasoning, those cells which have become resistant due to an increased dihydrofolate reductase activity could produce more lethal synthesis of a reduced pteridine which could then have the unique property of inhibiting various tetrahydrofolate-requiring metabolic reactions. The new antifolate would not be used until resistance developed and only in situations where the resistance was due to higher levels of dihydrofolate reductase in leukæmic cells. There are at least two examples where resistance appears to be due to the inability of a cell to carry out lethal synthesis, namely, the conversion of 6-mercaptopurine (or 8-azaguanine)[27] and the conversion of 5-fluorouracil[28] to the corresponding nucleotides. The situation envisaged in this article is quite the opposite; resistance would lead to lethal synthesis if the proper antifolate were used only after resistance had occurred.

This investigation was supported in part by a research grant (*Cy*-4167) from the United States Public Health Service.

Existence of Net Electric Charges on Stars

V. A. Bailey[1] has urged that a variety of geophysical and astrophysical phenomena can be explained by a net charge on the Sun of $-1 5 \times 10^{28}$ e.s.u., admitting that this proposal is at variance with some of the "most cherished notions"[2] of theoretical astrophysicists. Attention may therefore be directed to certain deductions from Bailey's hypothesis that are in conflict with unambiguous evidence from observation as well as with what is generally regarded as sound theory.

(1) Bailey suggests two explanations of how the solar charge can be produced and maintained. The first derives from the assumption that neutrinos carry a positive charge in the range between 10^{-15} and 10^{-18} times the electron charge. Now, since the conductivity of the solar material is of the order of 10^{16}–10^{17} e.s.u. (ref. 3), the field created by the leaking of positive charges from the solar core would tend to push electrons off the solar surface at such a rate that there would be no net charge left on the Sun. Accordingly, electrons would have to drift outward, and whether a sufficiently high rate of escape materializes, or fails to, depends on the drift velocity required to compensate the postulated rate of charge production entailed by the nuclear reactions. From Bailey's figures we conclude that less than 1 electron per cm.^{2} and sec. must leave the solar surface. This rate of escape corresponds to a mean drift velocity of free electrons, in the photosphere, for example, of much less than 1 cm./sec., which is a negligible fraction of the average thermal velocity. By the same argument, it follows that this outward current would not stop in the solar corona, or even in interplanetary space. We do not carry this argument forward beyond the confines of the planetary system, since there cannot result a net charge within, say, the Earth's orbit.

(2) Having concluded that the charge production must be so fast that it cannot be compensated by currents, one might fall back on Bailey's alternative explanation and postulate the existence of a poly-dimensional space, such that charge conservation need not hold exactly in our four-dimensional world. The steady-state charge would be determined essentially by the local value of the conductivity and might follow closely the mass distribution. Then, of course, the atoms of the photosphere are moving in an electric field corresponding to a point charge of $-1{\cdot}5 \times 10^{28}$ e.s.u. at the centre of the Sun. This field ought to produce an excessive Stark effect. A simple calculation with well-known formulæ[4] shows that, for example, the numerous Stark components of the H_β-line would spread over 1000 Å., or so. The observed line width is of the order of 1 Å. In particular, and this is the crucial point, in the case of H_β no undisplaced component should be found at 4861 Å. This implication of Bailey's hypothesis is simply not borne out by the solar observations. By the same argument one can rule out electric fields in the chromosphere (flash spectrum) and the corona (ultra-violet emission lines). Hence, Bailey's second mechanism is incompatible with all spectroscopic evidence.

(3) Bailey's hypothesis predicts the wrong polarity for the general magnetic field of the Sun at the present epoch. Even if one agrees with Bailey in regarding the recent reversal of the solar field as the outcome of some intervening process, one may well question the appropriateness of calling this reversal a "secondary effect"[2], inasmuch as the primary effect was predicted with the wrong sign. Neither is it helpful to appeal, in support of his hypothesis, to the fact that for five stars the ratio of magnetic moment to angular momentum was supposed to be constant. It is well known that the early data on magnetic stars referred to are superseded[5]. Rather it has become obvious that the main feature of stellar magnetism is its enormous variability, and there is now little point in appealing to a mechanism which can produce only a constant field.

(4) Bailey's model could be subjected to test by terrestrial experiments. The ionosphere, according to Bailey, shields the Earth from the solar electric field, but not from its magnetic effects. Consequently, if magnetically polarizable particles are accelerated, to nearly the velocity of light, in a direction perpendicular to the radius vector Sun–Earth, in the reference frame of such particles there would exist a magnetic field of about 100 gauss, and it should be possible to measure the resulting polarization. Also, observers travelling by jet planes past the same point in opposite directions, perpendicular to the radius vector Sun–Earth, would record values for the local field differing by 20γ, provided that the direction of flight was so chosen as to make the excess field parallel to the local terrestrial field.

The following comments may be made on the communication by Oster and Philip concerning my article in *Nature*[1] and note in the *Journal of Atmospheric and Terrestrial Physics*[2].

Their introductory paragraph states: "Attention may therefore be directed to certain deductions from Bailey's hypothesis that are in conflict with unambiguous evidence from observation as well as with what is generally regarded as sound theory".

This claim cannot relate to their sections 1 and 2, for these refer only to two subsidiary hypotheses on the origin of the solar charge rather than to the main hypothesis, namely, its existence. At most, the arguments in these sections can lead only to the conclusion that the corresponding hypotheses of origin, H_1 and H_2, are untenable and that the origin of the solar charge remains to be discovered. Thus, so far as these two sections are concerned, the main hypothesis, that the Sun carries a large negative charge, remains intact.

Also, the argument in their section 2 which rules out the existence of strong electric fields below the coronal regions in which ultra-violet lines occur could serve as well to locate the solar charge mainly above these regions as to exclude the hypothesis H_2. This location is consistent with the conclusions given in the addendum to a paper published elsewhere[3].

The assertion made in their section 3, that "Bailey's hypothesis predicts the wrong polarity for the general magnetic field of the Sun at the present epoch", is itself wrong, for the Sun rotates like the Earth from west to east, and so its negative charge would impart to it a magnetic moment which is directed from north to south, with the result that the polar fields of the Sun would have the same directions as those observed by Hale and Langer, and, since 1958, by Harold D. Babcock[4]. This assertion by Oster and Philip could be right only if their phrase "at the present epoch" refers to some period later than the date of Babcock's report.

Their criticism, in section 3, of the original appeal to Blackett's comparison of the mean of five stars with the Sun does not affect the hypothesis on the solar charge; it merely throws doubt on Blackett's conclusion and so removes from consideration the last of the five different astronomical phenomena which the main hypothesis helped to explain.

The experimental tests suggested in their section 4 may be worth making provided that it is borne in mind that the medium surrounding the Earth may act as a partial magnetic screen. But, in accordance with the more recent revised estimate[3] of the solar charge as being about -3×10^{37} e.s.u., their estimate of the polarizing field should be reduced from 100 gauss to about 20 gauss or less and their estimate of the difference between the field intensities recorded by observers in oppositely travelling jet planes should be reduced from 20γ to 4γ or less.

Other experimental tests have been suggested earlier[1,3,5]. The launching, on March 11 last, of the solar artificial satellite *Pioneer* V has now (inadvertently) provided three of these tests. For the findings of the magnetometer of this satellite between March 11 and April 30 have now been published and so may be compared with the predictions, on apparent interplanetary fields, to which one is led by considering alone the hypothesis on the solar charge.

Such a comparison is made in the following communication. There it is shown that from the magnetic findings of *Pioneer* V during the first fifty days of its motion and from the simultaneous magnetic records made at Fort Belvoir (near Washington, D.C.) it is possible to arrive at the following conclusions concerning the quiet-time field vector $\mathbf{B}_q$ and the storm-time field vectors $\mathbf{B}_s$ recorded by the magnetometer in *Pioneer* V: (1) $\mathbf{B}_q$ was perpendicular to the ecliptic; (2) $\mathbf{B}_q$ was very probably directed from north to south; (3) the magnitude of $\mathbf{B}_q$ was about 2·5 gammas; (4) the storm fields $\mathbf{B}_s$ were very probably perpendicular to the ecliptic and directed from north to south, while the peak value of these fields was about 50γ.

The conclusions (1) and (2) agree exactly with the direction and sense of the magnetic field $\mathbf{H}_r$ induced by the motion of a negatively charged Sun relative to an inertial frame attached to the satellite. The conclusion (3) is within a factor of about 50 of the value 130γ for $\mathbf{H}_r$ which is yielded by the revised estimate -3×10^{37} e.s.u. for the solar charge; this suggests that *Pioneer* V may have been surrounded by a diamagnetic cloud of ionized hydrogen. The conclusion (4) promises to be significant in regard to theories of geomagnetic storms.

These conclusions and the discussion in the previous paragraph constitute evidence in favour of the solar charge hypothesis that is at least as cogent as most evidence against it, which is based on long-current views about the physical conditions in extra-terrestrial space or in the Sun. For nearly all such views are the result of combining direct observation from the Earth's surface with current extrapolations of physical theories to large and remote astronomical bodies or regions and it is well known that this practice has more than once led to erroneous conclusions.

With regard to any other astrophysical evidence which may be adduced for or against the solar charge hypothesis, it is essential to apply the present general principle of theoretical physics (which may be extended to include astrophysics and cosmology) that the sole purpose of this subject is "to calculate results that can be compared with observation" (Dirac).

Apparent Steady Component of the Interplanetary Magnetic Field

IN a recent communication, P. J. Coleman, jun., C. P. Sonnett, D. L. Judge and E. J. Smith[1] gave a preliminary report on findings provided by the magnetometer carried by the space probe *Pioneer* V during the first 50 days of operation. For brevity, this publication will be referred to as ref. 1.

In a later publication, P. J. Coleman, jun., Leverett Davis and C. P. Sonnett[2] reported more specifically on "an apparent steady component of the interplanetary magnetic field". This component is also termed a "quiet time field" in ref. 1 which speaks of "The sudden increases in magnetic field strength during solar activity and the apparent existence of a quiet time field perpendicular to the ecliptic".

For convenience, we shall here denote the apparent quiet-time field vector by $\mathbf{B}_q$, the "sudden increases" or storm-time field vectors by $\mathbf{B}_s$ and the total field $\mathbf{B}_q + \mathbf{B}_s$ by $\mathbf{B}$. Also the field variation vectors observed on the Earth's surface during the main phase of a storm will be denoted by $\mathbf{F}_s$.

Although ref. 1 states that the quiet-time vector $\mathbf{B}_q$ is perpendicular to the ecliptic, neither reference states the sense of this vector. As a knowledge of this sense is essential to any theory of the origin of this quiet-time field, I shall present here arguments which appear to show that from the facts stated in refs. 1 and 2 and from the well-established facts concerning the direction and sense of terrestrial storm fields $\mathbf{F}_s$, we may infer that very probably the quiet-time field $\mathbf{B}_q$ is directed from the north to the south of the ecliptic.

These facts may be set out as follows in four groups, 1–4.

(1) The two graphs in Fig. 2 of ref. 1 which give as a function of time the average measured values of $\mathbf{B}_{\perp}$, the field component perpendicular to the ecliptic, and the magnetic *a*-indices recorded at Fort Belvoir (near Washington, D.C., and so in latitude 38° 53′ N.) during the solar event which commenced on March 31 and ended on April 3, 1960. These graphs are strikingly similar throughout and have their main peak values, 50γ and *a*-index 400, near the beginning of April 1.

(2) During this event *Pioneer* V was about 6 million km. distant from the Earth and both were about 150 million km. from the Sun, that is, *Pioneer* V was both well outside the influence of the Earth's magnetic field and near to the Earth within about 4 per cent of the Earth's distance from the Sun.

(3) The terrestrial storm field vectors $\mathbf{F}_s$, at medium and lower latitudes and during the main phase of a storm, are in general nearly parallel to the Earth's magnetic axis and directed from north to south, that is, $\mathbf{F}_s$ is nearly perpendicular to the ecliptic and directed from the north to the south. Also, in such latitudes the storm-time variations in the magnitude of the horizontal component of the Earth's field are in general much larger than those of the other two components (this could perhaps be verified by examination of the records at Fort Belvoir), and so the *a*-index is a statistically consistent measure of the magnitude F_s of the storm-field $\mathbf{F}_s$.

(4) In Fig. 2 of ref. 1 the value of the component $\mathbf{B}_{\perp}$ of the total field $\mathbf{B}$ was never less than the observed magnitude, $2 \cdot 5\gamma$, of the quiet-time field $\mathbf{B}_q$. Fig. 2 of ref. 2 shows that approximately the same fact was observed over the much longer period of 15 days, March 27–April 11, and during 22 other days.

On these four sets of facts we may base the following arguments:

(*a*) By (1), during the period of the solar event the Sun produced simultaneously a magnetic storm field $\mathbf{B}_s$ at *Pioneer* V and a magnetic storm field $\mathbf{F}_s$ at the Earth which vary together quite similarly in time. Since by (2) these two fields occurred in a region with radial dimensions only 4 per cent of its distance from the solar source of these fields it is very probable that they were parallel to one another. It is also probable that they both arose from an apparent parallel field $\mathbf{H}_s$ produced by the Sun throughout this region.

(*b*) By (3) and (*a*) it now follows that very probably $\mathbf{B}_s$ was nearly perpendicular to the ecliptic and directed from the north to the south.

(*c*) Since $\mathbf{B}_q$ was also perpendicular to the ecliptic it follows from (*b*) that $\mathbf{B}_q$ was very probably nearly parallel to $\mathbf{B}_s$. Hence the total field $\mathbf{B} = \mathbf{B}_q + \mathbf{B}_s$ was probably nearly perpendicular to the ecliptic, and so its magnitude would be given by the observed field $\mathbf{B}_{\perp}$ perpendicular to the axis of spin of *Pioneer* V, for this axis is nearly parallel to the ecliptic.

(*d*) If the sense of $\mathbf{B}_q$ had been opposite to that of $\mathbf{B}_s$ the magnitude of $\mathbf{B}$ and therefore also $\mathbf{B}_{\perp}$ would often have become much less than $2 \cdot 5\gamma$. Since this never occurred during the 37 days mentioned under (4), it follows that $\mathbf{B}_q$ always had the same sense as $\mathbf{B}_s$.

(*e*) It follows from (*d*) and (*b*) that very probably the sense of $\mathbf{B}_q$ was from north to south.

We can now summarize, as follows, the interplanetary findings of the magnetometer on *Pioneer* V: (1) The quiet-time field vector $\mathbf{B}_q$ was perpendicular to the ecliptic; (2) $\mathbf{B}_q$ was very probably directed from north to south; (3) the magnitude of $\mathbf{B}_q$ was about $2 \cdot 5\gamma$; (4) the storm fields $\mathbf{B}_s$ produced by the Sun were very probably perpendicular to the ecliptic and directed from north to south. The peak value of $\mathbf{B}_s$ was about 50γ.

In their discussion of the findings labelled (1) and (3) above, Coleman *et al.*[2] refer to the "serious discrepancies between the implications of these observations and present models of the interplanetary field". It is therefore interesting to note that the findings (1) and (2) agree exactly with the direction and sense of the magnetic field vector $\mathbf{H}_r$ set up near the Earth as a result of its orbital motion about a negatively charged Sun. It should also be noted that this theoretical field $\mathbf{H}_r$ was deduced from a general hypothesis about the charges on stars similar to the Sun, which was considered in three papers[3–5] submitted for publication before the launching of *Pioneer* V.

For a comparison of the finding (3) above with theoretical estimates of the magnitude of $\mathbf{H}_r$ reference may be made to the addendum in the third publication[5], where it is shown that the observed quiet-time field is about 55 times smaller than the nearest estimate made without considering the possible diamagnetic effects of any plasmoid in which *Pioneer* V could have been immersed[6].

It is also interesting to note that the largest observed storm field vector $\mathbf{B}_s$ appears to agree in direction, sense and order of magnitude with the theoretical vector $\mathbf{H}_r$, as calculated in the same addendum.

Despite this encouraging partial confirmation of the solar charge hypothesis it is evidently necessary to test it thoroughly by means of magnetometers and electrometers carried in space probes moving in a number of different orbits and using the appropriate Lorentz transformations as well as any theory of electromagneto-ionic media which can be developed for this purpose.

GEOPHYSICS

Palæomagnetic Evidence Relevant to a Change in the Earth's Radius

Interest in the hypothesis that the Earth's radius has increased during geological history has been renewed in recent years because of several sets of independent observations and interpretations. From studies of the deformation of mountain ranges and the distribution of faults and oceans, Carey[1] proposes an increase in the Earth's area of 45 per cent since the Palæozoic era. Heezen[2] similarly interprets submarine topography as indicating that the oceans may be immense rift valleys formed by a pulling apart of the continents as the Earth expanded. Using a different approach, Egyed[3,4] infers a rate of increase of the Earth's radius of 0·4–0·8 mm. per year. This calculation is based on a decrease in the total amount of continental area covered by oceans during the past 400 million years, as determined palæographically. Egyed[4] has also pointed out the desirability of using palæomagnetic data to test this hypothesis.

During the Permian period, the Earth's magnetic field was remarkably steady. Palæomagnetic studies of western European rocks of this age have a high measure of internal consistency, and these western European data, together with the results from a recent palæomagnetic study by Gusev[5] of 1,600 igneous rock samples from Siberia, now make it possible to set some limits for changes in the Earth's radius during the past 235 million years.

In an expansion of the Earth as envisaged by Carey[1], Heezen[2] and Egyed[4], the continents do not increase in area; hence, the distance between any two points on a stable part of one continent remains constant, and as the Earth's radius increases the geocentric angle between the two points decreases. If the configuration of the ancient geomagnetic field is known, then this hypothesis can be tested with palæomagnetic results. In the present analysis a dipole configuration is used; this assumption is reasonable since palæomagnetic studies have firmly established that during the past million years, at least, the geomagnetic field was very closely dipolar when averaged over 10^4 years[6]. No assumption about coincidence of the ancient magnetic and rotation axes is required.

The method used for finding the ancient Earth radius from palæomagnetic data is essentially the one originally used by Eratosthenes in the third century B.C. to obtain the present Earth radius from astronomical data. If contemporaneous palæomagnetic data from two localities on the same stable continental block have different inclinations I_1 and I_2, so that the two localities are on different circles of geomagnetic latitude, and if the ancient geomagnetic field was dipolar, then the ancient Earth radius R may be found from:

$$R = d/[\cot^{-1}(\tfrac{1}{2}\tan I_1) - \cot^{-1}(\tfrac{1}{2}\tan I_2)]$$

where d is the distance measured along the Earth's surface between the two geomagnetic latitude circles[4].

In order to evaluate the Earth's radius during the Permian period, data were analysed from palæomagnetic studies of 16 igneous and sedimentary formations from western Europe and 5 igneous formations from Siberia. Representative sampling areas in western Europe and Siberia are shown in Fig. 1, together with the virtual geomagnetic poles (fictive geocentric dipoles that would give rise to the palæomagnetically measured field direction at each locality) corresponding to the 21 data used in the present analysis. Also shown are other poles based on western European data which could not be used in the present analysis because inclination values were not published. The data analysed include the study by Creer[7] of the Exeter traps, by DuBois[8] on the Mauchline sediments and lavas; the various studies of the Esterel volcanic rocks by Roche[9], Rutten *et al.*[10], and As and Zijderveld[11]; the study by Rutten *et al.*[10] of the trachyandesites of the Oslo graben; that of Armstrong[12] of the Ayrshire kylites; the studies by Nairn[13,14] of the Niedeck porphyry, Montcenis sediments, Saint-Wendel sediments, and Rotliegendes sediments and lavas; and the study by Gusev[5] on five igneous formations from Siberia. Although the geological age of the Siberian formations is subject to some uncertainty, Gusev[5] concludes that their radiometrically determined age of 250 million years is probably correct. This would correspond to mid-Permian on the new Kulp[15] geological time-scale, which incorporates recent Russian radiometric dating results.

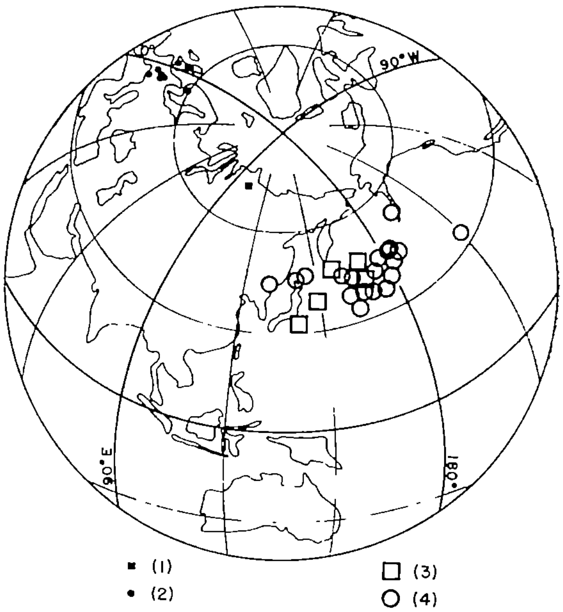

Fig. 1. Virtual geomagnetic poles calculated from western European (4) and Siberian (3) palæomagnetic data, and representative sampling localities in western Europe (2) and Siberia (1)

The method of calculation is by pairing each of the 16 inclinations from western Europe with each of the 5 inclinations from Siberia for a total of 80 determinations of R. To evaluate d for each pair of inclinations, small circles were constructed passing through each sampling locality about the average Permian virtual geomagnetic pole position as the common centre; d is the linear distance on the surface of the sphere between appropriate circles. The average Permian pole position was found by statistically analysing the 21 virtual geomagnetic poles, using Fisher's[16] method.

The average of the 80 values thus calculated for the Earth's radius during the Permian is:

$$R_{\text{Permian}} = 6{,}310 \text{ km.}$$

The standard deviation of individual determinations is 1,080 km. and the standard deviation of the mean (21 independent data) is 230 km. This result is subject to an additional uncertainty if, as is quite possible, the average magnetic pole position moved during the Permian and if the time-intervals spanned by the western European data and those from Siberia are not precisely the same.

Comparing these results with the present Earth radius of 6,370 km., we come to the following conclusions. The average Permian magnetic field, as seen from two sampling areas almost 5,000 km. apart on the Eurasian land-mass, shows no significant departure from the dipolar configuration and is perfectly consistent with a Permian Earth radius equal to the present one. An increase in the Earth's radius as slow as that suggested by Egyed (0·4–0·8 mm. per year or 94–188 km. in the past 235 million years) is neither confirmed nor rejected by the palæomagnetic data now available. Although precise statistical confidence limits cannot be assigned to the mean value of 6,310 km. for the Permian Earth radius, an increase since the Permian as large as the 1,100 km. required to produce a 45 per cent increase in area, as suggested by Carey, appears unlikely.

RADIOPHYSICS

Enhancement of Ionization in the *E*-Layer due to Solar Flares during the International Geophysical Year

INCREASES in the ionization of the *E*-layer have been reported after the occurrence of individual major solar flares[1,2], and an analysis by Bibl[3], for a three-month period in 1950, has shown that all increases in the critical frequency of the *E*-layer of more than about 0·2 Mc./s. above the monthly median value can be attributed to the effects of solar flares. Bibl considered only the deviations of the critical frequency from its monthly median value, and a similar analysis for 8 flares in the period 1951–56 has also been made by Taubenheim[4]. No detailed comparison has so far been made between the critical frequency after a flare and its value before the flare. Recently, in the course of other work, Minnis and Bazzard[5] have examined the hour-to-hour changes in the values of the *E*-layer critical frequency (*foE*) at Slough for the period of the International Geophysical Year. These data have been used to study the changes in *foE* associated with the occurrence of all the flares of importance 2+ and 3 which were listed in the CRPL *F*-Series Bulletins (Part *B*) and which occurred during the period 0800–1500h. U.T.

The value of *foE* for the observation at the hour immediately preceding the commencement of each flare and that for the two succeeding hours were examined in relation to the normal values for these hours. The normal value for each hour of any day was assumed to be that given by the best-fit line drawn through the points on a log *foE*–log cos χ plot for the period 0900–1500h. L.M.T. on the same day. The ratio of the observed to the normal value of *foE* was calculated for each of the three hours mentioned above. For each flare, the ratios for the two post-flare hours were then normalized by dividing by the corresponding pre-flare ratio.

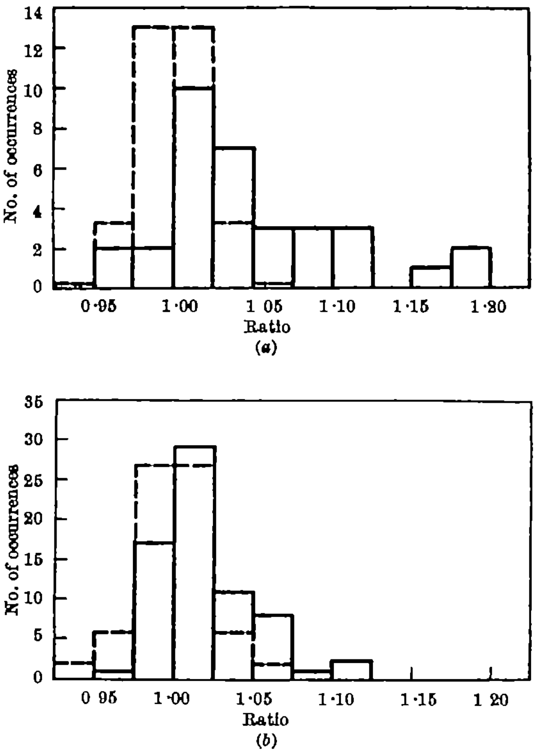

Fig. 1. Distribution of variations in *foE* about its normal value. Full line, up to 2 hr. after a solar flare; dotted line, no flare. (*a*) Class 3 flares; (*b*) Class 2 + flares

The distribution of the normalized post-flare ratios for Class 3 flares is shown in Fig. 1*a*. Twenty flares have been considered which gave 33 post-flare observations of *foE*. Some post-flare observations are not available, mainly owing to the high ionospheric absorption immediately following these flares. Minnis and Bazzard[5] have shown that the standard deviation of the hourly values of *foE* about the best-fit line was approximately 2 per cent at Slough during the International Geophysical Year. The expected distribution of ratios when there are no flares can thus be calculated and is also shown in Fig. 1*a*. Application of the χ^2-test to the distributions shows that the observed increase in the frequency of occurrence of high ratios during the two hours after a flare is significant. A similar result was obtained from an analysis of 41 Class 2+ flares which gave 69 post-flare observations of *foE*. The corresponding distributions are shown in Fig. 1*b*.

The distributions for the two classes of flare are also significantly different from one another. For Class 3 and Class 2+ flares, the mean values of the critical frequency ratios are 1·05 and 1·02 respectively, while the corresponding mean times of the observations are 65 min. and 59 min. after the commencement of the flare. It should be mentioned here that, owing to the extremely high absorption which often persists for a short time after the commencement of a flare, the number of missed observations of *foE* is greater during the earlier part than the later part of the post-flare period. For this reason, the mean ratios quoted above are probably less than they would have been if all the possible observations had been available, particularly for the more important flares.

An attempt was also made to estimate the rate at which the critical frequency returns to normal after a flare. It was not possible to measure this rate accurately as a function of time after the commencement of the flare. However, the mean rate of change of the critical frequency was found to be 3·4 per cent per hour for Class 3 flares and 1·4 per cent per hour for Class 2+ flares during the interval from approximately 25 to 120 min. after the start of the flare; this interval includes about 90 per cent of the observations of critical frequency. These observed rates of change of *foE* correspond to rates of change of electron density which are of the order of a thirtieth of those which would be expected if the layer were recovering normally from a sudden increase of ionization of the magnitude caused by the flares. It is assumed, therefore, that the observed rates of change of *foE* must represent the rate of change of intensity of the ionizing flare radiation incident on the *E*-layer. This conclusion is consistent with Taubenheim's results[4], which were, however, based on a smaller number of observations.

It is concluded from the foregoing analysis that, during the interval from about 25 min. to 120 min. after the commencement of a flare, there is a mean increase in the intensity of *E*-layer ionizing radiation which is at least 22 per cent for Class 3 flares and 8 per cent for Class 2+ flares. The mean rate of decrease of the intensity of ionizing radiation is approximately 15 per cent per hr. for Class 3 flares, and 6 per cent per hr. for Class 2+ flares.

The work described in this communication was carried out as part of the programme of the Radio Research Board and is published by permission of the Director of Radio Research of the Department of Scientific and Industrial Research.

Skip-Distance Ray-focusing in the Ionosphere

During the period March 1–April 6, 1960, the satellite *Sputnik* 3 passed over Britain at heights below 300 km., and on some sixty occasions the 20 Mc./s. signals were received at the Radio Research Station, Slough, when the satellite was close to or beyond the horizon, propagation being by 1/2-hop and 3/2-hop modes as has been reported for earlier satellites[1]. In the 1/2-hop mode the signal is reflected directly from the ionosphere to the receiving point, and, for the 3/2-hop mode, one ground reflexion precedes the ionospheric reflexion. Under these conditions, evidence has been obtained of strong focusing by the ionosphere of waves travelling along paths close to the skip-distance path.

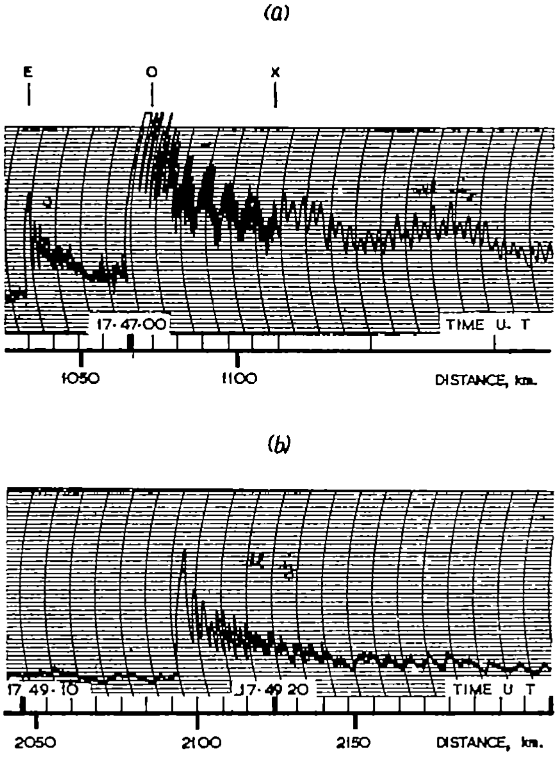

Fig. 1. Examples of skip-distance ray focusing 20 Mc./s. *Sputnik* 3 continuous wave transmissions, March 1, 1960. (*a*) 1/2 Hop; (*b*) 3/2 hop

For example, on near overhead transits, it was noticed that as the signal from the receding satellite began to fade out, a sudden burst of signal-strength occurred, which was often as strong as, and sometimes stronger than, the signal at nearest approach, and was followed by an oscillatory decay as illustrated in Fig. 1. The pitch of the audio-frequency note heard on the receiver due to the beating of the signal with a fixed reference frequency had a warbling characteristic during this period.

Fig. 1*a* shows an amplitude record of one such occurrence. Time marks at 1-sec. intervals are shown, together with the distance to the sub-satellite point. At point *X* the recording paper speed was increased five times. During this transit the satellite passed from north-west to south-east at 200 km. altitude, and the aerial used was a horizontal dipole oriented in a north-west–south-east line. The bursts of signal are attributed to the satellite crossing the 1/2-hop skip-distance boundaries: the first burst (*E*) occurring at the crossing of the boundary for the extraordinary wave, and the second, (*O*), 4 sec. later, at the crossing of the boundary for the ordinary wave. The higher-frequency oscillations (of the order of 10 c./s.) after the main burst are due to interference between the high-angle and low-angle rays, which may be received from a point beyond the skip distance; the depth of these oscillations decreases since the strength of the upper ray diminishes much more rapidly than that of the lower ray.

Appleton and Beynon[2] observed a similar phenomenon in 1946 when receiving fixed-frequency transmissions at Slough from a transmitter in Oslo. In this case events analogous to those described above were produced by the increase of skip distance due to a decrease of F-layer ionization. The theory of skip-distance ray focusing has been described by Bremmer[3], who gives a solution for the case of transmitter and receiver at ground-level, and shows a diagram somewhat similar to Fig. 1*a*. Using approximate ionospheric data obtained at the time of transit, a parabolic model, and the solution of Bremmer, a frequency of 10 c./s. has been calculated for the frequency of oscillation just after the main peak, increasing thereafter, for a transmitter moving away at ground-level with the satellite speed of 7·9 km./sec. The observed frequency is about 4 c./s., rising to 15 c./s. after 10 sec., which is in reasonable agreement with the calculated value. In addition, the record shows an oscillation of about 1 c./s., which is believed to be due to interference between the ordinary and extraordinary wave components.

Signals of the type shown in Fig. 1*a* have been obtained on the majority of close transits, except during the severe ionospheric storm of April 1–3, 1960. On many of the close transits, clear 3/2-hop skip-distance focusing has also been obtained. Fig. 1*b* shows the 3/2-hop peak which followed the 1/2-hop peaks shown in Fig. 1*a*; although two 3/2-hop peaks are usually present, only a single peak was observed on this occasion. In one case a clear 5/2-hop peak was also observed.

These observations provide confirmation of wave interference and focusing phenomena near the boundary of the skip zone, and are in general agreement with a related theoretical analysis of Bremmer.

This work forms part of the programme of the Radio Research Board and is published by permission of the Director of Radio Research of the Department of Scientific and Industrial Research.

PHYSICS

Standardization of Strong Electromagnetic Fields

THE possible harmful biological effects of high-intensity electromagnetic radiation have become of practical importance in recent years with the development of high-power radar and communication transmitters[1]. As a result, several instruments have been designed to measure total flux density in the frequency band 30 Mc./s.–30 Gc./s. (wave-lengths, 10 m.–1 cm.). In general, these devices indicate relative values only, and suitable techniques are therefore required by means of which they can be calibrated. Some comments on this problem are given in this communication.

In principle, standard flux densities of the specified value (1–20 mW./sq.cm.) can be established by radiating a known power from a transmitter under conditions which permit the calculation of the field strength or flux density at the receiver. This method is a convenient one, for example, at frequencies of the order of 10 Gc./s. with a horn-type aerial at the transmitter. If the horn has a gain of, say, 25 db. with respect to an isotropic radiator, a flux density of 10 mW./sq.cm. is produced at a distance of 3 m. (in a wave-front which is very nearly plane) using an oscillator of about 35 W. output. However, at frequencies in the range 100 Mc./s.–1 Gc./s. a similar procedure requires relatively large, directional aerials located well above ground on an open site, and transmitter powers of the order of a kilowatt or more. There is a need, therefore, for a standard laboratory technique operating at frequencies below about 3 Gc./s. and at power-levels of 10–50 W.

Some form of 'guided-wave' system presents an attractive solution to the problem. Apart from the advantages associated with the use of relatively low power-levels, such a technique would reduce possible radiation hazards to operating personnel to a minimum. Experiments have already been carried out at the Radio Research Station with these considerations in mind, and a summary of the basic principles and some preliminary results are given here.

A 'T.E.M.'-type wave is transmitted between parallel brass plates forming a large strip-line (3·5 m. long, 60 cm. wide and 10 cm. apart), terminated in an absorbing load. The input power (10–20 W.) is conveyed to the main structure by means of a 'coaxial to strip-line' transformer, followed by a taper section and a dielectric lens. The arrangement is somewhat similar to that adopted by El-Kharadly[2] for measurements on artificial dielectrics at a frequency of 3 Gc./s. A slotted section with a movable probe enables investigations to be made of the electric field distribution in both axial and transverse directions. An approximate value of the flux density in the parallel-plate section could be derived from a knowledge of the input power, but an indirect method is preferred for precision measurements. The latter technique makes use of a small probe and crystal detector calibrated by reference to a rectangular wave-guide transmitting a known power. If the total power flowing in a rectangular wave-guide propagating the dominant, H_{10}, mode is P watts, then the maximum electric field strength, E, at the centre of the broad face is given by:

$$E = (480\,P\,\pi\lambda_g/ab\lambda)^{1/2} \text{ volts/m.} \qquad (1)$$

where λ and λ_g are the free-space and guide wave-lengths respectively, and a and b are the internal dimensions of the guide in metres. If the voltage output of the probe is V for a field strength E in the rectangular wave-guide, then the same output, V, will be given by the same probe in the parallel-plate system when a flux density W is established, which is given by:

$$W = E^2/120\pi = 4P\lambda_g/ab\lambda \quad \text{W./sq.m.} \qquad (2)$$

The above procedure has been used in experiments carried out at a frequency of 1·2 Gc./s. The voltage standing-wave ratio ($E_{\text{max.}}/E_{\text{min.}}$) in the strip-line, when terminated by a hollow wedge-type load filled with powdered carbon, is 1·1 or less, and the transverse field distribution is approximately uniform. Devices calibrated in the strip-line have included crystal detectors and thermo-junctions surrounded by absorbing material. The results obtained to date suggest that an error of less than ± 1 db. can be expected at frequencies of the order of 1 Gc./s., and experiments are in progress to investigate the method at lower frequencies. In order to avoid the construction of a large rectangular wave-guide, a coaxial line terminated in a non-reflecting load could be used to calibrate the probe detector at frequencies of the order of one or two hundred megacycles per second.

It is important that the perturbation produced in the strip-line by the device being calibrated should be small. This should not often present any serious difficulty, however, since the monitoring devices being developed will normally have a small measuring probe remote from the main indicating equipment.

The work described above was carried out as part of the programme of the Radio Research Board. This communication is published by permission of the Director of Radio Research of the Department of Scientific and Industrial Research.

The 'Ballas' Form of Diamond

THE rare 'ballas' form of natural diamond is referred to occasionally in the literature. Ballas diamonds have been described by various authors as follows: (1) "Dense, globular aggregates of small, radially disposed diamond crystals"[1]; (2) ". . . a very hard, tough, globular mass of diamond crystals radiating from a common center"[2]; (3) ". . . a rare form of natural diamond with radial symmetry composed of apparently spherically grown layers . . ."[3]; (4) "Radial stalk-like formation of diamond crystals, or irregular growths of multiple crystals"[4].

These descriptions allude to the idea that a ballas has some type of radial structure in its crystal arrangement. Recently, I examined a polished section of a ballas with the view of determining its structure, since I could not find a photograph of such a section or imagine precisely what sort of structure would fit the published descriptions. The section was made about 0·5 mm. from the centre of a 0·70-carat stone. After a polishing operation, the stone was etched in molten potassium nitrate for 1 hr. at 700° C. A photomicrograph of the polished surface at 30 × is shown in Fig. 1. Residual scratches from the sectioning step are still visible. The centre of the sphere lies about 0·5 mm. below the × marked on the photograph

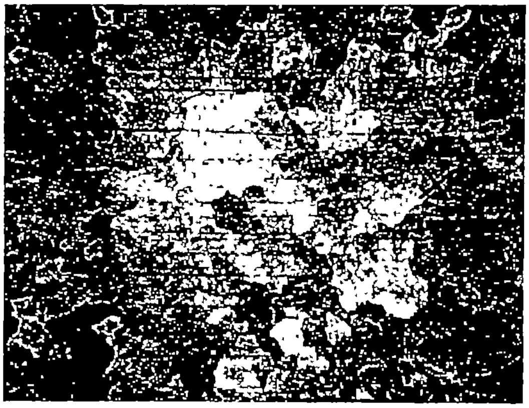

Fig. 1. Polished and etched section of a ballas diamond. (× 30)

Surprisingly, the many crystals making up the ballas do not appear to have any radial geometry. Such geometry should be revealed on a chordal plane so close to the centre of the sphere. This information indicates that previous descriptions are not precise or that the ballas at hand is an unusual variation. Part of description (4) above seems applicable to the findings. The irregularity of the crystal boundaries is an unusual feature of the structure. I should be glad to have any further information on this subject.

Williams, in his classic "Genesis of the Diamond", has shown sections of 'hailstone' bort which seems to fit description (3) above. It seems that 'hailstone' bort and ballas should not be confused as the same types.

Frictional Oscillations

IT is generally considered[1,2] that vibrations excited by friction are due to a variation of friction with velocity, μ decreasing with increasing velocity, and in some cases (unpublished work) this is so. Vibrations in sliding systems can, however, be excited by other mechanisms. Consider a rigid strut $O'P$ held in an elastic pivot O' which in turn is attached to another strut $O'O''$, the pivot O'' being stiffer than O' (Fig. 1).

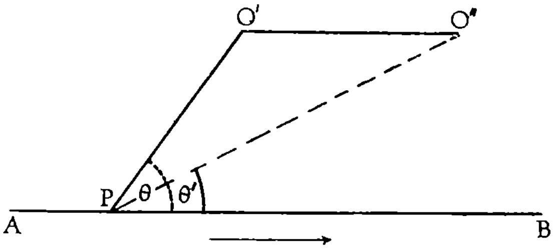

Fig. 1

The surface AB is moving past P in the direction shown and the coefficient of friction of the tip P is μ. The force F at P is given by $F = \mu L/(1 - \mu \tan\theta)$; so if $\mu = \cot\theta$, F is very large and 'spragging' occurs, that is, there is no slip between P and the moving surface AB. P is therefore displaced elastically in the direction of motion and θ increased slightly. As AB continues to move the elastic moment at the pivot O' opposing further deflexion of $O'P$ eventually becomes so large that $PO'O''$ becomes equivalent to a rigid strut $O''P$, O'' becomes the pivot point and θ is reduced to θ'. F falls accordingly so that the elastic energy stored in O' takes over and tends to swing P off the surface and slip occurs. The strut $O'P$ is therefore set vibrating and the surface AB is subjected to a periodically varying tangential force, and if AB is of suitable dimensions and elastic properties it can be set oscillating. Provided they are suitably mounted, solid bodies can be made to vibrate by a similar mechanism to the system of struts.

This sprag-slip motion can be demonstrated in several ways. If a strut OP pivoted in a rigid mount at O' is slid against a surface AB, $F=\mu L/(1-\mu\tan\theta)$ for values of $\cot\theta>\mu$; at $\cot\theta=\mu$ the strut breaks. If there are two pivot points $O'O''$, stick slip occurs at $\cot\theta=\mu$ and the oscillations of $O'P$ and $O'O''$ can be demonstrated with dial gauges or by moving smoked glass plates against probes attached to the struts. A very simple demonstration is to move a pencil held lightly at its extreme end and at its spragging angle across a sheet of paper.

The manner in which the exciter can set up vibrations in the opposing body can be demonstrated by holding a thin sheet of material edgewise against a rotating telephone bell. If the sheet is held at the spragging angle it is set in vibration and the bell emits a loud screeching sound. This sound contains a large number of harmonics, the vibrations are nonlinear and their frequency is determined by the natural frequency of the vibrator as well as that of the bell. In certain circumstances elastic deflexions in the bell itself reduce the friction force; the vibrations are then confined to the bell, which emits a loud relatively pure note. The frequency of this sound is almost the same as that of the sound emitted when the bell is struck.

Excitation Functions of (d,α)- and (d,αn)-Reactions on Natural Tungsten

By irradiation in the Amsterdam cyclotron of natural tungsten with 22-MeV. deuterons, three species of radioactive tantalum were observed due to the following reactions: ^{184}W(d,α)^{182}Ta, ^{186}W(d,α)^{184}Ta and ^{186}W(d,αn)^{183}Ta.

The chemical separation of these nuclides was performed by selective liquid–liquid extraction with di-*iso*butylketone in hydrofluoric – hydrochloric acid medium in the presence of tantalum carrier[1].

Absolute tantalum activities were determined by means of a calibrated end-window Geiger tube. The results appeared to be in excellent agreement with those obtained with a 4π proportional counter.

The maximum deuteron energy of the cyclotron was computed by fitting an experimental relative excitation function of the ^{27}Al(d,αp)^{24}Na reaction with those obtained by Batzel *et al.*[2] and Moeken[3]. The maximum energy appeared to be 22 MeV.

The beam intensity was computed from the same reaction at the maximum deuteron energy, as absolute cross-sections for this reaction are also accurately known.

The cross-sections for the three reactions under consideration as a function of deuteron energy were computed from the measured tantalum activities, after adequate corrections for chemical yield, decay and counting efficiency of stacked tungsten foils irradiated in the internal beam of the Amsterdam synchro-cyclotron. The deuteron energy in each foil was calculated from the range–energy curve of tungsten computed from the Bethe–Livingstone equation[4]. The results are summarized in Table 1.

GEOLOGY

Geology of the Floor of the Bristol Channel

A geological survey of the floor of the Bristol Channel was made from R.R.S. *Discovery II* between April 22 and May 2, 1960, using asdic[1–3] and bottom sampling equipment. Preliminary results are summarized in the accompanying map (Fig. 1). The northern part of the Channel is floored with superficial deposits except around Caldy Island. In the southern part there are extensive areas of exposed rock.

Upper Palæozoic rocks outcrop continuously from Hartland Point to Lundy Island. They include slates and quartzites, and the asdic records show a strong lineation orientated a few degrees north of west, which in some places appears to be bedding. The granite of Lundy Island does not extend more than a mile to the north, or half a mile to the south of the Island. We could not approach close to the east or west coasts on account of the sand banks, but believe that the outline of the Island corresponds closely to the boundary of the granite: no dykes were recognized near the Island.

Many west-north-west to north-west lineations were recorded by the asdic from the Upper Palæozoic rocks west of Ilfracombe, while eastward for 3 miles north-easterly lineations were found. At the Horse-shoe Rocks, a shoal surrounded by Upper Palæozoics about 4 miles north-west of Ilfracombe, we dredged dark green basic igneous rock comparable to a metamorphosed spilite. Skin divers have not yet established whether the spilite outcrops here, or whether it is derived from a superficial deposit.

Fig. 1

From the Holms westward to beyond Ilfracombe the floor of most of the channel is composed of Liassic rocks lying nearly horizontal: these approach very close to the southern shore west of Minehead. In some places there is New Red Sandstone between the Upper Palæozoics and the Lias, but a continuous strip of New Red Sandstone is not proved.

Two asdic reconnaissance lines run between Steep Holm and Flat Holm suggest that the intervening channel is floored by Mesozoic rocks, so that these Carboniferous masses were already isolated in Mesozoic times, as supposed by Strahan and Cantrill[4].

Between Lundy Island and Pembrokeshire the superficial deposits are continuous, except for Palæozoic outcrops near the Welsh coast. Westward extension of the Mesozoics to connect with the outcrops off north Cornwall reported by Day[5] is therefore unproved, but if such a connexion exists it must lie to the north of Lundy.

Detailed analysis of the findings is in progress and will be published elsewhere at a later date.

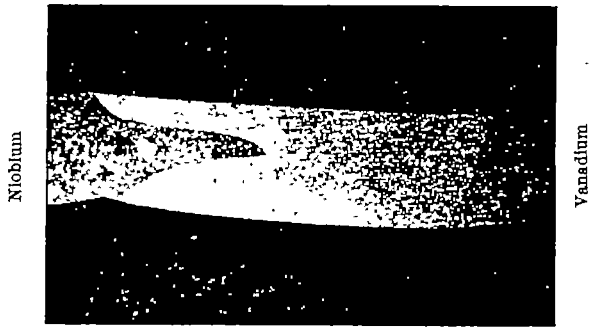
METALLURGY

An Unusual Feature of the Fusion Welding of Niobium to Vanadium

Theilacker, Baugh, Kasburg and Stermon[1] observed apex-shaped boundaries between the fusion zone and parent plate in zirconium–hafnium welding, but offered no satisfactory explanation.

During some recent investigations into the fusion welding of niobium to vanadium, a similar but more pronounced effect was noticed at the boundary between niobium and the fusion zone. This 'tongue effect' is illustrated in Fig. 1.

A micro-hardness traverse carried out through the tip of the tongue showed that there was no gradation in hardness as the boundary was approached on either side. The change in hardness was sudden and a



Niobium
Vanadium

Fig 1. Plate 1/16 in. thick

constant level persisted on both sides of the interface. The niobium parent plate had a hardness of 140 V.P.N. and the fusion zone had a hardness of 350 V.P.N. This indicated that there was virtually no diffusion layer showing a gradual fall of vanadium content in the solid niobium, but an extremely sharp division between the niobium and the fusion zone material. The same hardness conditions applied to the vanadium side of the weld.

Micro-hardness tests carried out across the tip of the tongue and parallel to the interfaces gave results in keeping with the above conditions.

The sectioning of further specimens has shown that at electrode traverse-rates of 4–5 in. per min., and given currents, or similarly at currents as low as 40 amp. and given traverse-rates, the tongue was much more blunt and under-developed. As the current increased or the traverse-rate decreased there was a definite trend from the blunt form to the sharp form of Fig. 1. In addition, it was noticed that at the start of a weld, it was necessary to melt vanadium first before the niobium became molten, at the currents used, and in fact a true bond would not form until the vanadium had run into the niobium and formed an alloy. Once this had happened welding appeared to continue normally. Thus it would seem that the temperature of the fused metal was below the melting point of niobium (2,420° C.) but above that of vanadium (1,860° C.). It was found also that in order to weld niobium to niobium, 30 per cent higher currents were required than to weld vanadium to vanadium for a similar bead width. This would be expected, when considering melting points and conductivities of the two metals.

Thus the evidence suggests that the blunt tongue is an early stage in the development of the sharper outline. This sharp contour was reached fairly quickly in the series and then was a constant feature. For example, a current of 70 amp. was used in the series of welds where traverse-rates were varied from 4 in. per min. to ½ in. per min. At a rate of 4 in. per min. the tongue was only partially formed, but at 2½ in. per min. it was complete.

It is considered that the mechanism of formation of the tongue is one of dissolution of niobium in weld metal.

A more complete treatment of this aspect will be published elsewhere.

Effect of Air Pressure on the Fatigue of Lead and Aluminium

It is known that the fatigue strengths of lead and aluminium are affected by the presence of the atmosphere during fatigue stressing[1–4]. The present communication reports the results of experiments on the dependence of the fatigue life of lead and aluminium on air pressure at room temperature, 22° C.

Specimens were prepared from high-purity rolled strip (99·999 per cent lead, and 'super pure' aluminium), and, after annealing, were fatigued in reverse plane bending at the rate of 500 cycles/min.

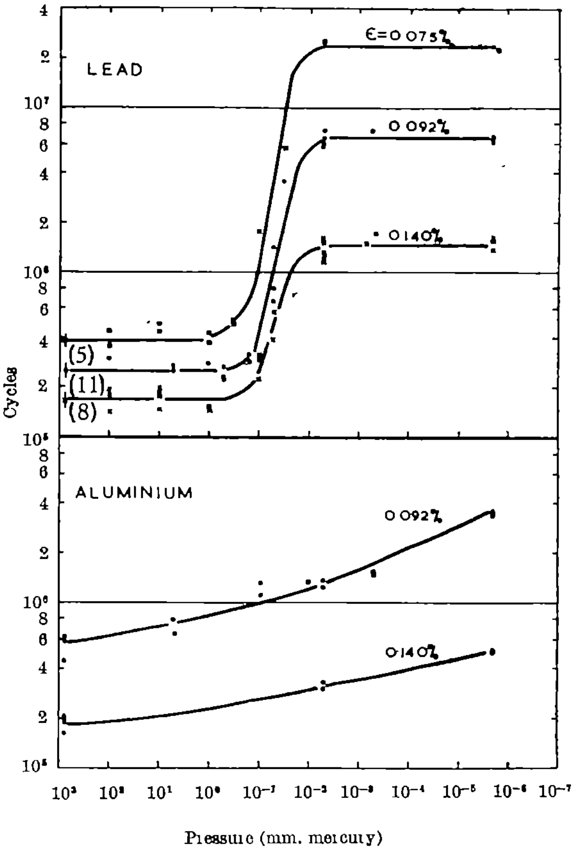

Fig. 1. Variation of log fatigue life with log air pressure. In the top figure (for lead) the figures in brackets refer to the number of specimens tested at normal atmospheric pressure; all other points are plotted

The influence of air pressure on the fatigue life at various constant strain amplitudes is shown in Fig. 1. The curves for aluminium indicate a steady increase in life with decrease of air pressure which is in agreement with the dependence on air pressure of the fatigue life of aluminium and copper found recently by Wadsworth and Hutchings[3].

In contrast, each of the three curves shown for lead displays three distinct ranges: (*a*) a high-pressure range in which the life is constant (atmospheric pressure to approx. 0·15 mm. mercury); (*b*) an intermediate range in which the life increases rapidly with decreasing pressure (approx. 0·15–5 × 10^{-3} mm. mercury); and (*c*) a low-pressure range in which the life is unaffected by further reduction of pressure (approx. 5 × 10^{-3}–2 × 10^{-6} mm. mercury). The stepped form of the curves for lead is thought to be associated with specific changes in the nature of the fatigue deformation produced by variations in the rate of reaction between the gas and the metal at different gas pressures. For example, in the high-pressure range (*a*) specimens failed by intercrystalline cracking whereas in the low-pressure range (*c*) the intercrystalline cracking was suppressed and failure occurred by extensive slip deformation[4]. On the other hand, in the case of aluminium[3], it appears that the presence of the air only affects the rate of propagation of cracks and does not affect the type of cracking. However, it may well be that the fatigue behaviour of aluminium at elevated temperatures would show a closer resemblance to that of lead at room temperature and, conversely, that the fatigue behaviour of lead at liquid-air temperature would show a closer resemblance to that of aluminium at room temperature.

This work formed part of the research programme of Broken Hill Associated Smelters Pty. Ltd. and was carried out under the supervision of Prof. J. Neill Greenwood, to whom thanks are due for helpful discussions.

RADIATION CHEMISTRY

Labelling of Organic Compounds by Mercury-photosensitized Reaction with Tritium Gas

The widely employed Wilzbach's tritiation method is based on the exchange reaction between an organic substance and tritium gas induced by radiation from several curies of T_2 (ref. 1).

In order to increase the exchange-rate and to reduce the amount of tritium required, several techniques have been developed which employ an external energy source for promoting the labelling process: electrical discharges[2-5], γ-rays[6], microwaves[5] have been used. Recently[7] the tritiation of two polymers by ultra-violet irradiation in the presence of tritium has been described.

We report here a simple labelling technique, based on the mercury-photosensitized exchange between tritium gas and an organic compound, which, in principle, allows the tritiation of all the substances, including those which do not absorb in the ultra-violet region. In using this method, a silica ampoule containing the organic sample and tritium gas, with a small amount of mercury, is irradiated at room temperature with a low-pressure mercury lamp. The energy of the 2537 Å. resonance line is absorbed by the mercury vapour which, as pointed out by Kaplan[8] in a detailed study on the reaction of unsaturated hydrocarbons with tritium, causes the excitation and the dissociation of both tritium and organic molecules.

Table 1

Compound	Run No.	T_2 activity (mc.)	Irradiation time* (hr.)	Specific activity in pure compound (mc./gm.)	Total activity in pure compound (mc.)
Toluene	1	10±2·5	120	1·78±0·01	1·58
Toluene	2	10±2·5	96	0·730±0·006	1·26
Toluene, blank†	—	10±2·5	—	0·0053±0·0002	—
*Cyclo*hexane	3	10±2·5	120	0·223±0·002	0·356
*Cyclo*hexane, blank†	—	10±2·5	—	0·0005	—

* The irradiations were performed at 25° C., tritium gas employed having been diluted with pure hydrogen.

† In the blank runs the tritium gas and the hydrocarbons were in contact for a period of 120 hr. without ultra-violet irradiation.

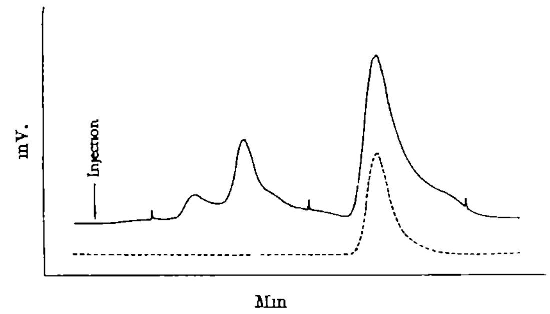

Fig. 1. Gas chromatographic (- - -) and radiochemical (——) analysis of crude, tritiated toluene. Carrier-free by-products, possibly hydrogenated toluenes, are detected from their radioactivity

The interaction of the reactive entities produced in this primary process ensures, among other reactions, an efficient tritium exchange including those cases where the organic compound does not exhibit absorption bands in the ultra-violet region. The application of the above technique to the preparation at tritiated toluene and *cyclo*hexane is briefly described. Table 1 summarizes the experimental conditions employed and the activity found in the pure, tritiated hydrocarbons.

A low-pressure model *NK* 20/40 Hanau resonance lamp was used for all the irradiations. A simultaneous gas-chromatographic and radiometric analysis of the crude toluene and *cyclo*hexane demonstrated the presence of several carrier-free radioactive by-products (Fig. 1).

An efficient radiochemical purification of the tritiated substances was achieved by preparative-scale gas chromatography. Columns 3 m. long, packed with di-*n*-decyl-phthalate on 'Celite *C*22' were employed, using nitrogen as carrier gas. The column temperature was 85° C. for the toluene and 70° C. for *cyclo*hexane.

The gas-chromatographic steps were repeated until a simultaneous mass and activity analysis failed to detect radioactive contaminants in the purified samples, the activities of which were measured in 250 ml. ionization chambers, connected to a vibrating-reed electrometer, as described by Wilzbach, Kaplan and Brown[9].

The results in Table 1 demonstrate that comparatively high percentages of the T_2 activity have been incorporated into the labelled compounds, including *cyclo*hexane, which does not absorb in the ultra-violet region.

To evaluate the efficiency of the present method, it may be pointed out that, with Wilzbach's technique, an activity of at least 500 mc. of T_2 must be employed to introduce the same tritium activity into pure toluene, in an equal exchange time. In this way, the higher efficiency of the mercury-photosensitized exchange method allows the preparation of labelled samples with a considerable saving of tritium activity and/or exchange period.

From the preliminary results obtained, it seems that the simple method described could be usefully employed as a general technique for the labelling of organic compounds.

Two mechanisms are conceivable to explain the mercury photosensitized exchange:

(1) Excitation and dissociation of gaseous tritium by $^3P_1$ mercury atoms, the energy of which is sufficient to dissociate the T_2 molecules; the tritium atoms can afterwards react with the organic substrate; (2) excitation and dissociation of organic molecules which can interact with tritium atoms or molecules.

More detailed information will be given later.

We are indebted to Prof. G. Giacomello for the helpful discussions.

A 'Dry' Mounting Autoradiographic Technique for the Localization of Water-soluble Compounds

ONE of the disadvantages of the stripping film autoradiographic technique is that the film is floated on a water surface and apposed to the radioactive material by dipping the slide into the water and picking up the film so that its under surface (the emulsion layer) is in direct contact with the specimen. During this mounting procedure (called here the wet technique) and subsequent drying period, which may be several hours, there is opportunity for water-soluble compounds to diffuse out of the specimen, or to leave their original site and be absorbed elsewhere[1,2].

In an attempt to define the metabolic pathway of labelled precursors of deoxyribonucleic acid using either phosphorus-32 or tritium compounds, it became apparent that the soluble intermediates were, in fact, readily lost during the conventional autoradiographic procedures. The use of vacuum drying, freeze substitution or other methods of cell fixation did not prevent a considerable loss of phosphorus-32 from nuclei afterwards placed in aqueous solutions; autoradiographs of nuclei using these methods of fixation and the wet autoradiographic technique revealed some isotope definitely associated with nuclei, but much more was randomly distributed throughout the extranuclear portion of the smear. In some cases, there was relatively little radioactivity evident in the emulsion above the smear, but more encircling it, suggesting by the pattern that diffusion of isotope from the smear had occurred.

A direct mounting of dry, rectangular (1·5 × 3·5 cm.) strips of autoradiographic stripping plate (*AR.* 10) (Kodak, Ltd.) film emulsion to smears of nuclei from rat thymus glands on histological glass slides was achieved by the simple process of chilling the specimen in a refrigerator at 0–5° for 2–3 min., removing the specimens to the high humidity of the dark room, and immediately fixing the stripped emulsion to the specimen slide by firm even pressure with the thumb. It is assumed that the precipitation of a slight amount of moisture on the cold slide together with the pressure and warmth of the thumb permitted the firm bonding of the stripping film emulsion to the specimen and the slide which had been previously coated with gelatin ('subbed'[1,2]). Even without chilling the slide it was possible to mount dry emulsion to slides of nuclei by heavy thumb pressure although more artefacts were noted with this method.

To avoid the possibility of radioactive contamination of the specimen by the thumb, pressure can be applied to the dry film by means of a large cover-slip or another glass slide.

The direct 'dry' mounting gave rise to firm bonding of the film and specimen so that the film withstood photographic processing and staining procedures and remained tightly bound.

Rat thymus nuclei were prepared in ionic and sucrose media[3]. They were fixed either by rapid lyophilization in a desiccator or by freezing in *iso*-pentane at liquid-nitrogen temperature and dehydrating in ethanol at solid carbon dioxide temperature for 3–7 days[4]. The latter were mounted by allowing the slide to warm at room temperature for a minute or two until most of the alcohol had evaporated and then fixing the dry film emulsion directly to the smear with thumb or cover-glass pressure. The lyophilized smears were chilled and the emulsion similarly applied.

By this direct dry mounting technique we have been able to show the presence of phosphorus-32 mainly in the nuclei and less in the extranuclear area of the smear whereas the standard wet mounting procedure revealed a diffuse distribution of radioactivity throughout the smear regardless of whether formalin or Bouin's fixative, vacuum drying, freeze-substitution, oven (90°) or room temperature fixation was used. Autoradiographs of nuclei from rat thymus gland after intramuscular injection of ^{3}H-deoxycytidylic acid showed more emulsion grains over the nuclei at 10 and 30 min. after injection than did corresponding nuclei prepared by the standard wet mounting process. Redispersion of nuclei in ethanol after isolation in sucrose or ionic media and 'dry' mounting also resulted in a higher nuclear than extranuclear concentration of phosphorus-32 when compared to the oven or room temperature drying or vacuum dehydration followed by wet mounting. The resolution attained by the use of tritium was not impaired[5].

Attempts are now being made to apply the 'dry' mounting technique to tissues fixed and cut in the cryostat[6,7] and to those cut in the cryostat and dehydrated by freeze-substitution methods[4].

Since satisfactory autoradiographs have been obtained by this dry mounting technique, it is likely that the method may also prove useful in similar work with other cell components.

A more complete account of the results given by this method will be described elsewhere. Our thanks are due to the Rockefeller Foundation for financial

assistance and to the Commonwealth Fund for a research fellowship to one of us (P. J. F.).

CHEMISTRY

Rates of the Reactions of Nitrogen Atoms with Oxygen and with Nitric Oxide

The reactions of nitrogen atoms with oxygen and with nitric oxide are of considerable interest, since whereas both processes (1) and (2) are exothermic:

$$N + O_2 = NO + O \quad \Delta H^0 = -32{\cdot}8 \text{ kcal./mole} \quad (1)$$

$$N + NO = N_2 + O \quad \Delta H^0 = -75{\cdot}1 \text{ kcal./mole} \quad (2)$$

the former reaction is very slow at room temperature, while the latter is extremely rapid. Kistiakowsky and Volpi[1] obtained a value of 2×10^{13} exp(-6200/R.T.) cm.^{3} mole^{-1}sec.$^{-1}$ for k_1 from a mass spectrometric investigation of the reaction between nitrogen atoms and oxygen molecules in a stirred reactor between 390° and 520° K. while a value of $1{\cdot}7 \times 10^{13}$ exp($-7{,}500$/R.T.) can be obtained from Kaufman's[2] work on the oxygen-sensitized decomposition of nitric oxide between 1,500° and 1,700° K. No direct determination of k_2 appears to have been reported, although values of 2×10^{11} (ref. 3) and a lower limit of 5×10^{13} cm.^{3} mole^{-1}sec.$^{-1}$ (ref. 1) have been recorded.

In the present work, we have studied the reaction between nitrogen atoms and oxygen molecules in the temperature range 412–755° K. Active nitrogen containing about $\frac{1}{4}$–$\frac{1}{2}$ per cent nitrogen atoms was produced by passing highly purified nitrogen through a 20 Mc./sec. electrodeless discharge. Active nitrogen flowed from the discharge through a 19 mm. internal diameter quartz reaction tube enclosed in an electric furnace. This tube had four sealed-in mixing jets spaced at 30-cm. intervals. Oxygen at known flow-rates was introduced at the first jet, and the decay of the nitrogen atom concentration along the tube was determined by titration of the nitrogen atoms at the three downstream jets, and at the first jet (before addition of oxygen). In the titration method[1,4–6] the end-point is observed as a sharply defined extinction point between the blue nitric oxide β-emission and the green air afterglow continuum with increasing nitric oxide flow-rate. This titration 'end-point' was taken to occur at the same nitric oxide flow-rate as the minimum current of a photomultiplier which observed the light emitted from the flowing gas downstream from the fourth jet. The nitrogen atom flow-rate was equal to that of nitric oxide at the end-point.

It was found that the rate of removal of nitrogen atoms was first order with respect to both nitrogen atom and oxygen molecule concentration and that two nitrogen atoms were removed for each oxygen molecule reacted, since reaction (2) is much more rapid than reaction (1). In this way a velocity constant of $8{\cdot}3 \pm 1{\cdot}0 \times 10^{12}$ exp($-7{,}100 \pm 400$/R.T.) cm.^{3} mole^{-1}sec.$^{-1}$ was determined for k_1 over the temperature-range 412–755° K. The rate constants calculated from this expression agree with the rates observed by Kistiakowsky and Volpi[1] and by Kaufman[2] to within the combined experimental errors of the observations.

At the higher temperatures used in our experiments and at high oxygen flow-rates (5–50 times the nitrogen atom flow-rate) a weak air afterglow spectrum was observed, and since this is known[7] to be due to the radiative process $NO + O = NO_2 + h\nu$, nitric oxide as well as oxygen atoms must be present in the reaction products. Under these conditions the rates of reactions (1) and (2) are more nearly comparable than at the lower temperatures and oxygen flow-rates used in the study of the kinetics of the overall reaction, and an appreciable amount of nitric oxide remains when all the nitrogen atoms have been consumed. The concentration of nitric oxide in the effluent gas was always less than 10 per cent of the initial nitrogen atom concentration, and it can be shown that in these circumstances the concentration of nitric oxide produced (y_0) is given by $y_0/b = k_1/k_2$, where b is the concentration of oxygen. The small amount of nitric oxide formed does not decay appreciably along the reaction vessel since the slow reaction (3):

$$NO + O + M = NO_2 + M \qquad (3)$$

is followed by the rapid reaction (4) which regenerates NO from NO_2:

$$O + NO_2 = NO + O_2 \qquad (4)$$

The amount of nitric oxide in the effluent gas (typically 0·05 per cent of the total flow) cannot be determined by conventional analytical techniques, and the following method was adopted. It is known that the intensity of the air afterglow is directly proportional to the concentrations of nitric oxide and oxygen atoms, and is independent of inert gases, and in runs where the oxygen flow-rate is varied the relative nitric oxide concentrations are given by the corresponding light intensities observed by the photomultiplier since the flow-rate of oxygen atoms produced is independent of the flow-rate of molecular oxygen used (always a large excess). The photomultiplier was calibrated to read directly in nitric oxide flow-rate by observing the enhancement of the light intensity when nitric oxide (diluted with nitrogen) was added to the reaction system at known flow-rates between the point of oxygen addition and the photomultiplier. For constant oxygen flow-rate, the photomultiplier current plotted against the flow-rate of added nitric oxide–nitrogen mixture gave a straight line, the slope of which was independent of oxygen flow-rate; and hence the small decay of oxygen atoms between the mixing point and the photomultiplier was roughly the same for all oxygen flow-rates used here. Making a small correction for the photomultiplier dark current, values of the effluent nitric oxide concentration (y_0) were thus obtained in runs where the flow-rate of oxygen (b) was varied. Plots of y_0 against b gave satisfactory straight lines with slopes equal to k_1/k_2. Nitric oxide flow-rates down to 3 mμmoles/sec. were measurable with good accuracy by the technique described.

k_2 was determined as $3\cdot0 \pm 0\cdot6 \times 10^{13}$ exp$(-200 \pm 700/\text{R.T.})$ cm.^{3} mole^{-1}sec.$^{-1}$ over the temperature-range 476–755° K. Thus, a direct determination of a velocity constant equal to about one-fifth of the bimolecular collision-rate has been made. The difference between the two frequency factors of reactions (1) and (2) appears to be greater than the combined errors of the determinations. This difference is of interest, since it cannot be explained on statistical grounds.

A full account of this work will shortly be submitted for publication. We thank the Department of Scientific and Industrial Research for a grant to one of us (M. A. A. C.).

Use of the Mercury Drop Electrode Method for Direct Evaluation of Minute Amounts of Lead in Urine

For the diagnosis of the degree of lead poisoning the determination of lead in urine is very important although not easy. In the case of chronic poisoning the amount of lead in urine is not much larger than in normal urine samples, in which the lead concentration is very low (up to 80 γ/l.). Therefore the direct determination of lead in freshly voided urine without decomposition of the sample by ashing or by digestion with oxidizing acid is difficult. Some attempts have been made to overcome these difficulties and to determine lead without preliminary concentration, but they have not given satisfactory results.

Chmielowski and Myślak[1], who applied Teisinger's method for the determination of lead in blood[2] to urine samples, could indeed determine lead directly, but because of the insufficient sensitivity of the polarographic method, only in quantities larger than 500 γ/l. This renders it possible to estimate lead in cases of acute poisoning solely or when a patient is treated by means of calcium versenate. Similarly, direct electrodeposition of lead on to a platinum electrode from unprepared urine carried out by Cooksey and Walton[3] has not been widely accepted.

The application of the hanging mercury electrode method[4] to such a problem offers some advantages. High sensitivity and the possibility of concentrating selectively lead, while the concentration of other components remains unchanged, enabled us to develop a method of direct determination of very minute quantities of lead in urine.

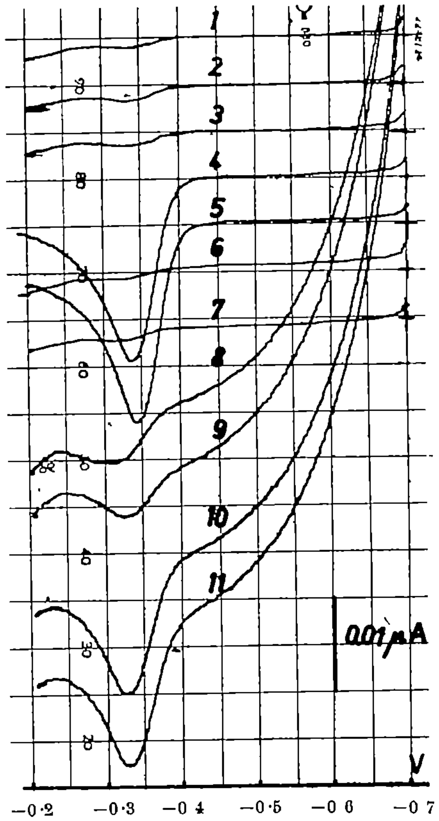

Fig. 1

The procedure is as follows: to the electrolytic cell which contains the hanging mercury drop electrode, salt bridge and small magnetic stirring bar, 10 c.c. of three times distilled water and 0·1 c.c. of specially prepared very pure concentrated hydrochloric acid were added. Oxygen was removed from the solution with hydrogen and then the preliminary electrolysis was carried out in an intensively stirred solution. During the electrolysis the potential of the cathode was kept constant at − 0·7 V. Stirring was stopped after 3 min. of concentrating electrolysis and the oxidation curves were recorded by means of a conventional polarograph polarized towards positive potential (− 0·7 to − 0·2 V.). In this way curves 1, 2 and 3 (Fig. 1) were recorded which show the degree of purity of the cell and added acid. A small minimum which appears at about − 0·35 V. corresponds to the oxidation of some traces of lead present in the acid and the electrolytic vessel. These traces can be determined by adding Pb^{2+} ions in such amounts that their concentration was 1×10^{-7} *M* (curves 4 and 5). Comparison of the curves 1, 2, 3 and 4, 5 shows that the concentration of Pb^{2+} ions in blank test solution was 5×10^{-9} *M*.

Again the electrolysis of a new sample of acidified water was carried out to show that lead previously brought in was sufficiently removed from the cell (curves 6 and 7). After removing this test solution, 10 c.c. of the urine was placed in the cell and 0·1 c.c. of acid was added, and then deposition as well as recording were repeated (curves 8 and 9). Due to the reduction of various organic components of urine, the curves recorded in acidified urine differ from those obtained in the test solution of acid. However, at the oxidation potential of lead the curve is sufficiently flat to observe distinctly the oxidation minimum of lead (curves 8 and 9). Curves 10 and 11 were recorded after adding a known quantity of lead forming a

1×10^{-7} M solution By comparing curves 8 and 10 it can be seen that the concentration of lead in urine was 5×10^{-8} M, that is, about 10 γ/l. The results obtained from twelve different 'normal' urine samples gave 10 3 γ/l. as a mean.

The oxidation minimum for lead corresponding to the same amount of the standard was much smaller in urine (curve 10) than in the acid (curve 4). This difference is caused by the greater viscosity of urine in comparison with the viscosity of the solution with acid added. The calibration curves describing the dependence of maximal intensity of oxidation curves on concentration of lead obtained for both solutions were linear, and this allows the use of the standard addition method.

These results show that lead can be directly and quantitatively determined not only in urine of persons poisoned with lead, but also in the 'normal' ones without any preliminary concentration and mineralization as a separate operation.

Pyrazine-Metal Halide Complexes : New Types of Metal-Ligand Polymers

THE compounds[1,2] of pyridine with metal salts have been well investigated, but little has been reported concerning the corresponding pyrazine (Fig. 1) compounds. Pyrazines have a second (potential) donor nitrogen atom in the 4 position and are much weaker[3] bases than the pyridines. (Pyrazine $pK_a = 1{\cdot}1$; *cf.* pyridine $pK_a = 5{\cdot}2$.) It appears to attach a proton, or to quaternize at one nitrogen atom only, the second being deactivated[4]. Condensed pyrazines, for example phenazine[5], have been studied, but only two simple pyrazine complexes, namely, tetracarbonyl-*bis*(methylpyrazine)-chromium(O) and the corresponding molybdenum(O) compound, appear to have been reported[6].

Our investigation springs from an interest in the relative donor capacities of the two nitrogen atoms towards metals, in the effect of substituents on donor capacity, and in the potential value of these complexes for the preparation of semi-inorganic (metal–ligand–metal) polymers. This communication summarizes certain novel reactions of pyrazine and its mono-, bi- and tetra-methyl substituted derivatives. We list in Table 1 some of the new complexes of univalent copper and of bivalent nickel and cobalt. Unfortunately, the low solubility of most of these compounds in suitable solvents renders inapplicable many physical techniques which are diagnostic of structure ; however, magnetic and spectroscopic data have proved specially valuable for this purpose.

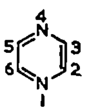

Fig. 1

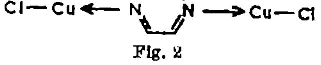

Fig. 2

Univalent copper gives rise to complexes in which there are *two* cuprous halide groups to each pyrazine molecule. The simplest structure for these complexes is shown in Fig. 2.

These represent the first complexes in which each nitrogen atom is bound to a metal atom. One is tempted to conclude that d_π–p_π bonding from the metal to the ligand could prove a means of increasing the negative charge on the ligand and hence of increasing the donor capacity of the second nitrogen atom. However, as will be discussed in a later communication, infra-red and other studies have led us to conclude that double bonding is probably less important than might have been expected at first sight.

Cupric complexes have been prepared, but these have not yet been studied in detail because their insolubility, coupled with a tendency to undergo reduction to the cuprous state, renders investigation of their structure rather difficult. Several different types of bivalent nickel compounds have been isolated. Complexes of the type ligand$_4$NiCl$_2$ are almost certainly six-covalent, and lose the ligand exceedingly readily, yielding complexes of the 1 : 1 type (see below). The 2 : 1 complexes (2 : 6-dimethylpyrazine)$_2$NiBr$_2$ and (pyrazine)$_2$NiI$_2$ achieve six-co-ordination through halogen bridging, and the 1 : 1 complexes (methylpyrazine)NiBr$_2$ and (2 : 5-dimethylpyrazine)NiCl$_2$ appear to reach the six-co-ordinate state by both halogen and pyrazine

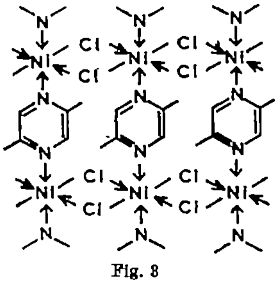

Fig. 3

bridging. A possible structure is illustrated in Fig. 3. These compounds are all paramagnetic with moments in the range expected for octahedral co-ordination (2·9–3·3 B.M.).

However, and in marked contrast, the purple (2 : 5-dimethylpyrazine)$NiBr_2$ is diamagnetic, a property generally associated (in the case of Ni(II) complexes) with a four-co-ordinate square planar or a six-co-ordinate tetragonal arrangement of the attached ligands. The behaviour is surprising in view of the fact that the corresponding chloro-derivative—this halide ion is usually assumed to give rise to a stronger ligand field than the bromide ion—is paramagnetic. Also the larger bromide ion is expected to cause greater steric interaction with the methyl group in a square complex than would occur in the chloro derivative. The chloro-complex is apparently octahedral six-co-ordinate, because it is isomorphous with the corresponding cobalt compound, the colour and magnetic properties of which strongly support octahedral co-ordination.

Of the bivalent cobalt compounds reported (2 : 6-dimethylpyrazine)$_2$$CoI_2$ is monomeric and its spectral and magnetic data point strongly to a tetrahedral arrangement. (2 : 5-dimethylpyrazine)-$CoBr_2$, on the other hand, is dimeric, though evidently still tetrahedral, and probably has a structure involving bromine bridges. The high magnetic moments, and colour, of the remaining cobalt complexes listed suggest strongly an octahedral structure. Those of the 1 : 1 type evidently involve both pyrazine and halogen bridging (as Fig. 3), whereas (2 : 6-dimethylpyrazine)$_2$$CoBr_2$ involves halogen bridging only.

Infra-red spectroscopy has proved to be a most useful tool in the elucidation of the structure of these complexes further data on which will be reported in detail shortly.

We are indebted to the Wyandotte Chemical Corporation, Detroit, Mich., for the supply of pyrazines and for financial support.

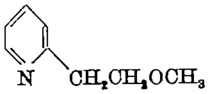
BIOCHEMISTRY

A New Anthelmintic with Unusual Properties

DURING studies on anthelmintic activity which have been in progress in these laboratories during the past few years, we have encountered an interesting degree of activity among a limited number of substituted pyridines. Nothing of practical value emerged from the early observations, but they caused us to retain an interest in related substances. Recently, through the courtesy of The Midland Tar Distillers, Ltd., we had the opportunity of examining some pyridine compounds made in their Research and Development Department, and one of them, prepared by Mr. P. Arnall, has proved of exceptional interest. This compound is 2-(β-methoxyethyl)-pyridine (U.K. Patent Application 40845/59; 40931/59; 20099/60):



It is a liquid and extremely soluble in water

Using experimental infections in mice with *Nematospiroides dubius*, *Nippostrongylus muris* and *Heterakis spumosa* and following methods developed by our colleague Dr. D. G. Davey, it has been possible to investigate the anthelmintic activity of this compound against nematodes inhabiting quite different regions of the alimentary canal. *N. dubius* inhabits the duodenum, *N. muris* the ileum and *H. spumosa* the colon, and marked activity has been obtained against all these species. In our experience a compound having similar activity against the three species is extremely rare, though we think this is not due to specific resistance on the part of the worms but to differences in their habitat. Thus the resistance of *N. dubius* to many anthelmintics appears to arise because it is confined to the duodenum.

The feature which makes 2-(β-methoxyethyl)-pyridine unique in our experience is the observation (Table 1) that it is more active when administered subcutaneously than orally. We know that the compound is excreted into the alimentary canal, seemingly along the whole length, and possibly this allows more intimate contact with all worm species whatever their location.

Table 1. COMPARATIVE ACTIVITY OF 2-(β-METHOXYETHYL)-PYRIDINE, PHENOTHIAZINE AND A MIXTURE OF BEPHENIUM EMBONATE AND HYDROXY NAPHTHOATE IN MICE

	2-(β-methoxyethyl)-pyridine		Mixture of bephenium embonate (1/3) and hydroxy naphthoate (2/3) (oral)	Phenothiazine (oral)
	Subcutaneous	Oral		
(1) *H. spumosa* Relative activity	360 1·0	560 0·64	1,054 0·34	800 0·45
(2) *N. muris* Relative activity	350 1·0	450 0·77	440 0·80	2,012 0·17
(3) *N. dubius* Relative activity	640 1·0	880 0·73	3,400 0·19	Approx. 14,000 0·05

The figures in the columns opposite the worm species give the dose in mgm./kgm. which is required for a 95 per cent reduction in worm burden.

Critical tests which will be reported in detail elsewhere have shown that 2-(β-methoxyethyl)-pyridine possesses greater activity against nematodes in mice than phenothiazine or a mixture of bephenium embonate (1/3) and hydroxy naphthoate (2/3), both of which are used in practice. Typical results are summarized in Table 1. Activity has also been demonstrated in mice against the immature forms of *N. dubius* and *N. muris*.

The results in mice with this compound were so promising that it was, and continues to be, tested in sheep, cattle and other domestic animals. Preliminary reports from various workers indicate that it may be of considerable value and, accordingly, it is being given more widespread use under the Imperial Chemical Industries brand name 'Promintic'.

A Pyroninophilic Component in Pathological Serum Proteins and Urinary Proteins

Pyronine-methyl green is frequently used in histological investigations for staining ribonucleic acid and deoxyribonucleic acid[1].

Yeoman[2,3] applied this staining method to serum proteins and urinary proteins from patients with multiple myeloma. In each of the 11 cases examined, the abnormal protein fraction stained red-violet with pyronine-methyl green after paper electrophoresis of both serum and urine. This staining reaction was negative in 100 cases of hyperglobulinæmia and proteinuria. Yeoman presumes that the staining is specific for true myeloma proteins.

For some considerable time, investigations in our laboratory have been aimed at the chemical and immunological characterization of paraproteins. Consequently we have at our disposal a collection of sera from patients whose blood plasma contains one or several abnormal protein fractions. In addition, a few Bence Jones proteins are available. The specificity of the above-mentioned staining was tested in this material. A sample of each serum and each Bence Jones protein was submitted to electrophoresis at pH 8·6 in agar gel[4], and then stained with pyronine-methyl green in an acetate buffer at pH 4·8.

Table 1. Staining of Paraproteins with Pyronine–Methyl Green

	Positive	Negative
Multiple myeloma	9	—
Bence Jones proteins	8	—
Waldenstrom's macroglobulinæmia	13	19
Atypical macroglobulinæmia	4	3
Unexplained paraproteinæmia	1	7

The results obtained (see Table 1) show that the abnormal serum protein fraction stained with pyronine-methyl green in all cases of myeloma. Eight different isolated and purified Bence Jones proteins likewise produced a positive reaction.

A positive staining reaction was found in about half the cases of Waldenström's macroglobulinæmia and of so-called atypical macroglobulinæmia[5].

Sera from patients with an unexplained paraproteinæmia failed to stain, with one exception.

Therefore, this staining is unfortunately not specific for myeloma proteins from serum and urine, although these proteins showed a positive staining reaction both in the series examined by Yeoman and in our own material.

It is remarkable, however, that only abnormal protein fractions from serum and urine can be stained with pyronine-methyl green. This stainability might be taken to denote the presence of ribonucleic acid or deoxyribonucleic acid in these pathological protein fractions.

In order to verify this, the ultra-violet absorption spectrum of the electrophoresis-spots of these fractions was determined. This proved to be identical with that of proteins; ribonucleic acid or deoxyribonucleic acid was not demonstrable in these fractions (see Fig. 1).

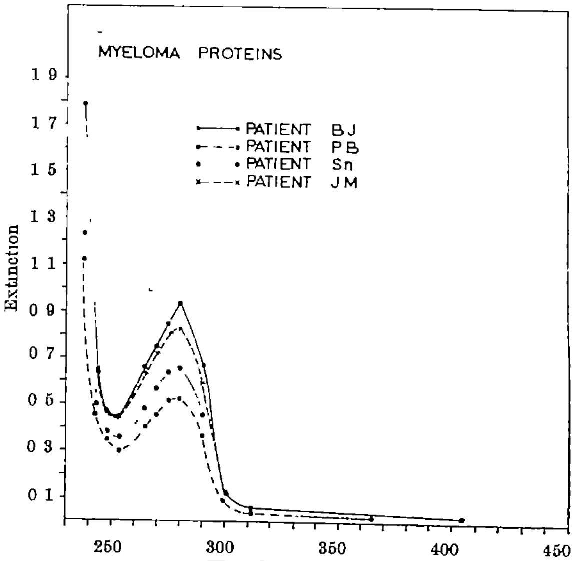

Fig. 1. Ultra-violet absorption spectrum of the pathological proteins in the serum of four myeloma patients

Both exposure to the influence of the enzyme ribonuclease (0·1 per cent in acetate buffer pH 6·0 at 37° C. for 30 min. and 7 hr., respectively) and treatment with 1 N perchloric acid at 4° C. failed to influence the stainability of the pathological protein fractions. The Feulgen reaction was also negative.

This warrants the conclusion that these proteins contain no ribonucleic acid or deoxyribonucleic acid.

Further investigations will be aimed at a definition of the component responsible for the positive staining reaction with pyronine-methyl green.

Thanks are due to Dr. D. Pragay for his kindness in supplying us with some Bence Jones proteins.

Transferrin in Normal Cerebrospinal Fluid

Previous work has shown differences between some of the proteins in cerebrospinal fluid and those found in serum[1-3]. Thus paper-electrophoresis of concentrated normal cerebrospinal fluid may show a peak in the intermediate area between the beta- and gamma-fraction ('tau-fraction'), which is not seen in paper-electrophoresis of normal human serum[4-6]. The similarities and differences between transferrin in cerebrospinal fluid and in serum have been further investigated.

The cerebrospinal fluid was obtained by lumbar puncture from individuals without any neurological

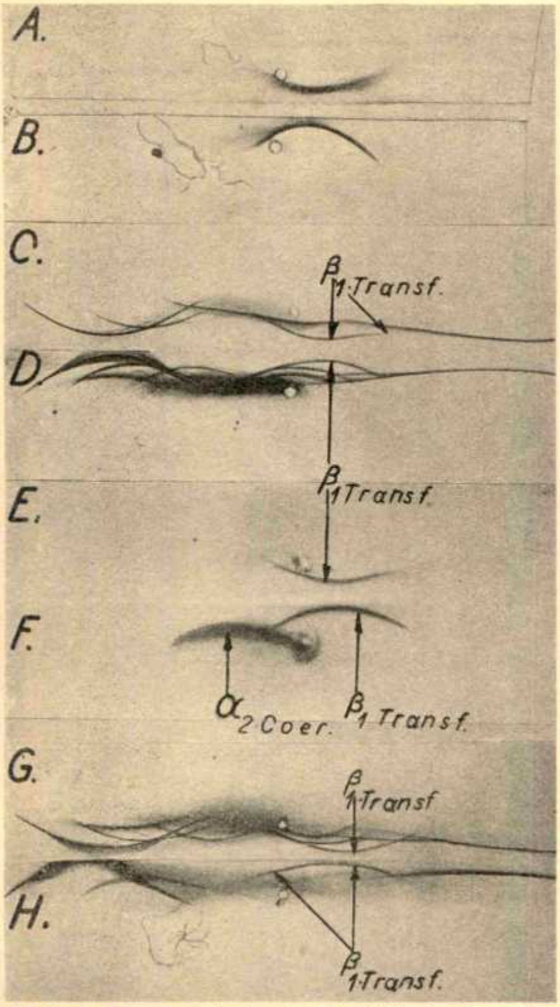

Fig. 1. *A*, Immuno-electrophoresis of iron-59 incubated cerebrospinal fluid, concentrated by pressure dialysis 50 times. The tracing is developed with a specific rabbit anti-transferrin antiserum. *B*, Immuno-electrophoresis of iron-59 incubated normal human serum, developed as *A*. *C* and *D*, The same as *A* and *B*, respectively, but now developed with a horse anti-human antiserum. *E* and *F*, The same as *C* and *D*, respectively, but now developed as autoradiogram. *G*, Immuno-electrophoresis of normal human serum developed as *C* and *D*. *H*, Immuno-electrophoresis of proteolytic digested normal human serum

disease. Care was taken to avoid any admixture of blood during the puncture. The fluid was concentrated by pressure dialysis and submitted to immuno-electrophoresis[3]. The development was performed with horse anti-human antiserum and specific rabbit anti-human transferrin, respectively.

A partial enzymatic digestion of normal serum proteins was achieved by means of pancreatic enzymes *NOVO*, possessing a proteolytic activity of 12 *NOVO* units/gm. = 600 Löhlein-Volhard units/gm.

The iron-binding capacity of transferrin and related proteins was demonstrated by autoradiography. 10–20 μl. of concentrated cerebrospinal fluid were incubated with about 10 μl. of a solution of radioactive iron-59 as ferric chloride; per sample 0·15 μc. was added with a specific activity of 5 mc./mgm. of iron. After incubation the serum was run immuno-electrophoretically and the plate exposed to a Kodak X-ray film.

The immuno-electrophoretic pattern of normal concentrated cerebrospinal fluid is shown in Fig. 1, and compared with that of normal human serum. The precipitation bow of transferrin from cerebrospinal fluid shows two differences from the corresponding bow of serum transferrin, indicating somewhat different physico-chemical properties of the two transferrins. The precipitation bow of cerebrospinal fluid transferrin has a double curvature and is more extended in the anode-cathode direction than the corresponding bow from serum. This extension is the result of a wider interval of mobility.

By incubation 2 ml. of human serum with 100 mgm. pancreatic enzymes *NOVO* at 37° C. for 1 hr. similar changes were found in the transferrin of this partially digested normal serum. Fig. 1 shows the immuno-electrophoretic tracing of such a proteolytically digested serum compared with that of genuine serum. No similar changes could be obtained from human sera treated with receptor-destroying enzyme (alias neuraminidase). In these experiments with the receptor-destroying enzyme several of the serum proteins showed a change in mobility, but not a reduplication of the immuno-electrophoretic bow. These changes in mobility are caused by a splitting off of the neuraminic acid[7].

The characteristic property of transferrin of binding iron was not qualitatively changed in cerebrospinal fluid. Fig. 1 shows the autoradiogram of an immuno-electrophoresis on concentrated cerebrospinal fluid incubated with iron-59. It is seen that the anodal as well as the cathodal part of the double-curved precipitation bow is able to bind iron. This figure, too, demonstrates the iron-binding capacity of normal human serum.

When the immuno-electrophoretic tracings of human serum are developed with a polyvalent horse anti-human antiserum not only transferrin but also coeruloplasmin was found to bind iron, and so was albumin when the maximal capacity of the two other proteins is surpassed (unpublished work).

In paper-electrophoresis on concentrated cerebrospinal fluid incubated with iron-59 the radioactivity could be traced to a maximum in the intermediate area between the beta- and gamma-fraction corresponding to the tau-fraction as seen by staining the paper for proteins with bromphenol blue.

No similar work on partial changes of the proteins compared with their normal carrier function is known to us.

One of us (J. C.) was in receipt of a grant from the National Multiple Sclerosis Society of Denmark.

Methods for Determining the Rates of Catalase Synthesis and Destruction *in vivo*

Alterations in the amount of enzyme in a tissue can result from changes in the rate of synthesis or of destruction. The demonstration that 3-amino-1,2,4-triazole irreversibly inactivates catalase in the liver[1] without interfering with its resynthesis[2], and allyl-*iso*propyl acetamide blocks synthesis of new catalase[3] suggested that these compounds might be used as tools for studying the kinetics of catalase synthesis and destruction *in vivo*.

On injection of 3-amino-1,2,4-triazole, 1 gm./kgm. intraperitoneally, into rats there is a rapid fall in the liver catalase activity to a minimal value. After a lag period, during excretion of the aminotriazole, the catalase activity increases progressively over a period of 3–4 days, as originally described by Heim, Appleman and Pyfrom[4]. Experiments with radioiron have shown that this return of liver catalase activity results from the synthesis of new catalase[2]. Kinetic studies on the rate of catalase return following administration of aminotriazole show that the curve after the initial lag-period can be described by the equation:

$$C = \frac{k_S}{k_D}\left(1 - \exp(k_D t)\right)$$

where C is the catalase activity at any time, t, and where k_S is interpreted as the rate of catalase synthesis, and k_D as the fraction of catalase destroyed in unit time.

In order to check the validity of the above interpretation, k_D, the first-order rate constant for catalase destruction, was determined by blocking catalase synthesis with allyl*iso*propylacetamide (we are indebted to Dr. W. E. Scott of Hoffmann-LaRoche, Inc., Nutley, New Jersey, for a generous gift of this compound). For the experiment one group of animals was given a single injection of aminotriazole, 1 gm./kgm. intraperitoneally; a second group was given allyl*iso*propylacetamide 200 mgm./kgm. twice daily intraperitoneally; a third group was given both drugs, and the fourth was used for controls. Five animals from each group were killed daily and the liver catalase assayed spectrophotometrically[5]. The results are plotted in Fig. 1. It can be seen that while the catalase activity of the aminotriazole group was rising, that in the allyl*iso*propylacetamide group was falling. The group of animals given both drugs was of particular interest, since it showed whether or not catalase synthesis had actually been completely blocked by the allyl*iso*propylacetamide. An early increase in catalase activity was observed to a low plateau of about 10 per cent of the normal value. This represents catalase which can be destroyed by aminotriazole, but the synthesis of which is not blocked by the allyl*iso*propylacetamide. This catalase is presumably in a different location within the liver cell from most of the liver catalase, or else is in cells other than the hepatic cells of the liver. Since this catalase may have different rates of synthesis and destruction from the main catalase fraction, it may create minor deviations from the theoretical curve for the return of catalase activity following aminotriazole.

Liver catalase synthesis and destruction *in vivo*

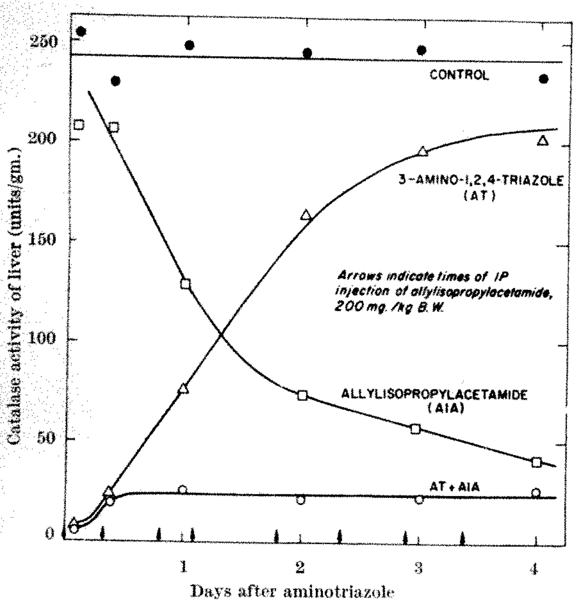

Fig. 1

Kinetics of liver catalase destruction *in vivo*

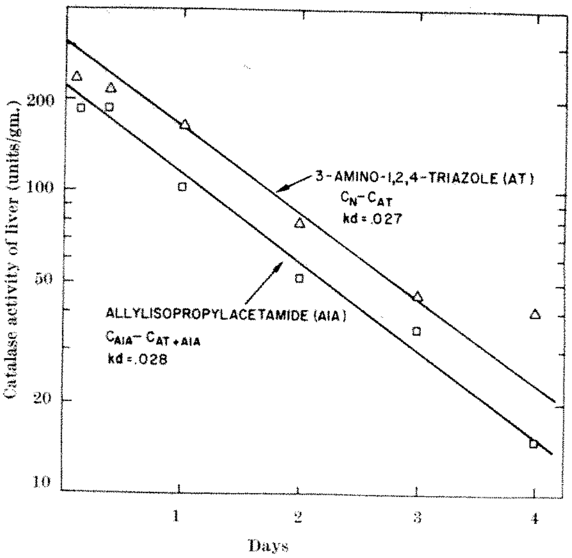

Fig. 2

If the rate at which the catalase activity of the aminotriazole group approaches the normal plateau is compared in a semilogarithmic plot (Fig. 2) with the rate at which the catalase activity of the allyl-*iso*propylacetamide group approaches its limit, which is the low plateau of the group given both drugs, it will be seen that two lines are obtained the slopes of which are nearly equal. The slope of these lines is equal to k_D, the rate constant for destruction. The rate constant for catalase destruction determined from the aminotriazole data is almost identical with that obtained when catalase synthesis is blocked with allyl*iso*propylacetamide. By substituting k_D in the equation: $k_S = k_D C_N$, where C_N is the catalase activity at the normal plateau, one can readily calculate k_S, the rate of catalase synthesis.

The above methods for studying the kinetics of catalase synthesis have the advantage that they are rather simple and require only injection of the drugs and assay of the liver homogenate for catalase activity. Only occasionally, to check the validity of a given system, does one need to use the radioisotopic methods, which require laborious purification of the enzyme to a constant specific activity. These techniques should prove useful in determining whether the lowering of catalase activity in the liver during starvation[6], during tumour growth[7], and following injection of toxohormone[8] results from a decreased rate of catalase synthesis or an increased rate of its destruction. Experiments along these lines are under way.

The above investigation illustrates the usefulness of inhibitors of enzymes and of enzyme synthesis for kinetic studies on the rate of enzyme synthesis and destruction. Many other enzyme systems have been described where similar types of inhibitors are available. As these systems are being studied, it may be useful to carry out kinetic studies similar to those presented here.

Formation of Hippuric Acid from Phenylalanine labelled with Carbon-14 in Phenylketonuric Subjects

VARIOUS authors have recently demonstrated the formation of hippuric acid from endogenous benzoic acid in the mammalian organism. Fasting humans[1] as well as humans and rats on a lactalbumin–carbohydrate diet[2] excreted hippuric acid, and its formation in the intact rat could not be inhibited by sulphasuxidine[2] or chloramphenicol[3]. Application of deuterium and phenylalanine labelled with carbon-14 resulted in labelled urinary hippuric acid[2–4]. In addition, when benzoic acid was isolated from the urine of human or rats fed benzoic acid, labelled with deuterium or carbon-14, the specific activity was about 20 per cent lower, indicating dilution by endogenous benzoic acid[4,5]. During the investigation of phenylalanine turnover in human phenylketonuria[6], I had the opportunity of studying the formation of hippuric acid from phenylalanine. Phenylketonuric subjects are characterized by their inability to convert phenylalanine to tyrosine to any significant extent. This results in an accumulation of phenylalanine and its keto derivative, phenylpyruvic acid.

Two phenylketonuric patients were subjects for this work. Their plasma phenylalanine concentrations were dietetically adjusted to 17·0 (patient K. H.) and 47·0 (patient R. S.) mgm. per 100 ml. 20 μc. of uniformally labelled phenylalanine-^{14}C, corresponding to about $7 \cdot 7 \times 10^6$ c.p.m., were injected intravenously into both patients after an overnight fast. All urine was collected for 6 hr.

The total amount of the urinary hippuric acid was determined by the photometric method of Komei[7]; to avoid inhibition by urea, the urine was first treated with urease. A hippuric acid standard was run in urine with every sample. The urinary hippuric acid was isolated by adding 1·0 gm. of non-isotopic hippuric acid and 50 gm. of neutral ammonium sulphate to 100 ml. of urine and acidifying with concentrated hydrochloric acid to *p*H 2·0. The resulting crude precipitate was recrystallized by dissolving in sodium hydroxide and heating in a boiling bath for 1–2 min. after the addition of a small amount of 'Norit'. After filtering, the *p*H was again adjusted to 2·0 with dilute hydrochloric acid and the solution placed in ice-water. This step of recrystallization was repeated once more. The hippuric acid was then repeatedly recrystallized from hot water until the melting point (189–190° C.) and specific radioactivity remained constant. This end-point was achieved when no chlorine ions were demonstrable with silver nitrate in the supernatant.

Hippuric acid isolated from patient R. S. was hydrolysed by refluxing with 6 *N* hydrochloric acid for 90 min. The hydrolysate was extracted several times with one volume of ether. The ether extract was cautiously evaporated on a steam bath and the residue taken up in a small volume of alcohol. The alcoholic extract was diluted with 10 vol. of water, whereupon crystals appeared, and cooled in ice for about 1 hr. The benzoic acid so obtained was recrystallized from hot water until melting point (121° C.) and specific radioactivity remained constant. In addition a solution of 60 μgm. of the purified benzoic acid did not demonstrate any colour formation with ninhydrin on filter paper. A comparison of the specific radioactivity of hippuric acid and benzoic acid in this patient gave 797 and 801 c.p.m. per mmole respectively. This indicates that only the benzoic acid part derived from phenylalanine and that there is no appreciable amount of radioactivity in the glycine side-chain.

Table 1 summarizes the findings. The absolute turnover-rate of free phenylalanine was calculated from the disappearance of the radioactivity from the blood plasma. These experiments and their results will be described in detail elsewhere. The calculation of the fraction of phenylalanine converted to hippuric acid was made assuming that all urinary hippuric acid derived from phenylalanine. Therefore, these values are only an estimate of the upper limit of hippuric acid formation from phenylalanine in phenylketonuric subjects. These upper limits are likely to be considerably lower for normal individuals,

Table 1

Name	L-Phenylalanine-^{14}C injected (c.p.m.) (*A*)	Hippuric acid excreted (m*M* per 6 hr.) (*B*)	Specific activity hippuric acid (c.p.m. per m*M*) (*C*)	Absolute turnover-rate of phenylalanine (m*M* per 6 hr.) (*D*)	$\frac{B}{D} \times 100$
K. H.	$7 \cdot 60 \times 10^6$	0·76	$2 \cdot 78 \times 10^4$	20·9	3·6
R. S.	$7 \cdot 76 \times 10^6$	1·27	$2 \cdot 36 \times 10^4$	22·1	5·7

Absolute turnover-rate as defined in (*D*) is the ratio of the total amount of free phenylalanine present in the body to the turnover-time of free phenylalanine.

$\frac{B}{D} \times 100$ is the percentage of phenylalanine leaving the free phenylalanine pool which is converted to hippuric acid.

since they possess the ability to convert phenylalanine to tyrosine and have, consequently, a higher absolute turnover-rate than phenylketonuric patients.

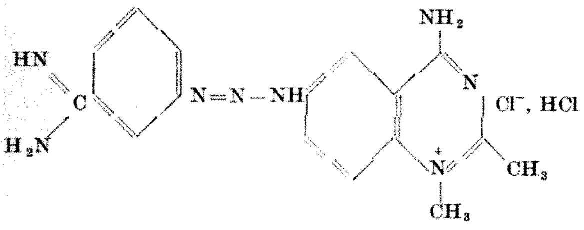
6-(*m*-Amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium Chloride Hydrochloride: a New Drug active against *Babesia canis*

As part of a study of diamidines which has extended over many years, we have recently screened for trypanocidal and babesicidal activity a number of compounds in which one of the amidine groups has been replaced by a cyclic amidine group. One of the most active of these is 6-(*m*-amidinophenyldiazoamino)-4-amino-1,2-dimethylquinazolinium chloride hydrochloride[1]:



(I)

(M. and B. 4986) (I). This compound, which contains the *m*-amidinophenyldiazoamino linkage present in the very active trypanocidal drug, *iso*metamidium[2], has babesicidal properties and is markedly active against *Babesia canis* in dogs.

The approximate maximum tolerated dose (subcutaneous) of M. and B. 4986 in healthy puppies was 25 mgm./kgm. body-weight, though marked tachycardia, accompanied by diarrhœa and vomiting, followed this dose, and persisted for about 1 hr. Fourteen days after a subcutaneous dose of 20 mgm./kgm. body-weight of M. and B. 4986 in adult dogs, there was no loss in weight, and no macroscopic signs of toxicity, apart from slight local skin thickening at the injection site, were observed on autopsy.

In therapeutic tests, a total of 46 puppies experimentally infected with *Babesia canis* were treated with doses of M. and B. 4986 between 0·5 and 10 mgm./kgm. body-weight. All the 12 infected puppies which received a subcutaneous dose of 2·5 mgm./kgm. survived, 3 were parasitologically negative within 24 hr., and all within 72 hr., 8 remained free of parasites for at least 30 days and 4 developed a parasitological relapse.

M. and B. 4986 (I) was prepared by coupling *m*-amidinobenzenediazonium chloride with 4,6-diamino-1,2-dimethylquinazolinium chloride. It was obtained as an orange crystalline solid, which decomposes at 237–238° C. (Found: N, 24·6; Cl, 15·3; H_2O, 11·4. $C_{17}H_{19}N_8^+,Cl^-,HCl,3H_2O$ requires N, 24·4; Cl, 15·4; H_2O, 11·7 per cent). It is approximately 0·5 per cent w/v soluble in water. In order to present a more soluble salt for field investigations the corresponding methanesulphonate (M. and B. 4986*A*) has been prepared as orange crystals, decomposing at 205–208° C. (Found: N, 20·6; S, 12·0; H_2O, 3·4. $C_{17}H_{19}N_8^+,CH_3SO_3^-,CH_3SO_3H,H_2O$ requires N, 20·6; S, 11·7; H_2O, 3·3 per cent); it is approximately 25 per cent w/v soluble in water.

Further details, including a report on the field investigations, will be published in due course.

We thank Mr. D. J. Mellersh for his help with some of the biological work.

PHYSIOLOGY

Excretion of Tryptophan Metabolites after Physical Effort

IT has been shown that muscular effort is accompanied by the increased urinary excretion of one of the metabolites of tryptophan, namely, indoleacetic acid[1]. Pelikán and co-workers[2] have proved that there is increased excretion of another tryptophan metabolite, xanthurenic acid, after muscular effort.

Another tryptophan metabolite, 5-hydroxyindoleacetic acid, was then studied. The close relation between 5-hydroxytryptamine and the central nervous system is well known, and I wished to find out whether there is an increased urinary excretion of 5-hydroxyindoleacetic acid after muscular effort which is, moreover, often accompanied by considerable nervous tension.

5-Hydroxyindoleacetic acid is formed from 5-hydroxytryptamine by oxidase, and Sjoerdsma[3], Ressel[4], Udenfriend[5], de Gennes[6] and others state that its excretion is relatively constant. The normal urinary excretion of 5-hydroxyindoleacetic acid in men varies from 2 to 9 mgm./day[7]. Using a modification of Udenfriend's reaction, Schön and co-workers[8] recently found 1–6 mgm. (average 2·53 mgm./day). In the case of food only, the consumption of bananas results in increased excretion of this substance[9,10].

The urinary excretion of 5-hydroxyindoleacetic acid in men after various degrees of stress during athletics was followed. It was estimated in samples of urine within 30 min. before and after muscular effort, its determination being carried out by the method of Sjoerdsma, Weissbach and Udenfriend[3].

Altogether 50 men, aged 19–50, were examined after muscular effort lasting from 5 min. to 3 hr. Twelve men ran an average of 1,250 m. for 5 min. at maximum effort on a laboratory treadmill. Eight men were examined after a 3-km. cross-country race and 21 men after a marathon race. Also included in the group examined were 9 football players after a football match.

In no case was sulphosalicylic acid proteinuria found before the effort. With the exception of 4 well-trained cross-country runners and 5 marathon runners, proteinuria could always be detected after the effort was made (ranging from slight turbidness to heavy protein precipitation). After a marathon race, proteinuria of 6–166 mgm./100 ml. (average value 47·1 mgm./100 ml.) was detected by means of Exton's method.

In no case, either before or after the effort, could any 5-hydroxyindoleacetic acid be detected. From this it can be concluded that, even when accompanied by considerable nervous excitement, muscular effort does not result in increased urinary excretion of this substance.

Anionic Permeability of the Inhibitory Postsynaptic Membrane of Motoneurones

It has been postulated that the inhibitory postsynaptic potential in motoneurones is caused by the movement of ions across patches of the postsynaptic membrane that are momentarily (1–2 msec.) made very permeable for ions less than a certain critical size[1]. A sufficiently increased intracellular concentration of anions capable of passing through the postsynaptic membrane would change the normally hyperpolarizing inhibitory postsynaptic potential into a depolarizing one. In accordance with the hypothesis it was shown that injections of the small ions, Br^-, Cl^-, NO_3^-, and SCN^-, but not injections of the large HCO_3^-, $CH_3CO_2^-$, SO_4^{--}, $H_2PO_4^-$ or HPO_4^{--}, were effective in transforming the inhibitory postsynaptic potential into a depolarizing response. The diameter of the largest effective anion (derived from limiting ion conductances[2] and expressed relative to $K^+ = 1{\cdot}00$) was 1·11 and that of the smallest not effective, 1·65 (ref. 1). A weakness in the experimental evidence was the relatively few ions tested and the gap in size between the effective, and not effective, ions. Furthermore, it was not possible to exclude a slight effect of the bicarbonate ion (diameter 1·65) (ref. 1).

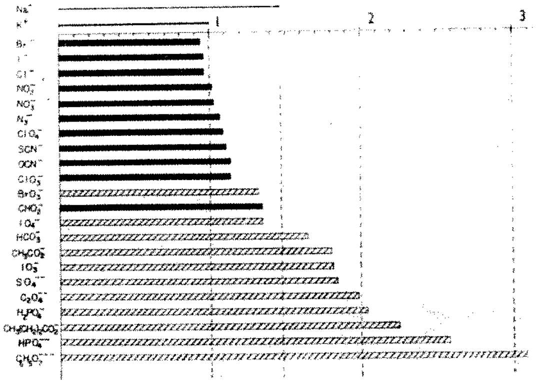

Fig. 1. The ions specified in the left column are arranged in order of hydrated ion size (derived from limiting ion conductances (ref. 2) and expressed relative to $K^+ = 1{\cdot}00$). The black bands indicate ions that are effective in changing the inhibitory postsynaptic potential into a depolarizing response; the hatched, those which are not effective. It should be noted that these results are consistent with the hypothesis that potassium ions can pass through the membrane but not sodium ions (ref. 1)

We have now extended the previous investigation and tested 22 different species of anions. Microelectrodes containing the anion to be tested were inserted into motoneurones and used both for injection and recording. Most tests were made on knee flexor motoneurones that were inhibited by quadriceps group Ia afferents. The anions were injected by a steady current of 3–10 × 10^{-8} amp. during 1 min. or more. The effect of the injection was judged by the polarity and size of the inhibitory postsynaptic potential immediately following the injection. The effects of the injections were always reversible within a few minutes after the injection. This recovery is attributable to the outward diffusion of the injected ions across the cell membrane.

The results are illustrated by the histogram (Fig. 1) showing the ions arranged according to their diameters. It appears that all ions with a diameter less than 1·32 (bromate) were effective in producing the reversible change of the inhibitory postsynaptic potential into a depolarizing response. Larger ions were ineffective except for the only slightly larger formate-ion (1·35). Injections of bicarbonate ions or carbonate ions never resulted in an immediate change of the inhibitory postsynaptic potential. After several injections of any of these ions there was often a gradual decrease of the hyperpolarization and finally a change to a depolarizing inhibitory postsynaptic potential. This late cumulative change is presumably due to secondary effects of these ions and cannot be taken as evidence for a similar action as that exerted by the small ions. Hence our findings support the hypothesis that the activated inhibitory postsynaptic membrane has an increased permeability for all anions less than a certain critical size.

Lack of Uptake of Catecholamines after Chronic Denervation of Sympathetic Nerves

DENERVATION of sympathetically innervated structures has been known to cause supersensitivity of these organs to catecholamines[1] and depletion of these hormones[2]. However, no conclusive explanation has been offered for these findings. To clarify these phenomena further we compared the uptake of injected DL β-^{3}H-noradrenaline and DL β-^{3}H-adrenaline by intact and denervated tissue.

The right superior cervical ganglion was removed from cats, and sufficient time (more than 5 days) was allowed to elapse to ensure degeneration of the nerve fibres. The operated cats all had pupillary contraction and relaxation of the nictitating membrane on the denervated side. Tritium-labelled noradrenaline or tritium-labelled adrenaline was administered intravenously, 1 hr. later the animals were killed and the ^{3}H-catecholamine content was examined[3,4] in structures innervated by the cervical sympathetic nerve.

A striking reduction in the levels of ^{3}H-noradrenaline was observed in the chronically denervated structures (Table 1). Similar results were obtained after administration of ^{3}H-adrenaline. No differences were found in cats in which the right cervical ganglion was removed 15 min. before the administration of ^{3}H-noradrenaline. It is apparent from these results that the nerve endings or neighbouring structures take up and retain circulating catecholamines.

Table 1. EFFECT OF DENERVATION ON THE UPTAKE OF ^{3}H-NORADRENALINE AND ^{3}H-ADRENALINE

Tissue	Chronic denervation				Acute denervation	
	Noradrenaline		Adrenaline		Noradrenaline	
	Denervated	Innervated	Denervated	Innervated	Denervated	Innervated
External ocular muscle	5·9	47·9	1·8	15·4	24·9	26·6
Retractor bulbi muscle	1·9	11·3	1·8	8·2	13·2	13·4
Lachrymal gland	3·2	44·7	3·0	24·7	—	—
Salivary gland	5·7	42·4	2·5	115·8	75·5	88·6

In the chronic experiment the right superior cervical ganglia were removed from six adult male cats under pentobarbitone anæsthesia. After 5–21 days, 4 cats were given ^{3}H-noradrenaline and 2 cats ^{3}H-adrenaline (25 μgm./kgm. DL base, specific activity 3·25 mc./mgm.) intravenously under pentobarbitone anæsthesia. One hr. after the administration of the catecholamines the cats were decapitated and the ^{3}H-catecholamine content was assayed in denervated and innervated structures. In the acute experiment the right superior cervical ganglion from 2 cats was removed 15 min. prior to the administration of ^{3}H-noradrenaline. Results are expressed in mμgm. ^{3}H-noradrenaline or ^{3}H-adrenaline per gm. of tissue.

We have previously shown that binding is an important mechanism of catecholamine inactivation[3]. The present findings indicate that degeneration of nerve endings results in the inability to bind these hormones and consequently this mechanism of inactivation is inoperative. The effective concentration of unbound, active catecholamines in the vicinity of the receptors in denervated tissue would be expected to persist for longer periods, thus resulting in supersensitivity. Cocaine, which reduces the uptake of circulating catecholamines by the tissues[5], presumably by interfering with binding, also causes supersensitivity.

Removal of free catecholamines can also occur by enzymatic transformation. Catechol-O-methyl transferase[6] and monoaminoxidase[7] have both been considered to be involved in the metabolic inactivation of the catechol hormones. However, Burn *et al.*[8] have shown that inhibition of monoaminoxidase by iproniazid does not prolong the contraction of the nictitating membrane after stimulation of the sympathetic ganglion, whereas Wylie *et al.*[9] have demonstrated that inhibition of catechol-O-methyl transferase by pyrogallol prolongs the contraction.

From the results described here and elsewhere[3], inactivation of catecholamines at nerve endings and tissues is a complex process involving enzymatic transformation and binding. It appears that binding occurs primarily at the nerve endings and enzymatic transformation (presumably by catechol-O-methyl transferase) in tissue and at receptor sites.

Effects of Pantothenic Acid (Calcium Pantothenate) and of Thyroxine on the Development of Chicken Embryos

IN earlier investigations, we have demonstrated[1] that the injection of 100 μgm. of calcium pantothenate into the yolk sac of chicken eggs after incubation periods of 4 and 10 days is responsible for an increase in body-weight, lasting 3–6 days. Together with the increase in body-weight, we have observed also an increase in tissue differentiation (studied by means of serial histological examination) especially of the nervous system (ganglia), kidneys, glandular stomach, liver and cartilages.

In the present work, eggs of White Leghorn–New Hampshire fowls, divided into four lots, were used. In the first lot 100 μgm. calcium pantothenate in sterile physiological solution (total volume of 0·1 ml.) was injected into the yolk sac after 4 and 10 days incubation. The second lot was injected with 5 μgm. thyroxine (Roche); the third with 100 μgm. of calcium pantothenate together with 5 μgm. thyroxine. The fourth lot (kept as control) was injected with 0·1 ml. of sterile physiological saline.

In six eggs of each group, embryonal life was interrupted after 7, 10, 13, 16, 19, 21 days of incubation for the eggs injected after 4 days incubation.

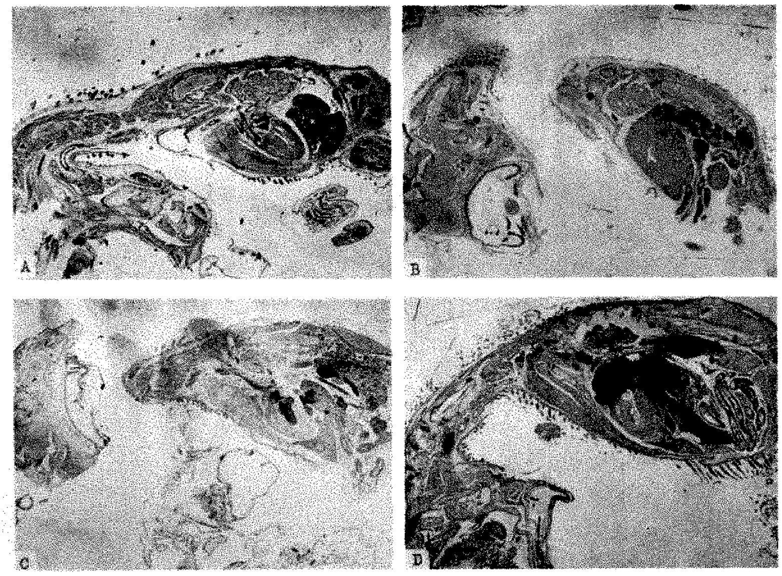

Fig. 1. Chicken embryos, tenth day of incubation, injected on fourth day. *A*, Control ; *B*, thyroxine ; *C*, calcium pantothenate ; *D*, calcium pantothenate + thyroxine

For the eggs injected after 10 days incubation, embryonal life was interrupted after 13, 16, 19, 21 days of incubation.

All the embryos treated survived until the end of incubation. The embryos were weighed with all fœtal membranes after remaining in a refrigerator at 4° C. for 6 hr.

Our results may be summarized as follows : (1) Embryos treated with only 100 μgm. of calcium pantothenate show an increase in body-weight, which is more marked in the embryos injected after 10 days incubation, and lasting 5–6 days, as was demonstrated in our earlier work[1]. (2) Embryos treated only with a dose of 5 μgm. of thyroxine show, on the contrary, a reduction of body-weight, lasting from the day of injection until almost the end of embryonal life. (3) Embryos treated with calcium pantothenate together with thyroxine show a tremendous increase of body-weight compared to the controls, and still more striking if compared to the embryos treated with thyroxine alone. They are also bigger than the embryos treated with calcium pantothenate alone. This increase lasts until almost the end of embryonal life, for a longer period than that observed in the embryos treated with calcium pantothenate alone.

In Fig. 1 are shown examples of histological sections of 10-day embryos that give an idea of the effects of calcium pantothenate, thyroxine and thyroxine + calcium pantothenate on the body and on the tissues of the embryos treated.

The histological serial slides (which will be described in detail elsewhere) show clearly, in the embryos treated with calcium pantothenate alone and with thyroxine alone, a major, marked, differentiation of organic tissues, particularly evident in liver, nervous system, glandular stomach and cartilages. This increase in tissue differentiation is also very clear, and may be more marked, in the embryos treated with calcium pantothenate together with thyroxine.

In the light of these experimental results, it is possible to state : (*a*) that the pantothenic acid (calcium pantothenate) and thyroxine mutually increase, if injected together, their separate effects on organic tissue differentiation of developing chicken embryos ; (*b*) that pantothenic acid prevents the well-known reduction of body-weight produced by thyroxine in chicken embryos ; (*c*) on the other hand, thyroxine enhances the increase in body-weight produced by calcium pantothenate when that substance is injected alone.

The effects observed may be explained by the marked influence that pantothenic acid exerts on the intermediate metabolism, and particularly on protein synthesis, as a constituent of co-enzyme A.

It seemed of interest, therefore, to recall that de Franciscis and Landauer[2] have recently demonstrated in chicken embryos, of almost the same age as those we used, that cortisone and insulin exert different effects on the development of the embryos (micromielia, abnormalities, body-weight, etc.), when the two hormones are injected together or injected alone.

Experimental Pre-Thrombotic State of an Organism resulting from the Dysfunction of the Physiological Anticoagulating System induced by an Atherogenic Diet

We have already shown[1–6] the existence in the animal organism of a reflex-humoral protective system which prevents the coagulation of blood circulating in the vascular system. In connexion with these results we became interested in the work of Wilgram[7,8] as well as in that of Thomas and Hartroft[9]. These authors have observed spontaneous myocardial infarctions in rats kept for several months on a diet enriched with fat and cholesterol. We supposed the diet indicated to produce a negative influence on the functional condition of the physiological anticoagulating system, due to which fact a pre-thrombotic state is seen to arise in the animal organism.

To verify this supposition, 100 adult male rats were transferred from a natural diet to that of Wilgram[7,8], supplemented with vitamin E in the form of an oily preparation from natural sources. Rats of the same age receiving a natural laboratory diet served as control. The functional state of the anticoagulating system in test and control rats was checked at various experimental stages by injecting thrombin or thromboplastin solution (preparation from the rat brain) into the jugular vein. The experiment proved that the fat-cholesterol diet began to produce a negative effect on the functional state of the anticoagulating system 1½–2 months after its application, and in five and more months it blocked the activity of that system. Intravenous administration of moderate thrombin doses to such test animals causes their immediate death following intravascular clotting, in contrast with the control remaining alive after the same thrombin doses injected intravenously (Table 1). In all rats fed the experimental diet for five and more months the following changes were established: a rise in the concentration of fibrinogen (exp., 433 mgm. per cent; control, 312 mgm. per cent), a decrease of the blood fibrinolytic activity (exp. 7·5 per cent; control, 48·0 per cent), a sharp increase of the blood plasma tolerance to heparin (exp., 2 min. 25 sec.–6 min. 28 sec.; control, 7 min. 31 sec.–22 min. 48 sec.), and a ten-fold increase of the total cholesterol content in the blood (exp., 943 mgm. per cent; control, 95 mgm. per cent). It seems that a combination of the first three symptoms may be used to diagnose a pre-thrombotic state of the organism.

Table 1. DEPRESSION OF THE FUNCTION OF THE PHYSIOLOGICAL ANTICOAGULATING SYSTEM IN ANIMALS KEPT ON A PROLONGED FAT–CHOLESTEROL DIET (AVERAGE RESULTS)

Experimental conditions	Animal body-weight (gm.)	Thrombin dose* intravenously (ml.)	No. of animals		
			Total in the experiment	Survived	Died of thrombosis
Experiment: Rats kept on a fatty diet from 5 months to 7 months and 15 days	221–276	1·0–1·2	25	3	22
Control 1: Rats kept on a natural laboratory diet	223–276	1·0–1·2	25	22	3
Control 2: Rats kept on a fatty diet for 5 months. Thrombin inactivated by heating	251	1·7 inactivated	12	12	0

* Thrombin solution clotted an equal volume of oxalated blood in 5 sec. at 37°.

As a prophylactic against the formation of thrombi in test animals in a pre-thrombotic state a soybean trypsin inhibitor was used, as suggested by the results previously obtained[10]. The inhibitor preparation was isolated according to Künitz's method[11].

According to the results in Table 2 the trypsin inhibitor injected intravenously 5 min. before the thromboplastin injection has shown a good prophylactic action against thrombus formation.

Table 2. PROTECTIVE ACTION OF TRYPSIN INHIBITOR AGAINST THE FORMATION OF THROMBI IN THE CASE OF INTRAVASCULAR INJECTIONS OF LETHAL THROMBOPLASTIN DOSES INTO RATS KEPT ON A FAT–CHOLESTEROL DIET FOR 5 MONTHS (AVERAGE RESULTS)

Dose of 5 per cent trypsin inhibitor solution intravenously (ml.)	Dose of thromboplastin (ml.)	Average animal weight (gm.)	No. of animals		
			Total in experiment	Survived	Died of thrombosis
Experiment (a fatty diet)					
1·4	2·1	254	10	10	0
Control (a fatty diet)					
0	2·1	253	10	0	10

The experimental results obtained by us indicate that the development of the myocardial infarction in rats fed the atherogenic diet of Wilgram[7,8] and of Thomas and Hartroft[9] is connected with the appearance in the test animal of a pre-thrombotic state resulting from a depression of the function of the physiological anticoagulating system.

HÆMATOLOGY

Haptoglobin and Transferrin Types in the Kuru Region of Australian New Guinea

KURU is a rapidly progressive and fatal neurological disease found to occur with high frequency among the Fore natives in the Eastern Highlands of New Guinea. Their tribal area, of several hundred square miles, is in a remote and rugged part of the highlands which has only recently become accessible to Europeans. Between 20,000 and 30,000 people live in the area affected and, of these, about 1 per cent is afflicted with the disease at any one time. Altogether kuru is responsible for more than half the deaths of Fore females and about 10 per cent of males. Extensive studies have as yet failed to reveal evidence of any environmental or nutritional factor involved in the production of kuru[1]. The possibility of the Fore people having a genetical predisposition to kuru was first mentioned in 1957[2]. Shortly afterwards, when a preliminary genetical study had been made, distinctive family patterns were found[3,4], and it was then suggested not only that the disease had an important familial component but also that this was quite possibly based on a single gene locus. The genetical hypothesis, advanced tentatively, was that kuru is under the control of autosomal alleles *Ku* and *ku* such that in females the homozygotes *KuKu* and heterozygotes *Kuku* are early- and late-onset victims, respectively, while in males the homozygotes *KuKu* are kuru victims but the heterozygotes are clinically normal. There are obvious weaknesses in basing inferences on genealogical data obtained from such primitive people through pidgin-English-speaking native interpreters. At the present time, however, this is the only way in which such material can be obtained. Nevertheless, it must be noted that the genealogical data gathered from many different parts of the affected region in extensive field studies during the past two years all exhibit essentially the same distinctive family patterns[5].

A puzzling observation has been Curtain's[6] reported association of kuru with the haptoglobin gene Hp^2. Using starch-gel electrophoresis, he found that the frequency of the Hp^2 gene in 54 kuru patients was 61 per cent as against only 36 per cent in 62 'normal' Fore individuals. Because this statistically significant difference seemed hard to reconcile with the genetical interpretation for kuru, an independent test for this association has been carried out. Blood samples were obtained by venepuncture from kuru patients and also from healthy Fore natives who were the parents of young female and male victims of kuru. Such parents, though not having any of the clinical symptoms of kuru, would be genetic carriers of the disease according to the above hypothesis. The samples were collected into Bayer venules and flown to Australia in ice-cold flasks. Haptoglobin typing of the sera was carried out in Perth using the vertical method of starch-gel electrophoresis as described by Smithies[7]. The results obtained are shown in Table 1.

Table 1. HAPTOGLOBIN GROUP FREQUENCIES

	No. tested	Haptoglobin group			Gene frequency	
		1—1	1—2	2—2	Hp^1	Hp^2
Kuru patients	47	21	20	6	0·66	0·34
Others	35	16	15	4	0·67	0·33
Total	82	37	35	10	0·66	0·34

The chief point which emerges from the present work is that there is no indication of any difference between the frequencies of the haptoglobin types in kuru patients and in those other Fore natives chosen for comparison. Furthermore, the frequencies of the Hp^1 and Hp^2 genes in both these groups are very similar to those reported by Curtain, not for his kuru patients, but for his control group of 'normal' individuals.

Several points of interest arise when the present results are compared with those reported for other populations. In this material, there is no Hp 0–0 individual nor is there anyone of the modified Hp 2–1 phenotype. These two types, which seem to be common in African Negroes[8], are rare in Europeans and in Japanese[9], Indian, Chinese and Malayan samples[10]. Neither type has been found in 89 Australian aborigines from South Australia, and there was only one 0–0 in a sample of 131 aborigines from the Western Desert (unpublished observations). The high frequency of the Hp^1 gene in this material is of interest. It is slightly higher than the frequency of 0·63 which has been reported for Micronesians of the Marshall Islands[11], and it is close to the highest value yet reported, namely, 0·72 for African Negroes. These values are much higher than in any of the series of South East Asian peoples so far tested[10], and they are in marked contrast to the low value of about 0·13 for the Hp^1 gene frequency found in Australian aborigines from South and West Australia—although a frequency of 0·64 for Hp^1 has been reported by Budtz-Olsen[12] for 100 aborigines from Central Australia, based on determinations using electrophoresis on paper.

The frequencies of the transferrin differences, typed simultaneously with the haptoglobins during starch-gel electrophoresis, are shown in Table 2. It is of interest that the frequency of the TfD_1 variant is the highest that has yet been reported, in published work, for any population. However, recent unpublished work in our laboratories indicates that it has an even higher frequency in Australian aborigines and that it is common also in the Veddahs of Ceylon.

Table 2. TRANSFERRIN GROUP FREQUENCIES

	No. tested	Transferrin group			Gene frequency	
		CC	CD_1	D_1D_1	C	D_1
Kuru patients	45	39	5	1	0·92	0·08
Others	35	26	8	1	0·86	0·14
Total	80	65	13	2	0·89	0·11

For both the haptoglobin and transferrin types, the observed genotypic frequencies shown in Tables 1 and 2 are in close agreement with those expected with random mating.

Hæmoglobin E in Egypt

HÆMOGLOBIN E is generally thought to occur exclusively among people of Mongoloid origin ; the greatest incidence being in the Burmese[1], Siamese[2], Cambodians[3], Indonesians[4] and Malayans[5]. The occurrence of hæmoglobin E in other peoples, for example, the Eti-Turks, an Arabic-speaking group living in southern Turkey[6], is usually accompanied by definite historic or familial ties with the South Eastern Asian. The discovery of hæmoglobin E in Egypt among a family which, so far as could be determined, has no direct relationship to the Asiatic (Mongoloid) is now reported.

The propositus was a 39-year-old male. The faces of the subject and two of his brothers and a niece who were seen are not those of the typical Arab. They represent, however, the features encountered among average Egyptians. Histories taken from the parents of the propositus revealed that the family had resided in the Nile Valley (delta) for many generations and had always gained a living as agricultural workers (fellaheen).

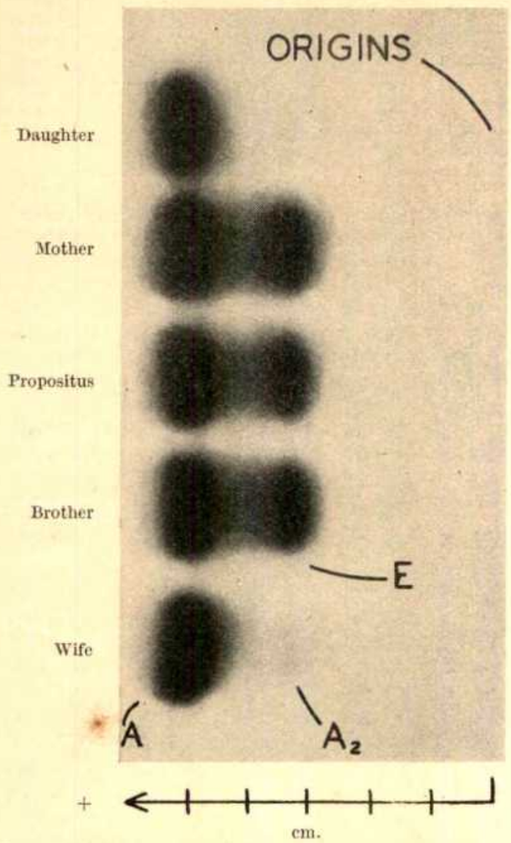

Fig. 1. Photograph of an unstained starch-gel slab after electrophoresis of hæmolysates from members of a family having the hæmoglobin E trait. Electrophoresis at 7 V. per cm. for 16 hr. Non-continuous buffer system (*tris*-maleate, 0·07 *M*, *p*H 8·7, for gel mixing; and borate, 0·3 *M*, *p*H 8·7, for bridge solution)

Twelve members of the family were examined. Nine were detected by starch-gel electrophoresis[7] to be hæmoglobin E heterozygotes. Consistent with previously reported results[8], we found no hæmatological or radiographical evidence of hæmolytic anæmia. A photograph of a starch-gel slab in which the hæmolysates of the propositus, his mother, wife, child and brother were submitted to electrophoresis is shown in Fig. 1. Of the family members studied, only the wife of the propositus (a second cousin on the maternal side), her brother and a daughter were free of hæmoglobin E. The concentration of the abnormal pigment was greater than 29 per cent in all cases.

It is interesting to speculate on the origin of hæmoglobin E in Egypt.

(1) *Origin by mutation.* Although it is difficult to establish unequivocally, the probability of gene mutation must be considered in distal occurrences of abnormal hæmoglobins. In this instance, we have demonstrated hæmoglobin E in persons who reside at great distances from its assumed focus and who are considered of a different race.

(2) *Origin as a new hæmoglobin.* Hæmoglobin E in the Asiatic and that reported here might arise from independent genetic mechanisms. Although standard identification tests did not vary from previously published results, we were able to derive some differences in migration-rates between hæmoglobin E and A_2, when the two were subjected to starch-gel electrophoresis in the second dimension. This is being studied further.

(3) *Origin by racial ties with Mongoloids.* This need scarcely be considered in the light of known anthropological differences between the two groups.

(4) *Penetration of hæmoglobin E gene.* This is the most attractive possibility, provided gene mutation is not the prime factor. It is indeed reasonable to harmonize the presence of hæmoglobin E in people of the Middle East with its existence among the Mongoloids of south Asia. It is in these areas and among these people that Islam was established in the Far East. Brumpt *et al.*[3] direct attention to the fact that in Cambodia there was something more than a coincidental increase of hæmoglobin E among natives of the Muslim faith. Another factor, of course, would be the Mongol invasions of the Middle East in A.D. 1258. Their attack extended as far as the eastern border of Sinai. They dominated the area of Syria and Iraq for decades. Most probably it was during one of these historical events that the gene of hæmoglobin E passed into the family we have examined.

The opinions or assertions contained herein are the private ones of the authors and are not to be construed as official or reflecting the views of the Navy Department or the U.S. naval service at large.

PATHOLOGY

Immunological Cross-Reactions between Salk 'Altered' Monkey Heart Cells and Ehrlich Ascites Carcinoma Cells

RECENT work[1] has shown that the metabolism of Ehrlich ascites carcinoma cells (EA cells) can be inhibited by small quantities of specific antiserum in the presence of complement. We have now observed that antisera prepared against the Salk 'altered' monkey heart cells (MHS cells)[2] show activity not only against the homologous cells, but also against Ehrlich ascites carcinoma cells and HeLa cells as well.

Antisera were prepared in rabbits as described in a previous communication[1]. The sera were lyophilized immediately after preparation and used without inactivation, unless otherwise specified. The methods of incubation and analysis were identical to those described previously[1].

Table 1. EFFECT OF ANTISERA ON DIFFERENT CELL LINES

Cells	Additions (antisera)	Uptake (c./min./mgm. dry weight)	Incorporation (c./min./mgm. protein)
MHS	Nil	1,360	100
	MHSAS	710	68
	EAAS	1,320	106
EA	Nil	3,140	144
	MHSAS	140	69
	EAAS	176	25
HeLa	Nil	2,060	46
	MHSAS	147	3
	EAAS	1,750	36

Glycine 2 μM, at 45 × 10^3 c.p.m./ml. Aerobic incubation for 1 hr. in Krebs–Ringer phosphate. Gas phase, oxygen.

Table 2. EFFECT OF DIFFERENT SOURCES OF COMPLEMENT, USING SALK 'ALTERED' MONKEY HEART CELL ANTISERUM AND EHRLICH ASCITES CARCINOMA CELLS

Additions	Uptake (c./min./mgm. dry weight)
Nil	2,200
Normal fresh rabbit serum	2,200
Normal fresh guinea pig serum	2,040
MHSAS inactivated	1,890
MHSAS inactivated + fresh guinea pig serum 1 : 1	1,790
MHSAS inactivated + fresh rabbit serum 1 : 1	1,100
Lyophilized MHSAS	420

Conditions as in Table 1.

Table 3. EFFECT OF THE ALTERATION OF THE CELL-SERUM RATIO

MHS cells (mgm. dry weight)	MHSAS (ml.)	Incorporation (per cent inhibition)	Uptake (per cent inhibition)
5·7	0·2	79	62
	0·1	37	17
	0·05	0	10
2·85	0·2	97	88
	0·1	54	43
	0·05	29	0
1·9	0·2	100	93
	0·1	75	75
	0·05	31	0

Conditions as in Table 1.

Conditions of the experiments were as follows: The incubations were carried out in Krebs–Ringer–bicarbonate medium (Tables 1 and 3) or Krebs–Ringer–phosphate medium (Table 2) under aerobic conditions for 1 hr.

The constituents per 1 ml. were :

Test serum	0·1 ml.
Complement (where applicable)	0·1 ml.
Glycine-1-^{14}C, 45 × 10^3 c.p.m.	2 μmoles
Glucose	10 μmoles
Cell suspension	0·5 ml.

The dry weight of the cell suspension was 4·0 mgm. unless otherwise indicated.

The results are expressed as follows : (*a*) uptake : counts/min./mgm. dry weight of cells ; (*b*) incorporation : counts/min./mgm. protein.

The results presented in Table 1 show that, while Salk 'altered' monkey heart cell antiserum markedly affects the uptake and incorporation of glycine-1-^{14}C by the Ehrlich ascites carcinoma cells and HeLa cells as well as by the Salk 'altered' monkey heart cells, the Ehrlich ascites carcinoma cell antiserum (EAAS) is much less effective against the heterologous cells.

We have also observed, as indicated in the previous report[1], that the reaction is dependent on the presence of complement. Inactivation of the antiserum at 56° C. for 30 min. brings about a loss of inhibitory activity. The conventional source of complement, namely, guinea pig serum, restores little of the inhibitory activity. Normal fresh rabbit serum is much more effective, but unheated (lyophilized) antiserum is always the most effective inhibitor. Table 2 shows the results of a typical experiment illustrating this phenomenon.

Since it was known from previous experiments (unpublished results) that with the Ehrlich ascites carcinoma cells and the homologous antiserum there is a ratio of cell to antiserum at which maximal inhibitory activity is observed, the effects of changing the cell/antiserum ratio with the Salk 'altered' monkey heart cells were considered.

The results in Table 3 indicate that the inhibition observed at a given concentration of serum is much greater when few cells are used.

Recently, Defendi and Colter[3] observed immunological cross-reactions between different cell lines. Our results, using different techniques, indicate that such cross-reactions exist between Ehrlich ascites carcinoma cells, Salk 'altered' monkey heart cells, and HeLa cells ; thus antisera against the Salk 'altered' monkey heart cells also inhibit the metabolic activity of the Ehrlich ascites carcinoma cells and HeLa cells. However, antiserum against Ehrlich ascites carcinoma cells does not affect the Salk 'altered' monkey heart cells to the same extent.

Further experiments are required using cross-absorption techniques to decide which cell fractions are responsible for this phenomenon.

We are indebted to the Connaught Medical Research Laboratories, Toronto, for having made the Salk 'altered' monkey heart cells available to us. This work was supported by a grant from the National Cancer Institute of Canada and the National Research Council of Canada. We are grateful for the help and encouragement given by Profs. J. H. Quastel and R. W. Reed.

Inhibition of Experimental Cirrhosis by Carbon Tetrachloride following Treatment with Aminoacetonitrile

EXPERIMENTS on lathyrogenic compounds have shown that they exert a delaying action on collagen formation[1–4]. The mechanism by which they act is still unknown.

Owing to the biological interest of these findings, and in view of their possible pharmacological implications in those pathological conditions where the new formation of collagen is the fundamental lesion or a most important component of the pathological picture, the present experiments were carried out in order to study the action of aminoacetonitrile (AAN), one of the lathyrogenic agents, on experimental cirrhosis by carbon tetrachloride.

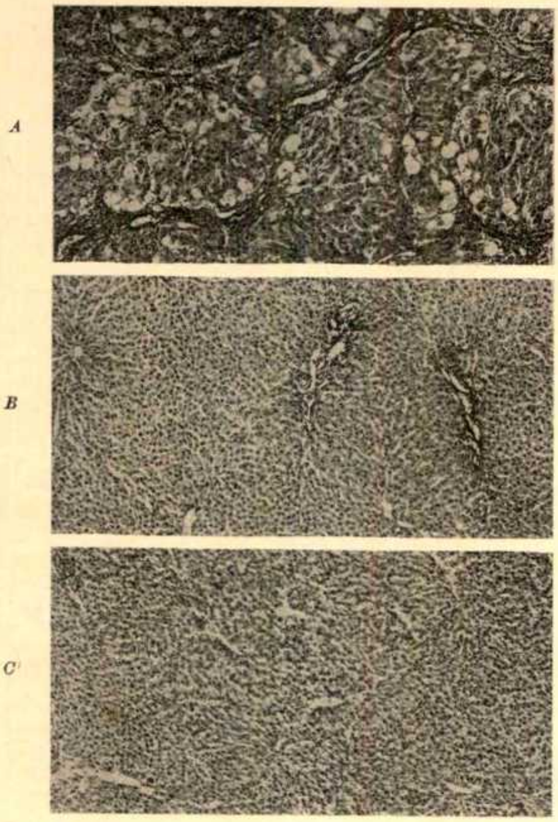

Fig. 1. *A*, Rat liver after 60 days of treatment with carbon tetrachloride; *B*, rat liver after 60 days of carbon tetrachloride and 53 days of AAN treatment; *C*, normal rat liver. Van Gieson staining. (× *c*. 31)

100 female rats weighing 150–200 gm. were used. Cirrhogenic treatment was given daily by inhalation, all the animals simultaneously breathing the same atmosphere with carbon tetrachloride vapour.

The cages containing the animals were put into a box where carbon tetrachloride was allowed to fall in drops on the plate of an electric oven until the vapour reached an approximate concentration of 50 gm. per m.^{3}. The dropping velocity was regulated so that this concentration of carbon tetrachloride vapours was attained after 7–8 min. Immediately after, the cages were removed from the box.

After the first week's treatment with carbon tetrachloride the rats were divided into two groups of equal number. One group was treated daily, in addition to carbon tetrachloride, with a subcutaneous injection of 20 mgm. aminoacetonitrile hydrosulphate dissolved in 0·2 ml. water and neutralized with sodium hydroxide. The other group, used as control, continued to receive daily treatment with carbon tetrachloride. After one month, at varied intervals, an equal number of animals from the two groups were killed and liver sections were histologically examined, having been stained with Van Gieson, Azan Mallory, hæmatoxylin and eosin. After two months the experiment was ended by killing all the surviving animals.

Both in the group treated with carbon tetrachloride and in that treated with carbon tetrachloride and AAN a high rate of mortality was observed, probably due to excessive amounts of the carbon tetrachloride used. Starting from the thirtieth day of treatment with carbon tetrachloride, livers were examined histologically, when possible, also from animals which were found dead.

Histological examination of the liver was carried out on a total of 25 animals treated with carbon tetrachloride and 24 animals treated with carbon tetrachloride and AAN. Between the thirtieth and fortieth days of carbon tetrachloride administration the newly formed connective tissue begins to be evident in the liver of animals treated with carbon tetrachloride alone, being detectable around the blood-vessels and in trabeculæ projecting among the lobules. From this moment the newly formed connective tissue is progressively increasing. After the sixtieth day's treatment, the cirrhosis picture is well marked. Big connective trabeculæ rich in fibroblasts and histiocytes surround the lobules, in which parenchymal cells show the typical severe alterations which follow carbon tetrachloride treatment (Fig. 1*A*). At this stage cirrhosis reveals itself macroscopically too, in that the liver acquires a clearly granular surface. On the contrary, in the liver of all the animals treated with carbon tetrachloride and AAN, including those which had received carbon tetrachloride for 60 days, the formation of collagen is extremely reduced: in comparison with the normal liver (Fig. 1*C*) it is slightly increased almost exclusively around the blood-vessels (Fig. 1*B*). Parenchymal cells are apparently normal.

The number of fibroblasts and histiocytes is also greatly reduced: this result does not agree with those of previous investigations[1-4] in which the action of lathyrogenic agents on the development of connective tissue was studied in different experimental conditions. It was then observed that lathyrogenic agents exert a delaying action on collagen formation, but do not inhibit the multiplication of fibroblasts and histiocytes. The present observations would suggest that the inhibitory effect of AAN on hepatic fibrosis due to carbon tetrachloride is not only due to the already known specific inhibition of collagen formation, but also to an inhibition of fibroblast multiplication.

Since the present observations do not exclude the possibility that AAN by some unknown interaction with carbon tetrachloride may prevent the latter substance from exerting its cirrhogenic activity, experiments are being made to ascertain whether it inhibits also fibroses of the same organ arising from other causes.

ANATOMY

Continuous Regeneration of the Dentinal Nerve-Endings

IN recent years several investigators have reported that nerve fibres have been observed growing from the dental pulp into the so-called predentine[1-5]. These authors all dealt with human dentine. I published[6] last year an account of work showing the presence of unmyelinated nerve fibres in the predentine and the tubules of the dentine also of the rat. The occurrence of these fibres in rat dentine is very irregular, and seemingly certain spots are preferred. The distribution of the sensory nerves in the higher mammals is very similar, with the exception, of course, that the pulp innervation of the continuously growing incisor[7], and other continuously growing teeth[6] of rodents follows a quite different pattern. I have examined freshly extracted young human teeth also, demonstrating the nerve fibre in the dentine by the slightly modified method described by Romanes[8] using frozen sections. I found, in agreement with Weddel and Zander[9], that *p*H and length of time in the different fluids are of importance.

In some preparations I could clearly observe and confirm the presence of nerve fibres, mostly in the predentine, and also in some specimens the presence of a widely distributed nerve net in the predentine. The nerve fibre cannot be followed regularly in the calcified dentine by the methods of Romanes or Holmes; apparently this is possible only in very rare instances, as in the case of Powers[3]. I could follow some nerve fibres for a short way at the border of the calcified dentine, where they become indistinct. It seems to me that in the calcified dentine there are incorporated nerve fibres which are rarely distinguished with our present techniques. There is a possibility also that they become calcified and cease to function as receptors.

The dentine of higher mammals develops during the so-called functional period of the tooth also; the dentine becomes thicker and the pulp chamber narrower. The greater part of the dentine becomes calcified, although the inner—newly developed ground substance—is for a while uncalcified. This mechanism goes on until the formative power of the odontoblasts is exhausted. On the outer border of the uncalcified dentine, calcification goes on —spreading mostly in a spherical arrangement—and on its inner border new collagen ground substance is laid down.

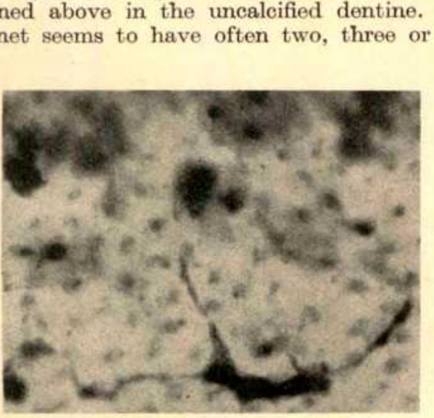

Fig. 1. Predentine, cross-section, showing a 'varix' with three nerve fibres originating from it. Left upper second premolar, girl, 14-years old. × 920

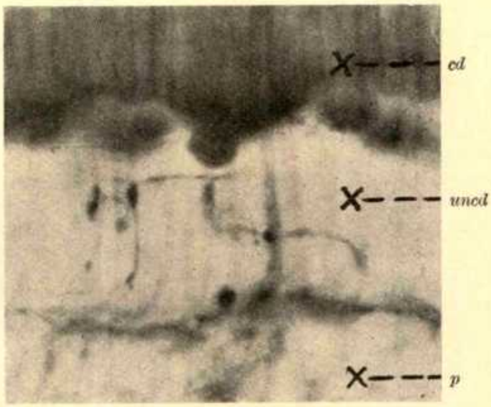

Fig. 2. Nerve fibres in the predentine running in three layers. From the same tooth as in Fig. 1. *cd*, Calcified dentine; *uncd*, uncalcified dentine; *p*, pulp; × 750

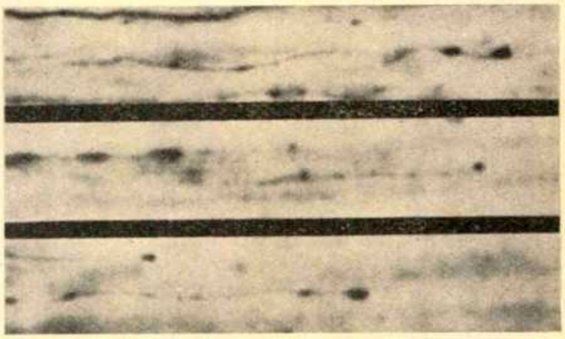

Fig. 3. Calcified dentine from a left lower second incisor of a boy 12 years old; longitudinal section. Three strips of dental tubuli with nerve fibres in it. × 1,200

I found that in the crown-pulp of human teeth the distribution of the unmyelinated nerve fibres in the uncalcified dentine or predentine shows a more or less regular pattern. I believe that some of these fibres come to a 'stop' on or near the inner border of the uncalcified dentine and develop there a 'varix' sometimes of considerable size (Fig. 1) and then, perhaps by active ingrowth, produce the nerve net mentioned above in the uncalcified dentine. This nerve net seems to have often two, three or more layers (Fig. 2); parts of the nerve net can also be found on the lowest layer, that is, on the inner border itself. Connexions between the different layers may be very numerous and of very different kinds. Some of the nerve fibres can be followed in the dentinal tubules, where they proceed with the odontoblastic process in the distal direction. Most of the fibrils are dotted or beaded at regular intervals in the uncalcified dentine as well as in the dentinal tubules (Fig. 3), and are, as in the case of the calcified dentine, only in this way discernible because the nerve fibres themselves become very thin.

All this—and the fact that 'varices' can be found at different levels or layers—suggests, in my opinion, the following conclusion. The peripheral part of the unmyelinated nerve fibre is, at least partly, in a state of continuous regeneration, that is, development. (Peripheral regeneration of the nerves is a common experience and is known also in newly formed tissues in the region of the teeth[10] in the case of injuries but not on a physiological basis.) It may be that the functioning recipient parts of the nerve fibre are the dotted ones, in the odontoblastic area, in the uncalcified dentine and in the dentinal tubules. With the centripetal calcifying of the dentine matrix, the nerve fibre of the predentine becomes incorporated in the calcified part and ceases to function; there develops eventually from the same fibril a branch at a lower level; perhaps repeatedly. If such a fibril is exhausted, then a new one grows in the uncalcified dentine, building a varix at the termination of the pulp. The varix becomes in this way itself involved in the developing ground substance. This explains why 'varices' can be found deep in the uncalcified dentine.

It seems highly likely that the mechanism briefly described here is not restricted to dentine, but is a regular pattern of the different subcutaneous free receptors, at least in the mucosa and in the skin.

A more detailed report of this work will be published elsewhere.

BIOLOGY

Promotion of Cucumber Hypocotyl Growth by Two New Gibberellins

Wittwer and Bukovac[1] and Lockhart and Deal[2] have recently shown that gibberellin A_4, though less active than gibberellin A_1 or gibberellic acid in most bioassay systems[1,3,4], is far more active than A_1 or gibberellic acid in promoting the growth of cucumber stems. We have found that two recently discovered gibberellins, A_7 and A_9, both produced by *Gibberella fujikuroi*[5,6], also show specifically high activity in promotion of cucumber hypocotyl growth.

Cucumber seeds were germinated on moist filter paper at 25° C. in darkness. After 48 hr. the seed-coat was removed from germinated seeds and they were transplanted in dishes of 1 per cent water agar. The gibberellin was applied in 2-µl. drops of ethanol to the cotyledons. After 2 (Table 1) or 3 (Table 2) days growth at 25° C. in diffuse white light, the lengths of the hypocotyls were measured. The results of experiments with two varieties of cucumber, in which gibberellins A_4 and A_7 and gibberellic acid were compared, are presented in Table 1. It will be seen that both A_4 and A_7 are considerably more effective than gibberellic acid in promoting hypocotyl growth. We have found that gibberellin A_7 is of the same order of activity as gibberellic acid in promotion of lettuce hypocotyl growth, but less active than gibberellic acid in promotion of pea stem extension.

Gibberellin A_9 is much less active than gibberellic acid in promotion of pea stem or lettuce hypocotyl growth; with both plants a dose of 10 µgm. A_9 is required to give an effect comparable to that of 0·1 µgm. gibberellic acid. Nevertheless, A_9 is much more active than gibberellic acid in promotion of cucumber hypocotyl growth (Table 2). In other experiments we have confirmed the observation of Wittwer and Bukovac[1] that gibberellin A_1 is of the same order of activity as gibberellic acid on cucumbers.

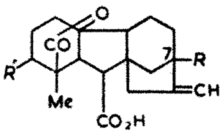
Table 1. Hypocotyl Length (mm.) of Cucumber Seedlings (Means of 20 Replicates ± *S.E.*)

Dose (µgm./plant)	Long Green ridge cucumber Gibberellic acid	Long Green ridge cucumber A_4	Long Green ridge cucumber A_7	Perfection ridge cucumber Gibberellic acid	Perfection ridge cucumber A_4	Perfection ridge cucumber A_7
0·2	15·7 ± 0·6	32·0 ± 1·4	33·3 ± 1·5	15·4 ± 0·8	28·7 ± 1·2	30·4 ± 1·5
1·0	17·5 ± 1·0	32·5 ± 1·5	32·3 ± 1·7	19·5 ± 1·4	30·1 ± 1·3	35·0 ± 1·5
5·0	21·2 ± 1·1	34·7 ± 1·9	29·9 ± 1·3	18·2 ± 1·5	28·5 ± 1·4	34·5 ± 1·6
Untreated controls	16·3 ± 1·0			12·4 ± 0·7		

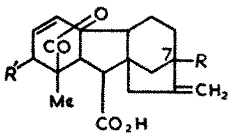
Table 2. Hypocotyl Length (mm.) of Cucumber Seedlings (Means of 30 Replicates ± *S.E.*)

Dose (µgm./plant)	Long Green ridge cucumber Gibberellic acid	Long Green ridge cucumber A_9	Perfection ridge cucumber Gibberellic acid	Perfection ridge cucumber A_9
0·2	27·2±0·9	41·3±1·1	33·4±0·9	42·1±1·0
1·0	30·5±0·8	50·9±1·2	37·2±1·0	51·1±1·3
5·0	40·8±1·0	55·8±1·4	41·0±1·6	53·9±1·5
Untreated controls	25·3±0·7		26·0±0·8	

It is perhaps significant that gibberellins A_4 (I; $R = H, R' = OH$), A_7 (II; $R = H, R' = OH$) and A_9 (I; $R = R' = H$) have one structural feature in common that distinguishes them from A_1 (I; $R = R' = OH$) and gibberellic acid (II; $R = R' = OH$), namely, the absence of a hydroxyl group at position 7.



(I)



(II)

We hope shortly to compare these gibberellins in other bioassay systems where A_4 has been shown to have specific activity[7]. We are indebted to Dr. B. E. Cross for samples of gibberellins A_4, A_7 and A_9.

Effect of High-Temperature Pre-Treatment on the Germination of Oil Palm Seed

It has been known for more than forty years that a high temperature is essential for the germination of oil palm seed[1], and on a commercial scale seed is germinated in sand beds exposed to the Sun, in fermentation pits or in artificially heated germinators.

The optimum temperature for the germination of kernels was shown by Hussey[2] to lie between 38 and 40° C., and a temperature of 39·5° C. has been successfully adopted for germinating seed in a specially designed germinator[4].

It has also been shown[3] that an 80-day period of high temperature is sufficient for the germination of fresh seed; periods longer than this have no significant effect on the percentage germination obtained. When the seed is kept at ambient temperature (about 27° C.) after heat treatment, the rate of germination is characteristically rapid, 80 per cent germination being obtained in about 8 days, and complete germination within 15 days. If, however, the moisture content of the seed during the heat treatment is below the optimum for germination, the rate of germination at ambient temperature is lower and complete germination may take up to 6 weeks.

In a recent experiment, four 600-ml. jars covered with 0·002 in. polythene sheet and containing 50 *dura* (thick-shelled) seed were kept for 80 days at 39·5° C. at each of the four moisture contents shown in Table 1. The first of these was achieved by over-watering and maintaining a ½-in. layer of water at the bottom of the jar. In treatments 2 and 3 the seeds were examined three times a week and watered when necessary, the moisture content being estimated visually, while in treatment 4 the seeds were dried at the start of the experiment and received no water during the heat treatment. The moisture content of the seed in treatment 2 was the optimum for germination. After 80 days all jars were brought to ambient temperature. In two jars from each treatment the seeds were soaked for 5 days, then dried slightly to the optimum moisture content, and in the remaining two the seeds were left unchanged. The germination percentages obtained, together with the moisture contents determined from samples taken after the heat treatment, are shown in Table 1.

Table 1. GERMINATION OBTAINED FROM FOUR BATCHES OF SEED GIVEN 80 DAYS HEAT TREATMENT AT 39·5° C. AT A RANGE OF CONSTANT MOISTURE CONTENTS. HALF THE SEED IN EACH BATCH WAS THEN BROUGHT TO OPTIMUM MOISTURE CONTENT FOR GERMINATION AND HALF WAS LEFT UNCHANGED

Seed batch	Moisture content (per cent) Nominal	Moisture content (per cent) Actual	Germination (per cent) at Original moisture content	Germination (per cent) at Optimum moisture content	Days to 50 per cent of final germination at optimum moisture content after 80 days
1	24	24·2	12	71	28·5
2	21 (optimum)	21·3	95	92	6·5
3	19	18·6	0	97	17·5
4	14	14·2	0	97	25·0

It will be seen that excellent germination may be obtained from heat-treated air-dry seed afterwards cooled at optimum moisture content, although following cooling there is a time lag before germination starts which accounts for the differences in rates of germination shown for batches 2, 3 and 4 in Table 1. In large-scale germination of seed, thrice-weekly examination of seed for watering during the heat treatment period is rendered unnecessary, and, more important, the risk of over-watering, which is more dangerous to the final germination than under-watering, is eliminated.

This high-temperature requirement of seed, a pretreatment which corresponds to the well-known low-temperature stratification of seed of temperate plants, is remarkable in that it can be satisfied at a low seed moisture content.

In a region such as Southern Nigeria with a severe 3–4 month dry season, a high-temperature requirement has an obvious survival value, ensuring germination when water becomes available for growth.

This work is continuing and will be reported in fuller detail in the Institute's Journal.

Effect of Temperature Fluctuations on Flowering in *Salvia splendens*

IN the majority of experiments that have been carried out on the interaction of day and night temperature on plant growth, a certain day temperature is selected and this is compared with varying night temperatures or vice versa. From the results of such experiments[1,2] the explanation offered for any particular combination of temperature treatments proving more favourable for the development of the plant usually rests on the hypothesis that one or more of the processes susceptible to temperature change, for example, photosynthesis, respiration or translocation, is furthered or hindered during night or day. Therefore, depending on the suitability of the temperature combination with the period of illumination, the growth of the plant is similarly furthered or hindered.

In experiments carried out in the phytotron of the University of Liège[3] using a long-day flowering variety of *Salvia splendens* Sello it was found possible to produce the same response in the growth and flowering of the plant through using combinations of day and night temperatures that were the opposite of one another.

Salvias were grown at 20 and 27° C. keeping the day and night temperature constant in both cases. Plants were also grown in long days with the temperature kept at 20° C. by day and 27° C. by night, and vice versa. The changes in temperature were controlled by thermostatic clocks, thus avoiding the necessity of moving the plants abruptly from one temperature to another. In all the temperature treatments the relative humidity was kept at 80 per cent.

Table 1 compares the growth and flowering of the plants grown in 16-hr. days under the different temperature conditions.

It is seen that there is little difference in the time taken for the plants to flower or in the height of the

Table 1. COMPARISON OF STATE OF DEVELOPMENT OF SALVIA PLANTS GROWN IN 16-HR. DAYS WHEN 50 PER CENT OF THE PLANTS IN EACH TREATMENT (150 PLANTS PER TREATMENT) HAVE JUST PRODUCED THEIR FIRST FLOWERING BUD

	20° C. day and night	27° C. day and night	20° C. day and 27° C. night	27° C. day and 20° C. night
Age in days	36	38	49	53
Height (cm.)	4·6	4·6	6·3	8·6
Vegetative nodes formed	6	8	8	9

plants at flowering when the temperature is kept at 20 or 27° C. constantly day and night. However, when the temperature is allowed to vary either 20° C. by day with 27° C. by night or vice versa there is a retardation in the flowering of the plants. With both these temperature treatments the response is the same, the plants being both older and taller at flowering.

Explanations based on such hypotheses as used by Went *et al.*[1,3] are here of no avail, as opposite conditions produce in each case the same result. It can only be concluded that the alternation of temperature produces its effect without being correlated with either the period of illumination or darkness.

I am indebted to Prof. R. Bouillenne for facilities in the phytotron, to Dr. C. Sironval for advice and to the Carnegie Trust for the Universities of Scotland for a scholarship.

Biochemical Classification of Yeasts

Roberts and Thorne[1] disagree with my proposals[2] for improving the classification of yeasts, but themselves suggest no way of overcoming the difficulties (which they acknowledge exist) in using the present system[3]. Instead, they emphasize the desirability of constructing a phylogenetic classification; though this is obviously impracticable.

I advocated developing a classification of yeasts based mainly, not, as they claim, "exclusively", on the biochemistry of yeasts. Roberts and Thorne also imply that I hold the view that because morphological differences reflect chemical ones, morphology is neither interesting nor important. This argument is a *non sequitur* and I did not put it forward.

It is strange that Roberts and Thorne object to the idea that the most important thing about yeasts is their biochemical activity. Chemical processes determine the role of yeasts in brewing, wine-making, baking, nutrition, spoiling foodstuffs and as pathogens. Thus it is not surprising that of thirteen papers on yeast genetics published by Winge and Roberts[4] between 1948 and 1958, at least nine were concerned with biochemical characteristics.

In the present lack of knowledge about the ancestral history of yeasts, it is self-deception to say that any classification of them is phylogenetic. The idea of chronology is implicit in any phylogenetic classification; and this has little meaning except in terms of the age of ancestral forms[5]. Kudriavzev's[6] and Zsolt's[7] theories of evolutionary relationships are based on insufficient evidence; and Wickerham's speculations[8] on the phylogeny of the *Hansenulae* involve false assumptions[9]. Kudriavzev held that it was necessary for his classification to be phylogenetic. Because of the difficulty in developing a phylogenetic theory for the asexual forms (p. 80), he did not publish any data on the species of non-sporing yeasts, and this detracts enormously from the value of his book[6].

The Dutch classification of yeasts[3] is by far the most complete and therefore the most useful. As I have pointed out before[2,9], it has, however, three major weaknesses. (1) Sporulation tests are given supreme importance. These involve a bewildering array of media (Phaff and Mrak[11], list 18) and extensive searching for spores. Moreover, since a negative result is equivocal, these tests are very unsatisfactory. (2) The morphological criteria used, are ill-defined and difficult to specify precisely. (3) The biochemical tests are excessively crude and hence uninformative.

Roberts and Thorne do not say that these criticisms are invalid. Assuming their validity, it seems reasonable to develop techniques for classifying yeasts in which: (*a*) there are no sporulation tests; (*b*) the morphological criteria are given greater precision; (*c*) biochemical tests are designed to give more information.

I do not suggest that studies of morphology or of sporulation should stop; but I do suggest that in classification biochemical criteria should be given more importance than at present. No embargo on evolutionary speculation has been proposed; but there is no reason why such conjecture must be applied to yeast taxonomy. Perhaps it is worth noting van Niel's striking *volte-face*: although in 1936 he held that bacterial classification had to be phylogenetic[12], ten years later he wrote: "Bacterial taxonomy is far more similar to Linnaeus's original system of the plants. . . . Both kinds of system are useful if they permit the rapid assignment of a specimen to a restricted group, but neither can lay claim to representing phylogenetic relationships", and in another passage: "It is not hereby implied that such systems are inferior to the 'natural' systems of the botanist and zoologist, but merely that they serve a different purpose, and are arbitrary"[13].

Effects of Light and Optical Sensitization by Acridine-Orange on Living Bull Spermatozoa

Continuation of investigations on the effects of vital fluorochroming of bull spermatozoa with acridine-orange[1] has now confirmed the view that the observed adverse effects may be attributed to photodynamic action exerted by the fluorochrome.

Bull semen was diluted with optically clear egg-yolk – citrate buffer, every sample being split into

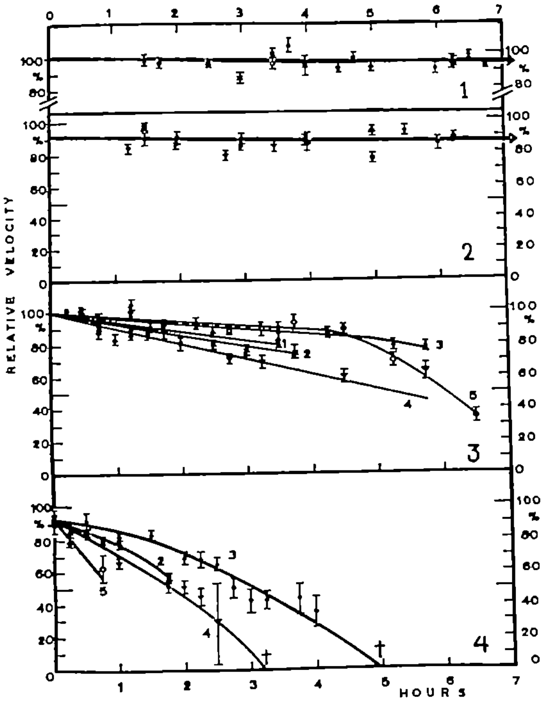

Fig. 1. Relative mean velocities of bull spermatozoa as a function of time, with and without acridine-orange.

Curve 1. Controls without acridine-orange, kept in darkness, initial mean velocities have been taken as 100 per cent; the absolute values were 107 ± 11 μ/sec. (*S.E.* ± 5).

Curve 2. Samples with acridine-orange, kept in darkness. Initial velocity 92 per cent relative to the initial mean velocity of the controls, as a result of the adverse effect of photosensitization during the measuring procedure.

The regression lines of (1) and (2) were calculated from data extending to 30 hr., only the first 7 hr. being shown here. The spread of the curves obtained in the individual experiments being very small, only the regression lines for pooled data are shown. Curve 3. Controls without acridine-orange, kept under illumination with white light. Initial mean velocity taken as 100 per cent. Curve 4. Samples with acridine-orange, kept under illumination. At † no actively swimming specimens could be observed visually under the microscope

four portions, to two of which acridine-orange in a final concentration of 1 : 50,000 was added. The darkness samples were kept in a Dewar vessel with ice, the tubes being isolated from direct contact with the ice by an air mantle. The samples used for irradiation (also isolated by an air mantle) were placed in a glass beaker with ice, separated from the light source (a 220-V., 200-W. incandescent lamp) by a cooling cylinder filled with water and ice. At regular intervals drops were taken from the test-tubes and brought into the photo-electric equipment[1-4].

With the samples kept in darkness, there was no statistical difference between the semen with acridine-orange and the control with respect to the rate of decrease of velocity, and the rate of decrease of the number of spermatozoa moving normally; however, the curves were shifted to a lower level. The amount of this constant difference per ejaculate could be accounted for completely by the effect of optical sensitization by acridine-orange during the period of measurement. The mean rates of decrease of velocity with time were 0·55 ± 0·18 (*S.E.*) μ/sec./hr. for the controls and 0·56 ± 0·17 μ/sec./hr. for the samples with acridine-orange.

In the illuminated samples the mean velocity of spermatozoa with normal movement decreased rapidly in comparison to the samples kept in darkness, the effect of addition of acridine-orange being most striking (Fig. 1). All curves bend towards the abscissa. From an analysis of much more extensive material on the rates of decrease of velocity under different conditions, it may be expected that all the curves will bend down to the abscissa if the period of taking measurements is sufficiently extended. The curves can be described by the equation:

$$\bar{v}_t = \bar{v}_0 - \alpha t.\exp(kt) \qquad (1)$$

where $\bar{v}_t$ is the mean velocity at an interval of time t after the beginning of the experiment when the mean velocity is $\bar{v}_0$; α and k are constants determining slopes and bending points. If the numerical value of kt is small, (1) reduces to the straight-line equation:

$$\bar{v}_t = \bar{v}_0 - \alpha t \qquad (2)$$

obtained in experiments of short duration relative to the rate of decrease of velocity.

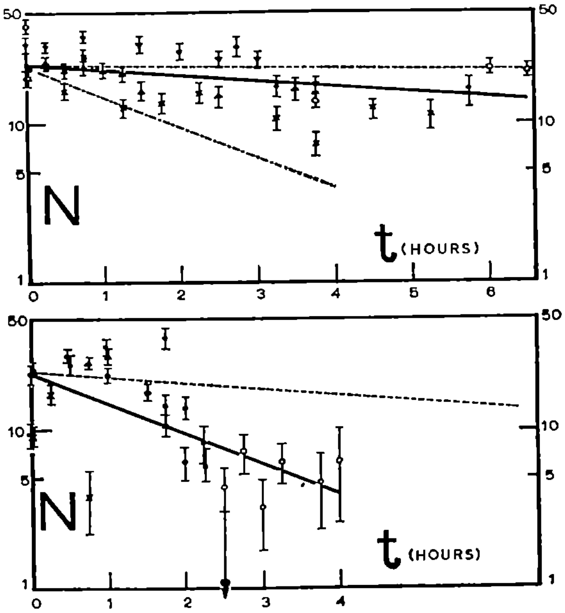

Fig. 2. Semi-logarithmic plots of numbers *N* per volume (in arbitrary units) of bull spermatozoa moving normally, as a function of time, under illumination with white light.

Upper graph: Controls without acridine-orange. The upper dotted line indicates the curve obtained for the samples kept in the dark, while the lower dotted line indicates the curve for samples with acridine-orange added kept under illumination. These dotted curves may facilitate comparison.

Lower graph: Samples with acridine-orange added. The dotted line indicates the curve of the illuminated control

The number *N* per unit volume of spermatozoa moving normally has been found to decrease exponentially with time during the limited periods actually investigated[3-6], according to:

$$N_t = N_0.\exp(-kt) \qquad (3)$$

yielding a straight-line relationship on a semi-logarithmic plot (Fig. 2). Whether this relationship would hold over an extended range is doubtful, since according to (3) the number of moving specimens would only become zero at infinite time, which is obviously impossible, the last specimen in reality becoming immotile at a very finite time indeed. With this restriction, the values of k and the half-life periods $t_{1/2}$ obtained for the four different conditions were:

Samples without fluorochrome, in the dark: $k = 0{\cdot}018$ hr.$^{-1}$, $t_{1/2} = 38$ hr.

Samples without fluorochrome, illuminated: $k = 0{\cdot}078$ hr.$^{-1}$ $t_{1/2} = 8{\cdot}8$ hr.

Samples with acridine-orange, in the dark: $k = 0{\cdot}017$ hr.$^{-1}$, $t_{1/2} = 40$ hr.

Samples with acridine-orange, illuminated: $k = 0{\cdot}43$ hr.$^{-1}$, $t_{1/2} = 1{\cdot}6$ hr.

There is no significant difference in slope between the curves obtained for the samples with and without acridine-orange kept in darkness ($P > 0{\cdot}90$). The slopes of both curves differ significantly from a horizontal line ($P < 0{\cdot}001$).

The slope of the curve of the samples without acridine-orange, kept in darkness, differs significantly from that of the illuminated portions of the same samples ($0{\cdot}02 < P < 0{\cdot}05$), illumination increasing the rate of reduction of the number of spermatozoa.

The slope of the curve of the illuminated samples with acridine-orange is significantly steeper than that of the curves obtained for the samples kept in darkness ($P < 0{\cdot}001$), and also than that of the curve obtained for the samples with acridine-orange kept in the dark.

These results confirm that the number of normally moving spermatozoa in diluted semen without the addition of fluorochrome decreases much faster under the influence of illumination than in darkness, in agreement with previous findings by Norman and Goldberg[7], whose results, however, do not allow further analysis of the relationship since evaluations were performed at two time intervals only. The ratio of the slope constants in these two conditions is obviously dependent on the actual level of illumination employed. This is not the case with a comparison between the constants for the slopes obtained for the same illuminated samples with and without acridine-orange, since both are then exposed to the same light intensity. Whereas in darkness acridine-orange (1 : 50,000) did not have any demonstrable effect on the mean velocity and the number of normally moving sperms during a period of storage in a Dewar vessel with ice up to 30 hr., a big and deleterious effect in both respects occurs in the samples kept under illumination; this effect is enhanced considerably by photosensitization by acridine-orange.

Size of Particles ingested by *Simulium* Larvæ

THE diet of the aquatic larval stages of the blackfly, *Simulium*, some adults of which transmit onchocerciasis to man and animals, has been described; but little information is available on the size of the particles ingested.

The size of particulate matter taken in by *Simulium* larvæ has been measured for four temperate species of *Simulium*.

S. ornatum was obtained from a small highly calcareous stream at Hawarden, Flintshire. This stream is heavily shaded by trees and slightly polluted by farm drainage.

S. ornatum, *S. reptans* and *S. variegatum* were collected from the River Ceirog at Chirk, Denbighshire. This river, a tributary of the Dee, is shaded by trees, is moderately calcareous, and is slightly polluted from cattle pasture.

S. tuberosum was obtained from the Hirnant, a soft-water hill stream at Bala, Merionethshire.

The contents of the midgut were separated from the gut tissue on a slide, and spread by gentle pressure on a coverslip. The longest and shortest axes of 45 randomly selected particles were measured in 5 last instar larvæ in each group, and in 5 earlier instar larvæ which were not identified, taken from the Ceirog.

The frequency distribution of particle sizes in each group was log normal, and the sizes in the individuals of the different species from the different rivers were similar.

(*S. ornatum*, Hawarden, 11·3 ± 1·8μ, 6·6 ± 1·7μ; *S. ornatum*, Ceirog, 13·2 ± 2·1μ, 7·3 ± 1·8μ; *S. reptans*, 15·1 ± 2·0μ; 8·0 ± 1·8μ; *S. variegatum*, 14·8 ± 2·1μ, 7·8 ± 1·9μ; *S. tuberosum*, 12·0 ± 1·9μ, 7·7 ± 1·9μ; unidentified early instars 14·0 ± 1·7μ, 7·3 ± 1·7μ.)

BACTERIOLOGY

Chelating Agents for Selective Growth of Bacteria

THE use of *p*H buffers for stabilizing the *p*H of growth media has become common bacteriological practice. There do not appear to be any reports, however, of the similar use of chelating agents for controlling the concentration of metal ions as 'metal buffers'[1,2]. With metal ions there is a more complex situation, of course, since there are few chelating agents selective for one particular metal. An observed effect on bacterial growth can, therefore, be due to simultaneous sequestration of several metal ions and this must be allowed for in designing experiments.

It has been found that, by suitable control of the concentration of magnesium ions, liquid and solid media can be devised for selection of coagulase-positive staphylococci in presence of coagulase-negative strains and of many commensal organisms. By calculation from the controlled *p*H and from the known stability constants of the chelating agents[3] employed, it is found that the concentration-range over which an effect can be observed in the growth-rate of coagulase-positive staphylococci lies roughly between $M/1{,}000{,}000$ and $M/25{,}000$ free magnesium ions (or if expressed more conveniently in terms of the negative logarithm, from *p*Mg 6·0 to 4·4). This accords with the value of $<M/250{,}000$ to $M/25{,}000$

found by Shooter and Wyatt[4] by returning magnesium and calcium ions to media previously exhausted by treatment with '*IRC*-50' ion-exchange resin.

A representative liquid medium which will distinguish coagulase-positive from coagulase-negative strains of staphylococci (picked from colonies on blood agar plates) after 6–24 hr. incubation at 37° C. is as follows: 'Casamino' acids (Difco), 0·2 per cent; yeast extract ('Oxoid'), 0·05 per cent; Na_2HPO_4, 0·0144 *M*; KH_2PO_4, 0·0056 *M*; Na_3H salt of ethylenediamine tetraacetic acid (Na_3HEDTA), 0·0012 *M*; Na_2 [MgEDTA], 0·006 *M*; Na_2 [CaEDTA], 0·007 *M*; Na_2 [MnEDTA], 0·001 *M* (added phosphate 0·02 *M*, *p*H 7·2, calculated *p*Mg 4·8).

A representative agar medium which can be used for selection of coagulase-positive colonies in primary cultures from a slit sampler, or from sweep inocula from swabs or like sources, is as follows: Nutrient agar (Difco), 3·4 per cent; Na_2HPO_4, 0·0144 *M*; KH_2PO_4, 0·0056 *M*; Na_3HEDTA 0·00325 *M*; Na_2 [MgEDTA], 0·01 *M*; Na_2 [CaEDTA], 0·008 *M*; Na_2 [MnEDTA], 0·001 *M* (added phosphate 0·02 *M*, *p*H 7·2; calculated *p*Mg 4·6).

These recipes make allowance for the free metal ions originally present in the nutrient media used, and might require modification if different nutrients with different contents of metal ions were employed.

An early application of the agar medium has been in the detection of coagulase-positive staphylococci in pillows and mattresses (Knights, H. T., unpublished work), cultures from which are commonly overgrown by other organisms. Work on further applications of chelating agents is continuing.

I am indebted to Dr. J. D. Manning, director of the National Health Institute, who suggested work with the staphylococci originally and whose interest has been most encouraging.

Plasma Membranes and Mitochondrial Equivalents as Functionally Co-ordinated Structures

A controversy has existed since 1951 concerning the sites of oxidative-reductive reactions in the bacterial cell. Several investigators have demonstrated biochemically the presence of oxidative-reductive systems in particulates derived from the bacterial cytoplasmic membrane and probably also from contiguous granules. Weibull[1], Mitchell and Moyle[2], Storck and Wachsman[3], Weibull and Bergstrom[4], Keeler, Carr and Varner[5], Cota-Robles *et al.*[6] and Weibull *et al.*[7] have presented evidence that the cytoplasmic membrane, its fragments and associated granules contain most of the cytochromes and enzymes responsible for succinate, reduced diphosphopyridine nucleotide, DL-lactate, and α-ketoglutarate oxidation and about half the L-malate oxidative activity.

Evidence of oxidative-reductive events localized in cytoplasmic granules has been advanced by Bielig, Kausche and Haardick[8], Kellenberger and Huber[9], Georgi *et al.*[10] and Mudd *et al.*[11]. A considerable literature has grown up in support of each view. The purpose of this communication is to indicate that the reality of the situation lies rather in integration than in continuing opposition of these views concerning the sites of bacterial oxidation-reduction.

In the present work strains of *Bacillus megaterium* were examined as bacterial cells, as protoplasts and as ghosts, with the light and the electron microscopes. Cell walls, septa, cytoplasmic membranes and contiguous granules were clearly visualized. Reduction of various tetrazolium salts, serving as oxidation-reduction indicators, occurred in the protoplasts very rapidly, often becoming microscopically visible immediately after addition of the indicator.

Tetrazolium salts were sometimes added to the intact bacilli in sucrose solution without lysozyme. When granules of the reduction product had become visible microscopically, lysozyme was added, thereby converting the granule-containing bacilli into granule-containing protoplasts, showing that the tetrazolium granules of the bacilli and the protoplasts were one and the same and that the granules were not associated with the cell wall. When protoplasts containing formazan granules were centrifuged and distilled water was added in place of sucrose to cause rupture of the protoplasts, the irregular, shattered membranes could be seen in wet mounts to be associated with the stained granules.

Reduction of potassium tellurite proceeded slowly in both bacilli and protoplasts and usually required several hours to produce granules; the resulting sites appeared to be similar to those produced by reduced tetrazolium salts. The protoplast membrane took on a greyish shade after long exposure to tellurite. The granules, which appear as homogeneously dark particles in the light microscope, were seen in the electron micrographs to be localized deposits of tellurium crystals.

For observation in the electron microscope cells were grown in a medium containing potassium tellurite and studied either as intact cells or as ghosts or after ultra-thin sectioning. Such preparations were fixed in buffered formaldehyde to avoid re-oxidation of the reduced tellurium by the usual fixatives. In such preparations, crystals of the reduction products were seen throughout the cells. In sections clusters of crystals were seen at sites near the periphery of the cytoplasm, and as individual crystals or amorphous grains in the periphery of the ghosts. The persistence of reduction products in the ghosts strongly suggested that the sites of reduction were in or in close association with the plasma membrane. These results are compatible with the interpretation that oxidation-reduction reactions occur both in the plasma membrane and in associated cytoplasmic organelles.

In offering a definition of bacterial mitochondria in 1956, the senior author concluded with the following sentence[11]: "There is at present no positive evidence of the existence of double membranes or *cristae mitochondriales* in bacterial mitochondria". In the intervening years electron micrographs of lamellated cytoplasmic organelles have been published by a number of authors[12-23].

The nature of the cytological association between cytoplasmic membranes and contiguous cytoplasmic organelles has most recently been defined with even greater precision in at least one genus of Eubacteria and in Actinomycetales. In electron pictures of ultra-thin sections of *Mycobacterium tuberculosis*[14,15], of *Bacillus subtilis*[16] and of *Streptomyces coelicolor*[27] the lamellæ of the cytoplasmic membranes are seen to be continuous with the outer lamellæ of cytoplasmic organelles. In most recent work by Giesbrecht[28] on *Bacillus megaterium* 'organized' mitochondria are demonstrated the interiors of which are filled with closely packed *tubuli mitochondriales*. These mitochondria closely resemble the mitochondria of protozoa. It is greatly to be hoped that the biochemical relationships of these structures may soon be defined with equal elegance.

Preliminary accounts of this work have already appeared[29]. The work was aided by a grant from the United States Atomic Energy Commission, AEC Contract No. *AT*(30–1)–1342, and by Contract No. *E*–2690 with the Public Health Service, National Institutes of Health.

GENETICS

Lethal Mutations in Brazilian Human Populations

A SURVEY has been made in some socio-economically similar rural populations in three neighbouring townships in the southern region of the central State of Minas Gerais, Brazil. About 1,100 families of unskilled workers and a few small farmers were studied. These families have been classified according to the ethnic background of the spouses and grouped into six categories: White × White ($W \times W$), White × Mulatoes ($W \times M$), White × Negroes ($W \times N$), Mulatoes × Mulatoes ($M \times M$), Mulatoes × Negroes ($M \times N$), and Negroes × Negroes ($N \times N$). The Whites are almost exclusively of Portuguese ancestry. Within each class, families were grouped according to the coefficient of inbreeding f of their offspring; these values ranged as follows: 1/8, 3/32, 5/64, 9/128, 1/16, 3/64, 17/512, 1/32, 3/128, 1/64, and 0 (assumed to be non-related). A number of families where the values of f were known to be lower than 1/64, but the precise values could not be ascertained with certainty have been discarded.

In the summary presented in this communication (details will be given elsewhere), only mortality within the group with $f = 1/16$, within the total sample of consanguineous marriages, and within the outbred control will be compared (Table 1). Mortality has been divided into three categories: (1) abortions plus miscarriages (from about the second up to and including the sixth month of pregnancy); (2) stillbirths; (3) mortality from birth up to and excluding the mean age of marriage (nineteen years for women and twenty-four for men). The frequencies of abortions plus miscarriages were calculated on the basis of pregnancies (twin pregnancies being taken as one); those of stillbirths, on the basis of children born (twin births were taken as two); and mortality after birth, on the basis of liveborn children. Mortality is not different among the five control samples ($\chi^2 = 7{\cdot}62$, for abortions plus miscarriages; $\chi^2 = 0{\cdot}52$, for stillbirths; $\chi^2 = 1{\cdot}74$, for post-birth mortality; $\chi^2 = 2{\cdot}80$, for the total). Among the five consanguineous samples, one value of χ^2 (3·86; stillbirths) is not significant; two values (9·20 and 9·22; abortions plus miscarriages and post-birth mortality, respectively) are rather close to the 0·05 level of significance; and one value (13·88; for the total) is highly significant ($P < 0{\cdot}01$).

Mortality is generally higher in the inbred groups than in the controls, but the differences are significant only in the $M \times N$ and $N \times N$ sub-samples: abortions plus miscarriages, $M \times N$, $\chi^2 = 7{\cdot}97^{**}$; mortality after birth, $M \times N$, $\chi^2 = 11{\cdot}70^{**}$; abortions plus miscarriages, $N \times N$, $\chi^2 = 11{\cdot}54^{**}$: stillbirths, $N \times N$, $\chi^2 = 4{\cdot}12^{*}$; total, $M \times N$, $\chi^2 = 12{\cdot}27^{***}$; total, $N \times N$, $\chi^2 = 5{\cdot}84^{*}$. The higher inbreeding effect in these two classes is not due to higher mean coefficients of inbreeding (Table 1).

Within each of the five groups of marriages, the inbreeding coefficients have been pooled, when possible, to form five classes as follows: 0; 1/64; 3/128 and 1/32; 17/512 up to and including 1/16; 9/128 up to and including 1/8. In situations where some of these classes were not present or the number of observations were too small (less than 25), coefficients were pooled in a different way according to the

Total‡	Control Inbred† $f = 1/16$	31·12 30·27 31·07	31·31 33·58 39·66	29·86 33·12 28·30	27·17 48·53 56·76	30·59 44·93 43·75	30·61 33·27 34·78

* The two classes have been pooled because of the small number of pregnancies in the $W \times N$ consanguineous sample.

† Total consanguineous sample, including $f = 1/16$.

‡ Calculated on the basis of pregnancies.

F_s, Mean coefficient of inbreeding of the whole sample.

F_c, Mean coefficient of inbreeding of the consanguineous fraction. In both cases, the unit has been the pregnancy.

possibilities given by their distribution. Significant positive correlation between these pooled coefficients of inbreeding and inbreeding effect was found in ($W \times M$) plus ($W \times N$), stillbirths, $r = 0·95$* (d.f. = 2), and post-natal mortality, $r = 0·90$** (d.f. = 4); in $M \times N$, abortions, $r = 0·98$** (d.f. = 3), and post-natal mortality, $r = 0·95$** (d.f. = 3); and in $N \times N$, abortions, $r = 0·98$** (d.f. = 3).

Mean numbers of lethal equivalents carried by each person have been calculated according to the formula by Freire-Maia and Freire-Maia[1]. The estimates (Table 2) are suggestive of differences in the number of lethal equivalents in the two ethnic groups (Caucasians and Negroes) involved.

Negative values in Table 2 refer to situations where the frequencies of abortions (plus miscarriages) and mortality after birth were larger in the control group than in the consanguineous one. The negative total estimate for $W \times W$ ($-$ 0·37) turns out to be 0·06 when one uses only the data from 1/16 up to and including 1/8, and to 0·10 with data regarding only $f = 1/16$. Morton, Crow and Muller's approach[2] leads to $-0·18$ and Schull's variant[3] leads to 0·16 (Freire-Maia[4]).

Arbitrary values 1, 2, 3 and 4 were respectively ascribed to Whites, Light Mulatoes, Dark Mulatoes and Negroes. From these basic values, the five classes of marriages (in the order they are present in Tables 1 and 2) received the following values: 2·00, 3·35, 4·80, 6·48, and 8·00. The mean numbers of lethal equivalents estimated from the five groups of couples (that is, $-$ 0·37, 1·20, 1·89, 12·15 and 9·12) are positively correlated to the above values ($r = 0·87$*).

Table 2. MEAN NUMBERS OF LETHAL EQUIVALENTS PER PERSON

Couples	$W \times W$	$W \times M$ plus $W \times N$	$M \times M$	$M \times N$	$N \times N$	Total
Abortions	0·08	$-1·53$	1·46	3·95	5·24	0·68
Stillbirths	0·18	1·26	0·16	0·36	2·39	0·45
Mortality after birth	$-0·58$	1·47	0·27	7·84	1·49	0·47
Total	$-0·37$	1·20	1·89	12·15	9·12	1·55

The method developed by Morton, Crow and Muller[2] has been applied to our $W \times W$ and $N \times N$ data, and the results, rather close to ours, revealed a significant difference at the 0·05 level between the total estimates of B for the two ethnic groups. According to a method developed by Crow[5], it was concluded that, at least among Negroes, heterotic genes seem not to contribute substantially to mortality. Their genetic load would be entirely (or almost so) of the mutational load type, that is, due to lethal and semi-lethal genes not belonging to systems of balanced polymorphism and so being maintained by recurrent mutation. This problem will be discussed in full elsewhere[4].

We want to emphasize that the results of the present work refer exclusively to the populations under investigation. No generalization can be made uncritically.

This work has been supported by grants from the Rockefeller Foundation, the National Research Council of Brazil, and the Research Council of the University of Paraná.

We thank Dr. Warwick E. Kerr and Dr. R. Vencowsky for help during the analysis of the data. We are also indebted to Dr. James V. Neel, Dr. William J. Schull and Dr. Newton E. Morton, for criticisms of a preliminary draft of this communication.

Origin of Expressed Mutations in *Schizophyllum commune*

PREVIOUS investigations on tetrapolar sexuality in Basidiomycetes[1-3] have shown that morphologically aberrant sectors arise in surprisingly high frequency in the common-A heterokaryons of *Schizophyllum commune*. These heterokaryons are established whenever matings are made of two strains which share common factors at one of the two complex loci governing incompatibility, the A factor[1]. On further isolation these sectors are capable of growing into homokaryotic mycelia of a limited number of phenotypes, and in the majority of cases each type can be shown to be the result of a single-gene mutation[4]. No such occurrence of visibly expressed mutations has ever been observed within homokaryons. Among the hypotheses which have been proposed to account for the origin of these expressed mutations are[3]: (a) increased mutagenesis within the heterokaryon at a few specific loci; (*b*) increased mutagenesis at all loci followed by selection of the few specific types encountered; (*c*) no increase in mutagenesis, but selection of a few specific types of low-level, spontaneous mutation.

The present report offers evidence which tends to support the last hypothesis. By means of a null-point method, similar to that employed by Luria and Delbruck in their classic researches on mutation in bacteria[5], the mutation-rates of three common-*A* heterokaryons and of their component homokaryons have been determined. This technique makes possible a comparison of the 'basic mutability', uncomplicated by the subsequent phenomena of nuclear migration and differential multiplication.

A number of series of replicate microcultures of each mycelial type were grown on a limiting concentration of nutrient (10^{-3} the concentration of a standard glucose–peptone medium[1]). At the end of a suitable period of growth, usually 21 days, after which time 10^{6}–10^{7} cells were present, each microculture was individually macerated in a Waring Blendor. The fragments were plated out on complete medium, and the resulting colonies were visually screened for the presence of mutant types. On the assumption that the mutations were distributed according to Poisson's Law[5], the fraction of cultures within any one series which contain no mutants is equal to e^{-m}, where m is the average number of mutations per culture. The rate of mutation per nucleus per nuclear cycle is then equal to m divided by the average number of nuclei per culture, N. The value of N was calculated from viable fragment counts by means of a correction factor which expressed the ratio of a microscopically measured number of cells and the viable fragments surviving the maceration thereof.

It was seen, first of all, that mutations could indeed be detected in homokaryotic microcultures as well as in heterokaryons. This finding has previously been reported only sporadically[3,4]. Secondly, the rate of mutation within any one heterokaryon, about 10^{-7} per nucleus per nuclear cycle, was not appreciably higher than the rate within either of the component homokaryons. Thirdly, the various series, homokaryotic as well as heterokaryotic, showed no marked differences in the spectrum of mutations obtained; thus, fourteen more or less distinct morphological classes were isolated, and almost all classes were recoverable from any one mycelial type. Twenty-five such mutants, of various types and derived from both homokaryotic and heterokaryotic mycelia, were crossed to wild type; the mutant character segregated as a single-gene trait in every case. These experiments were repeated using 5- and 10-day-old cultures. The proportion of mutant-bearing cultures decreased in accordance with the smaller total cell population per culture, but the estimations of the mutation-rate were substantially the same as for the 21-day-old cultures. Hence, the mutation-rate appears to remain constant for at least the period 5–21 days. Although differences in expressed mutation have been observed between differently constituted heterokaryons[2], no difference in basic mutability was found between the three heterokaryons studied here. Furthermore, increasing the degree of isogenicity between the component strains of a heterokaryon (to the extent of 10 back-cross generations) had no effect on the mutation-rate or spectrum. A summary of the principal results is given in Table 1.

Table 1. MUTATION-RATES COMPUTED FROM VARIOUS VALUES OF m AND N

Strain	Age	Mean N	m	Rate of mutation ($\times 10^{-7}$)
699	5 days	264,000	0·0516	2·0

* Estimated on the basis of $N = 917{,}000$.

† Estimated on the basis of $N = 4{,}112{,}000$.

To test the possibility that these results were due to the decidedly suboptimal conditions of growth obtaining within the microcultures, agar-plate mycelia of the above series were established on complete medium. Plugs from the older regions were excised, macerated, and examined for the presence of mutant fragments. It was found that mutant fragments could be recovered from homokaryons under these conditions as well. In general, mutant nuclei were present in heterokaryons in greater abundance than in homokaryons, but since there was considerable variation between individual samples of a particular mycelial type, further investigations of a more extensive nature are necessary to confirm this point.

It would appear from these preliminary results that the rate of mutation of any particular nuclear type is basically the same whether that nucleus exists (*a*) homokaryotically or (*b*) heterokaryotically in association with another nucleus having the same *A* factor. Thereafter, however, the differing mycelial conditions in homokaryons and heterokaryons operate to promote the phenotypic expression of the mutations within the latter mycelial type only. Whether the stage of subsequent mutant development which is affected is the multiplication of mutant nuclei or the phenotypic expression of existing mutant nuclei is not quite clear. The recovery of considerable numbers of mutant nuclei from homokaryons after maceration, even though the intact mycelia showed no evidence of mutant sectors, suggests that the phenotypic expression of existing mutant nuclei can in some way be suppressed or masked in the homokaryon. Experiments will be carried out shortly to determine in reconstituted systems the extent of selection against mutant nuclei in homokaryons, as well as the factors in the mycelial environment which significantly affect the degree of selection.

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, January 9

Institution of Electrical Engineers, Electronics and Communications Section (at Savoy Place, London, W.C.2), at 5.30 p.m.—Dr. G. H. Metson: "Recent Research in Thermionics".

Illuminating Engineering Society (at the Federation of British Industries, Tothill Street, London, S.W.1), at 6 p.m.—Mr. H. R. Ruff, Mr. H. E. Bellchambers and Mr. G. K. Lambert. "Modern Aids to Lighting Design—Computer Techniques".

Royal Geographical Society (at 1 Kensington Gore, London, S.W.7), at 8.30 p.m.—Mr. Emil Schulthess: "Portrait of Antarctica".

Tuesday, January 10

Institution of Electrical Engineers, Measurement and Control Section (at Savoy Place, London, W.C.2), at 5.30 p.m.—Scientific Papers.

Institution of the Rubber Industry (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 5.30 p.m.—Mr. S. C. Stokes: "Rubber Bonded Non-Woven Fabrics"; 7 p.m.—Mr. R. L. Zapp: "Recent Developments in Butyl Rubber".

Society of Chemical Industry, Plastics and Polymer Group (joint meeting with the Chemical Engineering Group, at 14 Belgrave Square, London, S.W.1), at 6 p.m.—Mr. G. A. Rawcliffe and Dr. T. Love: "Some Industrial Uses of Plastics".

Royal Society of Medicine, Psychiatry Section (at 1 Wimpole Street, London, W.1), at 8 p.m.—Discussion on "Implications on Recent Genetic Research for Psychiatry". Speakers: Prof. L. S. Penrose, F.R.S. and Prof. P. Polani.

Wednesday, January 11

Society of Chemical Industry. Microbiology Group (joint meeting with the Society for Applied Bacteriology, in the Barnes Hall of the Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 2.15 p.m.—Meeting on "Quantitative Microbiology".

British Institution of Radio Engineers (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W.C.1), at 6 p.m.—Annual General Meeting. 7.15 p.m.—Dr. G. F. Taylor: "Multi-layer Switching Devices".

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 6 p.m.—Dr. C. B. Frisby: "Ergonomics—Fitting the Job to the Worker".

Women's Engineering Society (at "Hope House". 45 Great Peter Street, Westminster, London, S.W.1), at 7 p.m.—"Ground Effect Machines". Speaker from Britten-Norman, Ltd.

Thursday, January 12

Royal Society of Arts, Commonwealth Section (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Captain John Noel: "Photography and Exploration in the Himalayas".

Institute of Metals, Metal Physics Committee (at 17 Belgrave Square, London, S.W.1), at 6.30 p.m.—Dr. J. E. Hilliard (U.S.A.): "Metallurgical Research at High Pressures".

Chemical Society (in the Lecture Theatre, The Royal Institution, Albemarle Street, London, W.1), at 7.30 p.m.—Prof. R. D. Haworth, F.R.S.: "Some Problems in the Chemistry of the Gallotannins" (Pedler Lecture).

Radar and Electronics Association (at the Royal Society of Arts, John Adam Street, Adelphi, London, W.C.2), at 7.30 p.m.—Mr. G. Stannard: "Programme Circuits on Telephone Plant".*

Friday, January 13

University of London (at Imperial College of Science and Technology, City and Guilds College, Exhibition Road, London, S.W.7), at 4.30 p.m.—Prof. C. J. D. M. Verhagen: "Education and Research into Instrumentation in the Technological University of Delft".*

Saturday, January 14

London County Council (at the Horniman Museum, London Road, Forest Hill, London, S.E.23), at 3.30 p.m.—Miss M. V. Thornton: "Indians of Canada".*

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant Experimental Officer (with a School Leaving Certificate with passes in three subjects at higher level, including two science subjects; a Higher National Certificate or equivalent) to be responsible for preparative work in a research programme concerned with biochemical and developmental genetics—The Secretary, Poultry Research Centre, Agricultural Research Council, King's Buildings, West Mains Road, Edinburgh 9 (January 14).

Lecturer or Assistant Lecturer (Grade B) in Electronics; and an Assistant Lecturer (Grade B) in Physics—The Registrar, Welsh College of Advanced Technology, Cathays Park, Cardiff (January 14).

Research Assistant (with a suitable veterinary qualification or a degree in agriculture or natural science) in the Department of Animal Husbandry and Veterinary Hygiene, for studies in poultry husbandry—The Secretary, Royal Veterinary College (University of London), Royal College Street, London, N.W.1 (January 14).

Lecturer (preferably with previous experience in the application of computers in statistics and/or operational research) in the Electronic Computing Laboratory—The Registrar, The University, Leeds 2 (January 20).

Senior Lecturer or Lecturer in Electrical Engineering—Joint Clerk to the University Court, Queen's College (University of St. Andrews), Dundee, Scotland (January 21).

Senior Lecturer in Geology, and a Lecturer in Geology at the University College of the West Indies—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (January 27).

Senior Lecturer (preferably with research interest in the application of mathematics to some engineering subject) in charge of the Department of Engineering Mathematics—The Secretary, The Queen's University, Belfast, Northern Ireland (January 30).

Assistant Lecturer in Physics—The Secretary, Birkbeck College (University of London), Malet Street, London, W.C.1 (January 31).

Senior Lecturer (with research and teaching experience in the fields of cardiovascular physiology and respiratory physiology) in Physiology at the University of New South Wales—The Agent-General for New South Wales, 56 Strand, London, W.C.2, and the Bursar, University of New South Wales, Box 1, Post Office, Kensington, New South Wales, Australia, marking envelope "University Appointment" (January 31).

Assistant Lecturer or Lecturer in the Department of Pure Mathematics—The Registrar, The University, Liverpool (February 3).

Lecturer or Assistant Lecturer (with a particular interest in sedimentary petrology) in Geology—The Secretary and Registrar, The University, Southampton (February 3).

Senior Lecturer (familiar with modern methods in clinical biochemistry, and preferably holding a medical qualification) in Clinical Biochemistry at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, February 4).

Imperial Chemical Industries Research Fellows in Physics, Chemistry, Biochemistry, Engineering, Metallurgy and Pharmacology or any related subjects—The Registrar, The University, Liverpool, quoting CV/N (February 11).

Lecturer or Assistant Lecturer (with a good honours degree in engineering, mathematics or physics, together with suitable experience in hypersonics or noise and vibration theory) in either Hypersonics or Noise and Vibration Theory in the Department of Aeronautics and Astronautics—The Secretary and Registrar, The University, Southampton (February 13).

Hazel Clifford Postgraduate Student, for research in medicine or in a scientific topic concerned with the advancement of medical knowledge—The Secretary to the Scholarships Committee, University of London, Senate House, London, W.C.1 (February 14).

Imperial Chemical Industries Research Fellows in various branches of Chemistry, Chemical Engineering, Engineering, Technology, Physics and allied subjects—The Registrar, The University, Manchester 13 (February 14).

Turner and Newall Research Fellows in Engineering, Inorganic Chemistry, Physics and allied subjects—The Registrar, The University, Manchester 13 (February 14).

Senior Lecturer or Lecturer (with a higher degree, preferably a doctorate, with special qualifications in some branch of physical chemistry) in Physical Chemistry at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, February 15).

Imperial Chemical Industries Research Fellows in Biochemistry, Chemistry, Engineering, Pharmacology, Physics or Chemical Technology (Chemical Engineering)—The Secretary, The University, Edinburgh (February 16).

Lecturer (preferably with training and/or publications in the field of human and economic geography) in Geography at the University of Western Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, February 25).

Lecturer (with a Ph.D. or a degree in veterinary science with postgraduate experience in protozoology) in Protozoology within the Department of Parasitology, University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, February 28).

Imperial Chemical Industries Research Fellow in Chemistry, Biological Chemistry, Engineering, Pharmacology, Physics or in a related subject—The Registrar, The University, Bristol 8 (March 1).

Departmental Demonstrator in Biochemistry—The Administrator, Department of Biochemistry, The University, South Parks Road, Oxford (March 4).

Senior Lecturer (with a science degree and research experience to Ph.D. or comparable level, some experience in mineral and rock analysis and the ability to do fundamental research) in Geology (Geochemist) at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, March 31).

Abstractor (with a sound knowledge of German and Dutch and the ability to abstract in English from these languages, Scandinavian and/or Spanish and Portuguese an added qualification, and preferably a knowledge of microbiology and/or botany)—The Director, Commonwealth Mycological Institute, Ferry Lane, Kew, Surrey.

Agricultural Chemist (with a good honours degree in agricultural chemistry, with some postgraduate experience, preferably in the tropics) in Sierra Leone, to advise the Director of Agriculture on specific problems, and for investigational studies in the field, including the laying-out of field trials and their statistical analysis and interpretation—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.63/15/04.

GRADUATE ASSISTANTS (candidates wishing to proceed to the M.Sc. in mathematics) IN THE DEPARTMENT OF MATHEMATICS—Head, Department of Mathematics, Essex College, Assumption University of Windsor, Windsor, Ontario, Canada.

GRADUATE ASSISTANTS (candidates wishing to proceed to an M.Sc. in physics) IN THE DEPARTMENT OF PHYSICS—The Chairman, Department of Physics, Essex College, Assumption University of Windsor, Windsor, Ontario, Canada.

READER IN APPLIED NUCLEAR PHYSICS—The Secretary, Northampton College of Advanced Technology, St. John Street, London, E.C.1.

RESEARCH FELLOW IN THEORETICAL PHYSICS, NUCLEAR PHYSICS or SOLID STATE PHYSICS—The Secretary Research Institute for Fundamental Physics, Kyoto University, Kyoto, Japan.

SCIENTIFIC ASSISTANT (female, preferably graduate with microbiology as one subject and an interest in virology)—The Director, Public Health Laboratory, Priorsdean Hospital, Milton Road, Portsmouth.

SCIENTIFIC OFFICERS (MINERAL DRESSERS) (with a good honours degree in mineral dressing or mineral engineering, and preferably not over 35 years of age, with some experience in industry) IN THE GEOLOGICAL SURVEY DIVISION of the Federal Ministry of Mines and Power, Nigeria, to undertake research on mineral dressing, particularly in connexion with the recovery of minerals from alluvial concentrates in the Plateau tinfields—The Appointments Secretary, Federal Public Service Commission, Nigeria House, 9 Northumberland Avenue, London, W.C.2, quoting J.2/8.

SENIOR BOTANIST (with a first- or second-class honours degree in botany or equivalent qualification and at least 15 years research experience and a good record of published work. Proven ability to plan and supervise research programmes and experience with tree crops, preferably in the tropics, is also desirable), to take charge of the Botany Division (comprising plant breeding and plant physiology sections) of the West African Cocoa Research Institute, Ghana—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.197/200/028/01.

SENIOR LABORATORY TECHNICIAN (with a knowledge of chemistry)—The Assistant Secretary. Royal Veterinary College, Royal College Street, London, N.W.1.

NIGERIA'S INVESTMENT IN EDUCATION

THE proposals of the Commission on Post-School Certificate and Higher Education in Nigeria, reviewed on page 95 of this issue, are indeed massive, expensive and unconventional. To fulfil its recommendations 600 secondary schools, 6 technical institutes, 8 teacher-training colleges and 3 universities will have to be built and staffed during the next ten years. The programme will require about 4,000 graduate teachers on short-term contracts and 1,000 university teachers. The capital cost of the universities alone will approach £20 million, and a realistic estimate of the total recurrent costs would be £50 million over the next decade. To provide sufficient graduate teachers will entail an expenditure of about £20 million over the ten-year period. The Commission makes no estimate of the capital cost of the schools, colleges and institutes; but it seems unlikely that the overall cost of implementing the proposals will be less than £150 million between now and 1970. Aid will have to be provided on an international scale.

The Commission has obviously been placed in a dilemma. A programme of this magnitude is necessary to enable Nigeria, a country with potential, rather than present, wealth, to expand economically and take its right place among the nations. But the proposals come at a time when there is considerable expansion in secondary schools and universities throughout the Commonwealth. The recruitment of sufficient teachers to 'prime the pump' of this educational programme is in itself a major project. To make it succeed, there will have to be considerable co-operation between Nigeria, Britain and the United States of America. The secondment of both school and university teachers will have to be encouraged from the English-speaking countries. Nigeria, on her part, must be willing to show a spirit of welcome to the large numbers of expatriates; to appreciate that decisions in educational matters must be independent of the changing winds of politics; and be eager to accept the advice of experts on the many problems which will arise.

In the last resort, the universities are the backbone of the country's educational system. It is important, therefore, to examine critically the Commission's recommendations as to how these institutions should be developed, governed and financed. It is proposed that there should be one large university in each of the three Regions, and that they should be financed largely from Federal funds. It is also suggested that the regional branches of the Nigerian College of Arts, Science and Technology, which are Ibadan in the west, Enugu in the east, and Zaria in the north, should become centres of university education

While the Ibadan branch could be absorbed easily by the adjacent University College, it would be more difficult for the Enugu branch of the Nigerian College to form as close links with the University of Nigeria, at Nsukka, some 40 miles away. In the Northern Region, the problem of geographical separation of the different parts of a single university is more acute. Zaria, which already has an engineering faculty as a basis for university development, is 75 miles from the Ahmadu Bello College of Arabic Studies at Kano, and is 150 miles from Vom, where considerable development of the Veterinary Research Institute is envisaged. From this aspect alone, it may be necessary for the separate units to have much greater independence than would be possible in a single university. This might also help to solve another difficulty of which the Commission has taken insufficient cognizance.

In Nigeria to-day there are strong feelings of regional loyalty. These were a large part of the driving force which has already led to a university being established at Nsukka, to the development of the College of Arabic Studies at Kano, and also to the intention of the Western Region Government to found a new university. These institutions may prefer to be financed mainly from regional funds, as they are at present, and become regional universities. The centres at Zaria, Vom and Enugu could continue to receive federal support to develop faculties of technology, agriculture and veterinary science, and would become federal universities, as University College, Ibadan, has always been. It is unlikely that the regional universities would become in any way academically inferior to the federal universities, especially if the new institutions seek the sponsorship of well-established universities overseas. The relationship between the University of London and University College, Ibadan, has proved invaluable in establishing high academic standards. The federal and regional universities would be complementary; the more expensive medical and technological faculties being in the Federal institutions, while the regional universities could develop characteristics of the particular needs and traditions of their regions. Both types would be autonomous, and both would admit any suitably qualified student.

Of the 2,000 students who will graduate annually, there will be 800 teachers, 600 technologists, and 200 doctors; 200 will have agricultural or veterinary qualifications and 200 will have commerce degrees. The Commission deals with the training of these groups in detail, except for the technologists, who form 30 per cent of the total output. It would be particularly helpful to know what proportions should be trained in metallurgy, chemical, civil, mechanical, and electrical engineering, mining and other technologies, so that an estimate can be made of the size of the departments which are needed in the universities. Until a more detailed survey of man-power needs has been made, it is difficult to make these estimates accurately.

One-half of the annual output of graduates must go into either teaching, agricultural, or veterinary appointments. At present these are the professions which receive the fewest numbers of graduates. It seems unrealistic to suppose that sufficient undergraduates will elect to prepare for the B.A. (Education) degree, or for agricultural or veterinary degrees, unless there is some substantial inducement. Since the success of the whole programme depends so much on an adequate flow of graduates into these professions, more detailed recommendations on this point, based on the experience of members of the Commission, would be helpful.

There is one danger which the report does not stress sufficiently strongly. This is that the universities, in expanding rapidly to meet a need for trained men and women, may tend to become centres where knowledge is disseminated rather than places where knowledge is acquired. This is simply to say that great stress must be laid on research. This is particularly the case in arts, science and technological faculties offering general courses, which will be much less specialized than those for single honours degrees. To maintain a balance and a high level of scholarship good research facilities must be provided. Only with these provisions will expatriates and Nigerians of high calibre be attracted to staff the universities, and will Nigerians be trained to replace gradually the expatriates. For some years to come, the burden of this training must fall on University College, Ibadan. In connexion with research facilities, a most welcome suggestion is that each university should have a Research Institute of African Studies attached to it.

The proposal to found a new university at Lagos, which would have two main constituent schools, Commerce and Business Administration and also Economics and Social Sciences, is a sound one. As the Commission points out, in an under-developed country, the universities must accept the responsibility of training accountants, bankers, transport executives, etc., because facilities for training 'on the job' are so lacking.

The Commission has faced squarely three other aspects of the educational programme. These are the provision of sufficient secondary school places, particularly in sixth forms; creating a virtually new teacher-training programme; and expanding technical institutes which will give training at an intermediate level. The problems which may arise here will result mainly from the rapid growth and sheer size of these projects.

These aspects are quite as important as the university development, for the whole is an integrated programme. The Commission has been bold and imaginative in its approach to Nigeria's educational needs. For the country's proper development ways must be found to make the plan succeed as a whole. It is sincerely to be hoped that international aid on a large scale will be forthcoming to help this "awakening giant of Africa", as Nigeria has been so aptly called.

COTTON IN INDIA

Cotton in India

A Monograph. By B. L. Sethi, S. M. Sikka, R. H. Dastur, P. D. Gadkari, R. Balasubrahmanyan, P. Maheshwari, N. S. Ranga Swamy, and A. B. Joshi. Pp. xiv+474+30 plates. (Bombay: Indian Central Cotton Committee, 1960.) Rs. 30.; 45*s*.

THIS is the first of four volumes of a monograph, "Cotton in India", in which the Indian Central Cotton Committee is gathering together all available information in the domains of cotton culture, technology and marketing. The present volume is mainly concerned with research work in India, but gives a creditable, if not always critical, survey of the work done in other countries. The eight chapters cover the subject-matter as follows: history of cotton (B. L. Sethi); climate and soils (S. M. Sikka and R. H. Dastur); taxonomy (P. D. Gadkari); morphology (R. Balasubrahmanyan); embryology (P. Maheshwari and N. S. Ranga Swamy); breeding (S. M. Sikka and A. B. Joshi); genetics (S. M. Sikka and A. B. Joshi).

There is great need for a monograph of this kind, since cotton cultivation in India occupies an area of about 20,000,000 acres—about six per cent of the whole arable area. There are extensive and well-planned schemes of research in all the widely scattered cotton-growing areas. Large numbers of young and enthusiastic workers are without facilities for consulting the relevant literature. An encyclopædic work of this kind, for the most part soberly and factually written, will be of great use not only to Indian workers but also to those in other countries, especially as the authors have avoided the parochial attitude of over-emphasizing Indian contributions, which indeed often represent pioneer work of great merit.

On the whole the authors have done their task well, and have produced a work of great value. There are a few errors of emphasis and interpretation; for example, the term genetical erosion is used in a wrong sense. It does not, as Sikka and Joshi imply, mean the breakdown which occurs in the second generation of interspecific crosses. It means the impairment of primitive adaptive complexes through extensive substitution of genes in the processes of selection or domestication. The first exploitation of the back-cross method is ascribed to Harland and Pope, instead of Harlan and Pope.

It is only to be expected that exuberant optimism will at times lead authors to express favourable opinions on future possibilities which are scarcely justified by existing scientific information. Thus, on p. 38, the reader is given to understand that sea island cotton can be grown successfully on the west coast (Kerala). It is, however, well known that the establishment of a sea island industry in this region would encounter almost insuperable obstacles of climate, soils, pests and disease. Its ultimate success is therefore doubtful. The main tasks of the breeders in India are first to increase yields to a level comparable with other cotton-growing countries, and second, to breed cottons which will spin good 40's. At present such cottons do not exist except perhaps occasionally in small experimental lots.

The book is well produced and relatively cheap. The index is poor, and there is no author index.

S. C. Harland

MINERAL PROCESSING

Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy

Held in Geneva, 1 September–13 September, 1958. Vol. 3: Processing of Raw Materials. Pp. ix+607. (Geneva: United Nations; London: H.M. Stationery Office, 1958.) 64 Swiss francs; 106*s*.; 15 dollars.

THIS volume is a collection of seventy-eight papers, each dealing with some aspect of the technology of winning and processing the ores of metals of interest in the field of atomic energy. A group of three papers deals with the methods of mining used for obtaining uranium ores in North America. Five are concerned with mathematical aspects of evaluating ore deposits and nine with instrumental methods of detecting and estimating radioactive materials, including potassium salts. The rest of the volume is concerned almost entirely with chemical aspects of mineral processing and physical methods of analysis for uranium, thorium and beryllium. There is also a valuable review of the chemical methods available for estimating uranium.

Very little work is reported on physical methods of ore concentration, so presumably the conventional techniques have proved adequate. An automatic method of sorting uranium-bearing rock using the radioactivity of desirable pieces to identify them is described, however, and there is an account of a normal type of process for separating the constituents of a beach sand containing monazite. There has also been limited interest in flotation as a means of concentrating minerals relevant to the Conference except in special cases. One of these concerns a lode deposit of monazite in South Africa which could not be treated by electrostatic and magnetic methods and another is, of course, the difficult problem of the separation of beryl from the other silicates which accompany it in Nature. The paper dealing with the latter topic shows with particular emphasis that valuable as the information presented at this Conference may be, there is much that is not given. Thus a large amount of data on the use of carboxylic acids, such as oleic acid, for separating beryl is given, followed by a table showing very much better results. These are said to have been obtained using a "special procedure"; but whether this means that the same reagents were used in a different way or that other reagents are better than those described in the paper is not clear.

Pretreatment of uranium ores before dissolving out the uranium has not been necessary in most cases, and is scarcely likely to be economically possible in the near future. However, a large amount of the known potential uranium reserves occurs as very low-grade ore, and three papers deal at least in part with the flotation of uranium minerals. The most active field of work in uranium mineral processing has undoubtedly been the study of methods for dissolving the uranium and recovering it from the resulting aqueous solution. Leaching either with acid or carbonate–bicarbonate mixtures has received about equal attention, and although the chemistry of both processes is well understood there are some interesting accounts of their application to particular ores. The work designed to produce an oxidizing sulphuric acid solution suitable for use as a leaching reagent by oxidation of sulphur dioxide in the presence of manganese or ferric ions as catalyst is worthy of particular attention.

Recovery of uranium from solution is carried out by solvent extraction or ion exchange, and there is a comparison of the relative merits of the two processes in various circumstances. Considerable interest in the treatment of unclarified solutions using the resin-in-pulp method or solvent extraction of the slurry is shown by the number of papers on these subjects. This is due to the difficulty of removing the suspended solids, and one communication deals with the use of flocculating agents to assist in this process. Of interest also is the method of reducing uranium in solution to precipitate the dioxide, using hydrogen with nickel or uranium dioxide as catalyst.

Chemical methods of cracking minerals are not confined to uranium treatment, of course, but few other cases are dealt with. There are, however, papers dealing with the breaking down of thorium minerals and of zircon.

It is unfortunate that the volume contains no index and that few of the papers include a summary. In spite of this, however, the book should prove valuable to anyone wishing to gain an idea of recent advances in the hydrometallurgical processing of minerals. A. R. BURKIN

ELECTROMAGNETISM AND RELATIVITY

Les Principes de la Théorie Électromagnétique et de la Relativité

Par Prof. Marie-Antoinette Tonnelat. Pp. 394. (Paris: Masson et Cie., 1959.) 5,000 francs.

THIS text-book is divided into three parts, dealing with electromagnetism, special relativity and general relativity. The section on special relativity is the largest and the most complete part of the book. It sets out the historical development of the ideas and concepts which led, in the end, to the special theory, and it traces very carefully the interplay between the theoretical concepts and the few decisive experiments during the course of this development.

The main factors on the theoretical side were very straightforward. First, Newton's equations of motion and the Galilean invariance which resulted implied that no (inertial) reference system had preference over any other system moving uniformly relative to the first. Then, later, the nineteenth-century ideas on the propagation of light appeared to single out one absolute reference system, which was specified by the ether. Later again, it was seen that Maxwell's equations were not Galilean invariant, and therefore they, too, supported the idea of the absolute reference system. Thus it seemed that all that was needed to determine absolute motion was a few accurate optical experiments. However, the culmination of these experiments was the famous interferometer work of Michelson and Morley, which gave the nul result.

This story is well told, with adequate digressions to deal with related matters of interest. For example, the relation is pointed out between the experiments of Fizeau, Hoek, and others on the propagation of light in moving media, and the experiment of H. A. Wilson on the effects of moving a dielectric in a magnetic field. In addition, the mathematical apparatus of special relativity is developed in a very complete treatment, and numerous applications of the special theory are given.

Unfortunately, the book could not contain an account of the recent work of Terrell and of Penrose[1] on the Lorentz–Fitzgerald contraction. A fast-moving object, it is well known, is contracted in the direction of its motion by a factor $(1-v^2/c^2)^{1/2}$. Thus, for example, a fast-moving cube becomes a rectangular parallelepiped with the shortest principal axis along the direction of motion. However, Terrell and Penrose have pointed out that this is not what an observer would see. For example, an observer at right angles to the line of flight of the cube would see the rear face of the cube as well as the face nearest to him. The result is that the cube appears to the observer to be rotated, but undistorted. (This is true provided the cube subtends a small angle at the observer.) The Lorentz contraction is nevertheless still valid. If (v/c) is close to unity, the face nearest the observer has shrunk to zero width, but the observer sees the rear face at full size.

The section on electromagnetism contains a rather formal treatment of Maxwell's theory; for example, the electrostatic properties of conductors are derived before there has been any discussion of the presence of electrons in conductors. Indeed, the main purpose of this section appears to be to emphasize that electromagnetic phenomena can be described entirely by fields rather than by action at a distance.

The final section is that on general relativity. Here there is a good mathematical treatment, with several interesting worked examples, and an adequate physical discussion. However, it is at this point that one would expect some discussion of fairly new ideas and developments. Some comment might be expected on whether we can hope to detect gravitational waves, what is the present status of theories of the expanding universe, whether we should expect there to be anti-galaxies, and whether the latter have reversed gravitational interaction with ordinary galaxies. Discussion of some of these topics might perhaps have been more rewarding than the account of the unified theories of gravitation and electromagnetism with which the book concludes.

ESSENTIALS OF LOGISTICS

A Précis of Mathematical Logic

By J. M. Bocheński. Translated from the French and German editions by Otto Bird. (Synthese Library.) Pp. ix+100. (Dordrecht: D. Reidel Publishing Company, 1960.) 13.75 D. fl.

ONE of the most remarkable features of twentieth-century thought is the immense creative effort of Polish scholars in the field of mathematical logic. In this, of course, they are by no means alone, since (among others) Italy, Great Britain and the United States have contributed vital elements to the growing structure. Nevertheless, there is something intrinsically majestic about the Polish work, both in the profundity of research, and in the wide range of studies. Having enriched what they have touched, they have become scholars in analysis and artists in symbolism.

This means that, sooner or later, it becomes desirable to 'tidy up', that is, to tabulate with extreme formality the propositions and theorems which the power of the new 'logistik' has produced. The result is the slender volume before us, a masterpiece of condensation and taxonomy. A touch so appropriate to a book of this character is that the introduction starts with paragraph zero, so that "Fundamentals" begin with paragraph 1, and onwards; the decimal notation is correspondingly simplified throughout.

The arrangement is: (1) "General Principles"; (2) "The Logic of Sentences"; (3) "The Logic of Predicates and Classes"; (4) "The Logic of Relations"; (5) "Varia". At the end are a table of logical signs and an exceptionally full bibliography. This latter will be welcomed as a reinforcement of the literature listed from time to time in *The Journal of Symbolic Logic*.

A further aid to the student is a short summary, at the conclusion of each section, dealing with the history and literature of the particular aspect under discussion, for example, laws and rules, predicates, the theory of identity, syllogistics and so on. It is interesting to note that the first of these originated with Husserl's distinction; Aristotle thought of his theorems as laws, whereas to the stoics and scholastics they were rules.

There is a clear account of the newest branch of the subject, namely, the logic of relations, which is capable of extension over perhaps the whole of knowledge. Even at the present early stage of development its fundamental connexion with geometry begins to appear.

The value of this précis lies in its power to bring the main results of logistics into exact focus, so that they can be seen both in derivation from classical principles and in terms of contemporary notations. Denuded of verbiage, it is remarkable how many of them were known to the Greek philosophers and to medieval savants. Yet the modern discipline (including in particular the many-valued logics) is of incomparably greater force, as well as possessing enhanced importance in advanced mathematical education.

F. I. G. RAWLINS

CATALYSIS

Catalysis, Vol. 7

Oxidation, Hydration, Dehydration and Cracking Catalysts. Edited by Paul H. Emmett. Pp. vi+378. (New York: Reinhold Publishing Corporation; London: Chapman and Hall, Ltd., 1960.) 108*s*. net.

THE publication of this final volume of a major work dealing mainly with industrial catalytic reactions will be welcomed by the many chemists who are interested in this rapidly moving field; and Prof. Emmett and the individual contributors are to be congratulated on making available, in a convenient form, summaries of the very large mass of material, having largely an industrial bias but relating also to some academic applications of catalysis, which lies scattered and difficult of access in the patent and journal literature.

In the first chapter of this volume, L. B. Ryland, M. W. Temele and J. N. Wilson, of Shell Development Co., deal with the use of modern fluidized and other finely divided catalysts for the cracking of crude petroleum into lighter oils. This is followed by a long section on catalytic hydration and dehydration, by M. E. Winfield, of the Commonwealth Scientific and

Industrial Research Organization, who has himself been responsible for much work on this subject. The remainder of the volume has been written by J. K. Dixon and J. E. Longfield, both of the American Cyanamid Co., who give, in successive chapters, an account of the partial oxidation of hydrocarbons, mainly on catalysts of the vanadium pentoxide or metallic platinum types, detailed attention being given to the theoretical aspect of these reactions. This is supplemented by two further chapters on the mechanism of catalytic oxidation generally and by a rather disappointingly short section on miscellaneous catalytic oxidations.

The spreading of the publication of the complete work over some six years (the first volume appeared in 1954) has necessarily rendered some of the volumes to some degree out of date and incomplete; but this is inevitable in a rapidly moving subject, and Prof. Emmett has probably acted wisely in publishing the material as it was received. The now complete work is to be strongly recommended as a necessary acquisition both by technical and academic libraries and by individual chemists. It will be found to be an exhaustive source of reference in almost all branches of modern catalysis, and should be particularly useful as a foundation for further research.

E. B. Maxted

EVOLUTION

Implications of Evolution

By Dr. G. A. Kerkut. (International Series of Monographs on Pure and Applied Biology. Division: Zoology. Vol. 4.) Pp. x+174. (London and New York: Pergamon Press, 1960.) 30*s.* net.

DR. KERKUT begins his book with seven 'assumptions' which he thinks are implied in any acceptance of the theory of evolution. The first three of these are that non-living things gave rise to living material, that this happened only once, and that all living things—viruses, bacteria, animals and plants—are interrelated. Even if we read conclusions in place of assumptions, it is by no means true that all or even a majority of the biologists who believe in evolution would accept any of these as necessarily true or as implied in their belief. Evolution is the theory that in the history of life change has taken place by 'descent with modification', and the study of the course of change is phylogeny, not the theory of evolution. If we accept evolution, it by no means necessarily follows that phylogeny is monophyletic, and certainly not that any conclusions about the origin of life are implied.

Dr. Kerkut's aim in the main part of his book is to show that these 'assumptions' are ill founded, especially that we have no good reason to believe that the viruses, bacteria, rickettsias and higher organisms are related, or that the invertebrates, and even the vertebrate classes, are monophyletic. Though our views on these questions have little bearing on our belief in evolution, they are certainly questions of interest, and it is good to have them discussed by one who disagrees with widely held views. But any discussion of such questions, if it is to carry weight, must be on a fair consideration of all the relevant evidence, and I cannot agree that Dr. Kerkut gives us that. He does not discuss all the evidence, and not always the parts of the evidence that seem weightiest to most biologists. To take one example, in considering the morphology of the cell as indicating that all animals are related, he mentions only the mitotic figure—itself one might think strong enough evidence, though he does not agree—and says nothing of the rest of cell morphology—the visible and submicroscopic structure of the cell and nuclear membranes, Golgi apparatus, mitochondria, etc. It is on these many similarities, together with other evidence, that most biologists think that the cell cannot have been evolved more than once.

Other objections to the argument of the book might be raised, but to me the most general criticism is that evidence that bears against its thesis is often not discussed. As Darwin so well realized, one is much more likely to convince by over-stating one's opponent's arguments and answering them, rather than by passing them by without discussion. On these grounds the arguments of this book cannot, in my view, be thought conclusive. It is well produced; misprints, though they occur, are not especially numerous.

G. S. Carter

ZOOLOGICAL LITERATURE FOR 1957

The Zoological Record

Vol. 94: Records of Zoological Literature relating chiefly to the year 1957. Edited by G. Burder Stratton. Pp. 1842. (London: The Zoological Society of London, 1960.) 160*s.*

THE orange-coloured bindings of the "Zoological Record" stand out in any library, for they have been coming out for nearly a century and now occupy many feet of shelving. The volumes have changed very little over the years, and the present one—Volume 94, referring mainly to the literature of 1957—retains almost the same format and the somewhat out-dated system of classification of the earlier numbers. Vermes, for example, is almost Aristotelian in its breadth, and includes Platyhelminthes, Nemathelminthes, Rotifera, Annelida, as well as an assortment of smaller groups. However, there are certain advantages in changing as little as possible a reference work of this nature, and the sections into which it is divided are conveniently arranged, so that any person consulting the "Record" will have no difficulty in finding the publications on any particular subject or by any author, with the least possible delay. The contents, apart from their general usefulness to all workers in the subject, are also of interest as a rough indication of trends in zoological research work, based on the number of publications in the various sections. These trends are difficult to understand, for while Insecta remains by far the biggest section, Mollusca now takes second place although its economic or medical significance is somewhat limited. Owing to difficulties of recording, the sections dealing with Amphibia and parasitic Protozoa have not been included in the present volume, but it is hoped that they will appear in the near future.

Zoologists throughout the world are greatly indebted to the Zoological Society of London for undertaking the publication of this invaluable compilation with such little delay, for most of the sections of Volume 94 were available in 1959 and three even in 1958, the year following the literature to which they refer.

RADIOACTIVE FALL-OUT IN ISRAEL RESULTING FROM THE NUCLEAR TESTS IN THE SAHARA DESERT

By Y. FEIGE, E. SHALMON and J. VARDI
Health Physics Department, Israel Atomic Energy Commission

J. R. GAT (GUTMANN)
Weizmann Institute of Science, Rehovoth

AND

Y. L. TOKATLY
Israel Meteorological Service

ON February 13 and April 1, 1960, nuclear test devices, reportedly in the kiloton range, were exploded in southern Algeria. These tests followed a prolonged period during which no nuclear tests were conducted, with the result that fall-out of short-lived fission products had decreased to a very low level. The tests offered an opportunity of observing fall-out from isolated and well-defined sources of activity in this area.

Radioactive materials resulting from these tests were first picked up by the Israel Fall-out Monitoring Network on February 17, and were repeatedly observed again during the following months. The interpretation of the resulting fall-out deposition pattern in the light of the meteorological data gives some insight into the movement of radioactive 'clouds' and their mode of deposition of activity.

Measurement of Fall-out

The Israel Fall-out Monitoring Network has been described by Gat and Gilat[1]. It consists of seven sampling stations where activity deposited on gummed tape is collected. The stations are situated throughout the country from Eilath on the Gulf of Aquaba to Upper Galilee, and cover hill and valley areas. In addition, air filtration is carried out at ground-level at Rehovoth with the aid of Staplex type air-pumps and a continuous air monitor. The β-activity accumulated on the samplers during the exposure period is counted on the third day after collection (after the decay of short-lived natural activity) and again at fixed time-intervals thereafter. The counters are standardized by the radiation from potassium-40 in natural potassium chloride, following accepted practice. The homogeneity of the deposited activity and the presence of 'hot particles' is determined by autoradiography of the ashed samples.

Fall-out Pattern and its Correlation with Meteorological Data

The results of deposition measurements from five of the stations are plotted in Fig. 1 where some of the pertinent local meteorological information is also given. Fig. 2 shows the decay of some representative samples plotted on a log activity versus log time-scale, with the reported explosion dates taken as the time origin. The decay data enables one to relate the activity peaks to the first, second or to previous nuclear explosions.

The main impact of the first nuclear explosion was detected in Israel on February 17. On this day a fairly large number of discrete hot particles was collected on the gummed tapes, resulting in a deposition of activity of about 25 $m\mu c./m.^2$ (activity on fourth day after collection).

The meteorological synoptic maps of that day show the passage over Israel of a cold front associated with an eastward moving centre of low pressure which had developed over the central Mediterranean some days before. The upper air at 500 mb. had flowed from the explosion region towards this 'low', continuing to move with it (Fig. 3). The front which coincided with the deposition of activity was more diffuse in the southern part of the country, as was reflected in the spreading out of the activity peak at the Eilath station. (Due to an oversight, the gummed tape of February 16 was not changed at Jerusalem until noon of the following day. Hence the activity shown on the tape of February 16 apparently includes that of the following day.)

On February 18, fall-out values returned to normal levels everywhere except at Eilath where the trailing edge of the cold front was still effective, and at Jerusalem where one single 'hot' particle was collected. (It cannot be established with certainty whether this single particle is due to some residual activity which remained aloft or whether this is a blow-over particle from material deposited on the previous day.)

During February 20–21 and again on February 24–25 anticyclonic cells, moving in a north-easterly direction from the Western Desert, passed over the Levant. Both occurrences were associated with some deposition of fall-out. Backtracking of the air masses shows that their probable source was low-altitude air (< 3 km.) near the test site. Air circulation had been stationary over the whole of North Africa during this period. From these more or less stationary air masses over North Africa 'bubbles' were detached, in conjunction with the formation of anticyclonic cells, which slowly moved north-eastward into the Mediterranean and over Israel (Fig. 4).

The origin date of the activity peaks, as determined by decay measurements, is indicated on the top of the diagram

The passage of a marked cold front accompanied by rainfall on February 28 resulted in an appreciable deposition of activity throughout Israel. This front also trailed back and diffused in the south of the country. Backtracking in the 500-mb. layer shows that air in this layer had passed over the Sahara some days before. Since there is apparently no alternative contamination source, we postulate that this air had picked up activity by vertical mixing from the near surface air while passing over the

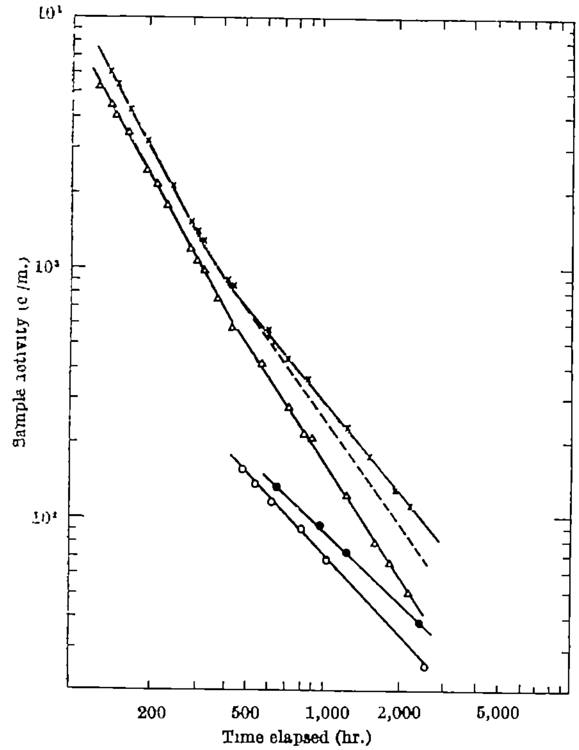

Fig. 2. The decay of representative samples of fall-out activity. △ Activity deposited on 'gummed tape collector' at Rehovoth, on February 17, 1960 (time origin February 13), ×, activity collected by air filtration at Rehovoth on February 17, 1960 (time origin February 13); the broken line shows the decay of the sample corrected for the presence of an average amount of long-lived background activity; ○, activity deposited on 'gummed tape collector' at Rehovoth on April 15, 1960 (time origin April 1); ●, activity deposited on 'gummed tape collector' at Tirat-Yael on April 24–25, 1960 (time origin April 1)

Sahara. It is worth while to note that this assumed mode of transport resembles the mechanism whereby activity from the Windscale release reached Western Europe[3].

During the first week of March good deposition conditions (rain) occurred on a number of occasions, without fall-out being observed. On March 9–10, however, activity was brought down by rainfall, presumably from a nuclear 'cloud' which had circled the Earth with the prevailing westerly winds of the upper troposphere (at an average rate of 65 km./hr.).

During the second half of March unstable cold air caused precipitation throughout the country which was not accompanied by much activity. From March 26 onwards hot desert air moved in from the south, gradually building up sharav conditions. ('Sharav' is a period of hot and dry weather caused either by subsidence owing to the persistence of an anticyclone over the area or by advection of desert air from the Arabian Peninsula or the Syrian Desert.) The presence of this air mass resulted in a substantial increase in the deposition-rate of activity. Peak activities were recorded on March 26 and 27 in the northern part of the country. There was notable deposition even though subsidence conditions prevailed, so that there was no vertical air exchange in turbulent drafts. The influx of cold air during March 30–31 which replaced the hot and contaminated air terminated the heat wave as well as the fall-out.

The deposition pattern of fall-out from the second nuclear test explosion differs in some respect from that described above. No fall-out was detected here during the first ten days following the test in spite of the fact that two cold fronts, accompanied by some rain, passed over this area. This result is in agreement with the fact that the streamlines of upper air (above 3 km.) were due eastward from the test site and therefore probably carried debris on a more southerly route than the one followed after the first test explosion (Fig. 5). The near surface air (up to 1·5 km.) near the test site was, however, seemingly trapped in the desert for some days by a 'high' which extended over Lybia at that time. On April 6 some of this air formed an anticyclonic cell which reached Israel on April 13, its edge advancing as a warm front northward on April 14 and 15 (Fig. 6). The radioactivity measurements (Figs. 1–2) show that this desert air carried with it some activity from the second test. Its slow northward advance is clearly reflected in the results of fall-out measurements of the stations in the south and north. The fall-out came to an end on April 17 on the arrival of cold air from the west. The additional activity peak recorded on April 24 (except at Eilath, where its appearance was delayed) can perhaps be attributed to the passage of a nuclear cloud from the second test explosion which had circled the Earth. This deposition of activity occurred during the passage of a cold front. The decay-rate of the deposited activity is similar to that of activity deposited during the week of April 12–18.

No further significant deposition-rates were recorded up to August 1, 1960.

Air Activity Measurements

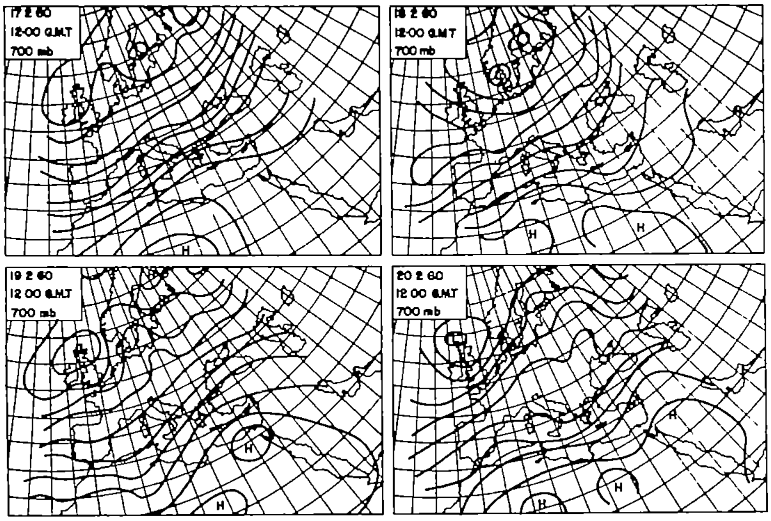

Fig. 4. Streamlines of 700-mb. layer, showing the formation of anticyclonic cells over North Africa and their trajectory into the Levant

filtration with Staplex- and Victoreen-type air pumps, is shown in Fig. 7. It should be noted that the air activity diagram shows less variations than the corresponding 'deposited activity' diagram. There is an appreciable long-lived activity background of about 0·08 μμc./m.^{3}. Marked increases in the air activity were observed only on February 17, March 9, during March 13–14 and March 27–31, on April 14 and 15 and on April 24. Only the peaks of February 17, March 9 and the April activity peaks have their counterpart in the deposited activity diagrams. The decay of the activity collected on these days is very similar to that of the activity deposited on the gummed tape collector, if one takes into account the long-lived background activity (Fig. 2). The decay-rate of the activity collected on the other peak days shows that little activity of recent origin is included in these samples. The relative sizes of the air activity peaks (ratio of signal to average background) recorded on the air monitor after the first nuclear test are smaller by two orders of magnitude (a factor of 30 on the Staplex pumps) than the corresponding peaks of deposited activity, but are about equal for the peaks detected during April following the second nuclear test

Discussion

Deposition of nuclear weapon debris resulting from the Sahara tests was noted on rainless days only when one of two distinct meteorological conditions prevailed: during the passage of cold fronts or during the sojourn of air from anticyclonic cells moving in from the African continent. The deposition pattern was quite different in these cases.

The cold fronts resulted in large amounts of activity being deposited during a short time-interval, the amount apparently depending on the temperature gradient of the front. The observation of activity at ground-level is in this case made possible by the existence of a vertical transport mechanism active to a height of a few kilometres. The coincidence between all measured activity peaks and the existence of such a mechanism shows that no activity can be detected at ground-level unless two conditions are satisfied: (1) The presence of a 'nuclear cloud' aloft; (2) the existence of an atmospheric transport mechanism reaching up to the height of the cloud. It follows that the extent of the nuclear cloud aloft cannot be determined from the duration of the deposited activity peak.

On the other hand, the radioactivity carried by the warm air cells appears in the form of broad peaks on the deposited activity diagrams. Activity was detected even in the absence of any distinct mechanism for vertical air exchange. The duration of these peaks is therefore determined by the time of stay of the contaminated air masses in the area.

Each of the activity peaks recorded during the period under discussion was associated with air which was tracked back directly to the vicinity of the test site, either through the surface or upper-air layers. Meteorological systems which brought air along different tracks during this period contained no measurable amounts of (recent) fission product activity. This simple deposition pattern is probably the result of the tendency of the air-flow to be zonal during this period. The high circulation index indicates the lack of transport of radioactivity on a large scale across latitudes, except for one occasion when a northward protrusion of an upper ridge of high pressure extending from North Africa to Europe may have been responsible for the activity peak reported in the United Kingdom between February 28 and March 1[3]. Judging from our experience with the flow regime observed following the tests, it

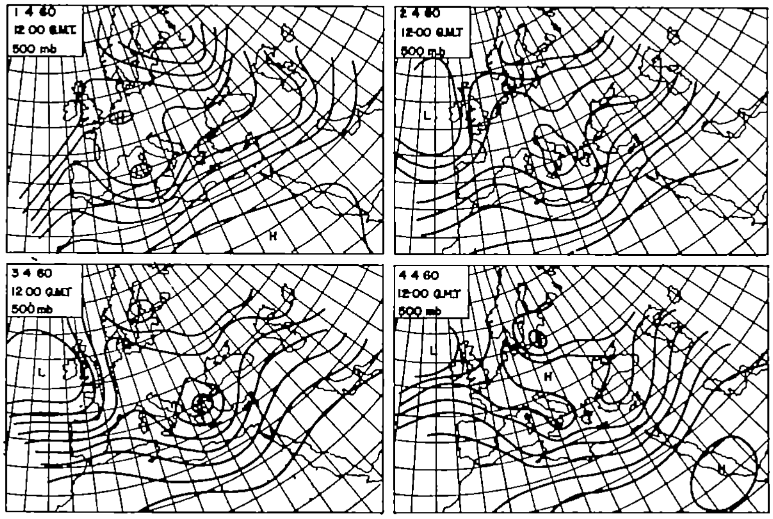

Fig. 5. Upper air streamlines following the second nuclear test

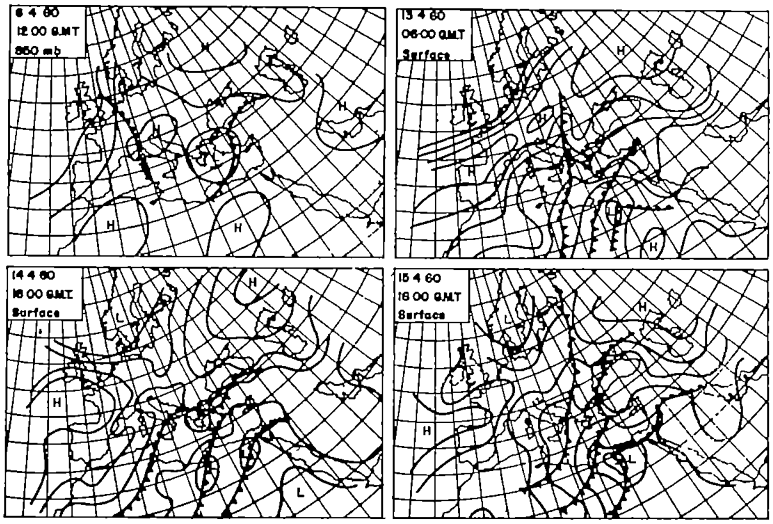

Fig. 6. Map 1: typical synoptic situation which results in activity being confined over North Africa. Maps 2–4: surface pressure distribution (during period April 13–16) showing the development of an east-moving low across the North African coast which caused this activity to move into the Levant

appears that synoptic data are sufficient in a simple meteorological system to forecast quite accurately the transport of radioactivity in the weather layer. This, however, may be very difficult where more complex meteorological systems develop.

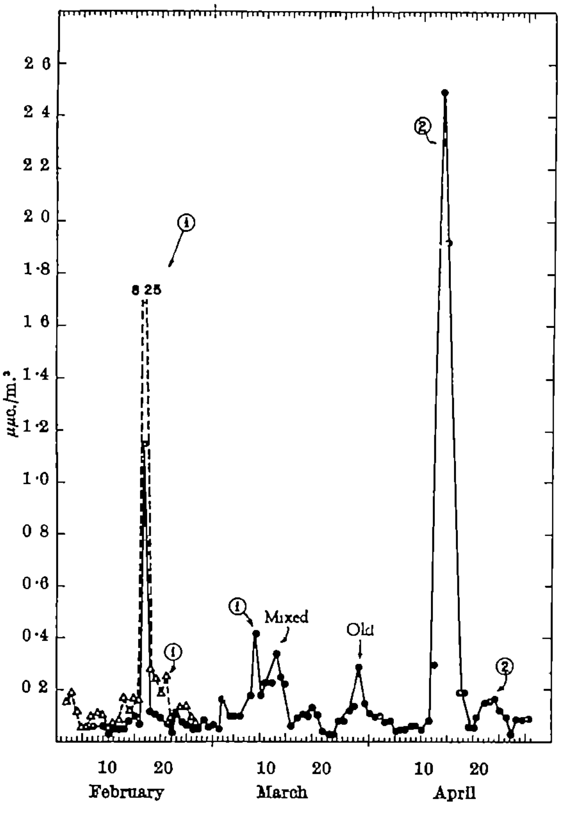

Fig. 7. Activity of particulate matter in surface air at Rehovoth Station, February–April. (Activity is given in units of μμc./m.³ on fourth day after collection.) Δ, Staplex air pumps with *TFA* No. 41 filters; ●, Victoreen, Model 900–2, mobile air monitor. The origin of the activity peaks (first, second or previous nuclear test) is indicated

The surprising result of the measurements is the fact that, for more than a month following each test, every air mass which reached Israel after having been in contact or in exchange with near-ground-level air of the Sahara contained radioactivity. The localized persistence of the radioactivity in the air above the Sahara, inferred from this result, is noteworthy. It is undoubtedly due to the aridity and the semi-stagnant air circulation pattern of the region and hence a peculiarity of the dates and location of the tests. The results of radioactivity measurements at Ghana, reported by Ward and Marr[4], confirm the continuously high air count of the desert air up to the beginning of March.

The debris from the first nuclear test was detected much more efficiently on the gummed tape than by the air pumps. It behaves quite differently in this respect from the material from the second test as well as from the residual airborne activity which is responsible for the appreciable background count on the air-filters but is barely detectable on the gummed tape.

The gummed tape collector is considered (except during showers) to be a sampler of large-sized particles only. The air-filters, on the other hand, are known to be effective in collecting fine particles (larger than $0\cdot01\mu$). The Staplex type air pumps when set up horizontally with these filters are, however, poor collectors of coarser grain particles at the flow-rate used; the continuous air monitor having a curved inlet pipe is even less responsive to the larger particles.

From the different response of the sampling equipment to debris from the two test explosions it is inferred that the debris materials differ considerably in the size distribution of the radioactive particles. The results may be interpreted in terms of (size) spectral shift to larger particles of the atmospheric radioactivity associated with the first nuclear test, relative to the residual atmospheric radioactivity which is responsible for the background counts. This seems to be true for the peak of February 17 as well as for subsequent peaks related to the first test.

Debris from the second nuclear test seemed to be in a more finely divided form. No hot spots were found, and the air monitor proved to be as responsive (signal to background ratio) as the gummed tape collector. The different size distribution of the debris from the two tests is probably related to the fact that the second explosion was an air drop whereas the first test was reported to be a tower experiment.

The results emphasize that the quantitative response of the conventional fall-out detection systems depends on the size distribution of the fall-out material at ground-level as well as on its concentration in the air. A number of discrepancies between air activity and fall-out deposition-rates seen in the literature[5] may find their explanation in the different sensitivity of different monitoring equipment to the size and shape of the aerosol particles. The possibility of detection at ground-level of fall-out material from higher-altitude layers depends, of course, with any monitoring system, on the operation of favourable meteorological transport conditions.

The measurements show the 'gummed tape' to be an efficient collector of fresh nuclear test debris even on rainless days; the activity measured cannot, however, be quantitatively related to true air concentrations of fall-out.

The amount of activity deposited in Israel as a result of the nuclear tests in the Sahara turned out to be insignificant from a public health point of view; it contributed only a small addition to the fission debris accumulated as a result of previous nuclear test explosions.

We are indebted to the Director, Israel Meteorological Service, and to the staff of the Forecasting Division at Lod for the use of synoptic maps and to the Israel Atomic Energy Commission under the auspices of which the measurements were carried out.

POST-SECONDARY AND HIGHER EDUCATION IN NIGERIA

By Dr. C. T. MORTIMER
University College of North Staffordshire, Keele, Staffordshire

"INVESTMENT in Education" is the title of the report of the Commission on Post-School Certificate and Higher Education in Nigeria*. Sir Eric Ashby was the chairman, and the Commission included American and Nigerian members. It was constituted to investigate Nigeria's needs in education over the next twenty years, and to recommend how these needs might be fulfilled.

The Commission's approach to the problem reflects the optimism which is to be found in Nigeria to-day. It thinks of the country as it will be in twenty years time: a nation of some fifty million people, with industries, oil, and a well-developed agriculture. To provide for this development the Commission's educational proposals are massive, expensive and unconventional. They include doubling the secondary school intake, creating a completely new teacher-training scheme, building six large technical institutes, and increasing the output of graduates from 300 to 2,000 a year; all in the next ten years. This would undoubtedly be beyond the present resources of the Federal and Regional Governments. Only with aid on an international scale can this educational 'crash' programme be accomplished.

A survey of the need for 'high-level' man-power, to enable Nigeria to carry out the programme of economic development, has been made by Prof. Frederick Harbison, of Princeton University. In this context 'high-level' man-power means men and women who have had education beyond school certificate. The minimum need, over the next ten years, is for 80,000 people with some post-secondary education. About 30,000 of these are described as "senior: managerial, professional and administrative", and a majority of them should be graduates. Some 50,000 people will be required with an "intermediate" qualification, calling for two or three years of full-time study after school certificate.

It should be emphasized that these estimates are a minimum which is required to permit the economic growth of Nigeria in the next decade to be equivalent to that in the ten years prior to independence. This has been only 4 per cent per annum in real terms. Moreover, even if this rate of economic growth is sustained, by 1970 Nigeria will still have a lower number of high-level man-power per thousand population than either Ghana or Egypt has at present. Also, during this time Nigeria's population will have increased by about one-sixth of its present number.

The report stresses, however, that in planning educational institutions, it is the rate of flow which is important. The objective is, therefore, to propose an educational machine which will produce at least 8,000 people per annum with some post-secondary education.

In 1958, about 600,000 pupils entered primary schools, which is a substantial proportion of the 800,000 who (at a rough guess) reach the age of seven each year. This represents almost univeral primary schooling in the Eastern and Western Regions, although in the Muslim Northern Region, where the development of Western education has been much slower, only about one-tenth of the young children attend primary schools. In order to fulfil Harbison's estimates, about 5 per cent of those who finish primary school (some 30,000 pupils) should enter secondary schools each year, with a view to slightly more than 1 per cent (8,000 pupils) eventually obtaining a post-secondary qualification. For these objectives to be achieved, four distinct, though inter-related, parts of the educational system must be strengthened or developed. These are: (1) the teacher-training programme; (2) the secondary schools; (3) facilities for technical training; (4) the universities. These topics the Commission considers in detail.

As in all undeveloped countries, much depends on the teacher-training programme. Both an emergency, short-term scheme and also more permanent facilities are recommended. At the base of the educational pyramid the first step is to give an "injection of remedial education" to some 8,000 primary and secondary school teachers, many of whom have only the most meagre of qualifications. This would be in the form of short residential courses of one or two months, held in the universities. The benefits of these courses would be consolidated by a teacher-guidance service of about 1,000 experienced travelling teachers, most of whom would have to be expatriates, at least for some time to come.

---

* Investment in Education: The Report of the Commission on Post-School Certificate and Higher Education in Nigeria. Pp v+140. (Lagos: Federal Government Printer; London: Crown Agents for Oversea Governments and Administrations, 1960.) 5*s*. net.

More permanent training facilities will provide for Grade I colleges, offering a qualification which would be a minimum for secondary school teachers, and also Grade II colleges, which the majority of intending primary school teachers will attend. It is hoped that by 1970 the Grade II colleges, which now offer only a two-year post-primary education, will be upgraded and provide training up to school certificate level, together with the teaching certificate, and have an output of 18,000 teachers a year. These colleges will require a large number of graduate and Grade I staff. It is estimated that the output of teachers with the equivalent of Grade I status must be not less than 3,000 a year. The main avenue to this qualification must be two years of formal education after the school certificate, and involves finding 6,000 teacher-training places. The majority of the Grade I teachers will be trained in eight new colleges. The technical institutes will train about 500 teachers a year, who will teach manual subjects, which would become obligatory in all primary and secondary schools. This should help to correct one of the major defects in Nigerian education, namely, a strong bias towards the traditional literary and academic subjects, which is reflected in a lack of respect for manual skills and technical achievement. The training of graduate teachers is considered under the section dealing with the universities.

The secondary schools should be able to take about 30,000 pupils a year. At present there are facilities for only 12,000 entrants annually, so that 18,000 places a year must be created. This is equivalent to some 600 secondary school streams. From the 30,000 who will enter secondary schools, it is expected that 25,000 will obtain a school certificate, and of these 5,000 would proceed to some intermediate training, while 3,000 would continue with sixth-form studies, with the view of entering universities.

The Commission is strongly in favour of sixth-form work being carried out in secondary schools, rather than in special colleges, or in preliminary courses at the universities. At present there are sixth forms in only 22 schools, catering at most for 500 pupils a year, so that over the next decade another 100 sixth-form streams must be created (which, incidentally, will require at least 400 additional highly qualified teachers). But these sixth forms cannot wait until they are built up from the junior classes of new secondary schools. The Commission therefore recommends that national high schools be established, consisting initially only of sixth forms (the pupils being admitted from other schools in the area). In time junior classes would be grafted on. In addition, selected secondary schools should be encouraged to develop sixth forms.

It is estimated that some 3,000 technicians should be trained each year. The most efficient development of technical education would be to have about six large institutes in centres of population. For the next ten years the institutes at Enugu, Ibadan, Kaduna, Yaba, together with that planned for Benin City, that contemplated at Port Harcourt, and, it is hoped, one at Kano should suffice.

Part of this scheme is 'self-generating' and should produce, by 1970, enough men and women to staff the 18,000 Grade I appointments in primary and secondary schools, in teacher-training colleges, in technical institutes, and in the supervisory teaching scheme. It will provide entrants to the universities, some of whom will return to fill the 7,000 graduate teacher appointments. But unless some initial momentum is given the whole machinery will get under way too slowly. To "prime this educational pump" the Commission hopes it will be possible to import a corps of teachers into Nigeria on short-term contracts. Graduates would have to be engaged at the rate of 1,000 a year between 1962 and 1966. At the same time a group of Nigerians (some 600 a year) would be sent overseas for university training to prepare for teaching. This measure would produce enough Nigerians to replace the short-term, expatriate teachers by 1970. During this period it is hoped that the output of graduate teachers from Nigerian universities would rise to about 800 per year.

For the continued growth of Nigeria's economy at its present modest rate it is estimated that the country needs at least 2,000 graduates a year. The student population in Nigerian universities at present is about 1,500, and the output of graduates is 300 a year. Also, about 500 Nigerian graduates return each year from overseas universities. The Commission recommends that at least 7,500 student-places should be available in Nigerian universities by 1970. Three aspects of this proposed university expansion are considered in detail: the range of studies, the sites for new universities, their financing and government.

There must be more diversity and flexibility in university education than is found in the British system if it is to meet the needs of the Nigerian people. The British system of university education suits Britain because there are many alternative routes to professional training. These are lacking in Nigeria. However, greater diversity must not carry with it lowered standards. African studies, commerce, teaching, engineering, medicine, agriculture, law and extra-mural studies are fields of study which are vitally important.

The most obvious need for innovation in Nigerian universities is in African studies. It must be a first duty to foster study of African history, languages, and societies, and when a sufficient body of knowledge has been built up these could be incorporated into undergraduate courses.

In Britain, most accountants, bankers, company secretaries, insurance managers and transport executives are trained 'on the job'. In America, professionals in these fields are college-trained and have degrees. An amalgamation of these two methods would suit Nigeria's needs: to offer degree courses in commerce and business administration, preferably to be taken as sandwich courses, where the student would alternate some months of office work with some months of study.

Nigeria will need 800 graduate teachers a year. Only a minority of these teachers will require a concentrated training in a narrow field, for sixth-form teaching. For the great majority, a degree based on a general curriculum would be more useful. The Commission proposes that all Nigerian universities should institute a degree of B.A. (Education). The course would take three years, and would consist of four subjects in the first year, three in the second, and three in the third year. Teaching practice and a course in pedagogy would also be included.

For many years to come Nigerian specialists in engineering will seek postgraduate experience overseas, but for her indigenous engineering training the country needs degree courses with an emphasis on the practical side, and not over-sophisticated.

The needs of Nigeria for medical services are totally different from those of Britain. It is unreasonable to assume that the standards of attainment for Nigerians practising in Nigeria must be the same as those of Englishmen practising in England. Also, in Nigeria to-day there is one doctor to every 40,000 people (as compared with a ratio of 1 : 1,000 in Britain) so that there is a tremendous need to increase the output of doctors. Specifically, the Commission makes three main recommendations ; (*a*) doubling the output of the University College Hospital, Ibadan ; (*b*) instituting a locally recognized examination, for those who fail to qualify for the medical degree at Ibadan ; (*c*) re-orientating the medical courses to emphasize public health, preventive medicine and pædiatrics.

The Commission was favourably impressed with the state of agricultural (degree) courses at the University College, Ibadan ; but the flow of graduates (20 a year) is pitifully inadequate to meet the nation's need of 200 a year.

So far as the siting of new universities is concerned, the Commission proposes that there should be four large universities, one in each of the three Regions and one in Lagos, the federal capital, rather than a number of smaller universities. These universities should be independent of one another ; they should be national institutions with all three Regions equally represented on their governing bodies ; and they should be financed largely from federal funds on the advice of a national universities commission.

It is recommended that the three regional branches of the Nigerian College of Arts, Science and Technology should become centres of university education. The Ibadan branch would be joined to the adjacent University College, Ibadan. The branch at Enugu, in the Eastern Region, would become part of the new University of Nigeria, at Nsukka. It would be used to develop departments of engineering, metallurgy, surveying and the social sciences, and also be the headquarters of an institute of education. The Zaria branch of the Nigerian College would become the centre of a university in the Northern Region, which would also embrace the Ahmadu Bello College of Arabic Studies, at Kano, and the Veterinary Research Institute at Vom. A particular proposal about this new university in the Northern Region is that opportunity should be given for undergraduates to read combinations of subjects drawn from different disciplines.

The University at Lagos would be an unusual type of institution, which would be non-residential, and would have three main departments. These would be a School of Commerce and Business Administration, offering both day and evening courses, a School of Economics and Social Studies, and a Department for Correspondence Courses. Although this would offer only a limited range of courses, it is believed that it would encourage large numbers of men and women, who would otherwise not have the opportunity, to improve their education and fit them for more responsible posts.

This is an outline of the Commission's main proposals. What it recommends is a stupendous undertaking, and will cost large sums of money. The Nigerian people will have to forgo other things they want, so that every available penny is invested in education. Even this will not be enough. In the words of the report, "Nigerian education must for a time become an international enterprise".

VERTEBRATE LOCOMOTION

A SYMPOSIUM on "Vertebrate Locomotion", the fifth in the series sponsored by the Zoological Society of London, was held at the rooms of the Society on Wednesday, November 9, 1960.

Sir James Gray opened the meeting with a paper on the general principles involved in studying the mechanics of vertebrate movement. He stressed the difficulty of providing an exact treatment of the problems of aquatic and aerial locomotion and gave examples from his own work and that of his students on these and on the more amenable problems of tetrapod movement. Here, exact measurement of forces exerted by the limbs on the substratum provided a basis for analysing the locomotor system ; from these results it was demonstrated that the muscular system must be treated as a single integrated whole.

Dr. R. Bainbridge, after enumerating and commenting on the many still unsolved problems in fish locomotion, concentrated on one of these—the relationship of power output, in terms of known data for muscle, to drag, calculated on various simple assumptions.

He showed that within the wide range of experimentally established estimates for the power output of different vertebrate and invertebrate muscles, it was possible to account for the observed steady speeds of progression of most small fish as well as of whales and dolphins without the need to assume completely laminar flow over the body surface. A surprising exception was provided by the barracuda.

Dr. G. M. Jarman contributed a brief note on the form of intermuscular bones and myocommata in the fish myotome. He suggested that the conical surface of a myocomma is inclined at such an angle to the longitudinal (contractile) axis of the muscle that the connective tissue mass does not change in area or thickness and therefore waste the contractile effort of the muscle.

Mr. E. H. Watts gave an account of some experiments in designing ships on lines which imitated certain features in fast-swimming fish. Perhaps the most significant of these practical exercises was the provision of lateral keels on either side of the stern, similar to those found in scombroid fishes and certain sharks. These structures slightly increased the propulsive efficiency and greatly reduced the minimum turning circle of the vessel. A more surprising result, which did not appear explicable on the models of fish locomotion described earlier by Dr. Bainbridge, was that the artificial creation of turbulent flow along the hull form appeared in some ships actually to increase the propulsive efficiency by reducing the drag.

The considerable variation in form and flexibility of the sacro-iliac joint in the anuran amphibian was described by Dr. H. P. Whiting. In *Xenopus* and

Discoglossus respectively, longitudinal sliding and horizontal rotation of the pelvis on the vertebral column are very marked; *Rana* shows the more commonly known rotation in a vertical plane. The different motions are consistent with observed differences in body movement of the normal animals, and suggest that an important shock-absorbing property, as well as a possible locomotory contribution, is provided by the musculature of the sacro-iliac joint.

Dr. K. M. Backhouse described the fish-like lateral motion of the hind feet of the seal when swimming in water; and contrasted this with the movement on land, where progression is achieved by dorso-ventral flexion of the trunk coupled with a hitching action of the fore limbs. Slow-motion films illustrated the terrestrial locomotion, in which the highly flexible metacarpophalangeal and interphalangeal joints of the fore limb play an important part.

Prof. E. J. Slijper, of Amsterdam, gave an account, also illustrated by film, of locomotion and locomotory organs in whales and dolphins. An interesting point to which he directed attention was the fact that cruising speed and maximum speed of the small dolphins was about the same as that for the much larger whales. He suggested that this could be explained partly by the better mechanical organization of musculature in dolphins, but also on the assumption that the flow of water over the body surface of the dolphin was almost wholly laminar, while it was partly turbulent in whales.

The power of the flying bird was discussed by Dr. R. H. J. Brown. He surveyed the various attempts to estimate this from the earliest date of Lilienthal to the more recent figures based on wind-tunnel tests, oxygen consumption figures and gliding parameters of birds in actual flight. These data suggest that the aerodynamic efficiency and the muscle-power must be very high even in normal sustained flight; greatly increased power must be available for take-off and climbing.

Terrestrial locomotion of dogs and horses was dealt with by Prof. C. W. Ottaway, who described the highly co-ordinated and integrated action of limb and shoulder muscles in the normal walking stride, and illustrated the value of nerve section and tenotomy as a method of studying the role of individual muscles.

Finally, a contribution on arboreal mammals by Dr. J. R. Napier reviewed the evolution of prehensility in the primate hand. The inward turning of the thumb which characterized true opposability required a deep carpal tunnel brought about by the set of trapezium and scaphoid, together with the existence of a saddle joint at the carpo-metacarpal articulation. True opposability is only attained in Old World monkeys, and was evolved fairly late in primate history.

The symposium was well attended, and the discussion which followed each session, though necessarily brief, raised a number of interesting points made from personal observation on locomotory behaviour as well as on the theoretical principles involved. It was fittingly concluded by the showing of a film, still in its partially edited condition, from the Zoological Society's television unit, demonstrating various modes of running and jumping by man and by animals from the collection. The slow-motion sequences collected together in the film, which was introduced by Dr. Fay Hall, were particularly interesting and instructive. John E. Harris

OBITUARIES

Prof. W. J. Duncan, C.B.E., F.R.S.

William Jolly Duncan, Mechan professor of aeronautics and fluid mechanics in the University of Glasgow, died on December 9 at the age of sixty-six. He had a very varied experience. Born on April 26, 1894, he was the son of Robert Duncan, M.P., senior partner of Ross and Duncan, engineers, of Glasgow. He was educated at Dulwich College and the University of London. He served in both World Wars, during the First in France and Flanders and later at the Aircraft Inspection Directorate. In the Second World War he worked for a time at the Royal Aircraft Establishment, and then as head of the Air Defence Research Establishment at Exeter. In 1945 he was sent to the Luftfahrtforschungsanstalt Hermann Göring, at Völkenrode, to supervise the disposal of German aeronautical equipment. He married in 1936 the daughter of G. S. Baker, who was then superintendent of the William Froude Ship Tank at the National Physical Laboratory, and had a family of four—all girls.

Duncan was appointed to the scientific staff of the Aerodynamics Division, National Physical Laboratory in 1926, and it was there that I, superintendent of the Division, first came to know him. In his work there, he was closely associated with the late Dr. R. A. Frazer, and A. R. Collar, now professor of aeronautical engineering in the University of Bristol. This team of three scientists was entrusted with the investigation of the new problem of aircraft flutter, a problem they were able to solve fairly completely, and in particular to lay down design rules whereby flutter could be avoided. In the process they greatly developed the theory of matrices, and together wrote a book, "Elementary Matrices", published in 1938, which has been reprinted four times and is a standard work on the subject. In 1934 Duncan left the National Physical Laboratory to become the first head of the Department of Aeronautics at Hull, and in 1938 he was made the first Wakefield professor there.

At the end of the War a group of four was entrusted with the search for a suitable site for the proposed new College of Aeronautics; Duncan and I were two of these, and we both became very interested in this revolutionary new idea in postgraduate training. When the College was eventually established at Cranfield, I became its first principal and Duncan was appointed professor of aerodynamics, and became also deputy principal three years later. I can say with certainty that the major part in the formulation of the teaching methods to be adopted in the new College was due to Duncan. It was during this period that he and I made arrangements with the Cambridge University Press for a series of aeronautical books, and Duncan's work on "Control and Stability of Aircraft" was the first of this series. Incidentally, he also wrote the first report of the College of Aeronautics to be issued.

Duncan's teaching at the College was outstanding in excellence, as is witnessed by the fact that many of his students who specialized in aerodynamics now occupy major positions in the aircraft industry and in aeronautical research. He left Cranfield in 1950 to become the first Mechan professor of aeronautics and fluid mechanics in the University of Glasgow, a post which he held until the end of his life. He had been chairman of the Aeronautical Research Council since 1957, and was very active not only on the Council but also on many of its committees and sub-committees.

Prof. Duncan was an able mathematician and a first-class engineer, painstaking and thorough in all his work, and a great inspiration to those who had the good fortune to work with him. He was elected a Fellow of the Royal Society in 1947 and was appointed C.B.E. in 1953. His publications, besides the two books already mentioned, include one on "Physical Similarity and Dimensional Analysis", together with numerous reports and papers published in the Reports and Memoranda of the Aeronautical Research Council, the *Proceedings of the Royal Society*, and the *Philosophical Magazine*. His death will be felt as a great loss by his many friends and collaborators, and by the world of mechanical engineering in general.

ERNEST F. RELF

Prof. J. G. Andersson

PROF. JOHAN GUNNAR ANDERSSON, formerly director of the East-Asiatic Collections at Stockholm, was one of the Swedes who have made lasting contributions to our knowledge about the natural resources of China and the history of the civilization of that country.

He was born on July 3, 1874, at Knista in the province of Orebro, and died in Stockholm on October 29. After studying at the University of Uppsala, he obtained there the degree of M.Sc. in 1901, became D.Sc. in 1902, and was appointed professor of geography in 1906. Already during his years as a student he devoted himself to the examination of the Silurian deposits of his native county of Närke and of Öland. These investigations resulted in a couple of palæontological communications and a study of the distribution of phosphorites in the Silurian.

As a young student he took part in several expeditions into the Arctic regions. Thus he was a member of the expedition to Spitsbergen led in 1898 by the Swedish polar explorer A. G. Nathorst. In 1899 Andersson undertook an expedition of his own to Beeren Island. The geological results of this undertaking he described in his doctoral thesis, "Über die Stratigraphie und Tektonik der Bären Insel". When in the years 1901–3 Otto Nordenskjöld undertook his famous Antarctic expedition, Andersson was second in command, and when Nordenskjold together with some other members had established winter quarters on Snow Hill, Andersson took over the leadership of the expedition to South Georgia, the Falkland Islands, and Tierra del Fuego, and also during the second trip of the vessel to the Antarctic. Afterwards Andersson left the vessel with two companions in order to reach Nordenskjold's winter quarters by land. Before reaching it he was, however, forced to spend a winter under very trying conditions. He then joined Nordenskjöld's group in the following spring. In the meantime, their ship foundered in the pack-ice, yet without loss of human lives. This expedition and its rescue by an expedition sent out from Argentina forms one of the more thrilling chapters in the history of the exploration of the polar regions.

In 1906 Andersson was made head of the Geological Survey of Sweden. After having had leave of absence since 1914, he left this post in 1916. During his comparatively short time as head of this organization, he introduced a number of new and important investigations into its programme. This applies first of all to the production of oil and radium from the oil-shales. The organization of the Geological Survey as established in 1914, which has remained in force to the present day, is to a large extent due to him. During the Eleventh International Geological Congress, held at Stockholm in 1910, he was, partly in collaboration with H. Munthe and A. Gavelin, the editor of the publications of the Congress.

As mentioned already, Andersson had obtained leave of absence in 1914 from his post as head of the Geological Survey, and had entered the service of the Chinese Government as mining adviser and organizer of the geological exploration of the ore and mineral resources of China. It was during this period that he became widely known as an explorer of China. In addition to the study of ore geology, he found time for extensive studies of the fossil faunas and floras of China as well as for remarkable archæological excavations that threw light on the earliest settlement of China. In his endeavours he enjoyed powerful support from the Chinese Government and from the Swedish Parliament. From this field of activity 'China Gunnar', as he was called in many circles, brought back extensive collections which are now in different Swedish museums.

After his return from China, Andersson was appointed in 1926 to a chair of geology in the University of Stockholm. From this he retired, however, in the following year, in order to devote himself to the arrangement of his collections, and to a new trip to China. On his return from his second visit to China he was made director of the East-Asiatic Collections in Stockholm, and was given a personal chair in East-Asiatic archæology which he then occupied until 1939.

Andersson published the results of his researches and explorations in a great number of scientific papers. His studies in the Far East were summarized in his "Topografisk-arkeologiska studier i Fjärran Ostern" (1939). He had a great gift of popularizing his knowledge, both as a lecturer and as an author. In 1926 he published his account of China, "Draken och de främmande djavlarna", followed by "Den gula jordens barn" (1932), the autobiographical "Kineser och pingviner" (1933), and "Under brinnande krig" (1938). He surveyed his own life and his life's philosophy in a book, "Mitt liv och min tro" (1956).

ERIK ÅHMAN

Dr. Louis Clarke

LOUIS CLARKE'S death on December 13 leaves a gap in the hearts of his innumerable friends, for he was a much-loved man. He was wealthy and was blessed with intelligence and common sense, with a lively understanding of human nature and with the standards of behaviour of his Christian Victorian upbringing. He travelled widely after leaving Cambridge, especially in South America and

Abyssinia, and was extremely knowledgeable in matters of archæology and art. Hence his two official jobs, first as curator of the Museum of Archæology and Ethnology at Cambridge, and later as director of the Fitzwilliam Museum.

But the outstanding fact was that Louis could neither be described as an academic nor as an ordinary person. He took a very modest degree, and, though in later life his eminence was such that his University gave him an honorary doctorate, he was essentially an example of the fine fruit of what England so specially has produced in the past: he was a distinguished amateur. This is high praise, and it was only possible because in his early life his intellectual energies had not been canalized into a narrow channel: he had had opportunity and leisure to cultivate wide interests and friendships and to gain a broad, wise outlook on life. His knowledge became encyclopædic: he could give you the provenance of any object you might offer for his inspection! Those who knew him well will never forget his enormous, cheery voice resounding through the two Museums he successively controlled, nor his capacity, possibly unrecognized by himself, to unite any team with which he worked into a whole.

At the Museum of Archæology and Ethnology, where he followed Baron von Hügel and Dr. A. C. Haddon and where much had been done to build up a new Museum, it was nevertheless under his direction that it became what it is to-day. He was extremely generous, too, in his gifts to the collections, and much more generous than people knew throughout his life to young or struggling archæologists, financing 'digs' in out-of-the-way parts of the world and adding the results of their excavations to the Museum collections. At the Fitzwilliam his influence was at first to some extent crippled by the War and all that world upheaval meant to a great art museum, but afterwards he was able to do much to further the objects of that universally known institution.

But facts give no picture of the man, with his kindly humour and tremendous knowledge of people, a knowledge which began in his own family of thirteen brothers and sisters and extended to include savants from all over the world. Above all, there was nothing ungenerous in his whole make up, and he has been an ornament to the Cambridge of his generation. For some years his heart had given him trouble, and he died quietly in Cambridge in his eightieth year on December 13.

M. C. BURKITT

NEWS and VIEWS

Geological Society of London: Awards

THE Council of the Geological Society of London has made the following awards for 1961: *Wollaston Medal*, to Prof. Roman Kozlowski, emeritus professor of palæontology, University of Warsaw, in recognition of his distinguished contributions to palæozoology, especially to knowledge of the graptolites; *Murchison Medal*, to Mr. W. N. Edwards, assistant director, Geological Survey of Great Britain (Leeds), for his contributions to the stratigraphy and structure of the Coal Measures, particularly in the Yorkshire–Nottinghamshire Coalfield; *Lyell Medal*, to Dr. J. V. Harrison, lately reader in structural geology, University of Oxford, for his contributions to structural geology and his pioneer work in remote countries; *Bigsby Medal*, to Prof. Alwyn Williams, professor of geology, Queen's University, Belfast, in recognition of his work on the Lower Palæozoic stratigraphy, palæontology and structural geology; *Wollaston Fund*, to Dr. E. A. Vincent, reader in mineralogy, University of Oxford, for his work on the iron–titanium minerals and on geochemistry; *Murchison Fund*, to Dr. J. Ineson, district geologist (Water Department), Geological Survey and Museum, London, for his fundamental contributions to the investigation of ground-water resources in Britain; a moiety of the *Lyell Fund* to Dr. R. G. West, demonstrator, Department of Botany, University of Cambridge, for his contributions to the geology and palæobotany of the Pleistocene of the British Isles; another moiety of the *Lyell Fund* to Dr. W. T. Dean, Department of Palæontology, British Museum (Natural History), London, for his work on the stratigraphy and palæontology of the Middle and Upper Ordovician in Great Britain.

Royal Society and Nuffield Foundation Commonwealth Bursaries

AWARDS under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme have been made as follows: Mr. J. Attridge, lecturer in zoology, Birkbeck College, to assist him in doing further work on the Dinosaur beds, and other fossil reptile deposits, of the Karroo System in Southern Rhodesia, from June to October 1961; Dr. M. M. Chakrabarty, reader in applied chemistry, University of Calcutta, to assist him in studying new techniques for the investigation of fatty oils at the Prairie Regional Laboratory, Saskatoon (and possibly also at the Paint Research Station, Teddington), for about six months from March 1961; Prof. J. H. O. Day, professor of zoology, University of Cape Town, to enable him, for about nine months from February 1961, to study type specimens at the British Museum (Natural History) in connexion with the preparation of a monograph on the South African Polychaeta; Dr. W. H. Elliott, Biochemistry Department, John Curtin School of Medical Research, Australian National University, Canberra, to assist him in visiting Cambridge for about a year from September 1961 in order to study microbiological techniques; Dr. D. E. Hoare, lecturer in physical chemistry, Queen's College (Dundee), University of St. Andrews, to enable him to study reactions of hydroxyl radicals with hydrocarbons at the National Research Council, Ottawa, from April to September 1961; Mr. C. R. Horrell, of the Department of Agriculture, Uganda, to enable him to visit Queensland from January to April 1961 to study the development of tropical pasture grasses and legumes for the production of temporary leys; Dr. C. A. Hurst, senior lecturer in mathematical physics, University of Adelaide, to assist him in visiting Edinburgh for about eight months from February 1961 in order to investigate the properties of relativistic two-body equations; Prof. J. C. Jaeger, professor of geophysics, Australian National University, Canberra, to enable him to carry out a study of stresses in deep mines and correlation with seismic observations, at the Bernard Price Institute, Johannesburg, for about three months from November 1961; Mr. I. C. McKellar, of the New Zealand Geological Survey, to assist him in studying glacial geology, Pleistocene stratigraphy and techniques in glaciology in British Columbia, during April and May 1961; Dr. S. S. Qadri, reader in zoology, University College of Science, Osmania University, to enable him to learn protozoological techniques at the London School of Hygiene and Tropical Medicine for a year from January 1961.

Electrical Research Association: New Appointments: Dr. R. H. Golde

FOLLOWING the retirement of Mr. H. M. Lacey on September 30, Dr. R. H. Golde was appointed head of the Surges and Transformer Department of the Electrical Research Association. Dr. Golde is secretary of the Study Committee on Lightning and Surges of the Conférence Internationale des grands réseaux électriques, a member of the International Committee on Lightning Protection and of several British Standards Institution, Institution of Electrical Engineers and International Electrotechnical Commission committees. He was educated at the Technical University of Berlin. He joined the Electrical Research Association in 1935 and took his Ph.D. degree at Queen Mary College, London, and has been awarded the D.Sc. (Eng.) by the same University.

Mr. M. Waters

MR. M. WATERS has been appointed deputy head of the Surges and Transformer Department. Mr. Waters received his early training with A. Reyrolle and Co., Ltd., and during his apprenticeship there he won the scholarship of the North East Coast Institution of Engineers and Shipbuilders, which enabled him to proceed to King's College, Newcastle upon Tyne, where he graduated with honours in electrical engineering. Mr. Waters returned to Reyrolle's, working in the Research Department. After gaining experience in power station construction with Parolle Electrical Plant Co., Ltd., he joined the Electrical Research Association in 1946 to undertake research on power transformers.

Mr. L. Gosland has been appointed deputy director of the Electrical Research Association. This appointment is additional to his position of research manager, which he will continue to hold. Mr. C. G. Garton and Mr. E. W. Golding are appointed assistant directors of the Association. Mr. Garton will continue as head of the Materials Department, and Mr. Golding will continue as head of the Rural Electrification Department, and also as overseas liaison officer.

The British Association for the Advancement of Science: Norwich Meeting

THE annual meeting of the British Association for the Advancement of Science for 1961 is to be held at Norwich during August 30–September 6. This will be the third time that the meeting has been held at Norwich, the previous occasions being during 1868 and 1935, and again it promises a programme with a strong East Anglian interest. Concurrently with the main meeting will be a series of four illustrated lectures for young people, who will themselves organize an exhibition designed to illustrate the scientific work being carried out in the Norwich and county schools. Appointments to the three special lectures are as follows: Kelvin Lecture, Prof. D. J. E. Ingram, professor of physics, University College of North Staffordshire, on investigations in the microwave region of the electromagnetic spectrum; Darwin Lecture, Dr. Judith Milledge, lecturer in crystallography, University College, London, possibly on the importance of borderline subjects—with special reference to crystallography; Lister Lecture, Dr. R. G. Lipsey, reader in economics, University of London, on a subject connected with theory and observation in economics. In addition to the programme for young people at Norwich, Junior British Association meetings will be arranged in 1961 in the West Midlands, Cornwall, Sheffield and Tees-side. The first of a new venture—"Science Fairs"—will be organized in Manchester during March (in collaboration with the Manchester Federation of Scientific Societies), in Tees-side during December and at Newcastle upon Tyne at Easter 1962. Further information concerning the activities of the Association can be obtained from the British Association for the Advancement of Science, 18 Adam Street, Adelphi, London, W.C.2.

Theology and the Sciences at Birmingham

THE University of Birmingham is undertaking a development in its Department of Theology of more than ordinary interest. A second chair, provided by the Edward Cadbury Trust, has been established for a period of seven years in the first instance. This chair will be filled by someone whose interests stretch across the borders between the natural sciences, philosophy and theology. It is hoped that the new professor will pioneer research and teaching in this general area. In Birmingham the sciences have always been strongly represented, and, at present, half the students in the University are reading for degrees in the Faculty of Science. Moreover, last October the Faculties of Arts and Law moved to Edgbaston, and, for the first time for nearly sixty years, all the departments of the University were gathered in a single place. This development seemed to offer an opportunity for interesting and profitable work in exploring the little-known territories where theology, the natural sciences and philosophy meet. The Department of Theology itself, now twenty years old and growing steadily, is non-denominational and widely representative.

Statistical Review of England and Wales for 1958

THE Registrar General for England and Wales has recently issued the third part of his "Statistical Review for 1958", containing the commentary on the vital events of that year (Pp. xiv + 222. London: H.M. Stationery Office, 1960. 13*s.* net). In this volume, which appears after the medical and civil tables, the official statisticians take a careful look at the figures and discuss the implications and trends of vital rates. During 1958, the home population rose by 199,000, of which 185,000 was natural increase (excess of births over deaths), and 14,000 the balance of migration, which it must be remembered includes migration from Scotland and Ireland. It is estimated that there was a net loss of 5,000 on overseas migration, and a net gain of 19,000 on migration within the United Kingdom. Marriage-rates continued to be high, and a continuation of 1958 nuptiality would imply that only 5 per cent of the population would have remained single at age 50, a lower proportion than any ever actually recorded. The number of unmarried men aged 17½–45 exceeded that of unmarried women aged 15–42½ by 6 per cent; only seven years earlier in 1951 this figure had shown a 3 per cent deficiency. On the reverse side, new divorce petitions continued to decline in number;

the 26,000 petitions filed in 1958 were the lowest number recorded since the end of the Second World War. The number of live births was 741,000, the highest figure since 1948. One-eighth of these births were conceived outside marriage, but 60 per cent of these were legitimized by the parents marrying before the birth of the child. It was still, however, premature to say whether this number indicated an increase in total family size, or merely a temporary change in the timing of births within marriage, though it was clear that the rates implied that the population was replacing itself with a margin to spare. In the extensive analysis of mortality, there is a comment on the gap between male and female death-rates. The male rate is now more than double the female in two age groups: 15–24, where men have much higher death-rates from accidents, and at ages 55–64, where the principal contributions are made by coronary disease, with a male rate 3·6 times that of the female, cancer of the lung (9·7) and bronchitis (5·2). There is the usual extensive discussion of cause of mortality. The volume contains a special note on deaths following vaccination and other prophylactic inoculations, and on deaths following from therapeutic misadventure.

Euratom Translation Office at Brussels

THE European Atomic Energy Community (Euratom), the United Kingdom Atomic Energy Authority and the United States Atomic Energy Commission have agreed to pool their efforts to collect and disseminate information concerning translations of nuclear literature, especially from such languages unfamiliar to Western readers as Russian and Japanese. A central information office, called 'Transatom', has therefore been established at Euratom's Brussels headquarters. The office publishes a monthly *Transatom Bulletin*, which lists existing translations recently reported to the Brussels office as well as new translations planned by international or national institutions and private firms in the European Community, the United States, the United Kingdom and in other countries. All data relating to translations, including those made before the establishment of Transatom, are being collected and recorded in a master file system at Brussels. Copies of this card file have been offered to appropriate institutions in countries with great interest in the nuclear field. Contacts have been established in order to avoid duplication of work when the European translation centre, to be established at Delft, Holland, is set up. The scope of this institution is much wider: it will cover all scientific and technical material in the field of exact sciences. The *Bulletin* is available on a subscription basis from Transatom, 51 Rue Belliard, Brussels, at 8 dollars per annum, or 16 dollars air mail.

Use of Film in Scientific Research

THE Department of Scientific and Industrial Research has set up a working party to consider national needs in the field of scientific film. It is especially interested in the aspects of film as a research tool and in communicating research results. To assist the working party the Department, in co-operation with the other research councils, the Atomic Energy Authority and some Government Departments, is circulating a questionnaire to industry, universities and research organizations. The working party consists of: Dr. W. L. Francis (chairman); Mr. Edgar Anstey, British Transport Commission, president of the Scientific Film Association; Mr. D. E. H. Densham, Ministry of Aviation: Sir Arthur Elton, Associated Electrical Industries; Mr. C. Engel, Medical Illustration Department, Guy's Hospital; Prof. G. E. H. Foxon, Guy's Hospital, president, British Universities Film Council; Mr. L. E. Hallett, Royal Photographic Society of Great Britain; Prof. C. H. Waddington, Institute of Animal Genetics, Edinburgh. Three members of the Department of Scientific and Industrial Research are also included: Mr. H. E. Beckett; Mr. L. Poole: and Mr. R. E. Overbury (secretary). Further information can be obtained from the Information Division, Department of Scientific and Industrial Research, 14–18 Cornwall Terrace, London, N.W.1.

British Catalogue of Films for Universities

To assist the university teacher, who may have difficulty in locating films available for teaching purposes, the British Universities Film Council has issued a catalogue of some 1,400 titles classified according to the Universal Decimal Classification, together with an alphabetical index of titles (Pp. 166. Glasgow: British Universities Film Council, Royal College of Science and Technology, 1960). Besides a list of distributors there is appended a list of subject catalogues. The Catalogue has hitherto been issued as a card index, usually placed in the university library, but it is intended to reprint it in four or five years time. It is hoped that issue in book form, by widening its distribution, for example, so as to permit copies to be available in departments, will both stimulate the use of films in universities and comparable institutions and engender interest in expanding the catalogue. Suggestions as to films which might be included in future supplements are invited. Issue of the Catalogue in separate parts is contemplated and this should be an advantage to many users, particularly with further expansion of the Catalogue.

New British Oceanographic Research Ship

PLANS for a new research ship to replace R.R.S. *Discovery II*—now 31 years old—are almost complete, and it is hoped shortly to invite tenders for her construction by the early summer of 1962. The great advances in oceanography in the past decade have shown that there is a real need for a comprehensive research ship capable of working in any ocean, and in almost any weather. The demands for laboratory and ancillary spaces, together with present-day requirements for crew accommodation, alone necessitate a ship larger than *Discovery II*, and, as the life of a research ship may well be 25–30 years, allowance must also be made for future needs. The suggested design envisages a ship with an overall length of 260 ft., a beam of 44 ft. and a displacement of about 2,800 tons. Laboratory and other scientific spaces will occupy some 3,000 sq. ft. and will provide facilities for marine physics, biology, chemistry, geology, geophysics and meteorology. Diesel-electric drive, with a single screw, will allow a service speed of 10 knots and a range of about 15,000 miles. Special attention is being paid to the provision of adequate supplies of electric power, not only now but also in the future. Deck machinery will include separate winches for coring, trawling and all normal oceanographical work. Other special features are the bow propulsion unit, for giving sideways thrust, and an open trunk through the centre of the ship through which experimental apparatus can be lowered.

Postgraduate Education for General Practitioners

A RIDDLE which puzzles all those concerned with the maintenance of standards of general practice is why more than 70 per cent of the general practitioners in England and Wales undertake no form of postgraduate education. Some general practitioners feel that they can keep up to date by their contacts with fellow-practitioners or consultants or by reading. Others think that the postgraduate courses offered to them are not satisfactory. There are many, however, whose reasons for avoiding postgraduate courses are far from clear, and, to help them, a conference was arranged by the British Postgraduate Medical Federation and the Metropolitan and Home Counties Faculties of the College of General Practitioners. The eight opening papers of the conference have now been published in a recent issue of *The Practitioner* (185, No. 1109 ; November 1960). With the exception of Dr. H. G. McGregor, who is adviser on postgraduate education to the South-eastern Metropolitan Hospital Region, the contributors are all general practitioners. The papers represent an authoritative review of what general practitioners feel they require if postgraduate courses are to be of real value. A general conclusion is that the formal lecture should now have little place in the education of the general practitioner, who should play an active part in all postgraduate courses.

History of Science in Poland

IN December 1958, a plenary meeting of the History of Science Committee of the Polish Academy of Sciences decided that a concise outline of the history of science in Poland should be prepared. In character and level, it is to be a university text-book, emphasizing general aspects of science, conditions of development, organization of scientific work, and the trends in scientific thought which are common to various disciplines. Specific sections will be devoted to the development of various branches of science and the more eminent personalities and their work in Poland. The sections devoted to specialized subjects in particular periods are to be as succinct as practicable, and to embody the maximum possible volume of information. A tentative plan is discussed in the January–March issue of *The Review of the Polish Academy of Sciences* (5, No. 1 (17) ; 1960).

Salvage : Waste or Wealth

ALTHOUGH it is well known that one industry's waste may be the raw material for another, it is equally well recognized that many firms have found themselves in difficulties because their waste costs have been too high and because they have been unable to make a saleable commodity from their wastes. In the first of a new series designed to be of practical use to industrial management, the Department of Scientific and Industrial Research has produced a booklet which, properly used, could mean the difference between success and failure for many struggling organizations. The booklet, "Waste or Wealth," by Clement Brown, is a collection of stories which show how, by research or technical aid, many industrial wastes are being turned to profit (Pp. 27. London : H.M. Stationery Office, 1960). There are still serious cases of unclaimed wastes—several million gallons of paint are lost each year during spraying ; little attempt is being made to make use of scrap leather and a fresh application is needed ; a new use for sugar, now produced in excess of demand, is being investigated and could form the basis of a detergent. The booklet's stories of success should spur the inventiveness of management. It may be obtained free of charge from the Department of Scientific and Industrial Research Lending Library Unit, 20 Chester Terrace, London, N.W.1. Readers will wish to commend the Department for the earthy and practical way in which the booklet has been presented and for choosing Peter Kneebone to add those humorous illustrations which tell vivid stories without words.

The British Society for International Understanding

THE annual report for 1960 of the British Society for International Understanding, presented to the twenty-first annual general meeting on November 16, 1960, notes that the Society has now published some 600 British Survey pamphlets (Pp. 10. London : The British Society for International Understanding, 1960). These pamphlets have been written by experts and each is devoted to the distinct characteristics of a single Commonwealth or foreign country or to some well-defined international topic. Much of the energies of the staff is now directed to building up and maintaining the Atlantic Treaty Organization and its United Kingdom branch, the British Atlantic Committee. Lord Bessborough, the chairman of the governing body, has suggested that the time has come to give the same special attention to the cultivation of good relations and mutual understanding between Britain and the emergent nations of Africa. The report includes details of publications during the year and of the activities of both the Atlantic Treaty Association and the British Atlantic Committee.

Aeronautical Research in Australia

THE annual report for 1958–59 of the Aeronautical Research Laboratories of the Australian Defence Scientific Service has recently become available (Pp. 39. Melbourne : Department of Supply, Aeronautical Research Laboratories, 1960). The report is a well-illustrated booklet of thirty-nine quarto pages which record recent progress in research and development, and is refreshingly devoid of 'propaganda'. The research undertaken is relevant either to Australian and Commonwealth defence, or to Australian industry and national development. It is distributed between the various divisions, aerodynamics, structures, materials and mechanical engineering, and covers a very wide range of problems. Since guided weapons are finding wider and wider application and since Woomera, the Commonwealth test-range, is at hand, there is great emphasis on missiles and missile propulsion. A co-ordinated team specializing in this field is suggested. Nevertheless, there is much that concerns current military and civil aircraft. Some interesting work on the fatigue life of aircraft structures is reported—including an investigation aimed at providing a method for the experimental verification of the 'fail-safe structure' so often claimed by designers. There is also the work of the human engineering group on the piloting problems during landing. In an appendix are listed 44 reports and notes dealing with major research projects and the 36 technical memoranda on minor and *ad hoc* investigations. Altogether an interesting year's work.

Rock Carvings in Central Australia

THE October issue of *Man* contains an interesting article recording some simple rock carvings at

Ewaninga in Central Australia by C. P. Mountford, who has done so much work on this subject. The carvings are made by a pocking technique and consist of rough drawings of stylized figures and signs, consisting of spirals, circles, arrows, etc. The local native inhabitants apparently know nothing about them, and indeed frequently had not realized that they were the works of man. Rock carvings do not occur everywhere in Australia. They have not been found along the southern and south-eastern coasts, but have been found in Tasmania. In Central Australia they have been known for a long time; Mountford records that Miss Helen Teague gave him some photographs of carvings near Glen Helen as long ago as 1937. The signs are very varied in type, but are, of course, nowadays inexplicable.

Fertility of Ewes

Margaret Ryle, of the Department of Physiology, University of Queensland, has investigated the relationship between high temperature and vitamin A metabolism and the fertility of ewes (*Austral. J. Science*, 23, No. 2; August 21, 1960). The gross effects of vitamin A deficiency have much in common with those of high environmental temperatures. Partial inhibition of follicle development and of œstrus have been reported as a result of vitamin A deficiency in rats and rabbits and of high temperature in rats. Some of the available data on sheep suggest a similar vitamin A effect; the adverse consequences of high temperatures on conception-rate in sheep are reported by several authors. Increased embryonic mortality is described in rats, rabbits and sheep as a result both of vitamin A deficiency and high environmental temperatures. Vitamin supplements have been shown to reduce fœtal resorptions in heat-treated rats. Failure of normal development of the maternal uterine epithelium as the immediate cause of fœtal mortality is indicated both in vitamin A deficient rats and in heat-exposed rabbits. Changes have been described in the pituitary and thyroid glands both of vitamin A deficient animals and of animals exposed to high temperatures, but strictly comparable studies are required to determine whether or not they are of the same nature. In general, only further experimental work can decide whether the similar consequences of the two types of stress are merely coincidental, or whether they have a casual connexion such as the one suggested.

Forthcoming International Scientific and Technical Conferences

A list, No. 28, has been issued by the Department of Scientific and Industrial Research entitled *Forthcoming International Scientific and Technical Conferences*. The list, covering the period January 1961–December 1962, amends and amplifies the information contained in the previous lists on all scientific and technical conferences of an international character, held in the United Kingdom or elsewhere. The information is presented under four headings giving the subject of conferences, their dates, the convening bodies and/or organizers, and also the places where they are to be held. The subject index at the end does much to enhance the value of this publication. Copies can be obtained from the Department of Scientific and Industrial Research, Charles House, 5–11 Regent Street, London, S.W.1.

Announcements

Sir Brian Windeyer, of the Meyerstein Institute of Radiotherapy, Middlesex Hospital, London, has been appointed chairman of the Radioactive Substances Advisory Committee in succession to Sir Charles Darwin, who has resigned.

The Ministry of Agriculture, Fisheries and Food and the War Office announce that Brigadier A. H. Dowson, director of military survey, War Office, has been appointed director general of the Ordnance Survey, with the rank of major general, in succession to Major General L. F. de Vic. Carey, C.B., C.B.E., who is retiring on June 30.

The Jones–Bateman Cup, which is offered triennially by the Royal Horticultural Society for original research in fruit growing, has been awarded to Mr. A. Gavin Brown of the John Innes Institute, Bayfordbury, Herts, for his research work on the inheritance of susceptibility to diseases in apples and pears, the inheritance of shape, size and season of ripening in apples, and other matters relating to the breeding of fruits.

Mr. P. Lloyd, deputy director of research and development at the National Gas Turbine Establishment, has been appointed director general of engine research and development in the Ministry of Aviation

The International Measurement Conference, IMEKO 1961, is to be held in Budapest during June 25–July 1, 1961, and will be accompanied by an exhibition. Further information can be obtained from the IMEKO Secretariat, Budapest, 5 (P.O. 3).

Under the sponsorship of Nato, a summer school will be organized at the University of Ghent during July 24–August 5. The subjects to be considered are the electrical, optical and mechanical properties of lattice defects. Information can be obtained from Prof. W. Dekeyser, Laboratorium voor Kristallografie en Studie van Vaste Stoffen, Rozier, 6 Ghent, Belgium.

The first international congress on "Ergonomics" is to be held in Stockholm during August 20–23, 1961; the congress is being organized by the International Ergonomics Association. The programme will include the following subjects: speed of work and ergonomics; adjustment of work and working environment to the ageing population; ergonomical job analysis. Further information can be obtained from Prof. Sven Forssman, Svenska Arbetsgivareforeningen, P.O. 16120, Stockholm 16, Sweden, or the British representative on the provisional committee, R. G. Stansfield, D.S.I.R. Warren Spring Laboratory, Gunnels Wood Road, Stevenage, Herts.

Hansom Books, Ltd., under the title "Technical Books-in-Print", list and detail all technical and scientific books available in Britain, including books due for publication. In *Physics and Mathematics* of September 1960 the titles are arranged alphabetically under: physics—general; light and sound; electricity and magnetism; heat, radiation, thermodynamics; mechanics, dynamics, quantum theory; nuclear and atom physics; physics—miscellaneous; mathematics—general; applied mathematics; algebra; geometry, trigonometry; calculus, differential equations; statistics (Vol. 1, No. 8. Edited by W. G. Smith Pp. 60. (London: Hansom Books, Ltd., 1960.) 6*d*.). From the October issues the price of each part is increased to 9*d*. (11*s*. per annum by post). *Books in Britain* will be 3*s*. per copy, 42*s*. per annum.

NEW BUILDINGS AT THE FIRE RESEARCH STATION

By D. I. LAWSON

Joint Fire Research Organization of the Department of Scientific and Industrial Research
and Fire Offices' Committee

THE new buildings of the Fire Research Station of the Joint Fire Research Organization of the Department of Scientific and Industrial Research and the Fire Offices' Committee, which have a floor area of 30,000 sq. ft., were opened on November 4 by the Right Hon. Viscount Hailsham, Lord President of the Council and Minister for Science. This new accommodation, built at a cost of about £300,000, doubles the previous floor area and makes the Fire Research Station the largest and best-equipped organization of its kind in the world.

The scheme comprises a three-storey block (Fig. 1), 200 ft. long, 36 ft. wide and 33 ft. high, of laboratories and offices and two separate blocks of three 30-ft. high laboratories, each having a floor area of about 2,500 sq. ft., for hydraulics, thermal radiation and chemical engineering research.

A 7,500-gallon concrete storage tank is built in the floor of the hydraulics laboratory to conserve water returned from experiments. Two pumps are provided in the laboratory, one having a capacity of 1,000 gal./min. at a pressure of 121 lb./in.^{2} and the other a capacity of 250 gal./min. at a pressure of 156 lb./in.^{2}. These are used for testing equipment submitted by manufacturers, including alarm valves and sprinkler systems.

The radiation laboratory will be used for problems relating to ignition and spread of fire, and for this purpose a 4-ft. square gas-fired radiant panel has been installed at one end of the laboratory.

Explosion hazards of combustible dusts and the self-heating of unstable chemicals will be studied in the new chemical engineering laboratory.

The opening of the new buildings came nearly fourteen years after the formation of the Joint Fire Research Organization by the Department of Scientific and Industrial Research and the Fire Offices' Committee. One of the principal older buildings houses furnaces for examining the performance of structural elements under fire conditions, the largest furnace having a maximum gas consumption of 25,000 cu. ft. per hour; indeed, the maximum total gas consumption of the Fire Research Station is sufficient for a small town.

During 1958, a large laboratory, the models laboratory, 150 ft. long, 50 ft. wide and 40 ft. high, was added to the existing buildings for the purpose of studying the modelling of fires. This has a roof which will open over 24 ft. to release smoke and hot gases. A 12-ft. diameter fan, driven by a 200-h.p. motor, can be used to draw air transversely across the laboratory at speeds up to 30 m.p.h. over a working section 15 ft. long, 15 ft. wide and 10 ft. high.

The present staff totals 136, and the scientific work of the Station is organized into five sections.

Operational Research and Intelligence

Each year this Section receives from the Fire Service Department of the Home Office details of about 120,000 fires which have been attended by local authority fire brigades. After coding and analysing them, the Section produces annual statistical tables and notes trends in the incidence of fire, casualties and damage. Detailed studies are made of specific hazards—for example, fires caused by oil-burning appliances or by electricity. Investigations are also made into the effectiveness of equipment, such as sprinklers and fire-detectors. The work of this Section provides an essential background for planning the research programme as a whole and for the administration of fire protection.

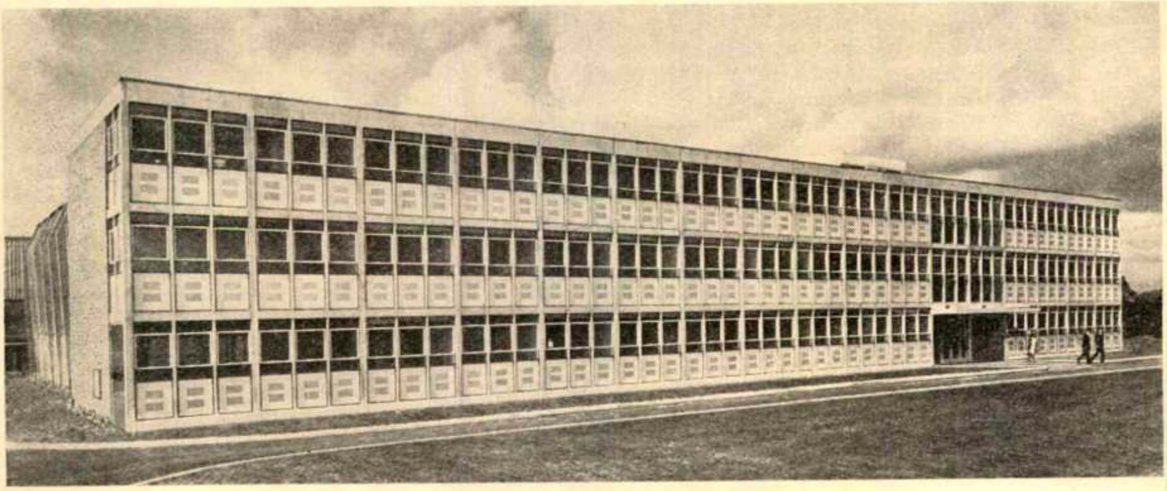

Fig. 1. The Main Building of the Fire Research Station, Boreham Wood, Herts

Ignition and Growth of Fire

In this Section physical aspects of combustion and heat transfer are studied. Techniques involving the use of models are being developed to determine the factors—particularly wind, ventilation, fuel, and shape and size of compartment—which control the growth of fire and its spread within and between buildings. The aim of this work is to provide a scientific basis for the fire grading and adequate separation of buildings. Ten laboratories in other countries are also co-operating on an agreed programme of experiments with models. The results of this international programme should lead to theoretical understanding of the progress of fires in buildings.

Further work is being carried out on the development of fires in the open, as this will have application both to forest fires and fires in built-up areas.

Building Materials and Structures

Since much of the total damage by fire occurs in buildings, this Section studies building materials under fire conditions to obtain basic data for the design and protection of structures which will help to control the development and spread of fire. It also performs, at the request of manufacturers, many tests on structural elements, and spread-of-flame tests on building materials. Its work is being used in the revision of building by-laws, and in the advice given to architects, builders, structural engineers and local authorities on appropriate types of structure and materials.

Chemistry and Chemical Engineering

This Section is concerned with industrial fires and explosions involving gases, vapours, dusts and unstable materials not classified as explosives. Working in close co-operation with the Factory Inspectorate of the Ministry of Labour, its aim is to assess hazards and devise precautionary measures. In collaboration with the Extinguishing Materials and Equipment Section, studies are made of the means of extinguishing fires in flammable liquids, the use of vapour phase inhibiting agents and the possibility of extinguishing fires in buildings by filling the interior with inert gas. Experiments with inert atmospheres are now being carried out with a specially adapted jet engine.

Extinguishing Materials and Equipment

The main purpose of this Section is to study the properties of, and methods of applying, extinguishing agents, for example, water, foam and dry powder. Models of rooms and buildings are used to learn more about the various mechanisms by which water puts out fires. This Section studies the automatic detection of fires and the performance of detection systems. It carries out tests—many of them for the Fire Offices' Committee—on equipment, including automatic sprinkler systems, portable fire-extinguishing appliances, and automatic fire alarms. In co-operation with official bodies and manufacturers, the Section assists in drawing up standards and specifications for such equipment.

In addition, the Fire Research Station has a library which provides an extensive coverage of fire literature as well as information and intelligence services.

FUTURE OF THE GENERAL DEGREE IN BRITISH UNIVERSITIES

DISCUSSIONS at the Home Universities Conference are not required to reach agreed conclusions. Had this been the case, the discussion on the "Future of the General Degree" during the recent Conference of the Universities of the United Kingdom, held in London during December 9–10, would probably have reached the conclusion that it is a good degree, but that it may have no future.

There were two opening speeches. The first was given by Mr. D. W. Reece, lecturer in humanity at the University of Aberdeen, who argued that the planned increase of student numbers to 170,000, which will bring the proportion of students to total population in England to the same figure as it now is in Scotland, must (since there are no grounds to suppose that the English are more intelligent than the Scots) lead to the entry of a large number of students of lower calibre than hitherto, who will need easier courses of instruction. He assumed that the general degree in England can be equated to the ordinary degree in Scotland, and that there will be an increasing need for it, as providing a suitable education for the less-able student.

The second opening speech, given by Prof. F. C. Frank (professor of physics, University of Bristol), dealt with the general degree with honours provided by most of the English universities, and in particular with the general degree of B.Sc. He took the opportunity to direct attention to the appalling complexity and disparity of terminology employed by various universities in describing the courses they offer. But while the general honours degrees are of various structure from university to university, broadly speaking they differ from special honours degrees mainly in the third year of study, which in a special degree is devoted to a single subject, whereas it still covers two or more subjects in a general degree.

The distinction between the special and the general degree ought not, Prof. Frank said, to be regarded as one of merit. He gave it as his considered judgment that in practice it is harder to get a first class in the general than in the special degree, though easier to get a poor second or a third class. It is judged to be a suitable career education for school-teaching, a course of education suited to the type of mind which is less happy concentrating on a narrow front, and a more balanced course for those whose intended future is a non-academic one (whereas the more academic will yet have time to take up their various academic subjects in turn). In short, he considered it a suitable education for a Cabinet Minister.

Judging from newspaper reports of the discussion, it is probably the former conception of the general degree which appears more realistic outside university circles. This view was not without support at the Conference, but most speakers concerned themselves with the general honours degree: its merit was confirmed, but its name was brought in question. The outstanding argument which can be made against the type of education given in a general degree was not brought into the discussion. This is Dr. C. R. Burch's principle, the broadening effect of specialization—if one studies chemistry, for example, superficially, it is chemistry only; the deeper one studies it, the more one is forced to discover its connexions with other subjects.

In the view of the University of Southampton, expressed by Prof. H. C. Baldry (classics), the general honours degree, under that title, has no future at all. It carries from the past (meaning, for Southampton, the period when it was under the tutelage of London) what according to this view is an indelible association with mediocrity. Southampton, in its regulations governing admissions since 1959, has abolished the general degree, but at the same time has provided a flexibility in the make-up of the course for an honours B.Sc. so that it is possible for it to be essentially similar to one of the less-wide general B.Sc. degrees, such as that provided at Bristol. Prof. G. Gee (Sir Samuel Hall professor of chemistry, University of Manchester), supporting the view that the choice between specialization and a wider curriculum is quite distinct from the need to provide courses at different intellectual levels, advocated a single B.Sc. certificate, with the appropriate class of honours, and the subjects studied, and for what periods, separately recorded on the certificate.

Against this view we have the policy, implied by the latest University of London regulations, and made explicit by Prof. J. G. Semple (professor of mathematics, King's College), that the general degree serves a dual purpose, being in its honours classes fully equal, and perhaps in the first class a shade superior, to the special degree, but in its pass category offering an easier route to a degree for the less-able student.

This is indeed how it tends to work out in practice, but it is a matter for urgent decision whether this dual purpose use is compatible with a proper recognition of the status of a good general honours degree. Prof. Frank, in his reply, considered that this was only possible if one made a strictly parallel division into general honours, general ordinary, special honours and special ordinary, even though ordinary specialists are the type of graduate which universities are least desirous of producing.

A distinct but important subject was brought into the discussion by Prof. W. F. W. Wynne-Jones (professor of chemistry, King's College, Newcastle on Tyne), namely, the danger that a general honours student may be nobody's baby. He suggested that interdepartmental professors—professors without portfolio—could take responsibility for these students, and Prof. Frank in his reply remarked that such interdepartmental professorships are being increasingly established in the United States, mainly to provide liaison between departments at the research-level. It was interesting to see in Prof. Wynne-Jones's proposal the way in which such interdepartmental professors could be given the opportunity to involve themselves with undergraduates.

F. C. Frank

THE UNIVERSITY GRANTS COMMITTEE

ANNUAL REPORT

THE annual returns from universities and colleges in Great Britain in receipt of Treasury grants for the academic year 1958–59, now covering 21 universities and 3 colleges, issued by the University Grants Committee, is this year prefaced by a somewhat longer summary of the Committee's major activities since June 1959*. Much time was given to consideration of possible changes in the university population during the 'sixties and 'seventies; and, following the Chancellor of the Exchequer's authorization in January 1960 to discuss with the universities the practicability of providing 170,000–175,000 places by the early 'seventies, the Committee asked the universities to consider what further expansion in student numbers they were prepared to contemplate by that date, together with their requirements for new accommodation. On the basis of subsequent discussions with the universities, the Committee has prepared a report for the Chancellor of the Exchequer. These discussions indicated that the existing universities, including the newly founded University of Sussex, could not of themselves alone provide a sufficient number of places, and that some new institutions were needed. The Committee therefore recommended to the Chancellor in March that immediate steps should be taken to encourage the establishment of new universities at Norwich and York, and authority to initiate such foundations was given in April.

After consultation with the Committee of Vice-Chancellors and Principals, the Committee has advised that these new institutions, which are to be multi-faculty, should have powers from the start to grant both first and advanced degrees, to set their own entrance requirements and to devise their own curricula. It is proposed that the safeguards previously achieved by close association with an existing university institution should be secured for a period by means of an Academic Advisory Committee consisting of members from existing universities and, possibly, with lay representatives. Possible means of assisting St. David's College, Lampeter, were explored during the year; a scheme has since been approved.

An independent sub-committee, with Sir William Hayter as chairman, was appointed to review developments in the universities in the field of Oriental, Slavonic, East European and African studies, consequent on the recommendations of the Scarbrough Commission in 1947, and to consider and advise on proposals for future developments.

An inquiry concluded during the year into the success or failure of students entering universities in October 1955 to study arts, pure science, technology, agriculture or forestry, showed that the proportion who left without success on account of academic failure was only 9·9 per cent, compared with 11·3 per cent in an earlier survey in 1952.

---

* University Grants Committee. Returns from Universities and University Colleges in receipt of Treasury Grant, Academic Year 1958–1959. Pp. 58. (Cmnd. 1166.) (London: H.M. Stationery Office, 1960.) 4s. 6d. net.

The Committee has continued to give thought to ways and means of ensuring the maximum economy in the expenditure of capital funds, and standards of accommodation of various types, based on analyses of comparable buildings, on which universities can base their applications to the Committee for grants for new accommodation, have been suggested. The Committee has also considered and adopted new methods, based on cost analyses, of assessing grants for halls of residence and for science buildings; the new system of assessing grants for science buildings distinguishes between the cost of the building with its basic requirements in the way of heating, lighting and ventilation and its special requirements in the way of services, which may vary greatly.

The number of full-time students in British universities increased further to 100,204, compared with 95,442 in 1958–59, and statistics collected in October 1959 showed a university population of about 102,000. There were 6,084 full-time and 2,270 part-time students from overseas within the British Commonwealth, and 4,116 full-time and 1,944 part-time students from foreign countries; for 1957–58 the figures were 6,180 and 2,208 for the Commonwealth, and 3,982 and 1,904 for foreign countries. Of full-time men students, 36·8 per cent were in arts, 24·2 per cent in pure science, 19·5 per cent in technology, and 12·5 per cent in medicine; these figures compare with 36·4, 23·7, 19·0 and 13·7 respectively, in 1957–58. For full-time women students, the corresponding figures for 1958–59 are 62·6, 20·7, 1·0 and 11·9, respectively, and for 1957–58, 63·5, 20·0, 0 8 and 12·1, respectively. Full-time advanced students of pure science numbered 4,071 (34·9 per cent); of technology, 2,125 (18·2 per cent); and of medicine, 900 (7·7 per cent); 3,185 students were taking post-graduate teacher-training courses.

Of the full-time students, 80,805 were reading for a first degree, 3,928 for a first diploma, and 14,839 were engaged in research or other advanced work; the corresponding figures for 1957–58 were 76,687, 3,937 and 14,069, respectively. Of the new full-time students, 24·1 per cent were in pure science, 16·2 per cent in technology and 8·9 per cent in medicine; in 1957–58 the corresponding figures were 24·0, 15·4 and 9·1 per cent, respectively.

The proportion of assisted students was 80·5 per cent compared with 79·2 per cent in 1957–58 and 71·9 per cent in 1953–54, ranging from 92·4 per cent in Wales, 87·5 per cent in English universities, excluding Oxford, Cambridge and London, to 70·6 per cent for Scotland. Full-time teaching and research staff increased to 10,823, compared with 10,542 in 1957–58. The proportion of full-time students residing in colleges or halls of residence was 26·6 per cent, compared with 26·4 per cent in 1957–58; 49·6 per cent were in lodgings and 23·8 per cent at home, but these proportions vary widely between men and women and between institutions.

Of the recurrent income of £52,273,306 (an increase of £2,855,004 in 1957–58), £36,448,118 was from Parliamentary grants (69·7 per cent), £5,739,316 (11·0 per cent) from fees, £1,795,344 from endowments, £1,500,918 from local authority grants, £479,093 from donations and subscriptions, and £3,657,530 (7·0 per cent) from payments for research. Non-recurrent grants in respect of capital expenditure amounted to £16,554,483, compared with £11,816,479 in 1957–58; and of the recurrent expenditure of £51,526,275—an increase of £3,191,222 on 1957–58—6·8 per cent was spent on administration, 44·5 per cent on salaries and superannuation of teaching staff, 11·0 per cent on departmental wages, 13·2 per cent on departmental and laboratory maintenance, 3·4 per cent on repairs and maintenance of buildings, and 9·7 per cent on rates, insurance, heating, lighting, etc. Expenditure on libraries, at £1,979,945, remained at 3·8 per cent of the total.

WIND TUNNELS AND FLOW VISUALIZATION

THE Fluid Dynamics Panel of AGARD held technical sessions at Istanbul, Turkey, during October 3–4. Fifteen papers were presented, the two main topics being the 'industrial' use of wind tunnels, and flow visualization. The term 'industrial' used in this context means 'non-aeronautical'; and these topics were chosen for this particular meeting because of the special requirements of the host nation, which has little aeronautical industry. The meeting also presented a rare opportunity for workers in a field of aerodynamics which, while it does not usually receive the consideration of bodies concerned with aeronautics, is not afforded much prominence in the proceedings of the various engineering institutions to which the work is relevant.

The titles of the ten papers presented on industrial aerodynamics showed a similarity which was reflected to a large extent in the contents of the papers. Nevertheless the papers revealed a very wide diversity of problems, ranging from work on insect flight (using live subjects) to that of the aerodynamic oscillations of long suspension bridges. The introductory paper by Mr. C. Scruton (United Kingdom) gave a brief review of the work carried out at the National Physical Laboratory. This was classified under three main categories: (1) the study of flow problems; (2) the assessment of the steady-wind forces and pressures on vehicles, ships, buildings, etc.; (3) the oscillatory effects of wind on structures. The techniques used and the conditions for similarity of behaviour between the model and the full scale were briefly indicated. In the first category most of the work was concerned with the flow over the decks of ships, and with pollution from the effluent of industrial chimneys, either with regard to the adjacent buildings or to the surrounding countryside. The oscillatory effects of wind were dealt with at somewhat greater length, with particular mention of the oscillations which can be induced by an air-stream on suspension bridges or tall stacks, and in tube arrays, such as are found in heat exchangers. It is now usual to carry out aerodynamic stability tests in connexion with all major suspension bridge projects, and, for this purpose, it has been shown that costly and time-consuming tests of aeroelastic models of the complete bridge are unnecessary and that the simple and cheaper 'sectional' model technique, in which a model of a representative length of the suspended structure is mounted on springs in the wind tunnel, is adequate. These tests have been usually carried out in a steady windstream, but on occasions it has been necessary to investigate the possibility of buffeting oscillations of the bridge arising from its immersion in the eddying wake of a nearby bridge. The wind-excited oscillations of tall circular stacks are usually in bending modes transverse to the wind direction, and are due to the alternating 'lift' forces produced by the shedding of vortices from alternate sides of the section. Whether or not a stack oscillates depends on the natural frequency (on which depends the critical speed for instability) and on the structural damping. Artificial structural damping has been used to suppress the oscillations, but it may be that a more satisfactory solution is to be found in modifications to the cross-sectional shape which destroy the aerodynamic excitation. One such device which has proved successful was developed at the National Physical Laboratory, and consists of a three-start strake wound helically round the surface of the stack. This has the effect of destroying the regular periodicity in the formation of vortices. The top of a stack may be forced also into oscillations as an elastic ring by the action of the vortices. A ciné-film was shown which records such an occurrence at a power station in England and provided a graphic illustration of this effect.

The paper by Mr. P. J. Pocock (Canada) provided a most complete review of the industrial uses to which wind tunnels have been put in various countries, together with a comprehensive bibliography of no less than 385 references. The range of subjects investigated is very wide: meteorology, water conservation, soil erosion by wind, the mechanics of wind-driven snow, dust transport, are included as well as those discussed by Scruton. The aerodynamics of sails is now receiving attention at the University of Southampton. Pocock also referred to the work on animal flight which has been carried out in wind tunnels. This ranges from the testing of dead or sculptured birds to the more intriguing measurements on live insects which were tethered on a delicate and intricate wind-tunnel balance and their performance in flight measured as they flew against the horizontal wind.

In his paper on the aerodynamic problems of motor-cars Prof. H. Schlichting (Germany) demonstrated the very considerable saving in fuel consumption which has been achieved on the Volkswagen lorry by a modification to the frontal shape suggested by wind-tunnel tests. Reference was also made to the use of such tests to obtain data required for assessing the directional stability at high speeds of the Volkswagen private car, and of the stream-lined *NSU* motor bicycle which attained the world's speed record.

Prof. G. H. Strom (United States) discussed several interesting aspects which had been studied at New York University. With the reduced linear scale necessary, the representation in a wind tunnel of portions of the atmosphere, to include motions of mechanical and thermal origin, was a complex problem. The determination of the appropriate scale criteria needed further development, particularly when convective air currents were significant. Prof. Strom mentioned experiments in which powdered borax had been used to simulate snow in tests of snow drifting, and tests to study the production of capillary waves on a water surface.

A brief paper by Mr. H. Petersen (Denmark) described a wind tunnel especially suited for work in industrial aerodynamics. The tunnel design was based on the model-law proposed by Dr. Martin Jensen to provide the correct simulation for phenomena in which the influence of the vertical gradient of wind speed near the ground is significant.

The range of the problems investigated in wind tunnels was extended still further by the subsequent speakers. At Lille, A. Martinot-Lagarde (France) has studied mine ventilation, the fluid-flow in heat exchanges, and, more remarkably perhaps, the drag of fishing nets. A surprising result of the last-mentioned tests was that the drag of a net of nylon material was only 0·7 that of a net of similar configuration in cotton.

An open-jet type wind tunnel at the National Luchtvaarlaboratorium has been used extensively by Mr. N. Feiss (Netherlands) for investigating a wide variety of industrial problems. Some interesting techniques have been developed for predicting the nuisance caused by the deposition of rain and snow on the windscreens of vehicles.

Profs. R. Clay Porter and F. K. Boutwell (United States) have used the low-speed wind tunnel at the University of Michigan for some detailed work on air pollution from industrial effluents. An investigation at present in progress concerns natural draught cooling towers. It is claimed that such work has resulted in considerable financial savings by the industry.

The subject-matter of the two remaining papers, by Mr. R. F. Creasey and Mr. K. Emslie (United Kingdom), "Industrial Uses of Wind-tunnels with Particular Reference to Wind Machines", and by Mr. L. E. Leavey (United Kingdom), "Wind-tunnel Tests to determine the Efficiency of a Proposed Extension to a Welding Shed on Suppressing Draughts", may be gathered from their titles. It may be noted that these were the only papers to describe work of a non-aeronautical character carried out in the wind tunnels of aircraft manufacturing firms. Such investigations have been mostly carried out either by the universities or by national scientific establishments. The subjects treated and the techniques described in the papers from the several countries were broadly similar. However, there were sufficient differences to avoid repetition, and to make all the papers very valuable and worth-while contributions to an art which is rapidly increasing in its importance and in its application to engineering design.

The first of three papers on flow-visualization was presented by H. Werle (France), and described a number of facilities, using water as the fluid medium, which allow qualitative work to be carried out on problems of air-flow. These facilities included a narrow tank for viscous-flow work, a water tunnel for incompressible flows, and a free-surface tank for the supersonic analogy. The paper was given with the aid of an excellent ciné film in colour, the use of dye streamers of different colours enabling three-dimensional flows to be followed very easily. Among the phenomena shown in this film were the flow of swept wings in which the leading-edge vortices 'burst' at a little distance downstream, the effect of 'blowing' over flaps and ablation effects on a bluff body. For the latter experiment the body was moulded in ice, but no similitude with the full-scale phenomenon was claimed.

Mr. R. L. Maltby (United Kingdom) based his presentation on one of five papers which have been prepared for an AGARDOgraph on flow-visualization, and which describes the methods used in British low-speed wind tunnels. In addition to the usual 'smokes', mention was made of the use of soap bubbles. Condensation trails can form a natural method of visualizing the leading-edge vortices from swept wings when the vorticity is of sufficient strength to produce the condensation.

Moving from methods suitable for use in low-speed tunnels to those for high-speed flow visualization, J. L. Solignac (France) described interferometric apparatus used at the Office National d'Etudes et de Recherches Aéronautiques. One of these employed split-beam interferometry, whereas the other, which was developed there, was a schlieren-interferometer system using polarized light. As compared with the ordinary schlieren system, the latter method was claimed to have the advantages of simplicity as well as of the ability to make quantitative measurements.

C. SCRUTON

PRIMARY AND INITIAL EFFECTS OF IONIZING RADIATIONS

PROF. G. M. FRANK organized in Moscow during October 18–22, on behalf of the Academy of Sciences of the U.S.S.R., an international symposium which was sponsored by Unesco and the International Atomic Energy Agency. Half the thirty participants came from countries other than the U.S.S.R. As the contributions ranged widely and encompassed several disciplines, the classification under the headings chosen for this report must be somewhat arbitrary.

Interference with Intracellular Structures

The concept that the initial radiochemical reaction leading to the death of a cell is brought about by interference with the intracellular organization of the cell found support from many of the participants. In the first of the scientific papers, P. Alexander (London) reviewed the chemical data concerning damage to proteins and nucleic acids by ionizing radiation, and concluded that reactions of this kind, although they occur in cells, as do many others, did not meet the requirements for the radiochemical events that initiate cell death. He suggested the phospholipids of the intracellular membranes as a more probable site. Since one of the most frequent and earliest biochemical lesions following irradiation is an increase in enzymatic activity, it had been proposed by Bacq and Alexander (enzyme-release hypothesis) that radiation interferes with the structures within the cell that are responsible for its essential compartmentalization. G. M. Frank (Moscow) provided a striking demonstration of an increase in metabolism within an hour of irradiation by showing that the time taken for oxygen-levels in the brain to return to normal after a short period of inhalation of pure oxygen was less in an irradiated animal. The same technique also revealed that radiation immediately interferes with the homeostatic maintenance of oxygen-levels in tissues.

L. A. Stocken (Oxford) and M. Errera (Brussels) described their experiments on the immediate effect of X-rays on the metabolism of the nuclei of rat thymocytes. Stocken concluded that low doses produce local disorganization of the nucleus, which alters binding sites, and he outlined his current research programme directed to discovering the factors that maintain the nucleus in an organized state. Changes in the structure and behaviour of cytoplasmic fine structures within minutes of irradiation were seen by M. N. Meissel (Moscow) using fluorescent vital staining and by A. Shabadash (Moscow) with histochemical techniques. O. Hug (Munich) reported that smooth muscle was unexpectedly radiosensitive, and contracted with a dose of a few hundred röntgens so long as this was given at a sufficiently high dose-rate. He interpreted this effect as a temporary change in permeability of the nerve (or muscle) membrane.

A. M. Kuzin (Moscow) observed mitotic inhibition in the tip of the bean root (*Vicia faba*) although only a leaf had been irradiated. An antimitotic substance could be extracted from irradiated leaves and on purification was shown to be a soluble oxidation product of a polyphenol (a quinonoid substance). Evidence was found in support of the view that the active substances were formed as the result of the release (activation ?) of enzyme peroxidases from cytoplasmic organelles.

A. J. Passynsky (Moscow) was led by general kinetic considerations to the view that death of a cell by radiation was due to interference with the orderly sequence of biochemical events due to damage to the interphases at which they occur. Experiments in a model system illustrated the breakdown of membranes by 20,000 r. of X-rays. Particles of an enzyme were coated with a layer, approximately 100 Å. thick, of ribonucleic acid and then suspended in a solution of substrate. Enzymatic activity was accelerated on irradiation because the permeability of the ribonucleic acid film was increased. N. N. Doemin (Moscow) carried out a very detailed study of the effect of radiation on the lipids and lipoproteins in different sub-cellular fractions (microsomes, mitochondria); surprising differences were observed in different organs of the rats, though in every case early lesions among lipids were observed.

B. N. Tarusoff (Moscow) has found that the concentration of lipid peroxides in tissues of mice increases with time after irradiation, which initiates the oxidation chain. A correlation was seen between the peroxide-level and the time of death of the animal, and Tarusoff supports the view advanced some years ago by J. St. L. Philpot that toxic peroxides contribute to radiation death in mammals.

Genetic techniques using 'sexual' transfer between biochemically deficient mutants were used by H. Marcovich (Paris) to show that the killing of *E. coli* (that is, the loss of ability of the cells to proliferate indefinitely and form colonies) could not be attributed to a dominant lethal mutation. K. Tobias (Berkeley), on the other hand, argued that killing of yeast and the very complex relationship between ploidy and radiosensitivity could be adequately explained as the combined action of dominant and recessive lethal mutations.

A comprehensive mathematical formulation of the processes leading to cell death was presented by A. V. Lebedinsky (Moscow), who considered the simultaneous occurrence of repairable interference with metabolism and irreversible blocking of mitosis.

Modification of Radiation Damage

Death of a cell, rate of mitosis, chromosome damage, mutation production can be altered by a variety of post-irradiation treatments in unicellular organisms and some plant materials. N. I. Shapiro (Moscow) has now found that chromosomal damage in Ehrlich mouse ascites cells irradiated *in vitro* and then injected back into the animal can be substantially reduced if the cells are suspended in a medium containing arginine for 1 hr. after irradiation. A. Hollaender (Oak Ridge) reported that genetic damage in *Paramecium* could only be repaired if the post-irradiation treatment was begun before chromosome duplication had occurred. Shapiro's data could bear a similar interpretation. Powerful synergism in the amount of chromosome damage was found at Oak Ridge if a dose of X-rays was followed by ultra-violet irradiation within a comparatively short time. F. Herčik (Brno) demonstrated that the treatments that result in the recovery of *Paramecium* also lead to recovery of the phage-synthesizing capacity of *E. coli* in spite of the fact that doses of the order of 5×10^5 r. are needed to inhibit this synthetic process. Another Czech scientist, J. Soška, finds that the regeneration of bone-marrow *in vivo* is significantly increased by the administration of cytidylic and thymidylic acid, but not by purine nucleotides. Interference by radiation with deoxyribonucleic acid synthesis of bone-marrow cells *in vitro* is reduced by the addition of triphosphates to the medium.

The reduction of the killing action of X-rays for mammalian cells in tissue culture by fractionation had been interpreted as evidence that post-irradiation restoration processes occur normally. On repeating these experiments with α-rays from polonium, J. W. Barendsen (Netherlands) could find no evidence for recovery, suggesting an important qualitative difference between densely and sparsely ionizing radiations.

Radiation response can also be modified by treatments that have to be given before and during irradiation. L. H. Gray (London) provided further evidence that the radiosensitizing action of oxygen cannot be attributed to early post-irradiation metabolic processes, but that it must be connected with the immediate radiochemical events. The phenomenon is, however, far from simple, and B. N. Tarusoff (Moscow) has shown that there is an optimum oxygen concentration for sensitization in the case of yeast cells. If the amount of oxygen in the atmosphere exceeds 80 per cent the cells become less radiosensitive. This observation is interpreted as support for the view that a branched, oxidative chain-reaction is involved in the initiation of radiation damage.

The mechanism of radiation protective agents received much discussion. Z. M. Bacq (Liège) stressed that the almost universal protective action of cysteamine arose from the fact that this substance could protect by at least three different physicochemical mechanisms: radical capture, energy transfer and 'repair' by transferring a hydrogen atom to an organic radical. There was no reason for believing that in biological systems the same chemical mechanism was involved in every case. In mammalian systems radical capture or 'repair' seemed the most probable and the suggestion that cysteamine protected mammals by producing anoxia had to be rejected. This view was strongly supported by the extremely detailed investigations of E. Y. Grayevsky (Moscow). His group showed that the protective action of hypothermia, neurotropic substances and substances combining with hæmoglobin, but not of cysteamine, was directly attributable to a fall in oxygen tension in the radiosensitive tissues to less than half the normal value. L. H. Gray (London) showed that the protection of cell suspensions *in vitro* by aliphatic alcohols was also not related to the oxygen effect. Evidence that protection against the mutagenic action of X-rays is independent of protection against death of the cells was presented by A. Hollaender (Oak Ridge). 10^4 r. kills no cells of *Aspergillus terreus*, but the number of mutations produced by doses of this order is greatly reduced by cysteamine.

P. Alexander (London) interpreted his results on radiosensitization as showing that substances which are normally present in the cell can act as intracellular protective agents. Blocking of sulphydryl groups of lymphoma cells by iodoacetate was responsible for the radiosensitization of these cells by this substance. The great variation in the radiosensitivity of micro-organisms may in part at least be due to the presence of particularly effective intracellular protective substances; for example, carotenoid pigments.

Radiosensitivity of Biological Macromolecules

E. C. Pollard (Yale) described the use of radiation as an analytical method for determining the size and shape of functional units within cells. He deduced that the organelle responsible for protein synthesis was a unit having the weight of a microsomal particle, but with highly asymmetric shape. This quite unexpected finding receives striking support in recent electron microscopic studies on sections of frozen dried cells which have suggested to some workers that the microsomal particles can assume a sheet-like character. L. H. Gray (London) interpreted death of a bacterial cell as a single-hit target event, since he finds the dose-response curve to be accurately exponential over a vast range. On the other hand, J. W. Barendsen (Netherlands) finds that a target type interpretation cannot be applied to mammalian cells since the log (survivor) v. X-ray dose-curve never becomes truly linear and increases continually in steepness. K. Tobias (Berkeley) presented data showing that the determination of 'target sizes' was impossible even for isolated pure proteins, as there was interaction between particles.

L. A. Blumenfeld (Moscow) gave a detailed review of what can be learnt from the electron spin resonance patterns of irradiated proteins and nucleic acids and provided further evidence for his own well-known theories on the presence of conduction bands in native proteins. The use of electron spin resonance for discovering the nature of the initial lesion is very limited, as almost all cell constituents give rise on irradiation to radicals. All these radicals are seen by electron spin resonance, although many of them have no part in the biological effects. E. L. Powers (Argonne, U.S.A.) used the electron spin resonance method to good effect to confirm the presence of a number of different types of trapped free radicals which remain in the dry spore after irradiation. He observed that post-irradiation treatments with hydrogen sulphide and nitric oxide reduced the number of spores rendered non-viable, while exposure to oxygen enhanced damage. Electron spin resonance measurements indicated that these effects were due to reaction with trapped radicals. In swollen systems, such as vegetative cells, radicals have only a very short lifetime, and to be detected a 'flash radiolysis' technique has to be used. L. H. Gray described some results obtained in this way. Mrs. B. Hölmes (Cambridge) described experiments of J. S. Mitchell which revealed the existence in irradiated mammalian tissues of relatively long-lived excited molecules that emit ultra-violet light after irradiation.

PETER ALEXANDER

COKE RESEARCH

NOT all annual reports of technical, or even non-technical, activities provide an absorbing story of events of interest to others than the specialist. The sixteenth annual report of the British Coke Research Association, however, is noteworthy for a new feature in the form of a very clearly expressed appendix, in which an attempt is made to clarify the objectives of the programme of research*. Any likely developments that may point to the future importance of coal should be of interest to many engineers and technologists, and indeed to quite a number of laymen engaged in pursuits perhaps of greater philosophical calm. Particularly so must be the situation at the present time, when one hears so much of the potentialities of oil and nuclear fuels, and when hoping that the price of coal was tending to find a stable keel, one is startled by new economic storms. In a refreshing and lucid manner the research objectives of an important industry on which the future of steel and coal must depend to a substantial measure are set out in a manner that brings conviction of the care and thought given to their preparation.

The interested reader will learn that 40 per cent of the research effort of the British Coke Research Association is devoted to the improvement in quality and yield of metallurgical coke, and that a further 28 per cent is devoted to work designed to throw light on phenomena and factors that govern the efficiency of use of all types of coke.

The modern blast furnace requires a coke of consistent quality in respect of its physical and chemical properties. The Coke Research Centre at Wingerworth has its small experimental ovens and the industrial scale 10-ton oven in which the various factors may be worked out to enable the optimum conditions to be arrived at for the carbonization of a 'standard' coal. At the same time, attention is devoted to the yields and nature of the by-products from the point of view of the efficiency and economy of the coke-oven process in general.

In the scientific work on coke the more advanced techniques of physical science such as X-ray diffraction have long been used. The latest techniques, that are now finding a place in the elucidation of a workable understanding of the structure of carbon and the texture of coke, are concerned with magnetic susceptibility and microwave absorption. Perhaps the lessons of the value of the more abstruse techniques necessary in fundamental investigations are not lost in these days on the comprehension of the layman, even if the mysteries of the techniques themselves seem to provide rather heavy going. In the present instance the ultimate answer may well be the means of production of cokes, capable of superior performance in use, from supplies of coal of unexpected suitability.

In the programme of research two other broad fields of interest are considered: first, the magnitude and complexity of the coke oven effluent and atmospheric pollution problems; and secondly, new methods of making blast furnace coke. In the former, the problem becomes an issue common with many other industries, and it is thus only a part of a larger national issue being considered by the Department of Scientific and Industrial Research. In the latter the matter is at the design-study stage where the fundamental requirements of the problem have to be analysed, the estimates of the chances and conditions of success determined, and some practical course of research devised.

The report of the achievements of the year covers not only the work on the new full-scale test plant but also that of the fundamental and applied studies laboratories at Wingerworth, and the progress achieved by work in the universities, notably at King's College, Newcastle upon Tyne. In this last case the technique of electron resonance absorption has been used to follow in the course of coke formation the development of reactive centres, described as 'free radicals'. They are formed in coke at temperatures up to 800° C., and play a part in the fixation of sulphur as organic sulphur in coke. At the University of Leeds work on the flow of heat in the coke oven during carbonization has been prosecuted with the application of a digital computer. This work constitutes a further proof of the potentialities of the use in this manner of the unsteady heat conduction equation in the solution of practical problems.

Also of specific interest to scientist and technologist alike is the correlation found, almost to a surprising degree, between the results of the performance in carbonization from a 5-cwt., a 10-ton oven, and even a commercial battery. Practical trials on cupolas have settled the question of the effect of coke size in iron melting, and have shown that a 3–1 in. coke size may be used successfully in hot-blast cupolas.

A very wise decision has been not to allocate 15 per cent of the effort of the Association to any strictly defined objective. For is there not force in the argument that on the border of the unknown there is needed the keener search? Alike, as in diagnosis, the less definite the symptoms the greater the need for the sensitive touch!

---

SOLID-STATE PHYSICS AT MELBOURNE

A SUMMARY of the proceedings and notes on the papers presented to the conference on solid-state physics held in Melbourne during August 17–21, 1959, under the auspices of the Australian branch of the Institute of Physics, has been published in the *British Journal of Applied Physics* (11, 137 ; 1960). The conference was the first of its kind to be held in Australia, and there was an attendance of about 130. Financial assistance in the form of grants was received from the Australian Atomic Energy Commission, the Commonwealth Scientific and Industrial Research Organization, the Australian Academy of Science, the Universities of Melbourne and New South Wales, and several industrial concerns. Forty-six papers were read and discussed at the conference, and the texts of a number of the original contributions have now been published in a special issue of the *Australian Journal of Physics* (13, No. 2*A* ; July 1960).

Prof. C. S. Barrett, of the University of Chicago, discusses the structure of the semi-metal bismuth at low temperatures, and describes a precision determination as a function of temperature of the displacement parameter of zone-refined bismuth containing less than 0·3 part per million of spectroscopically detectable impurity. The small but significant dependence on temperature at low temperatures disagrees with predictions from Blount and Cohen's theory and may signify a decrease in resistance to atom displacement from the simple cubic structure because of the thermal expansion of the structure.

Dr. J. J. Gilman, of the General Electric Research Laboratory, contributes an interesting paper in which he presents evidence to show that crystals exhibit a plastic resistance to dislocation motion. Direct observation of such resistance has been made with lithium fluoride and ferrosilicate crystals. The yield stresses and indentation hardnesses of many crystals can be correlated with their elastic moduli, and therefore the elastic modulus is one important factor which determines the plastic resistance. Another is the crystal structure type. Several papers deal with thermal transport in alloys, and individual papers with the nucleation and growth of ice crystals on crystalline substrates, X-ray measurements in metals, and the photographic process as a diatomic reaction.

SCIENTIFIC RESEARCH IN BELGIUM

THE annual report for 1959 of the Institute for the Encouragement of Scientific Research in Industry and Agriculture, Brussels, records research grants totalling 192,507,902 francs and grants amounting to a further 7,128,750 francs for special courses and travel ; 65 of the 79 grants for special courses were in chemical sciences and 7 in agricultural science*.

Of the research grants, one of 19,945,000 francs was for a systematic investigation of the pedological character of Belgian soils, and the completion of the pedological map of the country ; 13,220,000 francs were for the continuation of researches on the physics of the solid state in the laboratories of Prof. Dekeyser at the University of Ghent, of the Electrical Construction Factory at Charleroi, of Prof. Brasseur at the University of Liège and of the Gevaert Factory ; 11,200,000 francs to the Scientific and Technical Research Centre of the Metal Industry for research on the metallurgy of steel and special ferrous alloys, and a further 1,825,000 francs for soldering research ; 3,900,000 francs to the Carbochemical Society of Tertre for research on textile dyeing ; and 6,750,000 francs to the Gevaert Photoproducts Society for work on photographic dyes and processes of colour photography.

The Committee for the Application of Isotopical Methods in Agronomic Research received 9,485,000 francs for the continuation of researches on the utilization of radioisotopes, the Hainault Section of the National Centre for Metallurgical Research 7,770,000 francs for investigations on furnaces, 4,865,000 francs for its work on the continuous fusion of steel, the resistance of steel to brittle fracture, the improvement of converters, etc. ; and the General Metallurgical Society of Hoboken 7,560,000 francs for work on tantalum, niobium and their conversion to massive metal. Further subsidies of 2,905,000 francs and 4,455,000 francs went to the National Centre of Metallurgical Research and the Scientific and Technical Research Centre of the Metal Industry, respectively, for continuation of research on the mechanical properties of steel and improved methods of utilizing steel. The Liège Section of the former received a further 6,891,500 francs covering Belgian participation in the work of the International Committee for Research on Low Temperature Furnaces and 6,200,000 francs for continuation of research on cobalt. The Committee for the Study of the Nitrogen Problem received 6,520,000 francs for its studies on nitrogen in Belgian soils and on the fixation of nitrogen by legumes ; the Centre for the Biological and Colloidal Chemistry of the Soil, 6,395,000 francs for work on the formation of the organic matter of the soil and on the soil colloids ; the Research Centre of Gorsem, 5,500,000 francs for its researches on horticultural and agricultural diseases and pests ; the Scientific and Technical Centre of Belgian Textile Industry, 5,109,500 francs for new research on the manufacture of fibroplasts, on the carding of wool, on the utilization of isotopes for investigating the spinning of cotton and on the inter-relation between the properties of the threads and fibres of cotton ; the Biological Forestry Centre of Campine limbourgeoise, 4,800,000 francs for pedological, entomological, genetic and sylvicultural research bearing on the improvement of exploitation, conservation and natural regeneration of forests; and the Agricultural Physicochemical Centre, 3,960,000 francs for work on an improved method for the chemical determination of the nutritive elements in soil and the interpretation of the analytical results.

* Institut pour l'Encouragement de la Recherche Scientifique dans l'Industrie et l'Agriculture. Rapport Annuel. Exercise 1959. Pp. 237. (Bruxelles : Institut pour l'Encouragement de la Recherche Scientifique dans l'Industrie et l'Agriculture, 1960.)

Grants of 3,155,000 francs and 2,670,000 francs went to the Scientific and Technical Research Centre of the Explosives Industry and the Centre for Research on Plant Hormones, respectively; 2,630,000 francs to the Centre for Research on Parasite Diseases of Domestic Animals; 2,400,000 francs to the National Committee for the Study of Fruit Cultivation for the equipment of two large conditioning chambers; 2,365,000 francs to the Centre for the Study of the Forest Soils of Ardenne and of Gaume for research on types of forest humus, and 2,240,000 francs to the Centre for Research on Diseases of Ornamental Plants. The Committee for the Study of Agriculture received a grant of 1,975,000 francs; the Plant Physiology Laboratory of the Gorsem Research Centre, 1,890,000 francs to extend its researches on the maturation of fruits and their conservation and studies on photosynthesis and on the influence of insecticides and fungicides on the physiology of the vegetables on which they are used; the Centre for Phytopharmaceutical Research, 1,836,000 francs for research on the utilization of phytopharmaceutical products; and the Committee for the Study of the Solid State, 1,650,000 francs for research on the production of durable magnetic materials.

Among other grants are 1,610,000 francs to the Pedological Service of Belgium, 1,412,000 francs to the Technical and Scientific Centre of the Wood Utilization Industry, 1,410,000 francs to the Committee for Strawberry Research, 1,350,000 francs to the Committee for the Study of Creep of Metals, 1,230,000 francs to the Belgian Centre for the Study of Corrosion "Cebelcor" and 1,080,000 francs to the Committee for the Scientific Study of Lactation.

MYOCARDIAL TISSUE CHANGES ASSOCIATED WITH RIGOR MORTIS

INITIAL tissue changes associated with rigor mortis do not appear simultaneously throughout the myocardium, their onset being earlier in some areas than in others; such changes result from biochemical modifications occurring after death in myocardial fibres, that is, post-mortem dephosphorylation of adenosine triphosphate and disappearance of creatine phosphate. The evidence from an investigation by Piero Gallo, of the Tumour Control Research Centre, Rome, indicates that the adenosine triphosphate and creatine phosphate content in the areas first involved by rigor mortis is significantly smaller than that found to be present in other tissue areas (*Cardiologia*, 37 Supp. 1; 1960). Since adenosine triphosphate and creatine phosphate represent the last link in the long chain of reactions involved in the production of chemical energy, the results enable the rate of this metabolic stage in different tissue areas to be evaluated quantitatively.

Far from being uniform throughout, the rate of energy production appears to be lower in areas where microscopic signs of rigor mortis begin, because these areas have the lowest content of adenosine triphosphate and creatine phosphate; the areas first involved by rigor mortis are segments averaging 20μ in length of cardiac muscle fibres, the whole width of which is affected.

The non-uniform distribution of adenosine triphosphate and creatine phosphate in the myocardium has been compared with the results of investigations concerning (*a*) the distribution of interfibrillar cytochondria, which is remarkably uniform; and (*b*) the diffusion speed of oxygen and energetic materials from the capillaries to the fibres, which varies in tissue areas.

These variations chiefly affect the aerobic phase of metabolism as well as the concentration of creatine phosphate and adenosine triphosphate, which is lower in more slowly oxygenated areas.

Analysis of these experimental findings enables the following conclusion to be drawn: the relatively small amount of adenosine triphosphate in some myocardial areas is not dependent on the distribution of cytochondria, but appears to be due to the fact that such areas are supplied with oxygen at a slower rate than the remaining tissue areas. The slow rate of gas exchanges in such areas seems to be responsible for a marked decrease in the yield of oxidative phosphorylation processes, so ensuring the transfer of chemical energy derived from breakdown and oxidation of energetic materials to creatine phosphate and adenosine triphosphate, which retain it and yield it to myocardial fibrils at the time of contraction.

In the rabbit, topical application of γ-hexane on the skin at a dose-level of 2 mgm./kgm. body-weight does not alter the course of myocardial tissue changes associated with rigor mortis, which exhibit a pattern almost identical to that observed in animals not treated with this insecticide.

BOWER-BIRDS

THE popular belief that the display of bower-birds is either indiscriminate or satisfies some conscious æstheticism has been questioned by Prof. A. J. Marshall, of Monash University (*Endeavour*, 19, No. 76; October 1960). He suggests that, remarkable as they are, the bowers and display paraphernalia of bower-birds are no more than an extension of the territorial and display impulses to be found in other birds. Avian display—visual and auditory—is usually associated with conflict and the establishment of territorial domination, pair formation, and seasonal gonad development; final synchronization of the sexual processes of the pair occurs when the environment changes seasonally to a state appropriate for successful reproduction. Only then will the female accept the male. All kinds of widely unrelated birds —for example, waders, grouse, manakins and lyre-birds—make simple display-grounds and posture on them during their sexual season. These arenas are evidence of convergent evolution.

In bower-birds a simple display came first. The ontogeny of the satin bower-bird's display can be seen in the increasing elaboration of its ritual as the individual gains in maturity and experience. By scattering a few fragments of blue glass under a wild fig tree on which the young were feeding, Marshall was able to stimulate them to fly down, to snatch up the glass, and to display even without a bower. Later the young green males would build a simple platform of a few twigs and display there with the accumulated coloured objects ; generally these would be stolen from neighbouring adult blue males and carried off to their bowers. As the young green birds grow older, they make low-walled avenue bowers, but before they themselves change colour at the age of five or six years to a mature blue-black they are capable of building a bower as elaborate as that of their elders.

Marshall sees the bower as a result of a displaced nesting-drive. The male, which takes no part in nest building, erects a structure on his display arena. The bower-birds have developed this display tendency—known in various other species—to an extraordinary degree ; some species select coloured objects in the image of male rivals and use them violently in a noisy display which attracts the female and deters interlopers. Strong intraspecific competition has been a powerful factor in the evolution of bower-bird display.

Much has been written about the supposed intelligence of bower-birds, but there is evidence that they are no more intelligent than other highly developed passerine species. Much, too, has been written of their alleged conscious artistry ; but their choice is essentially mechanical and unvarying. A species that uses greenish-yellow, for example, will never select green. None, so far as is known, ever varies its colour scheme.

RADAR ECHOES FROM THE AURORA AT 1,300 MC./S.

By DR. E. EASTWOOD, G. A. ISTED and J. D. BELL
Marconi's Wireless Telegraph Co., Ltd., Great Baddow, Essex

DURING the course of radar experiments directed primarily to the study of the movements of 'angels' and various types of cloud forms, we have recorded some very interesting radar echoes from the aurora at a wave-length of 23 cm. The observations have been made with a high-power *L*-band radar possessing the following system parameters :

Radar frequency = 1,306 Mc./s.
Pulse recurrence frequency = 100 p.p.s.
Pulse-length = 5 μsec.
Power = 2 MW.
Aerial rotation = 4 r.p.m.
Horizontal beam-width = 0·7° (between half power points)
Vertical polar diagram = cosec.² (lobe maximum at 1·6°)
Polarization = horizontal
Aerial gain = 10,000

During the two years of observations with this equipment the following three sets of auroral echo records have been secured :

Date	Duration of radar aurora
July 15, 1959	15 50–17.15 U.T.
April 1, 1960	14 00–17 50 U.T.
October 6, 1960	16.50–18.25 U.T.

The appearance of the radar aurora as seen on the plan position indicator at 17.43 U.T. of October 6 1960, is shown in Fig. 1. This record shows those essential features of the fully developed aurora which have been substantially reproduced on the occasions listed above, namely, the presence of two auroral arcs, the ranges of the extremities of which lie between 600 km. and 1,200 km., the azimuthal position of the arcs and their lateral extent. The rapidly changing form of the aurora is rendered vividly apparent by the method of time-lapse photography whereby photographs of the plan position indicator are taken so that successive scans of the aerial occupy consecutive frames of a ciné film. Projection of such a film through an ordinary ciné projector running at 16 frames per sec. gives a time compression factor of 240 ; this technique permits the movements of the auroral forms to be clearly observed and measured. The real or apparent motions of the scattering electron clouds within the auroral arcs will be discussed elsewhere ; but it is of interest to note that there is a marked tendency for the western limb to show a preponderance of 'receding' clouds.

An interesting feature of the observations of July 15, 1959, was that this auroral record followed a series of plan position indicator photographs taken at sunrise (03.59 U.T.) on the morning of July 14 when the disturbed state of the Sun was made manifest by the greatly enhanced solar noise signal received by the radar. These two direct observations, on the one radar equipment, of the solar disturbance and the subsequent aurora set a time-interval between the two events of 36 hr. ; this figure has to be increased to 36½ hr. when the time of first onset of the solar disturbance, as observed by S.I.D.s in the eastern hemisphere, is allowed for. (Solar flare, importance 3+, 03.25 U.T., 14.7.59.) Such a time-interval would correspond to an average velocity of the particles emitted from the Sun of the order of 1,133 km./sec.

Examination of the advices of magnetic data issued by the Eskdalemuir Observatory shows that

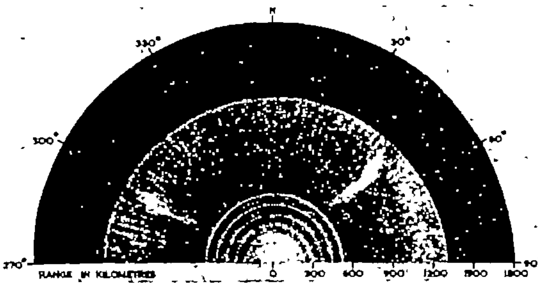

Fig. 1. Radar echoes from the aurora on 1,300 Mc./s. (17·43 hr., October 6, 1960)

the usual disturbance to the H-field there is of the order of 100–300γ. For April 1, 1960, however, disturbances of 2,600γ were recorded, while the magnetic storm of July 15, 1959, was even more violent in that disturbances of 4,100γ were observed. Survey of the records since 1949 shows that there have been only 21 occasions during the past 11 years when the disturbance in the H-field has exceeded 1,000γ; if these events are listed in order of diminishing intensity, then the first six entries appear as follows:

LIST OF MAGNETIC DISTURBANCES (1949–60)

Order	Year	Date	H-disturbance (γ)	Radar aurora (1,300 Mc./s.)
1	1959	July 15	4,103	Observed
2	1958	February 11	2,762	Equipment not in use
3	1960	April 1	2,592	Observed
4	1957	January 22	2,340	Equipment not in use
5	1957	September 4	2,300	Equipment not in use
6	1960	October 6	2,280	Observed

It is clear from this correlation between the occurrence of the radar auroræ reported in this article and the intensity of the magnetic disturbances as recorded at Eskdalemuir that only the more violent solar eruptions are likely to produce disturbances in the Earth's ionosphere of intensity sufficient to yield auroral echoes on a radar operating at so high a frequency as 1,300 Mc./s.; such events are likely to be comparatively rare.

The nature and spatial distribution of the radar echoes obtained at very high frequency during auroral activity have been studied by a number of workers; these investigations have clearly established the existence of aspect sensitivity in auroral radio reflexions. Chapman[1] has described the geometry of the reflexion process on the assumption that the reflecting 'rays' of the aurora are lying along the lines of force of the geomagnetic field, this latter being represented by the field of the equivalent centred dipole. Booker[2] has sought to reduce the degree of aspect sensitivity suggested by Chapman by a theory of scattering which postulates non-isotropic irregularities in the density of electrons in the aurora, such regions having their major axes parallel to the Earth's field. Booker[3] has applied his theory to the scattering of radio waves at frequencies up to 100 Mc./s., and in his treatment he assumes that the electron density in the aurora is increased only by a factor 10 over that normally obtaining in the E-layer. Fricker *et al.*[4] have obtained substantial agreement between the positions of auroral echoes observed at 400 Mc./s. and the areas of reflexion derived by approximate specular reflexion from columns of electrons lying along the Earth's field lines; in this analysis the actual Earth's field appropriate to the location of their radar stations was employed as distinct from the field inferred from the equivalent dipole approximation. The same process of specular reflexion was suggested by Peterson[5] to be the explanation of certain middle latitude echoes of auroral type, and Watkins[6] has shown that specular reflexion is closely obeyed in the case of the auroral echoes obtained at Jodrell Bank on wave-lengths of 4 m. and 8 m. Similar results have been reported by Harrison[7] from the International Geophysical Year auroral studies at Halley Bay.

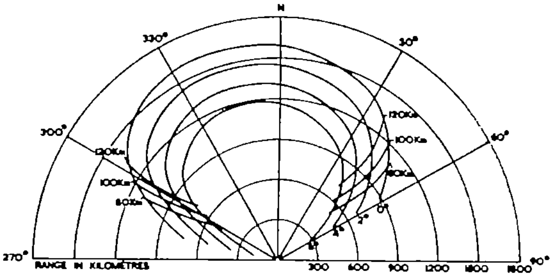

Fig. 2. Polar map for Bushy Hill, Essex, showing loci of feet of perpendiculars on the lines of force of the Earth's magnetic field

It is the high resolving power in both range and azimuth of the 1,300 Mc./s. radar equipment that has permitted the form of the aurora to be photographed with the precision shown in Fig. 1. The detail contained in this record allows the theory of radio reflexion from field-aligned regions of electron concentration to be tested and the stringency of the specular reflexion condition assessed in the case of a wave-length of 23 cm.

In Fig. 2 are shown the loci of the feet of the perpendiculars drawn from the radar site at Bushy Hill, Essex, to the lines of force of the Earth's field; each curve corresponds to a given angle of elevation of the rays from the radar. The magnetic data from which these curves have been calculated was taken from the Admiralty charts of isogonics and isoclinics (January 1960). Also included in Fig. 2 are the curves of constant height corrected for atmospheric refraction.

It will be seen that the area of Fig. 2 included between the 80 km. and 100 km. height curves and lying between the 0° and 6° elevation loci corresponds very closely indeed to the auroral arcs of Fig. 1. Now the beam-width of the radar in the horizontal plane is 0·7° while the angle subtended by a tangential element of the auroral arc at 1,000 km. is 5°. It is clear, therefore, that the azimuthal extent of the auroral form of Fig. 1 is not attributable to the beam-width of the radar. The azimuthal location of a height curve as plotted on Fig. 2 is quite sensitive to the height parameter and so a possible interpretation of Fig. 1 in the light of Fig. 2 would be that the auroral reflexions commence in the region of the 80-km. level of the ionosphere and extend upwards to an approximate height of 105 km. Alternatively, the azimuthal spread of the auroral arc could be regarded as arising from rays incident at angles between 90 ± ½° on the auroral columns of ionization located at a height of 90 km. It is probable that both the aspect and altitude effects play their parts in forming the auroral patterns of Fig. 1, but the present microwave experiments clearly show that the departure from the 90° reflexion condition is less than ± ½°, and that the region of the ionosphere where the auroral reflexions take place is of the order of 20 km. thick.

The mean height of the auroral layer as deduced from Fig. 1 by measurement of the azimuthal spread of the two auroral arcs, that is, 90 km., is lower than the value suggested by other workers operating at much lower radio frequencies. The evidence given above suggests that an auroral disturbance of sufficient intensity to be observed at 1,300 Mc./s. will only occur as an aftermath of a very vigorous solar upheaval and in association with extreme magnetic storms. In these circumstances it might be expected that the solar emission would contain a proportion of more energetic primary particles capable of producing ionization at lower levels of the ionosphere and also of yielding auroral displays at lower latitudes. This southward movement of the aurora during the growth of intense magnetic storms has been discussed by Störmer[8] and has received confirmation in recent International Geophysical Year work[9]. It will be noted, however, that the kinetic energy of the solar particles at the moment of penetration into the Earth's atmosphere, if taken as that corresponding to the average velocity of transit from the Sun to the Earth, that is, 1,133 km./sec. as given above, would scarcely seem adequate to produce the observed microwave auroral effects at so low an altitude as 80–100 km. ; it is probable that account must also be taken of the flux density of the incident particles.

The fact that the aurora of Fig. 1 was not observed in a northerly direction from the radar is a consequence of the shape of the vertical radiation diagram of the aerial, which extends from 0·2° to 6°, these elevations corresponding to 10 decibels of power reduction relative to that of the lobe maximum located at 1·6°. This figure of 1·6°, when associated with the observed range of 1,000 km. for the position of the echo of maximum amplitude, gives a height of 98 km. for this particular reflexion point.

The signal/noise ratio measured for this echo was 1·3/1 ; since the receiver noise-level was 4×10^{-15} watt, it may be deduced that the equivalent radar cross-section of a region of the aurora which yields a single pulse point on the plan position indicator is 1·4 sq. m. By making reasonable assumptions as to the volume of the ionosphere contributing to this signal the echoing area per unit volume of the auroral scattering region may be estimated as of the order of 10^{-9} m.$^{-1}$.

If incoherent scattering by electrons is responsible for this reflexion of microwave energy, then, taking the Thomson cross-section of a single electron as of the order of 10^{-30} m.^{2} would lead to a density of electrons of 10^{14} per c.c. On the other hand the electron density corresponding to normal critical reflexion for a frequency of 1,300 Mc./s. would be 2×10^{16} electrons per c.c. It seems clear that neither of these mechanisms can be responsible for the auroræ observed at 1,306 Mc./s. and that a theory of scattering such as has been developed by Booker (*loc. cit.*) must be applied.

We wish to thank our colleagues of the Radar and Photographic Groups for their assistance with the observational programme and the Director of Eskdalemuir Observatory for supplying the magnetic data.

A VERSATILE METHOD FOR SHORT-TERM SPECTRUM ANALYSIS IN 'REAL-TIME'

By J. S. GILL

Joint Speech Research Unit, Eastcote, Middlesex

THE variations with time of the short-term energy spectrum of signals such as speech, music, singing, etc., can be measured with a bank of electrical band-pass filters and rectifiers. This leads to the type of display in three dimensions (time, frequency, intensity) commonly known as a sound spectrogram. Spectrographic patterns have proved of great value in the study of complicated audio frequency signals, especially human speech. However, this method becomes impractical when large numbers of filters are required. For example, at least 160 filters would be needed to provide a reasonable display when analysing a band 4 kc./s. wide with filters 50 c./s. wide. A choice of analysis band-width is also often required, and this is particularly difficult to arrange on a large filter-bank.

The analysis can be performed in a much more economical and flexible manner by recording the signal and then analysing by repeatedly playing this recording through a single filter. The signal is swept slowly across the pass-band of this filter by means of a frequency-changing process[1]. (Any filter 'remembers' its immediate past history, and so it is not possible to analyse merely by sweeping the single filter rapidly across the frequency band occupied by the original signal[2].) The output of this filter is recorded on a surface, usually a sheet of electro-sensitive paper, which rotates synchronously with the recorded signal, thus producing a sound spectrogram. The time required for a complete analysis is at least:

$$T = t + \frac{Nt}{k}$$

where T = total time required, t = original duration of recorded signal, N = required number of separate analyses, k = play-back speed/recording speed. In most existing instruments of this type T/t is about 100.

There are many calls, particularly in the study of speech, for a versatile spectrum analyser the output of which unfolds as the speech proceeds in time, that is, operates in 'real-time'. Although a filter-bank can be used for this purpose, detailed analysis by this method is rather impractical, due to the large number of filters that are needed. The single filter method outlined above cannot provide 'real-time' operation, however large k may be, because recording and analysis do not proceed simultaneously. In the method to be described these two processes of recording and analysis are interleaved, as shown in Fig. 1, to enable a single analysis filter to be used for determination, in 'real-time', of the short-term spectral properties of a signal.

EACH INTERVAL OF $\frac{1}{2W}$ SECS CONTAINS THE PRECEDING 'n' ORDINATE SAMPLES OF THE ORIGINAL SIGNAL
HIGH SPEED SIGNAL OUT

Fig. 1. High-speed repetition of the immediate past of a signal by means of a circulating store

The signal to be analysed is restricted to the frequency band 0–W c./s. and ordinate samples taken at $1/2W$ sec. intervals are injected into a circulating memory of length $1/2W - 1/2nW$ sec. which always contains the last $n-1$ signal samples. These samples are now spaced at $1/2nW$ sec. intervals, and during each $1/2W$ sec. interval the entire contents of the memory, namely, the past $n/2W$ sec. of the original signal, circulate at n times their original rate. Each ordinate sample is available during n successive circulations and can therefore contribute to n separate analyses, which are performed by a single analysis filter preceded by a frequency-changer.

The high-speed signal fed to this filter has discontinuities at intervals at $1/2W$ sec. The effects of these must be excluded from, or at least minimized in, the final display. This is possible provided that the majority of the impulse response of the analysis filter is contained within $1/4W$ sec. These unwanted transients can then be suppressed by inhibiting the analysis filter output during the appropriate half of each $1/2W$ sec. interval. The frequency-time plane is mapped as a sequence of strips, each of effective length $n/4W$ sec. The actual time required for each strip is $1/2W$ sec., and so it is possible to produce a spectrographic display comparable to that provided by a parallel filter-bank of $n/2$ filters.

It has been shown that a gaussian shape of filter characteristic gives the smallest uncertainty product[3] (time resolution × frequency resolution) and so this characteristic was chosen for the analysis process. The impulse response of such a filter is not of finite duration, and so the effects of the $1/2W$ spaced transients cannot be completely suppressed. In practice the analyser output is inhibited during the intervals in which these disturbances exceed one-tenth of their maximum amplitude. The requirements for the circulating memory are, for an idealized gaussian filter:

$$ft \simeq 1\cdot14$$

where f = bandwidth at the $\frac{1}{2}$ power points, t = duration of impulse response at a tenth of maximum amplitude. So the unwanted transients can be suppressed and the frequency-time plane mapped when:

$$\frac{1}{2} \times \frac{1}{2W} \times \frac{1}{2W\tau} > \frac{1\cdot14}{f}$$

where τ = digit spacing within the memory. Hence, $\tau < f/9W^2$.

A magnetic or dielectric drum can be used for storage when the sampling-rate (and hence the required rate of rotation) is fairly low—say, less than 500 per sec. No wholly analogue method has yet been found that is suitable for storage and high-speed repetition of wider band-width signals such as speech. For this purpose the only satisfactory solution,[4] at

Fig. 2. A short-term spectrum analyser capable of processing a 3·3 kc./s. wide signal band in 'real-time' at analysis band-widths (half-power) down to 47 c./s

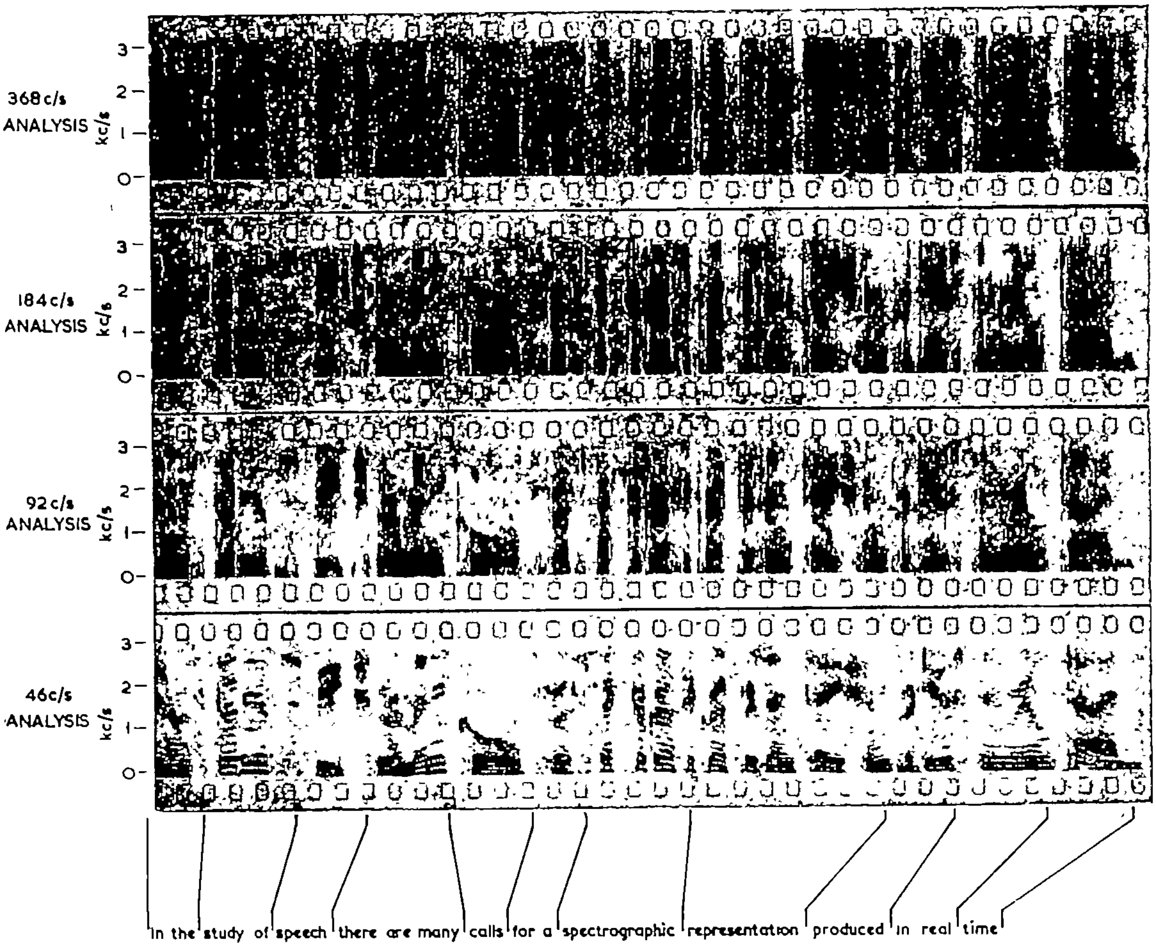

Fig. 3 Continuous spectrograms produced by the analyser shown on Fig. 2

present, is to express each ordinate sample as a set of *n* binary digits (that is, digitally encode the signal by means of pulse code modulation) and to store and repeat the signal in this binary form.

'Real-time' spectrum analysis of a 3·3 kc./s. wide band at analysis band-widths down to about 50 c./s. has been achieved by the method outlined in Fig. 2. The signal is sampled at 150·5-µsec. intervals and encoded into 6 binary digits/sample by a pulse code modulator, the output of which takes the form of six streams of binary digits. Each one of these streams feeds its own circulating store into which these digits are packed at ¼ µsec. spacing. The stores consist of magnetostrictive-acoustical delay lines of length 150 µsec. which use wire for the delay medium[4]. The six high-speed streams are decoded into a sequence of high-speed replicas of the immediate past 45 m.sec. of the signal, which are presented for analysis at 300 times their original rate. This high-speed signal is stepped at 150·5 µsec. intervals across the pass-band of a fixed analysis filter and the resulting display is of the form shown in Fig. 3.

The useful dynamic range of the analysis cannot, at any time, exceed that of the orginal binary digital encoder. In general, the range will be somewhat less than this and dependent on the structure of the signal. The appearance of the spectrograms shown on Fig. 3, which were produced by this continuous analyser, suggests that six bits/sample is probably sufficient for most work on speech. If necessary, the dynamic range can be increased by digitally encoding the original signal into a larger number of bits/sample.

This new instrument provides, for the first time, a continuous analysis of resolution sufficient to show both the gross spectral envelope of the speech (determined by the resonances of the vocal tract) and the fine detail associated with the exciting source (for example, the harmonic structure that characterizes the pitch of voiced sounds). This may materially assist work on voice training and speech correction[5]. The method can provide a suitable basis for excitation and system function[6] estimation in analysis–synthesis systems of telephony. Other more speculative applications such as phonetic transcription[7,8] and sound coding can be visualized.

I wish to thank Dr. J. Swaffield, head of the Joint Speech Research Unit, for his support and encouragement, P. F. Leach for much of the detailed design and D. Calvert for construction of the instrument.

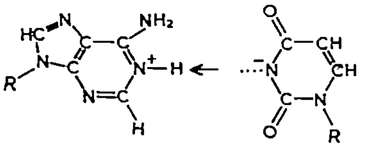
I. WATANABE
Institute for Virus Research, University of Kyoto

An Infra-red Criterion of the Base Pairing in Nucleic Acid Structure

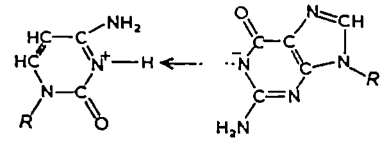
IN the course of work on the infra-red spectra of nucleosides[1], we have found that, from a 1-mole : 1-mole aqueous mixture of adenosine and uridine, a complex crystal is obtainable, the 6μ-region spectrum of which is greatly different from the sum of the spectra of the adenosine and uridine crystals (Fig. 1, *A*). In the spectrum of the complex crystal a strong band is observed at 1,700 cm.$^{-1}$ which is not observed in the adenosine spectrum or in the uridine spectrum. In the spectrum of adenosine hydrochloride, a strong band is observed at 1,693 cm.$^{-1}$ (not far from 1,700 cm.$^{-1}$), which is attributable[1] to a stretching vibration of the C = N bonds of the purine ring where the π-electrons are localized at the C = N bonds to a greater extent than in the purine ring of free adenosine. These facts are explained by considering that there is a base–base interaction between the adenine and uracil residues in the complex crystal, and that in this interaction there takes place a proton transfer from the uracil residue to the adenine residue such as :



(1)

which causes a π-electron localization[1] in the C = N bonds of the adenine residue, giving rise to the strong band at 1,700 cm.$^{-1}$.

From a 1-mole : 1-mole mixture of aqueous solutions of cytidine and guanosine, a complex crystal was obtained which gives a strong band at 1,720 cm.$^{-1}$ (see Fig. 1, *B*). Neither in the spectrum of cytidine crystal nor in that of guanosine crystal are strong bands observed in the vicinity of 1,720 cm.$^{-1}$, but in the spectrum of cytidine hydrochloride crystal a strong band is observed at 1,725 cm.$^{-1}$. The latter band can be assigned to the stretching vibration of the C=O bond of the cytosine residue which has acquired a proton. Therefore, the 1,720 cm.$^{-1}$ band of the cytidine–guanosine complex is attributable to a proton-transferred structure :



(2)

which may be formed by the base-base interaction of the two nucleosides.

Similar strong bands at about 1,710 cm.$^{-1}$ are observed for the complex of cytidine and uridine and for that of adenosine and guanosine, but not for the complex of adenosine and cytidine nor for that of guanosine and uridine[1].

All the above facts suggest that the specific pairings of cytosine–guanine and adenine–uracil generally postulated in nucleic acid structures[2] involve proton transfer from uracil or guanine to adenine or cytosine, and that such pairings cause strong absorptions in the vicinity of 1,710 cm.$^{-1}$. Therefore, the appearance of the strong band at 1,710 cm.$^{-1}$ may be used as a criterion of the existence of the specific base-pairing.

We have observed 6μ-region spectra of some nucleic acids and nucleoproteins in their solid films[3]. Some of the results are given graphically in Fig. 2. The sodium salt of deoxyribonucleic acid from calf thymus placed in air of relative humidity 75 per cent shows a strong band at 1,708 cm.$^{-1}$, but in dry air a much weaker band here. This fact may be taken as indicating that the specific base–base

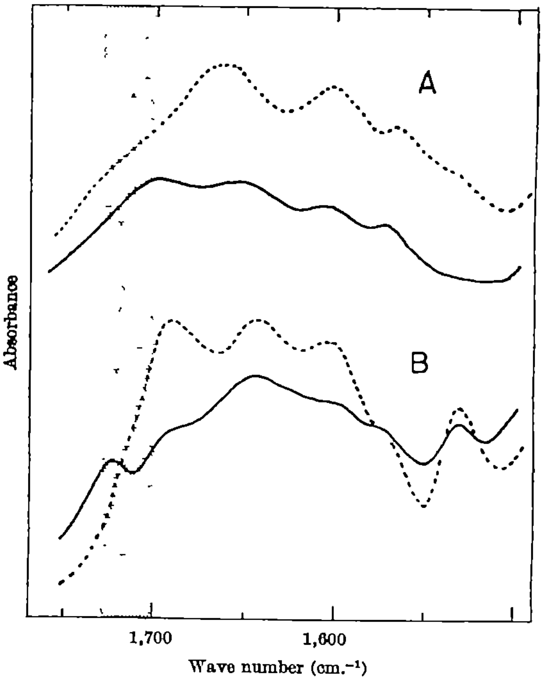


Fig. 1. *A*, infra-red spectrum of a complex (1 mole : 1 mole) of adenosine and uridine (——), and the sum of the spectra of adenosine and uridine (– – –); *B*, infra-red spectrum of a complex (1 mole : 1 mole) of cytidine and guanosine (——), and the sum of the spectra of cytidine and guanosine (– – –)

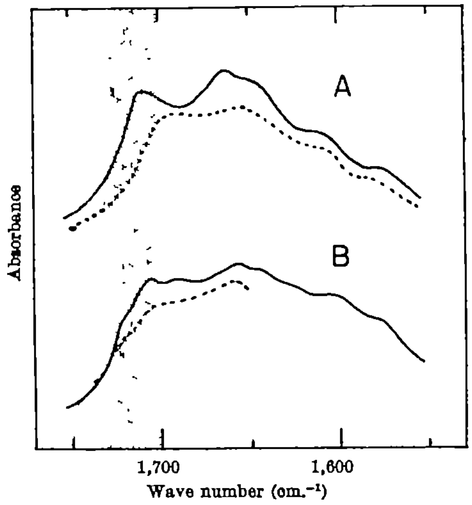

Fig. 2. *A*, Infra-red spectra of sodium salt of deoxyribonucleic acid film (from calf thymus) in air of relative humidity 75 per cent (——), and of the same film in dry air (- - -); *B*, infra-red spectra of a native sodium salt of ribonucleic acid film from microsomal particles of *E. coli* (——), and a film obtained from a solution of the sodium salt of ribonucleic acid heated at 100° C. for 10 min. (- - -). Both are observed at 75 per cent relative humidity

interaction is much weaker in the dry film than in the wet film. This is in accordance with what was concluded from other evidence[4,5]. The sodium salt of ribonucleic acid prepared from *E. coli* microsomal particles by the phenol method shows a moderately strong band at 1,705 cm.$^{-1}$ both in its dry and wet states. When it is heated at 100° C. for 10 min. or treated with ribonuclease, however, the 1,705-cm.$^{-1}$ band is observed with much weaker intensity, just as is expected.

A strong band appears at 1,710 cm.$^{-1}$ for the sodium salt of nucleohistone (deoxyribonucleic acid–histone) from calf thymus. This fact may be interpreted as indicating that there are numerous base pairings in deoxyribonucleic acid–histone, in accordance with the result of X-ray work[6]. For some samples of magnesium salt of microsomal particles from rat liver[7], only a weak band is observed at about 1,710 cm.$^{-1}$. This may indicate that, in such microsomal particles, a part of the base residues is bound to the protein and not available for the base–base interaction.

We have observed 6μ-region spectra of various nucleic acids and nucleoproteins, not only in their solid films but also in their deuterium oxide solutions. Results of these observations and the interpretations on the basis of the criterion suggested here will be given in detail elsewhere.

We wish to express our thanks to Dr. M. Takanami for his kindness in supplying rat liver microsomal particles. This work was aided in part by a grant from the Scientific Research Fund of the Ministry of Education of Japan.

Parallelism of the Hypochromicity at 260 mμ and the Hyperchromicity at 1,685 cm.$^{-1}$ of Nucleic Acids in Deuterium Oxide Solution

In a previous communication[8], it was shown that the absorption band at about 1,685 cm.$^{-1}$ of nucleic acids (deoxyribonucleic and ribonucleic acids) in deuterium oxide solutions is attributable to the base residues which are involved in the specific base–base pairings. In order to obtain further information of the nature of this 1,685-cm.$^{-1}$ band, we have observed the 6μ-region spectra of deoxyribonucleic acid and ribonucleic acid in their deuterium oxide solutions at various temperatures.

Some of the results obtained are shown in Fig. 3. Here, the samples used are the sodium salt of calf thymus deoxyribonucleic acid and the sodium salt of ribonucleic acid from rat liver microsomal particles. These are dissolved (5–10 per cent) in a deuterium oxide solution which is 0·1 molar in potassium chloride. The deoxyribonucleic acid solution was heated to 93° C., and the ribonucleic acid solution to 70° C. After they were kept at these temperatures for 1–2 min., they were cooled and the spectral changes were examined for reversibility. As is seen in Fig. 3, the most conspicuous spectral change that occurs with the change of temperature of the solution is that of relative intensity of the 1,685 cm.$^{-1}$ band.

In Fig. 4, the reciprocal of the intensity of the 1,685 cm.$^{-1}$ band relative to that of the 1,665 cm.$^{-1}$ band is plotted against the temperature of the solution. In the deoxyribonucleic acid solution there is a sharp change (transition) at about 85° C., while in the ribonucleic acid solution the change occurs gradually from 30° C. to 70° C. The 'cooling curve' lies always somewhat higher than the 'heating curve'. This trend is more evident when the maximum temperature reached is higher or when the solution is

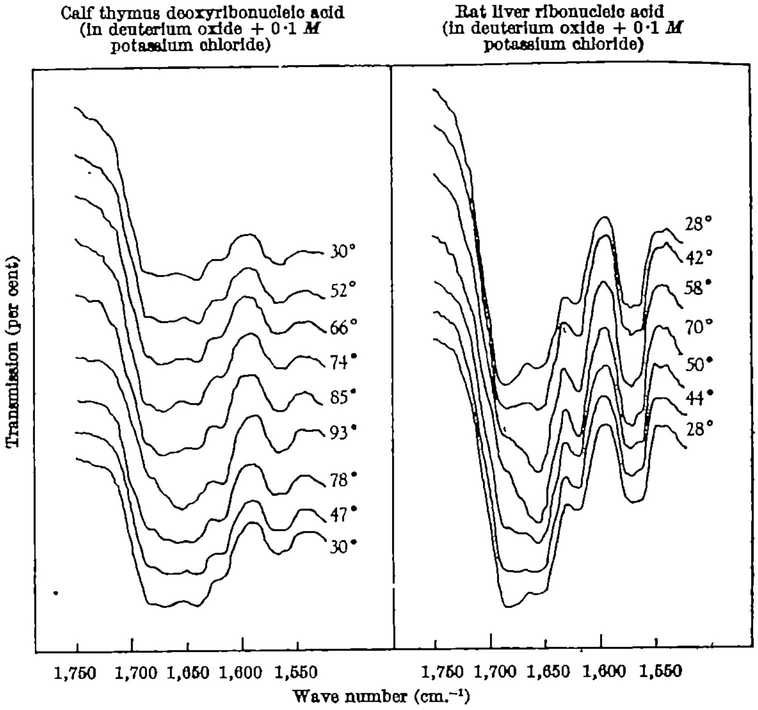

Fig. 3. Infra-red absorption spectra of deoxyribonucleic and ribonucleic acids in deuterium oxide solutions at various temperatures

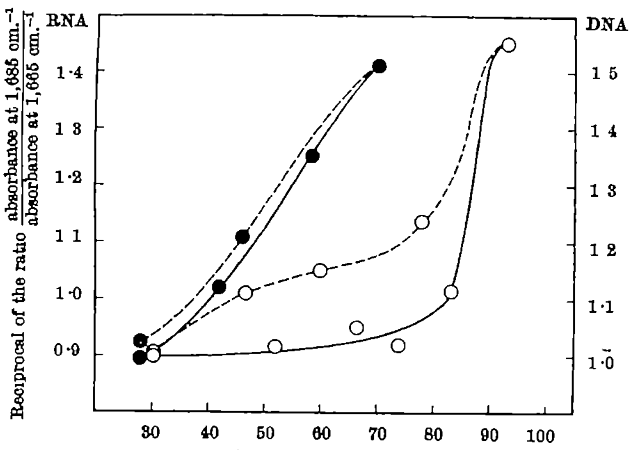

Fig. 4. The variation in the reciprocal of the relative intensity of the 1,685 cm.$^{-1}$ band as a function of temperature of the solution. — ○ —, Heating curve of deoxyribonucleic acid; -- ○ --, cooling curve of deoxyribonucleic acid; — ● —, heating curve of ribonucleic acid; -- ● --, cooling curve of ribonucleic acid

kept at the maximum temperature for a longer period.

All these features of the curves of reciprocal intensity at 1,685 cm.$^{-1}$ versus temperature of the solution are very similar to those of the corresponding curves of optical density at 260 mμ versus temperature of the solution given by Marmur and Doty[9] and by Doty, Boedtker, Fresco, Haselkorn and Litt[10]. Therefore, it is very probable that the change in the electronic structures of the base residues that causes the 1,685 cm.$^{-1}$ band (1,710 cm.$^{-1}$ band of the undeuterated base residues (preceding communication)) is directly correlated with the hypochromicity at 260 mμ.

We have also examined the relative intensity of the 1,685 cm.$^{-1}$ band at various temperatures of the yeast-soluble ribonucleic acid with sedimentation constant 4 Svedberg units. The reciprocal intensity–temperature profile of the soluble ribonucleic acid was found to be practically the same as that of rat liver microsomal ribonucleic acid in spite of the great difference in their molecular weights.

We wish to express our thanks to Dr. M. Takanami for the sample of rat liver microsomal ribonucleic acid and to Dr. S. Osawa for the sample of yeast-soluble ribonucleic acid. The expense of this research has been partly defrayed from grant-in-aid for scientific research from the Ministry of Education of Japan.

GRADIENT OF CHOLINESTERASE ACTIVITY AND OF CHOLINE ACETYLASE ACTIVITY IN NERVE FIBRES

Gradient of Cholinesterase Activity

THERE are many indications that cholinesterase is synthesized in the cell bodies of neurons and carried down the axons towards the nerve endings (cf. Hebb[1]). The mechanism of the transport is unknown. It seems that information concerning the fate of the enzyme along the axonal path at various distances from the cell bodies and end organs might serve as one of the preliminary steps towards elucidation of this problem.

The nerves used for this kind of investigation should fulfil the following requirements : (1) the nerve trunk should be unbranched, so that at any level of the nerve all fibres are approximately equidistant from their terminal organs ; (2) it should be long enough to permit determinations of cholinesterase activity at several levels of the nerve.

The phrenic nerve of the dog satisfies approximately these conditions. The thin fascicles innervating intrathoric organs are easily separated from the main bundle to the diaphragm. The amount of protein per unit length was found to be the same at all levels of this bundle. The phrenic nerve has the additional advantage of being one of the most regularly discharging muscle nerves of the body. The regular alternation of periods of activity and of rest is likely to lead to a steady state between synthesis and utilization and, consequently, to constant amounts of enzyme at any given level of the nerve.

The phrenic nerves used were some 200–300 mm. long from the exit from the vertebral column to the level of branching near the diaphragm. They were removed from living anæsthetized animals, divided into three parts and cleaned of epineurium under the dissecting microscope.

Cholinesterase activity was determined by an ultra-microtitrimetric method of W. Niemierko (personal communication). Acetylthiocholine iodate was used as substrate, following McOsker and Daniel[2], and no separate determinations of true and pseudo-cholinesterase have been made so far. About 12 mgm. of fresh tissue were necessary for each determination, consisting of two parallel runs and one blank.

There are considerable differences in cholinesterase activity in various animals, and differences up to 30 per cent between the right and left nerve of the same animal.

Table 1 shows the cholinesterase activity in thirteen normal phrenic nerves at the upper, middle and low levels. In all nerves activity was slightly higher at the upper than at the lower level, and, in most cases, the middle level presented intermediary values. The differences between high and middle,

Table 1. CHOLINESTERASE ACTIVITY AT THREE LEVELS OF THE PHRENIC NERVE

and between high and low levels, are significant (*t*-test) at $P > 0{\cdot}99$. The difference between the middle and low levels is significant at $P > 0{\cdot}95$.

After section of the nerve, the amounts of cholinesterase and of choline acetylase[4] increase above the site of lesion. This increase is attributed by Hebb to the accumulation of the enzyme carried down from the perikaryon and prevented by the lesion from further displacement towards the periphery.

It was interesting, therefore, to see how the normal distribution of cholinesterase throughout the length of the nerve is altered after nerve section. This was done in the following experiments. Under aseptic conditions, the phrenic nerve near the diaphragm was sectioned and a portion of it removed and analysed for cholinesterase activity. The value obtained served to estimate the normal cholinesterase content of the nerve investigated at its low level. Then, after various time-intervals, the rest of the nerve was removed and cholinesterase determined at three levels of the proximal stump. The result of two experiments, 4 and 7 days after section, are shown in Fig. 1. The activity of the normal nerve was determined at the low level only; the probable normal values at higher levels are taken from percentages of Table 1. The results show that the increase of cholinesterase activity immediately above the site of section is accompanied, initially, by depletion of enzyme in the more proximal parts of the nerve.

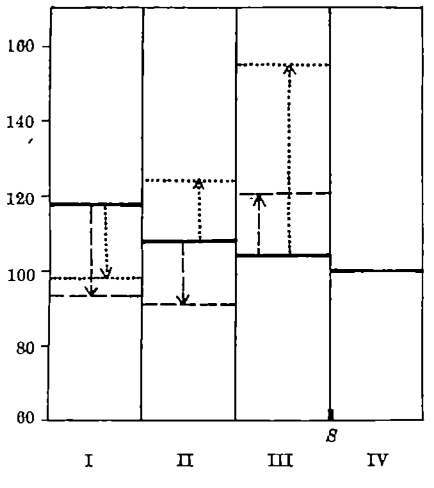

Fig 1. Changes of cholinesterase activity after section of the nerve at various levels of the proximal stump. I, II, III, IV represent portions of the nerve, the most proximal at the left. *S*, site of section. Ordinates: cholinesterase activity, as a percentage of that of the lowest part of normal nerve. Heavy line, normal nerve; broken line, 4 days after section; dotted line, 7 days after section

It should be noted that the phrenic is a very thin nerve and therefore rather long segments, of 60–100 mm., had to be taken in order to get enough tissue for determination of cholinesterase. In places where the differences of activity are likely to vary abruptly, as in the terminal part above the site of lesion, the use of long segments will tend to smooth out the real differences. A thick nerve, in which much shorter segments could be used, would therefore be more useful for exact determination of spatial re-distribution of the cholinesterase above the site of section, as was done by Hebb and Silver for choline acetylase (see following communication).

The re-distribution of cholinesterase activity in a sectioned nerve seems to indicate, besides the piling-up of the enzyme above the section, a slowing down of enzyme production by the perikarya in the initial period examined here. These results are in keeping with those of Schwarzacher[5] and Chacko and Cerf[6], who observed by histochemical methods a decrease of cholinesterase in perikarya during axon reaction, and they may be correlated with functional changes in respiratory discharge after section of the phrenic nerve described by Acheson, Lee and Morrison[7]. It should be noted that preliminary experiments in which the phrenic nerve was cut at the cervical level have failed to produce an increase of cholinesterase activity above the site of lesion.

As a result of these experiments, we conclude that, in the unbranched trunk of the phrenic nerve, there is a proximo-distal gradient of cholinesterase activity, the activity of the most proximal part exceeding by some 20 per cent that of the distal part of the nerve. Such proximal excess would suggest that the cholinesterase is metabolized not only at the nerve endings but also in the axon, although it does not constitute a direct proof of such utilization.

The changes of distribution of cholinesterase along the nerve after section seem to indicate that the transport of the enzyme stored in the nerve continues to be peripheral even at the time when its production in the cell bodies is slowed down or abolished.

Gradient of Choline Acetylase Activity

IT was shown earlier[1], that after section of a cholinergic nerve (the cervical sympathetic of the sheep) choline acetylase rises much above the normal concentration in the proximal trunk while, coincidentally, it falls steeply in the distal trunk. Unlike true cholinesterase[2], lipolytic esterase[3] and substance P (ref. 4) which behave somewhat similarly, choline acetylase eventually disappears completely from the degenerating distal portion of the nerve. This has been regarded as evidence that all the axonal acetylase is derived from the perikaryon, whereas the other substances such as cholinesterase which do not disappear completely may be derived in part from extra-neuronal elements[5]. The increase of choline acetylase proximally fits in with the view that it is manufactured in the cell body, for, on the hypothesis that in the normal nerve the enzyme is moving steadily distally, section of the nerve would interrupt its progress and cause it to accumulate at that point. However, although it may be accepted that there is a flow or movement of materials from cell to periphery, a concept first formally stated by Weiss and Hiscoe[6] and supported by experiments with isotopically labelled compounds[7], it is by no means clear how the movement takes place.

The simplest idea is that there is a flow of dissolved axoplasmic constituents; but experiments in this laboratory[8] have shown that most of the axonal choline acetylase is firmly bound to structural elements; and these we believe to be part of the system of membranes that is continuous with the endoplasmic reticulum in the cell body. Thus, transport of the enzyme would appear to depend on movement of some part of the structural framework of the axon, possibly the growth of the whole axon. To some extent the experiments reported here support this view.

In these experiments the sciatic nerve of the goat was sectioned approximately 5 cm. below the fusion of its constituent spinal roots. It was established initially that the rise in choline acetylase in the proximal stump reached a maximum 5–7 days after operation. It was also found that the rise, estimated by comparison with the corresponding contralateral nerve, was entirely confined to the nerve trunk, there being no significant difference in enzyme concentration in either the motor or the mixed spinal roots of the nerve on the two sides. At these more central levels, the concentration on the side of operation was always within 20 per cent of the controls, a variation which is within the overall experimental error of the method of the assay for choline acetylase.

The finding that the rise was limited to the nerve trunk led us to investigate the gradient of activity in the region of the nerve immediately above the section. For this purpose the proximal part of the sectioned nerve was divided into five portions, 1 or 1·5 cm. in length; each portion was analysed separately and then compared with the corresponding piece of nerve from the contralateral sciatic. Choline acetylase activity in each was expressed in terms of the unit length of nerve, since variations in protein and water content of the operated nerve might obscure changes in the enzyme concentration if this were expressed in terms of weight of tissue.

From the results given in Table 1, it is clear that the rise in enzyme 7 days after operation is confined to the terminal 3 cm. of nerve. In fact, it is probable that it is confined to an even shorter length of nerve, since the region immediately above the section always contained some damaged nerve tissue. Similarly, the length between 2 and 3 cm. (called $P3$ in Table 1) may extend beyond the area of increased enzyme activity. We therefore estimate that at 7 days after operation the change is limited to about 2–2·5 cm. of nerve immediately proximal to the level of damage or section. Since at 4 days the length of nerve affected is shorter, and since the rise in enzyme begins to subside after 7 days, it is a fair inference that the figures given represent the maximum length of nerve in which higher enzyme activity occurs.

Table 1. CHANGE IN CHOLINE ACETYLASE IN THE SCIATIC NERVE OF THE GOAT 7 DAYS AFTER NERVE SECTION

Proximal stump (segments numbered from the level of section)	Length (cm.)	Fresh wt. (mgm.)	Dry wt. (mgm.)	γACh/cm./hr.	Per cent change in sectioned nerve
$P1$ Sectioned nerve	1·0	327	34	147	+ 84
$P1$ Control nerve	1·0	158	35	80	
$P2$ Sectioned nerve	1·0	304	47	113	+ 117
$P2$ Control nerve	1·0	163	29	52	
$P3$ Sectioned nerve	1·0	227	51	122	+ 90
$P3$ Control nerve	1·0	131	31	64	
$P4$ Sectioned nerve	1·5	235	38	59	No change
$P4$ Control nerve	1·5	230	44	59	
$P5$ Sectioned nerve	1·5	233	45	58	+ 18 (less then signif.)
$P5$ Control nerve	1·5	238	33	49	
Distal stump					
$D1$ Sectioned nerve	2·5	719	162	3	− 94
$D1$ Control nerve	2·5	559	123	56	

These findings, which are in general agreement with those of Lubińska *et al.* (see preceding communication) on the cholinesterase gradient in the sectioned phrenic nerve of the dog, seem to dispose of any possibility that the accumulation of enzyme in the proximal part of a sectioned nerve depends on its free diffusion downwards, since it is difficult to see how such a process could produce so sharply localized an increase in enzyme activity. We can, however, suggest one situation in which free diffusion is compatible with a terminal increase in enzyme: that is, if there is an increase in the space into which protein can diffuse. It might, for example, be imagined that section of an individual axon would permit its expansion terminally as the growing tip reached out beyond the Schwann cell tube. Cajal[9] has shown that the neuroma typically consists in part at least of extensive growth of such exploratory nerve tips. Some curve back and some go forwards, together forming a brush-like growth. On such a hypothesis, however, it is difficult to account for the length of nerve involved. It is likely that at the most only a few millimetres are involved in this sprouting and in the ballooning and branching of axons which is also seen at this time[6].

It seems to us that the accumulation of enzyme we have described is more likely to be associated with the precocious formation of synaptic vesicles in the sectioned axons, as has been reported for sectioned frog sciatic nerves[10]. This is the kind of change that would escape detection by the light microscope, and might well involve much greater lengths of nerve than would the grosser changes described by Cajal and others. It is possible that what happens is that the severed axons undergo morphological changes which make them comparable to pre-synaptic terminals, a region where there is also relatively high choline acetylase activity. It may be that in terminals of a normal nerve, for example, at the motor end-plate or at the sympathetic ganglion cell, this relatively greater concentration of choline acetylase is due not only to branching of the axons but also to expansion of the membrane system which ultimately gives rise to the synaptic vesicles, particles thought to contain both choline acetylase and its product acetylcholine[11]. We suggest, therefore, a similar branching and budding of membranes at the tips of severed axons.

GLYCEROL IN *MYCOPLASMA MYCOIDES*

Unbalanced Growth of *Mycoplasma mycoides* caused by Glycerol Deficiency

MYCOPLASMA MYCOIDES var. *mycoides*, the agent of contagious bovine pleuropneumonia, requires glycerol as an essential nutrient[1]. The concentration required for maximum turbidity increases from about 5 μgm./ml. in static cultures to about 50 μgm./ml. in cultures rotated mechanically to give a moderate degree of aeration. Glycerol is rapidly oxidized by cell-suspensions, probably by a flavoprotein-catalysed oxidation of α-glycero-phosphate[2]. If this is a pathway which is essentially irreversible, then the need for exogenous glycerol for lipid synthesis would be readily explained. The observation that cultures undergo rapid lysis after a period of growth in media containing limiting concentrations of glycerol suggested that glycerol deficiency might cause unbalanced growth.

It has been found that when fully viable cells are incubated in medium lacking glycerol, but adequate with respect to all other nutrients, they die at a rate of about 80–90 per cent per generation time. There was an early increase, followed by a decrease, in turbidity; an early loss of streaming birefringence; and an increase in the viscosity of the cultures, suggesting that lysis had occurred. Profound morphological changes were evident in electron micrographs taken during the course of incubation. In the early stages the cells became enlarged, and many had shrunken appendages. Later, there was a great preponderance of flattened ghost-like forms, and only a few electron-dense elements probably representing the remaining viable cells. 'Glycerol-less death' is prevented if another essential nutrient (uracil) is omitted or if chloramphenicol is added, and the onset of the morphological changes is retarded by the omission of uracil.

The hypothesis derived from these observations is that glycerol is needed for the synthesis of some surface structure, and that this synthesis is more sensitive to glycerol deficiency than is the synthesis of the cytoplasm. The greater requirement for glycerol under aerobic growth conditions is due to the greater rate of oxidation and consequent loss of glycerophosphate for synthetic purposes.

A Polyglycerophosphate Compound from *Mycoplasma mycoides*

SOME preliminary work on the incorporation of glycerol labelled with carbon-14 by *Mycoplasma mycoides* var. *mycoides* has been carried out. The cells were grown in a partly defined medium (see preceding communication) to which 5–20 μc. of DL-glycerol-1-^{14}C was added per 100 ml. The total glycerol concentration was 4–20 μgm. per ml. The cultures were harvested after the end of the logarithmic phase, when glycerol had become limiting and streaming birefringence had largely disappeared. At this stage there is extensive conversion to non-viable ghost-like forms[1]. The cultures were centrifuged at 35,000*g* and the pellets extracted without preliminary washing. Although the main energy substrate was glucose, most of the glycerol was catabolized to lactate, and in none of the experiments was more than 8 per cent of the added isotope recovered in the pellet. Small amounts of non-dialysable activity found in the supernatant were presumably derived from cells which had lysed. Most of the carbon-14 in the pellet was present in substances which yielded glycerol or glycerophosphate compounds on hydrolysis, but about 10 per cent entered the ribose of ribonucleic acid where it was greatly diluted with unlabelled carbon.

In the first experiments the pellet was extracted with cold trichloroacetic acid, aqueous ethanol, and wet ethanol–ether according to a procedure used successfully for tracer studies with *E. coli*[2]. An unexpectedly large fraction (40–60 per cent) of the carbon-14 incorporated was not extracted by this method. Even after subsequent extraction with 5 per cent (w/v) trichloroacetic acid at 100° for 30 min., which removes the nucleic acids quantitatively from *M. mycoides*, a large amount of radioactivity remained in the residue. Alkaline hydrolysis of the latter released most of the remainder (33 per cent of the total incorporated) in the form of acid-soluble compounds. These included free glycerol and glycerophosphate, but at least three other compounds were present.

The results in Table 1 refer to an experiment in which the labelled cells were suspended in distilled water, frozen and thawed three times and then centrifuged at 26,000*g* for 15 min. It was convenient to include this step because about 80 per cent of the ribonucleic acid enters the supernatant fraction under these conditions. Only 9 per cent of the carbon-14 appeared in the supernatant, and nearly all this was accounted for as acid-soluble compounds and as ribonucleic acid ribose. After extraction with cold trichloroacetic acid, ethanol and ethanol–ether, the residue from the sedimentable fraction was washed with ether, dried and hydrolysed with 0·3 *N* potassium hydroxide at 37°. After 4 hr. and 24 hr., portions were cooled in ice, and protein, deoxyribonucleic acid and potassium perchlorate were precipitated by the addition of perchloric acid. The amount of carbon-14 rendered acid-soluble was not increased by prolonging the hydrolysis beyond 4 hr., but some activity remained unextracted. The acid-soluble products were taken up in 60 per cent (v/v) aqueous ethanol and applied to strips of Whatman 3 *MM* paper for ionophoresis in 0·05 *M* ammonium formate buffer, *p*H 3·6.

Table 1. DISTRIBUTION OF CARBON-14 IN FRACTIONS OF *Mycoplasma mycoides* GROWN IN THE PRESENCE OF DL-GLYCEROL-1-^{14}C

	c.p.m.	Per cent of total
Unfractionated suspension	142,000	(100)
Supernatant from frozen and thawed cells	13,000	9
Residue sedimented at 26,000*g* .		
Cold trichloroacetic acid soluble	800	1
Ethanol-soluble, water-soluble	5,800	4
Ethanol-soluble, ether-soluble	66,000	46
Acid-soluble fraction of potassium hydroxide digest	48,000	34
	133,600	94

Five heavily labelled bands were revealed by radioautography. These were well separated from each other and from the ribonucleotides, which were only feebly radioactive. The properties of the five concomitant compounds are summarized in Table 2. Ionophoresis was carried out by the hanging-strip method. The mobilities are corrected for electroendosmotic flow, but not for convection or other errors. Compounds I, II and III and their hydrolysis products were identified by chromatography in admixture with authentic carrier substances in at least three different systems.

Glycerol (G) and monoglycerophosphate (GP) were commercial products. α,α′-diglycerophosphate (GPG) was synthesized from DL-*iso*propylideneglycerol by the method of Fischer and Pfahler[3]. The phosphate esters were chromatographed as the ammonium salts and located with ammonium molybdate reagent[4]. Glycerol was located with silver nitrate. Incubation of compound *V* with the phosphatase gave a spot which migrated like GPG in four different systems. This suggested a structure (GPGP) in which an additional phosphate group was esterified to one of the remaining hydroxyls of GPG. Column 3 of Table 2 shows the changes in the relative densities of the bands on the radioautographs when the time of incubation in potassium hydroxide was increased from 4 to 24 hr. It suggests that compounds I, III and V, and perhaps II also, are formed by alkaline hydrolysis of IV. If so, one possible structure for compound IV was that consisting of three molecules of glycerol joined by two phosphate groups in diester linkage. This structure (GPGPG) is known to occur in the acidic phospholipid cardiolipin[5]. Cardiolipin was therefore prepared from fresh beef hearts[6] and saponified. The ethanol-insoluble potassium salt of the resulting polyglycerophosphate was converted to the ammonium salt and co-chromatographed with compound V in the following systems: water-saturated phenol (NH_3, HCN atmosphere), *iso*propanol/concentrated ammonia/water (70 : 6 : 30, v/v), and by ionophoresis at *p*H 3·5. In no case could separation of the radioactive material from the carrier be detected. No authentic sample of the dimer of glycerophosphate (GPGP) was available for comparison with compound V. It is of interest that several dinucleotides of analogous structure have been found among the products of alkaline hydrolysis of ribonucleic acid[7].

Table 2. PRODUCTS OF ALKALINE HYDROLYSIS OF THE RESIDUE FRACTION

No.	M_u*	Change 4–24 hr.†	Phosphatase‡	Acid hydrol.§	Diagnosis
I	0·00	Increase	—	—	G
II	1·14	Slight or nil	No change	G + GP	GPG
III	1·47	Increase	G	No change	$\alpha+\beta-$GP

* Anionic mobility at *p*H 3·6 relative to that of uridylic acid.
† See text.
‡ Products of hydrolysis with crude acid phosphatase at *p*H 5·5.
§ Products of 10 min. hydrolysis in *N* hydrochloric acid at 100°.

Consideration of the properties of the acidic phospholipids indicated that the procedure used might fail to extract them efficiently. It was found that, when the labelled cells were treated with 19 volumes of acetone at 0°, and then extracted with chloroform–methanol (2 : 1, v/v) at room temperature, no glycerophosphate compounds were present in alkaline hydrolysates of the residue. When the chloroform–methanol extracts were saponified, a large fraction of the carbon-14 was found in a substance which could not be separated from that obtained from cardiolipin when the two were co-chromatographed in the above three systems and also in *n*-butanol/acetic acid/water (5 : 2 : 3, v/v). Further work will be necessary to determine the nature of the substance extracted by chloroform–methanol, and its relationship to the process of 'glycerol-less death' (see preceding communication).

It is perhaps of more general interest that the ribonucleotide fraction, obtained from labelled cells which had been treated with cold trichloroacetic acid before extraction with chloroform–methanol, still contained radioactive substances migrating faster than uridylic acid at *p*H 3·5. These were not found if the cells had been precipitated with 4 volumes of ethanol at 77°, or with cold acetone as described above.

LETTERS TO THE EDITORS

ASTROPHYSICS

The Dust Cloud about the Earth

The existence of a high concentration of interplanetary dust near the Earth has recently been demonstrated from rocket, satellite and space-probe observations of acoustical impact. Suspected by Beard[1], the concentration has been proved by me[2] and by Hibbs[3]. To a distance of approximately 10^5 km., the concentration falls off roughly as the inverse 1·4 power of the distance from the Earth's surface (Fig. 1). The impact-rates on randomly oriented surfaces include all particles greater than mass 10^{-9} gm. and are adjusted for the differing sensitivities of the equipment. Data are from six U.S. rocket firings; from satellites *Explorer I* (1958 Alpha), *Sputnik III* (1958 Delta) and *Vanguard III* (1959 Eta); and from the space probes *Explorer VI* (1959 Delta) and *Pioneer I*. At some distance greater than 10^5 km., the impact-rates approximate those expected from calculations on the zodiacal cloud; the maximum concentration with respect to the interplanetary medium is perhaps as high as 10^4.

Four possible explanations for the dust concentration cannot immediately be eliminated by simple physical arguments: (1) The electrostatic explosion of fragile particles by charges ($\sim$ 100 V.) induced in the radiation belts of the Earth. (2) Capture into temporary circumterrestrial orbits by high-charge, high-drag processes in the radiation belts of the Earth. (3) Gravitational capture into temporary circumterrestrial orbits in the four-body system of Earth–Moon–Sun and particle (Beard's prediction). (4) Expulsion of dust and droplets from the Moon by meteoritic crater formation into temporary cislunar orbits.

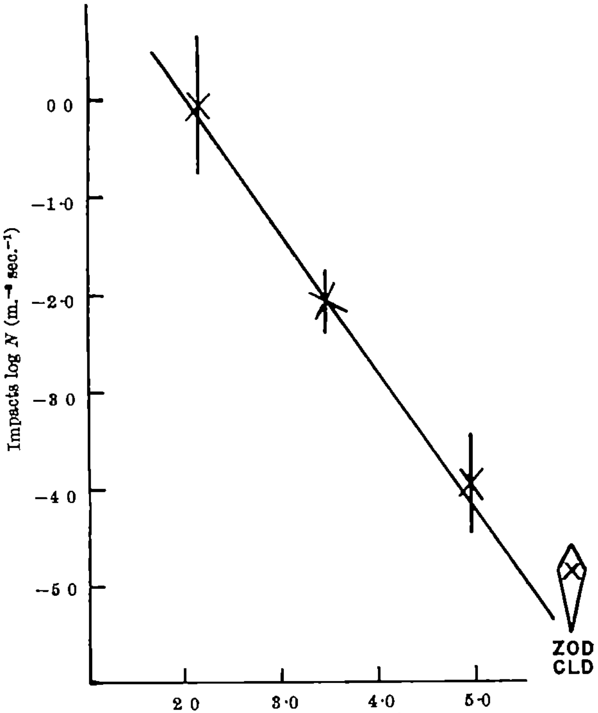

Fig. 1. Meteoritic impact (mass = 10^{-9} gm.) versus altitude from the Earth

Since there is no clear evidence that the Earth's radiation belts produce high electrostatic charges on particles, explanations (1) and (2) must be viewed sceptically until demonstrated. Gravitational capture of interplanetary particles by the Earth–Moon system appears to be a process of extremely small probability ($< 10^{-5}$?), but may be significant if the interplanetary orbits are nearly circular and of low inclination to the ecliptic. This type of motion has not been demonstrated. If capture orbits can persist for an unlikely 10^8 revolutions about the Earth, the small expected capture-rate might be adequate. I cannot verify Beard's theory of the three-body (Sun–Earth–particle) capture process, while Beard's predicted law of particle concentration near the Earth does not agree with the observed law. Hence explanation (3) shows doubtful promise.

Let us consider explanation (4). Meteoritic bodies of cometary and asteroidal origin certainly strike the Moon at high velocities, up to 73 km./sec., with perhaps a median value near 15–20 km./sec. Direct encounters from interplanetary orbits occur for the Moon at a rate less than 1/16 that for the Earth, this areal ratio being further reduced by the greater gravitational attraction of the Earth. The over-all rate may be approximately 2–3 per cent that for the Earth. No adequate theory yet predicts the high-velocity ejection component in crater-forming impacts. The solid material must consist almost entirely of dust and droplets, whatever the nature of the lunar surface; large ejection bodies, as suggested by Urey[4], should be extremely rare. Perhaps the dust ejected into cislunar orbits (2·4 < velocity < 3·4 km./sec.) may be a few per cent of the total mass striking the Moon, or of the order of 10^{-3} times the total meteoritic material directly striking the Earth. Since fine dust appears to be only a few per cent of the total solids striking the Earth directly, the two rates may be comparable within one or two orders of magnitude. From drag considerations, temporary circumterrestrial orbits for 10^{-9} gm. particles may possibly persist for 10^5–10^6 revolutions. If, indeed, the dust concentration factor is then greater than 10^3 within the Moon's orbit, the dust cloud about the Earth is semi-quantitatively explained. The higher concentration near the Earth would arise from convergence of the orbits and drag effects.

Thus a lunar origin for the dust seems fairly tenable. The hypothesis will predict a concentration in the plane of the Moon's orbit with generally a direct (eastwardly) motion of the particles. The dust cloud would be more comparable to the zodiacal cloud about the Sun than to the rings of Saturn (suggested by Hibbs). If this explanation is valid, the direct motion and distribution should be readily measurable in space experiments and the diurnal effects should be small for orbits close to the plane of the Moon's orbit.

Much more observational, analytical and theoretical research is required to clarify this surprising phenomenon.

Ionospheric Disturbance at the Time of Cosmic Ray Increases

IN a recent communication Legrand and Helary[1] have reported the occurrence of an anomalous increase in the intensity of the total cosmic ray component at the Paris Cosmic Ray Survey Station on December 4, 1957. At about the same time an increase was also observed in the intensity of the nucleonic component at Thule, Greenland. This cosmic ray event was further described as being analogous to one which was observed at Paris on January 21, 1957 (ref. 2). It has been suggested that these events are manifestations of the precipitation into the Earth's atmosphere of high-energy protons which emanate from the disturbed Sun.

Such cosmic ray increases at ground-level are rare, and their relationship to terrestrial atmospheric disturbances is not yet well understood. It is of interest, therefore, to consider conditions obtaining in the Earth's atmosphere at the time of such cosmic ray enhancements.

The ionospheric measurements reported here have been taken from the data collected by high-frequency vertical-incidence sweep-frequency sounders at Resolute Bay, Baker Lake and Ottawa. These stations have geomagnetic latitudes of 82·9°, 73·7° and 56·9° respectively. The ionosondes are part of a net which has been operated in and near the auroral zone for a number of years by the Department of Transport for the Defence Research Telecommunications Establishment of the Defence Research Board, Ottawa. The sweep-frequency equipment is conventional (2–20 Mc./s.) and soundings are taken continually at 15-min. intervals. The solar and magnetic data were taken from the monthly bulletin, *Solar Geophysical Data*, Part *B*, published by the National Bureau of Standards, Boulder, Colorado.

The cosmic ray increase on December 4, 1957, occurred during a period of low solar activity. An examination of the data from the Canadian ionosondes showed that there were no unusual conditions in the early part of December. All the ionospheric measurements remained very close to the monthly median values for several days before and after the cosmic ray enhancement.

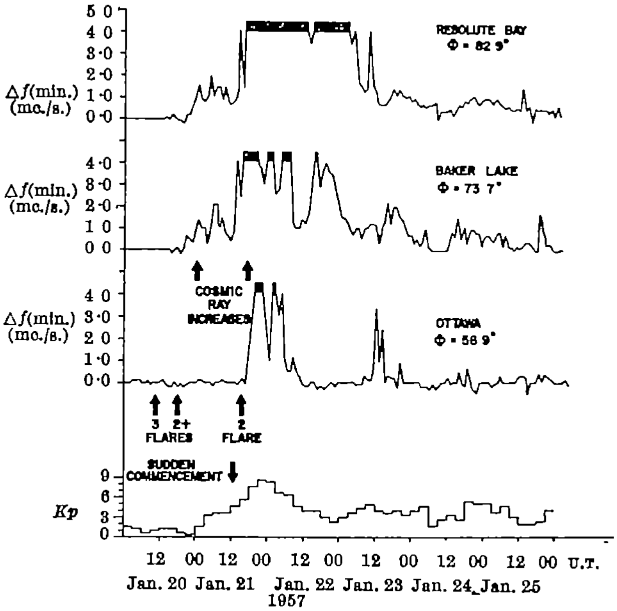

Fig. 1

The increase which was observed on January 21, 1957, occurred at a time of somewhat higher solar activity and the ionospheric conditions were quite different and considerably more complex. Both a geomagnetic storm and a polar-cap absorption event were observed during this period.

The polar-cap absorption event is now a familiar phenomenon, and, as a result of the International Geophysical Year work on radio-wave absorption at high latitudes, the gross features of these disturbances are fairly well known[3,4]. During a polar-cap absorption event the enhanced ionization in the lower ionosphere extends over the whole polar cap as far south as geomagnetic latitudes of approximately 60°. The disturbance lasts for several days and is much more intense when the ionosphere is sunlit. At such times high-frequency radio waves are completely absorbed, and very-high-frequency waves also suffer severe attenuation. It is generally believed that polar-cap absorption events are another manifestation of the precipitation of solar protons although these protons probably have somewhat lower energies (10–100 MeV.) than those responsible for the cosmic ray increase observed at the surface of the Earth[5].

Some of the measurements from three of the Canadian ionosondes which show the nature of the ionospheric disturbance in January 1957 are presented in Fig. 1. The three curves show the deviations from the monthly median values of the hourly values of *f*(min.) at Resolute Bay, Baker Lake and Ottawa. *f*(min.) is the lowest frequency reflected from the ionosphere. Since the lower frequencies are attenuated more strongly than the higher frequencies an increase in the value of *f*(min.) denotes an increase in absorption and hence an increase in the electron density in the lower ionosphere. The heavy horizontal bars at the tops of the curves represent intervals of blackout or complete absorption of the sounding transmission. The magnetic activity for the period (January 1957) is given by the histogram of *Kp* at the bottom of Fig. 1. An arrow denotes the time of the magnetic storm sudden commencement. Arrows marking the occurrence of flares are for the large solar eruptions which one might reasonably associate with the ionospheric effects. Times of maxima of cosmic ray increases have been taken from the report published by Legrand, Chanson and Bonpas[2].

It can be seen that the increase in Δf(min.) at the high-latitude stations on January 20 which marks the start of the polar-cap absorption began within a few hours of the first two large solar flares and was roughly coincident with the first cosmic ray increase. The second cosmic ray increase on January 21, which was slightly more intense than the first, followed the third flare by several hours. It has since been reported that the geomagnetic storm which began with the sudden commencement at 1230 on January 21 was accompanied by a Forbush decrease which began at Ottawa at 21 hr. (ref. 5).

Because of the timing, it seems likely that the magnetic storm and the Forbush decrease might be associated with the flares which occurred on January 20. One of these flares, it may be assumed, must have ejected particles with a wide range of energies if it were responsible for the observed ground-level increase of cosmic rays, the polar-cap absorption and the magnetic storm. Just what contribution was made to these events by particles from the third flare on January 21 is difficult to say since the polar-cap absorption event and the magnetic storm were already in progress at the time this flare occurred. It seems possible, however, that this last solar outburst produced only particles with very high energies since the polar-cap absorption event at Baker Lake was much reduced on January 22 and there was no second sudden commencement, nor was there any marked increase in the magnetic activity around January 23. Although the blackout at Ottawa occurred soon after the flare on January 21, it is not likely that these two events were related. It seems more probable that the particles producing the blackout at this station came from one of the flares on January 20 and were precipitated at the lower latitudes because of the distortion of the geomagnetic field at the time of the storm. This effect has been discussed by Freier, Ney and Winckler[6] in their description of the detection of solar cosmic rays below the normal cut-off rigidities appropriate to the latitude of Minneapolis on March 26, 1958.

The association of the foregoing events is of course highly speculative. It would seem, however, that although the cosmic ray increases in January and December of 1957 were in some respects analogous, they were associated with quite different ionospheric conditions. Further observations at the time of such cosmic ray increases are required to establish the nature of this relationship.

RADIOPHYSICS

Irregular Fading of Satellite Transmissions

In a paper by Kent[1] it was stated that irregular fading of satellite transmissions on 40 Mc./s. from *Sputnik* 1 did not occur when the satellite was south of 50° N., and indeed was of very small amplitude on the average when the magnetic inclination at the sub-satellite point was less than 68°, the value at the observing station near Cambridge. Mawdsley[2] has suggested that this might be due not to the absence of irregularities to the south of Cambridge but to the southerly irregularities being incorrectly oriented to give appreciable power scattering to the receiver.

Some observations made at Slough on transmissions from the satellite *Explorer* 7 at a frequency of 20 Mc./s. are of relevance in this connexion. Although this satellite never reaches as far north as the latitude of Slough, irregular fluctuations are frequently found on the signal-strength records; they were of greater magnitude at night than during the hours of daylight. If a scintillation index is defined, as is commonly done, by the ratio of the standard deviation of the fluctuations to the mean signal amplitude, then the distribution of the mean index with magnetic inclination is as shown in Table 1; a separate index was calculated for each half-minute of record.

Table 1. Mean Scintillation Index in Certain Ranges of Magnetic Inclination of the Sub-satellite Point. Nig it-time Results Only, for the Period January–February 1960

Ranges of magnetic inclination (deg.)	No. of indices in each range	Mean index
50–56	23	0 10
56–58	23	0 11
58–60	30	0·14
60–62	59	0·14
62–64	98	0·18
64–66	206	0·17
66–68	121	0·24
68–70	13	0·27

The inclination at Slough is 67°; it can be seen that there are scintillations well to the south of Slough, although the index certainly tends to fall off as the satellite moves away from magnetic north. The decrease is not so sharp and does not continue to such a low level as that found by Kent on the 40 Mc./s. transmissions he observed.

The height of *Explorer* 7 lay in the range 550–800 km. during these observations. The positional information on which the work was based was derived from prediction data. Consequently the figures in Table 1 may be subject to errors of up to 2° in the magnetic inclination of the sub-satellite point; this is not sufficiently large to affect the conclusions given above.

This work forms part of the programme of the Radio Research Board. This communication is published by permission of the Director of Radio Research of the Department of Scientific and Industrial Research.

PHYSICS

Random Fluctuations in a Nuclear Fission Reactor

The theory of the stochastic dynamics of a nuclear fission reactor has been formulated by Moore[1]. The present investigation is concerned with the measurement of time-dependent reactor parameters, using a spectral analysis technique and the formulation of both theory and experiment for the correlation analysis and measurement of spatially dependent reactor parameters.

The time-trace of the random fluctuations in neutron density in a nuclear reactor operating autonomously at low power has been recorded. From the direct recording of this 'noise' wave-form an amplitude spectrum and a spectral density-curve have been derived. Conclusions have been drawn concerning: (1) the effective, prompt neutron lifetime in the reactor; (2) the reactor transfer function.

Further experiments will be aimed at: (1) the measurement of the effective delayed neutron lifetimes, the temperature coefficient of reactivity and the study of possible 'neutron wave' effects; (2) the measurement of neutron age and other spatial parameters by a multi-channel correlation technique.

A block diagram of the recording apparatus is given in Fig. 1. The ionization chamber was placed centrally in the reactor core in a mean thermal neutron flux of 10^9 neutrons/cm.^{2}/sec. The inherent noise and long-term drift of the electronic circuitry were measured and minimized.

OPTICAL SPECTRUM ANALYSER

Fig. 1. Equipment for recording and analysis

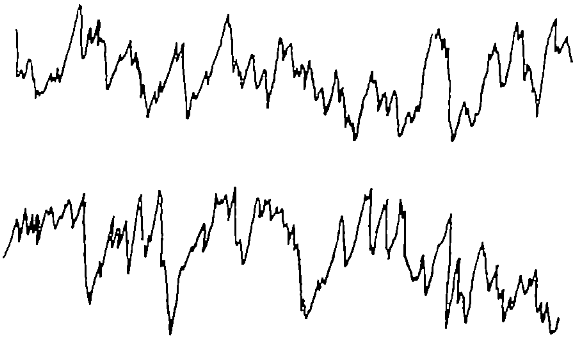

Fig. 2. Time trace of random fluctuation. Recording speed, 10 cm./sec.

A sample of the reactor-power random fluctuation is given in Fig. 2. The recording speed of 10 cm. per sec. was found to be most suitable for the measurement of the effective prompt neutron lifetime. The trace was generated by an optical galvanometer reflecting the beam of a mercury arc lamp on to an ultra-violet sensitive paper. This forms an immediately visible semi-permanent record which may be permanently fixed if required. The galvanometer sensitivity was 20 μamp. per mm. of trace reflexion. The investigation is being continued with a fifteen-speed multi-channel recorder and a range of galvanometers of sensitivity as high as 0·03 μamp. and flat frequency responses of 1–500 c.p.s.

The analysis of the time-trace was carried out on the frequency analyser described by Barber *et al.*[2]. Fig. 3 shows a sample of the amplitude spectra obtained. The amplitude spectrum contains sufficient information to plot the reactor transfer function or the power spectral density of the reactor 'noise' (Fig. 4). A typical set of results is given in Table 1.

Table 1

Frequency (c.p.s.)	Noise current spectral density (relative values)	Noise power spectral density (relative values)
1·06	97·2	2,332
2·00	102·7	2,852
2·94	99·3	2,223
3·88	98·3	2,294
4·82	66·0	1,055
5·76	76·2	1,904
6·70	64·8	992
7·63	67·7	1,158
8·57	56·1	709
9·51	58·0	753
10·45	38·9	335
11·39	51·9	670
12·33	41·3	368

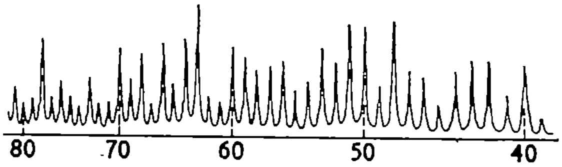

Fig. 3. Amplitude spectrum of random fluctuation, showing peaks from 40th to 80th harmonic of spectrum analyser

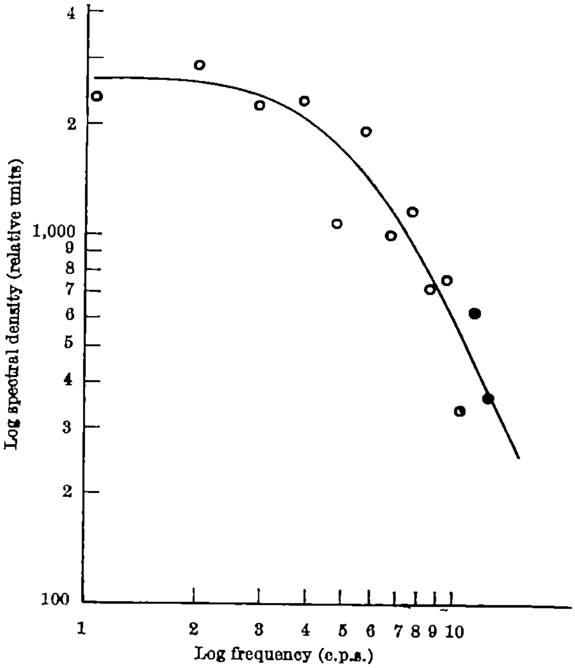

Fig. 4. Random fluctuation spectral density

The effective prompt neutron lifetime in the reactor core was found to be 174 μsec. with an experimental accuracy of 7 per cent. This is consistent with the accuracy of the delayed neutron data available at present. An improvement in accuracy could be obtained by refinements in the electronic circuit and an improvement in the statistics of the analysis through the use of greater lengths of time-trace records. The variation of the neutron lifetime in different parts of the core can be clearly observed with this technique.

A full report will be published elsewhere.

Time-dependent Tensile Strength of Solids

Hsaio[1], considering strain-rate effects on polymeric and metallic solids, states that for any given value of strain, the stress obtained at different rates of straining is linearly related to the logarithm of the strain-rate. This is considered to be a basic law which is reasonably safe to apply to a large number of solids. He also presents data for polystyrene showing a linear dependence of fracture stress on the logarithm of strain-rate. These facts are used as evidence supporting certain theories concerning the time-dependence of tensile properties.

The results quoted by Hsaio are confined to a range of two decades of strain-rate in the region of 10^{-5} sec.$^{-1}$. In hitherto unpublished work we have measured the tensile properties of isotactic polypropylene (in the form of thin filaments oriented to a draw ratio of about 5·5 : 1) over six decades of strain-rate from 10^{-4} to 10^{3} sec.$^{-1}$ at 20° C. The dependence of stress at a given strain, and of yield and breaking stress, on the logarithm of strain-rate is shown in Fig. 1. These figures reveal that though the conclusions of Hsaio might be applicable to this material in the range of strain-rates in which he worked, they are certainly inapplicable in a range which extends to higher rates of deformation.

Composition Requirements for Glass Formation in Metallic and Ionic Systems

We have developed in recent papers the point of view that all liquids, ionic and metallic included, would form glasses when sufficiently undercooled, save for the intervention of crystallization[1-3]. We have shown[3] that the glass-forming tendency (for a given rate of cooling and for substances of a given molecular type) is greater the lower is the reduced melting temperature :

$$\tau_m = \frac{kT_m}{h_v} \qquad (1)$$

where T_m is the thermodynamic crystallization temperature, and h_v is the molecular heat of vaporization. This criterion is in semi-quantitative accord with experience on glass formation. In particular it encompasses Zachariasen's[4] criterion, and accounts for the enhancement of glass-forming tendency by molecular asymmetrization, both being simply equivalent to the depression of τ_m. It is also clear, as we pointed out, that the addition of impurities which depress τ_m similarly enhances the glass-forming tendency. In this communication we point out striking new experimental confirmation of this last deduction.

Klement, Willens and Duwez[5] have recently reported the formation of glass in a gold–silicon alloy containing 25 atomic per cent silicon. This appears to have been the first instance in which a metallic glass was formed by cooling the melt. Glass formation in this experiment was, of course, facilitated by the drastic cooling-rate achieved. However, that the gold–silicon alloy in particular formed a glass is, we believe, a consequence of its low τ_m. The composition of the alloy is near the eutectic (reported[6] to be 31 atom per cent silicon) for which $\tau_m \sim 0·015$. Thus its τ_m and that of neighbouring compositions are low enough for a strong glass-forming tendency to exist. A similar strong tendency toward glass formation should be exhibited by gold–germanium alloys of near eutectic compositions and indeed by any eutectic with a similar pronounced dip in the melting temperature.

We infer from the reported room temperature instability that the glass transition temperature, τ_g (see ref. 3 for definition), of the gold–silicon alloy is near room temperature, that is, $\tau_g \sim 0·007$. This is a much lower glass transition temperature than for other fluid types and is a consequence of the generally higher fluidity of liquid metals.

Another unique feature of the gold–silicon glass is its high stability against crystallization at temperatures much above those at which pure amorphous metal films apparently can crystallize. For example, Hilsch[7] has shown that such films may crystallize at temperatures below 20° K. ($\tau \sim 0·001$). The reason for this stability is that, while in the pure material crystallization requires atom motions of less than one atom diameter, crystallization of a eutectic requires chemical diffusive motion over several atom diameters.

In ionic melts one would expect a similar strong glass-forming tendency in low melting eutectics. This expectation is confirmed by the observations of Dietzel and Poegel[8], who showed that the glass-forming tendency of the calcium nitrate–potassium nitrate system is greatest for solutions of near eutectic composition. J. D. Mackenzie (personal communication) has shown that these solutions are mainly ionic in character.

Ultra-Violet Absorption Spectrum of Water

On further examination, the absorption peaks of water recently discussed[1] have been found to be inherent in the instrumental technique used. The fall in the values of optical density at the lower wave-lengths is the normal stray-light effect under these conditions, but the 'fine structure' is now thought to be due to the oxygen absorption in the factory-sealed monochromator and inadequate compensation within the instrument when the slit automatically opens and closes on passing through the wave-lengths at the oxygen absorption peaks.

The water spectrum in the far ultra-violet to 185 mμ as shown by Barrett and Mansell[2] has been confirmed in this Laboratory by a grating instrument (Optika *O.F.*4) which has just been installed.

METALLURGY

Microhardness and Other Properties of Magnesium Compounds with the Calcium Fluoride Structure

Relations have previously been proposed[1,2] between hardness and latent heat of fusion, L_f, for pure metals. This communication shows that a relation also holds for the series of intermetallic compounds Mg_2Si, Mg_2Sn and Mg_2Pb, and by using the results for these compounds, L_f for Mg_2Ge is obtained by interpolation.

The four compounds form an isomorphous series from the covalent semiconductor Mg_2Si to the nearly metallic Mg_2Pb. On electrochemical grounds the bond-strength, and therefore also the mechanical strengths, would be expected to decrease in the same order. Fig. 1 shows that this is indeed the case for microhardness, while degree of brittleness (as indicated by cracking near the impression) also decreases in this order. Alloys near the composition of the respective phases were melted and slowly cooled to form large idiomorphic grains; the microstructures of the four alloys were remarkably similar. Impressions were made on a freshly polished surface with a diamond pyramid indenter under 50 gm. load. Great care was necessary in the preparation of these surfaces as all the compounds tarnish rapidly in moist air, the rate of attack increasing from Mg_2Si to Mg_2Pb.

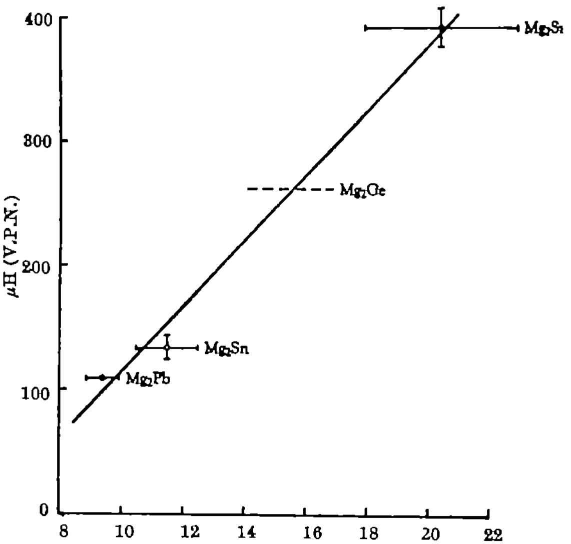

Fig. 1. Relation between microhardness and heat of fusion

In Fig. 1 it may be seen that the hardness-level of Mg_2Ge should intercept the curve at $L_f = 15{\cdot}5$ kcal./mole, and it is suggested that this would be accurate to ± 1·5 kcal./mole. No data have been found in the literature to verify this value.

That these compounds do in fact form a physico-chemical series is shown by Fig. 2, where the microhardness is seen to be a function of the interatomic distance, r, between unlike atoms. The relation is of the form given by Goldschmidt[3]:

$$H = S \cdot \frac{e_A \cdot e_B}{r^m}$$

where S and m are constants, and e_A and e_B the valency of the two atoms. The slope m seems to

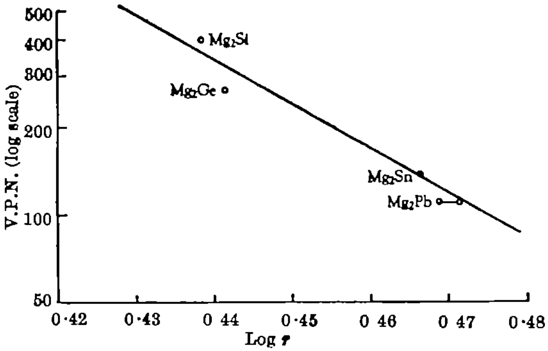

Fig. 2. Relation between microhardness and interatomic distance

ENGINEERING

Reactions on Metal Surfaces at High Temperatures

In a recent communication in *Nature*[1] reference was made to a technique developed at Thornton Research Centre for investigating high-temperature reactions between metal surfaces and 'extreme-pressure' lubricating oil additives. We should like to take this opportunity of describing briefly the development of the technique and its potentialities.

Extreme-pressure lubricating oil additives, as their name implies, are used in many applications to protect sliding metal surfaces against incipient seizure (scuffing), under conditions of heavy load when normal hydrodynamic lubrication fails. They are generally considered to function[2] by reacting with the metal surfaces in the contact zone, thus interposing a solid film of low shear-strength between the mating surfaces. The stimulus for reaction comes from the local high temperatures generated in the contact area. Extreme-pressure additives vary in their effectiveness, however, and this is due, at least in part, to differences in their reactivities. Investigating such a hypothesis is complicated by the difficulty of measuring the reactivities of relatively unstable additives at temperatures comparable to those generated transiently in practice.

This difficulty was partially overcome by simulating the high metal temperatures in a static system by electrical heating. The principle was simple and merely involved passing a current through a thin metal wire immersed in an oil containing an extreme-pressure additive. Metal temperatures were deduced from the measured resistance/temperature characteristics of the metal. Reaction-rates at various temperatures were followed from the increase in resistance of the wire due to chemical attack by the additive. The method was successful but had one limitation: the maximum temperature which could be attained was determined to a large extent by the boiling point of the oil. This meant that maximum temperatures in general were limited to about 600° C., even in oils of high boiling point. This limitation was overcome by passing short pulses of current through the wire. The duration of the pulse was selected so that the fluid surrounding the wire did not vaporize to any appreciable extent during this period. In this way, temperatures up to the melting point of the wire could be easily reached in both volatile and non-volatile solvents. The duration of a single pulse, and hence the minimum reaction period, was 10^{-3} sec.

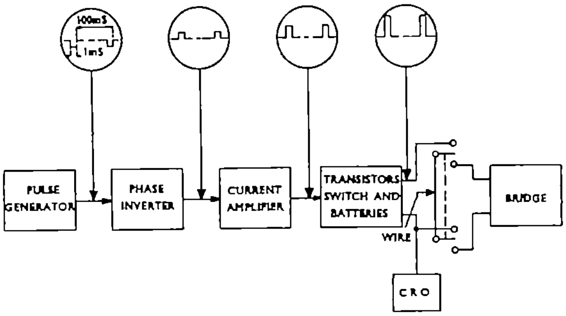

Fig. 1. Block diagram of hot-wire pulsing equipment

The heart of the system is the electronic device for the generation and control of the pulses. How this was achieved is shown diagrammatically in Fig. 1. Since the voltage across the wire is a square wave, the current wave-form is defined by the increase in resistance of the wire due to its rise in temperature. The current wave-form, observed on a suitable oscilloscope, can thus be used to determine the temperature of the wire. Reactions between additive and metal can be followed by estimating the thickness of reaction product by radiotracer methods, X-ray diffraction, etc., or more simply from increases in resistance of the wire, as mentioned previously. We have used the latter method.

Some results obtained with this pulse technique using a stainless steel wire are shown in Fig. 2. The plot of $\log_{10}$ initial reaction-rate against $1/T$(° K.) is linear and shows clearly the effect of temperature on the reaction-rates. Reactions of carbon tetrachloride (boiling point 77° C.) were as easy to study as those of dibenzyl disulphide in medicinal white oil (boiling point approx. 450–500° C.) The products

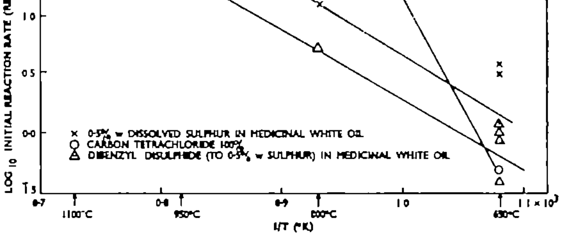

Fig. 2. Reactivity of extreme-pressure additives at different temperatures

of reaction, identified by X-ray diffraction, were: FeS for the sulphur additives and $FeCl_2.4H_2O$ for carbon tetrachloride.

The technique is versatile, rapid and simple to use, and certainly achieves temperatures comparable to those considered to be generated transiently on meshing gear surfaces, for example. These studies of reactions between extreme-pressure additives and metal surfaces at high temperatures are giving us a better understanding of the mechanism of action of extreme-pressure lubricants. A more detailed account will be published elsewhere.

CHEMISTRY

Use of Krypton for Surface Area Measurements

CONSIDERABLE interest has recently been focused on the suitability of using krypton adsorption isotherms at liquid air temperatures for the determination of the surface area of solids. From the isotherms the monolayer volume, v_m, which can be converted to surface area using the effective cross-sectional area of an adsorbed krypton atom, is obtained by the Brunauer–Emmett–Teller method[1]. This method generally yields a linear plot of $p/v(p^0 - p)$ against p/p^0 (v = volume adsorbed at an equilibrium krypton pressure, p; p^0 = s.v.p. of krypton at the adsorption temperature) in the range of relative pressure, p/p^0, 0·05–0·35.

Haul[2] considers that krypton is more suitable than nitrogen as adsorbate for measuring small surface areas. Malden and Marsh[3], however, state that nitrogen should be used in preference to krypton as the latter is liable to yield Brunauer–Emmett–Teller plots which are convex to the p/p^0 axis. These curved plots greatly reduce the accuracy of the determination of v_m. More recently, Gaines and Cannon[4], on the basis of a large number of area determinations and on theoretical grounds, consider that the general applicability of krypton, even for p/p^0 ranges extending well below 0·05, has been amply demonstrated. This conclusion is supported by recent work on evaporated iron films[5,6]. Krypton adsorptions on these films at liquid nitrogen temperature yield Brunauer–Emmett–Teller plots which are accurately linear in the p/p^0 range 10^{-4} to 5×10^{-2} and give meaningful v_m values. In the light of the foregoing remarks, the following results may be of interest.

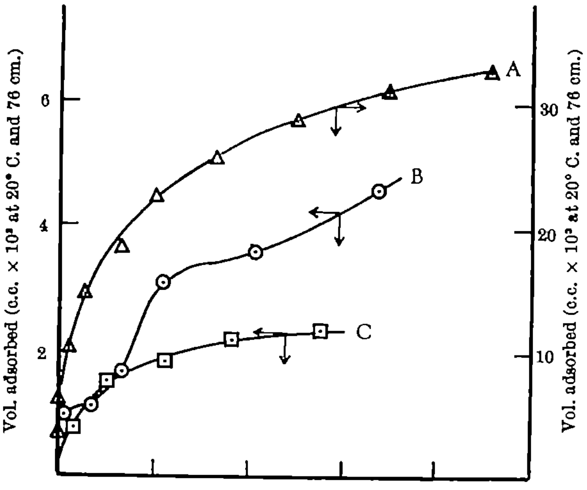

Fig. 1. Krypton adsorption isotherms. *A* (at −193·2° C.), fresh film, $v_m = 33·5 \times 10^{-3}$ c.c. at S.T.P.; *B* (at −192·8° C.), sintered film, $v_m = 5·24 \times 10^{-3}$ c.c. at S.T.P.; *C* (at −193·0° C.), 'treated' film, $v_m = 2·47 \times 10^{-3}$ c.c. at S.T.P.

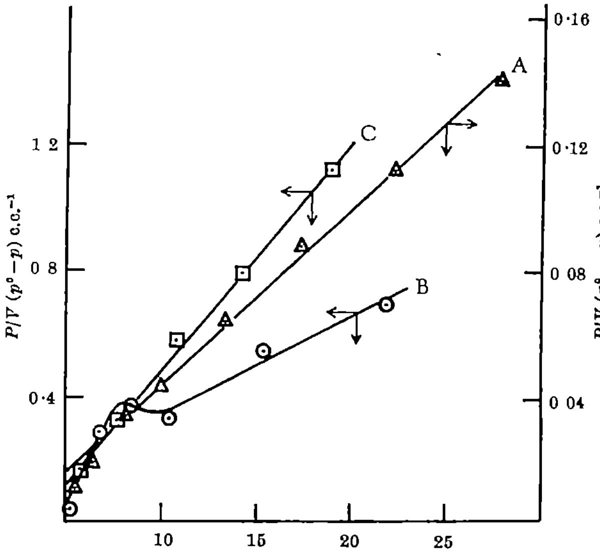

Fig. 2. Brunauer–Emmett–Teller plots from data shown in Fig. 1

A chemically clean silver film was produced in high vacuum ($< 10^{-6}$ mm. mercury) by evaporation on to the walls of a 'Pyrex' vessel the outside temperature of which was kept at − 193·3° C. This film, which weighed 10 mgm., gave the familiar σ-shaped krypton adsorption isotherm at − 193·2° C. and a linear Brunauer–Emmett–Teller plot (curves *A*, Figs. 1 and 2). Sintering the film at 20° C. for 90 min. caused the shape of the next low-temperature isotherm at − 192·8° C. to alter radically (curve *B*, Fig. 1). Moreover, the Brunauer–Emmett–Teller plot is anomalous, being composed of two approximately linear portions separated by a kink (curve *B*, Fig. 2). Curves *C* (Figs. 1 and 2), both of which are normal, were obtained at − 193·0° C. after the sintered film had chemisorbed oxygen at temperatures up to 20° C. followed by prolonged pumping (17 hr. at $< 10^{-6}$ mm. mercury) at room temperature.

For the freshly prepared and 'treated' silver surfaces, monolayer volumes deduced from the Brunauer–Emmett–Teller plots in the p/p^0 range 5×10^{-4} to 5×10^{-3} were in good agreement with those estimated roughly from the isotherms (*A* and *C*, Fig. 1). For the sintered silver surface, uncertainty exists as to which of the two straight lines in the Brunauer–Emmett–Teller plot should be taken as the basis for obtaining v_m. It does, however, emerge that the

v_m obtained from the slope of the Brunauer–Emmett–Teller straight line at the higher p/p^0 range 1×10^{-3} to $3{\cdot}4 \times 10^{-3}$ (curve *B*, Fig. 2) agrees to within 25 per cent with the v_m estimated roughly from curve *B*, Fig. 1, on the assumption that adsorption corresponds to monolayer completion at the last recorded pressure.

Other silver films prepared and sintered in the same way as the one described above gave essentially the same results as those shown in Figs. 1 and 2. In all instances, Brunauer–Emmett–Teller plots are anomalous for a freshly sintered surface over the p/p^0 range 5×10^{-4} to 5×10^{-3}, at which normal linear Brunauer–Emmett–Teller plots are obtained for a freshly evaporated or 'treated' silver surface.

Anomalous Brunauer–Emmett–Teller plots, similar in shape to those described here, have been reported previously on polycrystalline graphite[7] and, to a smaller degree, on evaporated carbon films[8]. No adequate explanation for such anomalies has yet been found, though it is significant that curve *B*, Fig. 1, suggests that vertical steps in the isotherm, and hence second-order phase changes in the adsorbed film, may be present.

From a practical point of view, however, the occurrence of anomalous krypton Brunauer–Emmett–Teller plots on surfaces which have not chemisorbed any gases but have simply been sintered reduces the power of the krypton adsorption method of measuring small surface areas. A further account of this work will be published elsewhere.

I acknowledge some experimental assistance from K. Syers, a grant from the Chemical Society, London, and the interest of Prof. S. Peat.

Reaction of Oxygen Atoms with Hydrogen

THE reaction between ground-state oxygen atoms and hydrogen:

$$O(^3P) + H_2 = OH + H\,;\ \Delta H^0 = 0\ \text{kcal./mole} \qquad (1)$$

is known to be an elementary process in the branching chain reaction between hydrogen and oxygen, and it is therefore of interest to determine its kinetics. Harteck and Kopsch[1] measured the amounts of water formed in the reaction between hydrogen and electrically discharged oxygen containing about 25 per cent of oxygen atoms at three temperatures between 300° K. and 462° K. From these data an activation energy of 6 ± 1 kcal./mole for reaction (1) was computed. However, the formation of water under these conditions may arise not only from reaction (1) followed by reaction (2):

$$OH + H_2 = H_2O + H\,;\ \Delta H^0 = -13\ \text{kcal./mole} \qquad (2)$$

but also from a chain reaction involving molecular oxygen. In the absence of undissociated oxygen, the only secondary reactions to be considered are reactions (2) and (3):

$$O + OH = O_2 + H\,;\ \Delta H^0 = -14\ \text{kcal./mole} \qquad (3)$$

The velocity constant of reaction (2) has been determined as $1{\cdot}2 \times 10^{14} \exp(-10{,}000/RT)$ cm.^{3} mole^{-1} sec.$^{-1}$ by Avramenko and Lorentso[2], and a value of $k_2 = 2 \times 10^{12} \exp(-2{,}000/RT)$ cm.^{3} mole^{-1} sec.$^{-1}$ can be obtained from Semenov's value[3] for the rate constant of the reverse reaction and from the calculated equilibrium constant.

There is evidence that ^1D oxygen atoms react more rapidly with hydrogen than do ^3P ground-state atoms[4–6], and it is also possible that the value of k_1 determined by Harteck and Kopsch[1] was affected by the presence of excited atoms in the discharged oxyen.

Oxygen atoms in the absence of molecular oxygen can be produced by addition of nitric oxide to nitrogen atoms in active nitrogen, when the stoichiometric and very rapid reaction (4) occurs[7–9]:

$$N(^4S) + NO(^2\Pi) = N_2(^1\Sigma) + O(^3P)\,;$$
$$\Delta H^0 = -75\ \text{kcal./mole} \qquad (4)$$

Tanaka *et al.*[10] have shown that the concentration of excited nitrogen atoms in active nitrogen is about 1/500 of that of ground-state atoms, and the high collision efficiency of reaction (4) (ref. 11) shows that it does not violate the spin correlation rules. It therefore follows from a consideration of the energies of the various electronic states of N_2 and O that both these species are formed in their electronic ground-states.

In this work active nitrogen was produced by passing purified nitrogen through an 18 Mc./sec. electrodeless discharge. Nitric oxide was added past the discharge in slight excess (about 5 per cent excess), as shown by the appearance of a weak air afterglow continuum ($NO + O = NO_2 + h\nu$) downstream from the mixing point. The nitrogen, now containing about 0·5 per cent of oxygen atoms, passed through a 21-mm. diameter quartz tube enclosed in a furnace. This tube had four mixing inlets spaced at 30 cm. intervals, through which hydrogen could be introduced[12]. Oxygen atom concentrations in the gas leaving the furnace were determined by measurement of the intensity of the air afterglow produced when known flow-rates of nitric oxide were added 10 cm. upstream from a photomultiplier tube, 30 cm. downstream from the furnace exit. The intensity of the air afterglow is known to be proportional to both oxygen atom and nitric oxide concentrations[13], and this process is unaffected by the presence of hydrogen atoms (unpublished results).

In this system the rate of removal of oxygen atoms by the third-body recombination reactions $O + O + M = O_2 + M$ and $NO + O + M = NO_2 + M$ is much smaller than the rate of reaction of oxygen atoms with hydrogen, and the correction to the data to allow for these reactions was less than 5 per cent. The rate of reaction of oxygen atoms was found to be first order in both oxygen atom and hydrogen molecule concentrations between 409° K. and 733° K. and at total pressures from about 1·5 to 3 mm. mercury. There was no evidence that the reaction-rate depends on total pressure, and the only third-order reaction which could be important in our system:

$$O(^3P) + H_2 + M = H_2O + M$$

has an apparently negligible rate, presumably because it violates the spin correlation rules. In our experiments $k_3(O)$ is always greater than $k_1(H_2)$ or $k_1(H_2)$ and the observed rate constant is therefore $2k_1$. Our results at six temperatures between 409° K. and 733° K. are represented by $k_1 = 1{\cdot}2 \times 10^{13} \exp(-9{,}200/RT)$ cm.^{3} mole^{-1} sec.$^{-1}$ to within 10 per cent. Measurements of the rate of reaction of oxygen atoms with deuterium are being made by the same technique.

An attempt is being made to investigate the kinetics of reactions (2) and (3) and thus to confirm the results of Avramenko and Lorentso[2], and of Semenov[3].

Origin of Some Primary Coal Tar Components

THE presence in the ether-, chloroform- or light petroleum-soluble portions of extracts from bituminous coals of paraffinic, alicyclic and alkylated aromatic hydrocarbons was demonstrated between 1910 and 1920[1-5]. Pictet and Bouvier first showed the presence of similar compounds in a vacuum tar[6], while Jones and Wheeler found the pyridine-soluble, chloroform-soluble extract of a bituminous coal to be the main source of hydrocarbons and resins, the former being characterized as paraffins, olefins and naphthalenes[4].

On the basis of a review of the literature, Dryden and others[7] contended, unlike me[8], that no tar was really primary in the sense that it contained materials related structurally to the coal, but that small, reactive fragments were first formed by pyrolysis, which built up to the more complex constituents of a tar. A 'primary' tar was one only in the sense that it contained substances formed by a relatively simple sequence of reactions. Subsequent experimental work carried out by this school, from which resemblances were found between chloroform extracts of coals heated to the plastic range and the volatile products of their vacuum pyrolysis, appears to have modified their original view. The existence of relatively primary pyrolysis products is now admitted[9], but the techniques they used did not result in the separation of hydrocarbons, and the hypothesis was put forward that these pyrolysis products were formed entirely by depolymerization of the coal.

A recent mass spectrometric study of coal vitrains by Holden and Robb confirms the earlier views that hydrocarbons contained in the coal are distilled off on heating, for the following were evolved before the main decomposition had set in: aliphatics of molecular weight 200–350, containing much cyclic material; and alkyl aromatics, including alkyl-substituted benzenes, naphthalenes and higher members. These compounds were thought to be bound in the coal in a loose, physical way, rather than chemically, and to be similar to those from chloroform-soluble extracts of coals[10].

It must, therefore, be taken as established that primary tars contain similar compounds to coal extracts containing lower molecular weight material. It has not been shown, however, how close is this relationship, qualitatively and quantitatively.

I have shown that four broad fractions were invariably present in the neutral, light petroleum-soluble portions of primary tars made from coals of low rank[11]. Their separation was later standardized as part of a method of analysis of tars based on solvent extraction and chromatography[12]. Preliminary qualitative work is here reported, undertaken to establish whether similar fractions were present in a bituminous coal as in the primary tar derived from it.

The tar was made by internal heating with hot gas of the coal[13] (Thoresby coal: orthohydrous, weakly caking, high-volatile bituminous). The neutral, benzene-soluble, light petroleum (40–60°)-soluble portion was subdivided by adsorption chromatography on silica gel with eluants in the following

Table 1. COMPARISON OF FRACTIONS FROM COAL EXTRACT AND COAL TAR

a, Coal extract fraction; *b*, coal tar fraction; (O+), oxygen and other elements by difference.

order: light petroleum (40–60°) (two fractions, the first non-fluorescent, the second fluorescent in ultra-violet light); benzene (one fraction); and ethanol (one fraction)[13]. Work is in progress on the characterization of these fractions, part of which has been published[14].

The same coal, sized between ¼ and ½ in. screens, was extracted with a benzene–ethanol mixture (70–30) for more than 50 hr. in a large Soxhlet apparatus until the percolate was virtually colourless. The yield of extract was 3·19 per cent on the coal, air-dried basis, equivalent to 3·50 per cent on the dry, ash-free basis. It is realized that these extractions were incomplete, but the method used enabled material to be obtained in sufficient quantity for a qualitative evaluation. The neutral, light petroleum-soluble portion of this extract, obtained by exhaustive extraction, was similarly subdivided by chromatography.

Table 1 gives data for the chromatographic fractions from both the coal and the coal tar. The similarity between the corresponding pairs of fractions in chromatographic behaviour, appearance, analysis and physical properties is striking. The yields of the coal extract components are less in each case than the corresponding ones from the coal tar.

The oxygen contents of all the coal tar fractions are higher than those from the coal, presumably due to the greater oxidation occurring during preparation and storage of the tar. The infra-red absorption spectra of the two fractions 4 have been found to be almost identical, both indicating the presence of free and chelated OH, aromatic structures and much alkylation. These two fractions oxidize and polymerize readily; thus, the molecular weight of that from the coal increased from 360 to 520 after storage for a few months.

This preliminary work has shown that an important part of the simpler, neutral constituents of a primary tar exists as such in the original coal. It still remains to be shown whether completer extraction of the coal will account for the whole of the remainder of the neutral, light petroleum-soluble constituents of the tar, or whether part of the latter is formed by decomposition of the coal.

I wish to thank Mrs. A. Sen Gupta and G. V. Blunt for help with the experimental work.

Organic Halides as Electron Acceptors in Charge Transfer Compounds

IN the literature several indications of the existence of directed chemical bonds between organic halogen compounds and molecules containing atoms like nitrogen, oxygen or sulphur may be found. Results arrived at during the past few years concerning the structure of addition compounds formed by halogen molecules and molecules of the latter type[1] made it appear desirable to determine the structures also of molecular compounds formed by halides.

X-ray crystallographic structure determinations have been undertaken in this laboratory of a series of solid addition compounds between electron acceptors, like iodoform or oxalyl chloride (bromide), and electron-donating molecules like dioxan, dithiane, amines and sulphur. It soon became clear that iodoform preferably makes use of the iodine atoms for the bonding to the atoms of the partner molecule exhibiting electron-donor properties. Furthermore, it appeared that the atomic arrangement—donor atom–halogen–carbon—is at least approximately linear. In some instances the bond formation results in chains extending through the entire crystal of alternating donor and acceptor molecules (for example, in dithiane-iodoform and dioxan-oxalyl halide).

Often the charge-transfer bonds are evidently very weak. Until now we had no proof of carbon–halogen distances differing from the corresponding ones in the free acceptor molecule, similar to the increase in the halogen–halogen distance observed in many addition compounds where a halogen molecule acts as the acceptor[1].

The bond distance halogen–donor atom is shorter in general than the corresponding sum of the accepted van der Waals radii, but the shortening is in some cases rather small (O—Cl, O—Br).

Representative donor–acceptor distances observed are listed in Table 1 and compared with the corresponding van der Waals values[2]. The figures given may be subject to some, but not significant, corrections after further refinements of the respective structures.

Table 1

Compound	Donor–acceptor	Donor–acceptor distance (Å.)	Sum of van der Waals radii (Å.) (ref. 2)
Quinoline-iodoform (3 . 1)[7]	N—I	2·99	3 65
S_8-iodoform (3 . 1)[8]	S—I	3·44	4 00
Dithiane-iodoform (1 : 1)[8]	S—I	3 29	4 00
Dioxan-oxalyl chloride (1 : 1)[9]	O——Cl	3 18	3 20
Dioxan-oxalyl bromide (1 : 1)[9]	O——Br	3 21	3·35

Molecules containing both donor and acceptor atoms would be expected to crystallize by forming charge-transfer bonds between the molecules. This is certainly the case in solid cyanogen bromide and iodide. Crystals of these compounds have been shown[3,4] to contain linear arrangements —Hal–C–N—Hal–C–N—. The structure determinations do not allow exact bond distances to be given. The chains, however, are directed along crystallographic axes and some conclusions may therefore be drawn from the observed lattice constants. If it may be assumed that the Hal–C and C–N distances do not differ significantly from the distances found in the free molecules (microwave measurements[5,6]), it follows that the Hal—N distances are equal to, or shorter than, 2·85 Å. (Br) and 2·80 Å. (I), with an uncertainty probably not exceeding 0·1 Å. Neutron diffraction studies of the cyanogen halides are being planned.

BIOCHEMISTRY

Enzymic Synthesis of 3-O-α-D-Glucopyranosyl D-Xylose

Transglycosylation reactions with microbial enzymes offer a facile method for the synthesis of new oligosaccharides. Following our earlier report[1] on the production of 3-*O*-β-D-glucopyranosyl D-xylose by the action of a cell-free extract of *A. niger* 152 on a cellobiose–xylose mixture, the corresponding disaccharide containing an α-glucosidic linkage has now been synthesized via the following reaction:

maltose + xylose → 3-*O*-α-glucosyl-xylose + glucose

catalysed by a transglycosylase from *Penicillium lilacinum*.

Mycelia of *Penicillium lilacinum* grown on mineral media (magnesium sulphate heptahydrate 0·074 gm., ammonium nitrate 0·1 gm., potassium dihydrogen phosphate 0·139 gm. and sodium chloride 0·001 gm. in water, 300 ml.) containing maltose (50 gm.) were harvested, washed, shredded in an Atomix and freeze-dried. A cell-free enzyme extract (3·5 gm.) prepared by disintegration of an aqueous suspension of the cells in a Mickle tissue disintegrator was incubated at 30° for 5 days with a sterile aqueous solution (150 ml.) of maltose (30 gm.) and xylose (15 gm.). After arresting enzyme action, the mixture of sugars formed was separated by chromatography on sheets of Whatman No. 3 irrigated with the organic phase of a butanol/ethanol/water (4 : 1 : 5) mixture. The band R_{maltose} 1·75 suspected to contain a reducing glucosyl–xylose was eluted and freeze-dried. Acidic hydrolysis (2 *N* sulphuric acid at 100° for 2 hr.) and paper chromatographic analysis of the hydrolysate confirmed the presence of glucose and xylose in the new component and its disaccharide character was established from the mobility[2] (*M* 0·8) of its N-benzylglycosylammonium ion. Reduction of the disaccharide (2 mgm.) with sodium borohydride (2 mgm.) and acid hydrolysis of the resulting disaccharide alcohol yielded a mixture of glucose and xylitol. Hence the disaccharide must have been a glucosyl–xylose. Its optical rotation ($[\alpha]_D^{18}$ + 87·5°, conc., 0·70 in water) and the presence of an absorption peak at 850 cm.$^{-1}$ in its infra-red spectrum established[3] that the glucosidic linkage was of the α-type. The instability to alkali of the disaccharide and the ionophoretic mobility of its borate complex[4] (M_G 0·68–0·70) both suggested that the junction of the two monosaccharide units was 1 → 3. Furthermore, the positive reaction of the disaccharide with the triphenyltetrazolium chloride reagent[5] ruled out a linkage of the 1 → 2 type. The disaccharide (9 mgm.) was treated with 4 per cent methanolic hydrogen chloride (0 5 ml.) at room temperature for 1½ hr. and the resulting methyl furanosides (6·5 mgm.: $[\alpha]_D^{18}$ + 74°, conc., 0·3 in water) isolated. Treatment with sodium metaperiodate (10 mgm. in 2 ml water) at room temperature for 36 hr., followed by addition of ethylene glycol (0·1 ml.), freeze-drying and passage down a column (15 × 1 cm.) of 'Ultrasorb', gave the salt-free periodate oxidized product (3 mgm.). Reduction of this with sodium borohydride (4 mgm.) yielded a polyalcohol containing an intact xylosyl moiety. This was demonstrated by acidic hydrolysis (*N* hydrochloric acid at 100° for 1 hr.) to yield xylose, characterized by the identity of its infra-red spectrum with that of an equilibrium mixture of an authentic specimen of D-xylose. This last experiment confirmed that the xylose moiety was linked through the 3 position and that the enzymatically synthesized disaccharide was 3-*O*-α-D-glucopyranosyl D-xylose.

Applicability of Hydroxocobalamin as a Long-acting Vitamin B12

The main difficulty in the treatment of vitamin B_{12} deficiencies has been that small doses of cyanocobalamin are inadequate to replenish the body's depleted stores and that most of the large parenteral doses are eliminated in the urine within the first 12 hr.

Consequently, attempts have been made to develop a long-acting vitamin B_{12} which could be retained in the body more efficiently than cyanocobalamin[1] by combining it with sesame oil and aluminium monostearate or by making it into a zinc–tannate complex[2].

In the search for a long-acting B_{12} preparation, we screened cobalamins in various media and in various modifications. In these investigations, which will be reported in detail elsewhere[3], only an aqueous solution of hydroxocobalamin (kindly supplied by Dr. Nathaniel S. Ritter, of the Merck Sharp and Dohme Research Laboratories, Division of Merck and Co., Inc., Rahway, N.J.) was found to possess all the features sought for in a long-acting vitamin B_{12}.

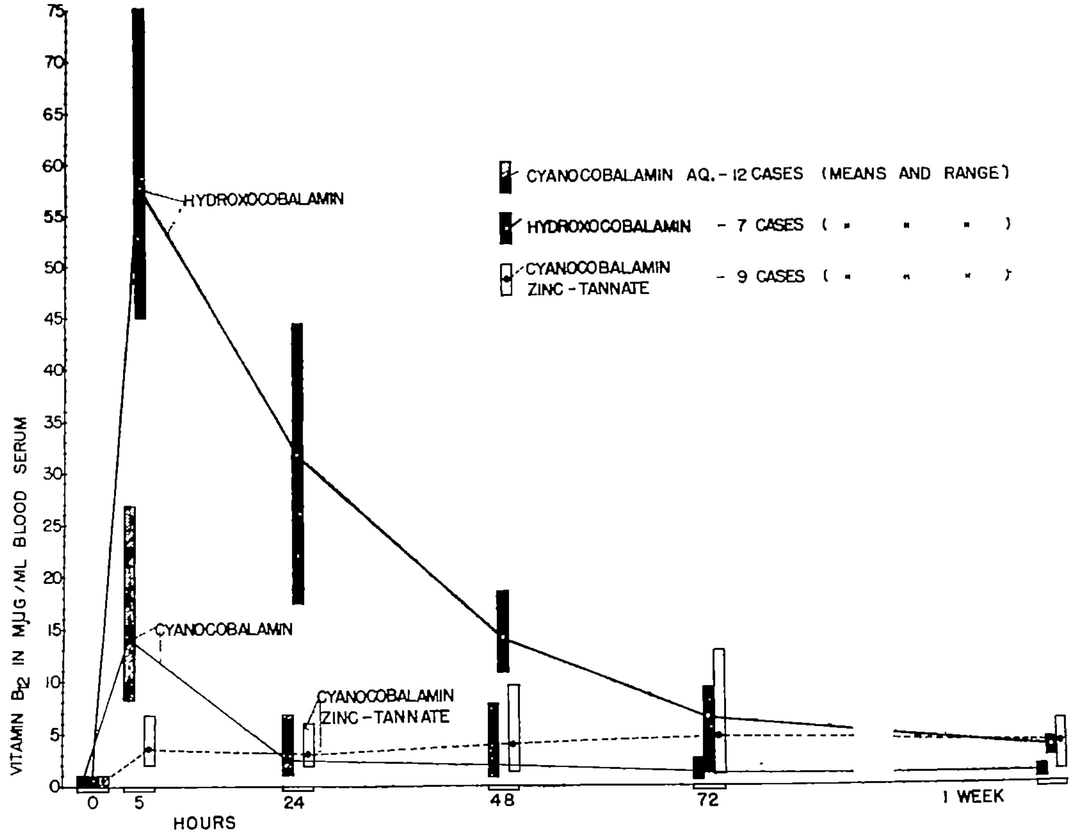

Fig. 1. Vitamin B_{12}-levels in blood serum following intramuscular injection of 1,000 μgm. cyanocobalamin, hydroxocobalamin and cyanocobalamin zinc – tannate

Since hydroxocobalamin (formerly known as vitamin B_{12a} and B_{12b}) exerts a hæmatopoietic activity approximately equivalent to that of cyanocobalamin in man[4], we made a detailed study of its absorption, deposition and excretion, and summarize here some of the results obtained.

Seventeen patients with normal B_{12}-levels in the blood and no evidence of circulatory or renal failure received hydroxocobalamin in aqueous solution; nineteen, cyanocobalamin in aqueous solution; and seventeen, cyanocobalamin zinc–tannate complex. These materials were injected in a single dose of 500 or 1,000 μgm. Blood was withdrawn, just prior to injection, and at frequent intervals afterwards.

Specimens of urine were collected during the three days after injection. In addition, 24-hr. urine specimens were obtained on the seventh, fourteenth, twenty-first and twenty-eighth days following injection. Determination of the total vitamin B_{12} values in blood serum and urine was made by *Lactobacillus leichmannii* assay[5]. In addition, six patients received alternate intramuscular injections of radioactive cyanocobalamin and hydroxocobalamin labelled with cobalt-57 and -58. For two weeks after injection, the sites of injection and several cutaneous projections of the liver were scanned for radioactivity[6] by means of a scintillation detector and gamma spectrometer.

It was found that a single intramuscular injection of 1,000 μgm. hydroxocobalamin results in an average 96-fold rise in the vitamin B_{12}-level in blood serum by the fifth hour, a 52-fold rise by the twenty-fourth hour, a 23-fold rise by the forty-eighth hour and a 10-fold rise by the seventy-second hour. For a 3-week period, the levels of B_{12} in the blood serum were significantly higher, statistically, after intramuscular injection of a single dose of 1,000 μgm. of hydroxocobalamin than after an identical dose of cyanocobalamin. While the initial levels in the blood did not show any statistically significant difference, the mean levels were 1·8 and 4·1 times higher, respectively, 5 hr. after injection of 500 or 1,000 μgm. of hydroxocobalamin, 4·6 and 12·8 times higher by the twenty-fourth hour, 2·4 and 5·2 times higher by the seventy-second hour, and 1·6 and 2·5 times higher by the second to fourth week, than after administration of identical doses of cyanocobalamin (Fig. 1). These differences were highly significant statistically, the *P* value in all instances being less than 0·001.

Compared with identical doses of cyanocobalamin zinc–tannate complex, the mean levels in blood following intramuscular administration of 1,000 μgm. of hydroxocobalamin were 15·5 times higher by the fifth hour, 10·8 times higher by the twenty-fourth hour and 3·6 times higher by the forty-eighth hour (Fig. 1). Statistically, these differences were highly significant.

Study of the urinary excretion of vitamin B_{12} following administration of cyanocobalamin and hydroxocobalamin showed that aqueous hydroxocobalamin was excreted in the urine much less rapidly than aqueous cyanocobalamin. After a single intramuscular injection of 500 or 1,000 μgm. hydroxocobalamin, only 16 and 27 per cent, respectively, are lost in the 72-hr. urines, while the corresponding losses of cyanocobalamin at equal doses and time-intervals amount to 60 and 69 per cent, respectively, of the amount injected.

Absorption of radioactive hydroxocobalamin from the site of injection is much slower than that of an aqueous solution of radioactive cyanocobalamin. Comparative studies of six individuals injected on opposite sides of the body with both materials indicate that, by 24 hr., only 0·7–2·0 per cent (and after 6 days, only 0·5–1·0 per cent) of the cyanocobalamin injected remains at the site of injection, whereas after the same time-interval, 6·0–12·0 per cent and 2·5–4·0 per cent, respectively, of the hydroxocobalamin can still be traced at the injection site. At the end of the 7–14-day interval, the hepatic deposition of radioactive hydroxocobalamin was the same as, or slightly higher than, that following injection of an equivalent dose of radioactive cyanocobalamin in the same patient.

Why hydroxocobalamin is absorbed slowly from the site of injection, why it is retained for a longer period in the body and builds up consistently high B_{12}-levels in the blood, may be explained by its greater reactivity and the formation of stronger bonds with substances in the body which bind B_{12}. This might have been suggested by the results of previous investigations into the binding of hydroxocobalamin to serum proteins[7].

The activity of hydroxocobalamin in its native state, and the higher levels at which it is maintained in the blood, make it a more desirable source of vitamin B_{12} for human use than artificial cyanocobalamin complex depot preparations. Moreover, since the equivalence of the hæmatopoietic effect of hydroxocobalamin to that of cyanocobalamin has been established[4], and its more effective retention by the body, at consistently higher levels in the blood, has been demonstrated, cogent arguments exist in support of the claim of the superiority of hydroxocobalamin over cyanocobalamin for the treatment of vitamin B_{12} deficiencies.

Later Stages of Protein Synthesis and the Role of Phospholipids in the Process

Recent work in our laboratory[1,2] has shown that lipo-amino-acid complexes are rapidly formed from amino-acids by protoplasts of *B. megaterium*, and further that these complexes have many of the properties to be expected of intermediates in protein biosynthesis. Related studies have also been reported by other workers[3–5]. We have also found that the membrane complex derived by lysis of the same protoplasts under defined conditions contains the complete apparatus of protein biosynthesis[6]. A more detailed examination[7] of this membrane complex has now shown that the bulk of the labelled protein formed after very short periods of incubation of the complex with labelled amino-acids (even a few seconds) is distributed between a phospholipoprotein fraction and ribosomal particles. However, the greater part of the labelled protein is found on the phospholipoprotein fraction, and detailed kinetic experiments[7] carried out with both whole protoplasts and the membrane complex indicate that this is both the main site of initial protein formation and that the protein formed in this fraction is passed on to form soluble protein. In this connexion, it is noteworthy that Dr. P. N. Campbell (personal communication) has evidence indicating that serum albumin synthesized in microsomes of rat-liver is formed on the membrane rather than the ribosomal component of the microsome, and it has been reported[8] that a highly labelled phospholipoprotein is rapidly formed from leucine labelled with carbon-14 by 'ribosomes' from pea-seedling cells.

On the other hand, the evidence that ribonucleic acid (RNA) plays an active part in protein biosynthesis is overwhelming, and it is the purpose of this communication to provide a hypothesis whereby these surprising results may be reconciled with current ideas on the mechanism of protein biosynthesis as outlined by Zamecnik[9] and others. After the initial stage of amino-acid activation, it seems probable from recent work[10] that there exists one RNA of low molecular weight (S-RNA) that acts as a specific receptor for each activated amino-acid, and it further seems likely[11,12] that the S-RNA–amino-acid complexes formed are transferred to an RNA molecule of high molecular weight. This RNA of higher molecular weight can be obtained in the ribosomal particles after suitable cellular fractionation has been carried out, but the work of Hanzon, Hermodsson and Toschi[13] indicates that this RNA may exist in the cell in a more extended form, a conclusion consistent with our own findings in *B. megaterium*[7]. However, for simplicity, it will be referred to here as ribosomal RNA.

The triplet hypothesis of Crick, Griffith and Orgel[14] provides a mechanism whereby the ribosomal RNA can bind and distinguish between the different S-RNA–amino-acid complexes; but a difficulty has been that the S-RNA molecules appear to be too long and complex to serve in their entirety as suitable transfer agents. However, it must be pointed out that this difficulty arises solely because it has been thought that the protein is first formed along the surface of the ribosomal RNA. If, instead, the protein is first synthesized along a phospholipid surface, this difficulty does not arise. We should like to suggest the following possibilities:

(1) That all the S-RNA chains have the same length from the point of triplet attachment to the amino-acid moiety at the end of the chain.

(2) That a phospholipid chain (presumably a phospholipoprotein membrane in most cases) is sited at a distance equal to this length from the ribosomal RNA.

(3) That the amino-groups of the amino-acid moieties can thus each make contact with only one phosphate group of the phospholipid chain. Therefore, although the phospholipid molecules themselves need possess no specificity, the sequence determined by the specific triplet attachment of the two types of RNA molecule is reproduced exactly on the phospholipid chain.

(4) That the further formation of lipo-amino-acid complexes and their condensation along the phospholipid chain to form phospholipoprotein proceed spontaneously, catalysed by the proximity of the charged phosphate groups. The structure of the whole proposed 'template' is illustrated roughly in Fig. 1, although the surfaces represented as straight lines may obviously be helical in form.

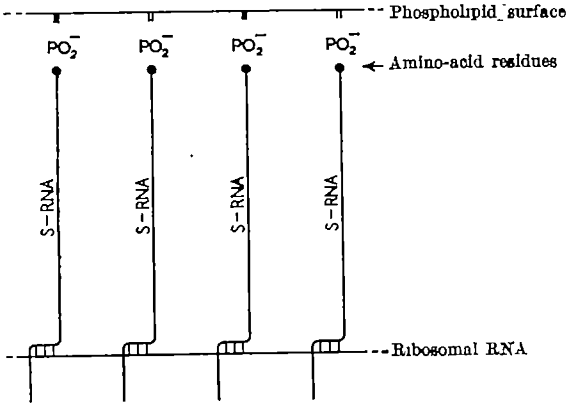

Fig. 1. Outline of structure of proposed 'template' for protein biosynthesis

In support of these suggestions, it may be pointed out that ribosomal particles prepared by detergent methods likely to remove the bulk of the lipid never seem to have activity at all comparable with, for example, pea-seedling ribosomes which apparently retain associated phospholipid[8]. Experiments *in vivo*, such as those carried out by McQuillen, Roberts and Britten[15], often seem to provide evidence that protein attached to the ribosomal RNA itself is labelled first. However, often phospholipoprotein surfaces would be destroyed by the methods of degradation used, or the material from them bound to the ribosomes themselves. The experiments of Zillig and his co-workers[16,17] in *E. coli* have indeed indicated that a lipoprotein membrane fraction (containing some RNA) is a much more active site of protein synthesis than free ribosomal particles obtained in the same experiments.

We wish to express our appreciation to Prof. J. A. V. Butler and Dr. K. S. Kirby for stimulating discussions.

An Iron Requirement for a Dissimilatory Nitrate Reductase in *Neurospora crassa*

NITRATE reduction in *Neurospora* is usually considered to be an assimilatory process. Nitrate reductase is a flavoprotein containing molybdenum, and the sequence of electron transfer has been determined as follows:

$$\text{TPNH} \rightarrow \text{FAD} \rightarrow \text{Mo} \rightarrow \text{NO}_3^- \qquad \text{(ref. 1)}$$

where TPNH is reduced triphosphopyridine nucleotide and FAD is flavin-adenine-dinucleotide. It was shown that a deficiency of iron in the felts grown under aerobic conditions did not depress enzyme activity[2,3]. In this communication we report that *Neurospora* grown at low oxygen tensions dissimilates nitrate, and under these conditions nitrate reductase is dependent on iron as well as molybdenum for maximum activity.

Neurospora crassa, wild-type 5297*a*, was grown in a modified Fries medium[2] with sodium nitrate as the sole source of nitrogen. The following methods[4] were used to remove trace metals from the macronutrients of the culture medium: phosphate co-precipitation for iron, manganese and zinc and acid copper-sulphide co-precipitation for copper and molybdenum. The fungus was grown at 25° C., in the dark, for the prescribed period and harvested in a small Buchner funnel. The felts were well washed with 2 per cent (w/v) glucose, squeezed dry and stored at − 17° C. They were ground in a cold pestle and mortar with seven times their weight of cold 0·1 *M* phosphate

(pH 7·4) and homogenized further in a Ten Broeck glass macerater.

The enzyme was assayed as follows: 0·1–0·2 ml. homogenate, 0·1 ml. 10^{-1} *M* sodium nitrate, 0·1 ml. 2×10^{-3} *M* reduced triphosphopyridine nucleotide and 0·5 ml. 10^{-1} *M* phosphate (pH 7·4). The mixture was incubated for 10 min. at 30° C. and then 0·1 ml. 6×10^{-3} *M* *p*-benzoquinone and 2 mgm. *p*-benzoquinone reductase[5] added to oxidize residual reduced triphosphopyridine nucleotide. After 4 min. 0·1 ml. *M* zinc acetate and 3 ml. 98 per cent (v/v) ethanol were added and the precipitate centrifuged at 1,000*g* for 5 min. Nitrite was determined in an aliquot of the clear supernatant solution by adding sulphanilamide and α-naphthylethylenediamine[2]. In the control tubes, reduced triphosphopyridine nucleotide was omitted. Cytochromes *b* and *c* were viewed in a Zeiss hand spectroscope and protein determined by the Folin method[6].

Two distinct stages can be distinguished during the growth of *Neurospora* in still culture. During the first stage, 2–3 days after inoculation, the felts were submerged and growing under semi-anaerobic conditions, when nitrate was dissimilated rapidly and nitrite accumulated in the felts and in the culture medium. After 3–4 days growth, however, the felts broke the surface of the culture solution and entered a more aerobic environment, and nitrite which was produced earlier was now re-utilized. The results in Table 1 show that deficiencies of either iron or molybdenum in felts at the 2-day stage reduced enzyme activity, but after 5 days growth molybdenum deficiency only depressed nitrate reductase. The results in Fig. 1 confirm the iron requirement for nitrate reduction during early growth, when the felts were submerged, since enzyme activity of the felts increased from deficiency to sufficiency levels of iron in the culture medium. The enzyme activity of 5-day felts, however, was independent of the iron status, thus confirming previous work[2,3]. Deficiencies of either copper, manganese or zinc did not decrease enzyme activity at any stage of growth.

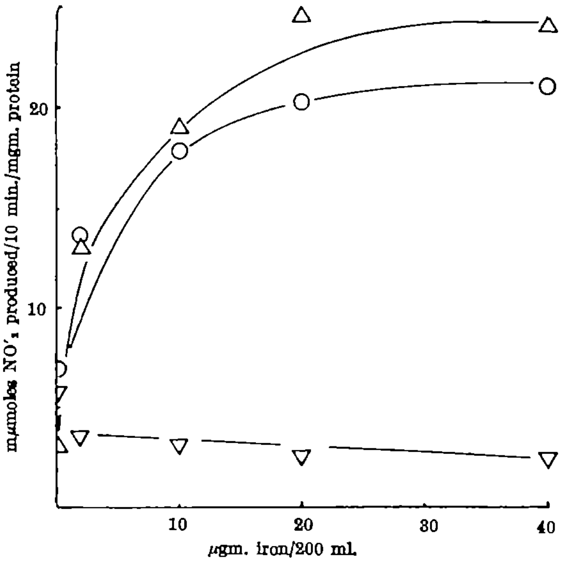

Fig. 1. Effect of the iron content of the culture medium on nitrate reductase activity in homogenates of *Neurospora crassa* harvested after 2, 3 and 5 days. *Neurospora* was grown at 25° C. in still culture depleted of iron to which 2, 10, 20 or 40 μgm./iron/200 ml. was returned. △, Felts harvested after 2 days growth; ○, felts harvested after 3 days growth; ▽, felts harvested after 5 days growth

Table 1. Effect of Deficiencies of either Copper, Iron, Molybdenum, Manganese or Zinc on the Growth of *Neurospora crassa* and on Nitrate Reductase Activity

Time of harvest (days)	Nitrate reductase and yield of the felts	Normal felts (per cent)				
		Omit copper	Omit iron	Omit manganese	Omit molybdenum	Omit zinc
2	Enzyme	100	21	98	61	103
	Yield	83	78	90	93	61
5	Enzyme	120	109	102	43	110
	Yield	49	0	67	52	8

Culture media were purified by the techniques described in the text and all the essential trace elements returned except the one to be studied. Felts were harvested after either 2 or 5 days growth in still culture at 25° C.

The effect of oxygen tension in the medium on nitrate reductase in the felts is shown in Table 2. At low oxygen tension the enzyme activity was markedly increased, nitrite accumulated and cytochromes *b* and *c* increased in the felts. The results suggest that, when oxygen is limiting, nitrate is dissimilated by an active nitrate reductase. This enzyme requires both iron and molybdenum for its activity, and in this respect it is similar to that prepared from the denitrifying bacterium, *Pseudomonas aeruginosa*[7]. During denitrification in bacteria and dissimilation of nitrate in *Escherichia coli*, the cytochrome contents of the cells increase and it is probable that they function during nitrate reduction[7-9]. A fuller account of this work is in preparation.

Table 2. Effect of Oxygen Tension in the Culture Medium on the Yield, Nitrate Reductase Activity, Nitrite and Cytochrome Contents of the Felts of *Neurospora crassa*

O_2 in N_2 (per cent)	Yield (gm. fresh weight)	Nitrate reductase (mμmoles NO_2^- 10 min./mgm. protein)	Nitrite (mμmoles NO_2^-/mgm. protein)	Cytochromes $b + c$ (relative values)
1	0·8	60·5	159	4
5	7·9	8·7	24	2
10*	9·0	2·3	9	1
21	16·8	1·3	0	1

Neurospora was grown in 500 ml. culture medium dispensed in 1½ litre Erhlenmeyer flasks. The flasks were shaken on a reciprocating shaker (100 oscillations/min.) at 25° C. and various gas mixtures of oxygen in nitrogen dispersed in the medium through a No. 2 porosity glass sinter. Felts were harvested after 3 days.

We are grateful to Dr. H. E. Davenport for determining cytochromes in the fungus. One of us (G. C. W.) is indebted to the Ministry of Agriculture, Food and Fisheries for a postgraduate studentship award.

Synthesis of L-Methionyl-L-Glutamyl-L-Histidyl-L-Phenylalanyl-L-Arginyl-L-Tryptophyl-Glycine and its Melanocyte-stimulating and Corticotropin-releasing Activity

THE occurrence of the heptapeptide, L-methionyl-L-glutamyl-L-histidyl-L-phenylalanyl-L-arginyl-L-tryptophyl-glycine, in both adrenocorticotropins (ACTH) and melanotropins (MSH)[1-3] has led to synthesis of various peptides[4-7] related to all or part of this amino-acid sequence. In recent reports[8] the synthesis of the glutamine analogue of this heptapeptide has been described, and it was shown to possess corticotropin-releasing (CRF) activity. In the course of the synthesis of a nonadecapeptide[9] which has a sequence identical with the first 19 amino-acid residues of ACTH and which possesses ACTH and MSH activity, we have synthesized the heptapeptide in its natural form and found it to have both MSH and CRF activity.

Carbobenzoxy-N^G-tosyl-L-arginyl-L-tryptophyl glycine methyl ester[7] was decarbobenzoxylated by catalytic hydrogenation and the product was coupled with carbobenzoxy-Im-benzyl-L-histidyl-L-phenylalanine[6] by the *p*-nitrophenyl ester method[10]. The resulting protected pentapeptide (I) was obtained in the form of crystalline white powder from acetone–methanol solution: m.p. 144–146° C., with sintering from 142° C.; $[\alpha]_D^{25°}$, – 22·5° (*c*. 2, in methanol); $[\alpha]_D^{25°}$, – 25° (*c*. 1, in acetone). Analysis for $C_{57}H_{63}N_{11}O_{10}S$: Calc.: C, 62·56; H, 5·81; N, 14·08. Found: C, 62·36; H, 5·61; N, 14·16.

Peptide I was catalytically hydrogenated and the product was allowed to react with the *p*-nitrophenyl ester of carbobenzoxy-L-methionyl-γ-methyl-L-glutamic acid. The latter (peptide II) was prepared by condensation of γ-methyl-L-glutamic acid[11] with carbobenzoxy-L-methionine by means of the *p*-nitrophenyl ester method[10]. Peptide II obtained in this manner was recrystallized from 75 per cent aqueous ethanol: m.p. 134–135° C.; $[\alpha]_D^{24°}$, – 17° (*c*. 2, methanol). Analysis for $C_{19}H_{26}N_2O_7S$: Calc.: C, 53·50; H, 6·15; N, 6·57. Found: C, 53·64; H, 6·16; N, 6·86.

The crystalline protected heptapeptide di-ester [m.p. 180–182° C.; $[\alpha]_D^{25°}$, – 39° (*c*. 1, 98 per cent acetone). Analysis for $C_{68}H_{81}N_{13}O_{14}S_2$: Calc.: C, 59·67; H, 5·97; N, 12·31. Found: C, 59·44; H, 6·13; N, 13·04] was saponified and then treated with sodium in liquid ammonia[13] to remove the protecting groups. The crude heptapeptide was purified by counter-current distribution in the 2-butanol–0·5 per cent trichloracetic acid system; the material with a distribution coefficient of 0·60 was isolated and shown to be the desired heptapeptide. When acid hydrolysates of the product (tryptophan was destroyed by the acid hydrolysis) were analysed for amino-acid content by the procedure of Spackman, Stein and Moore[14], the following results were obtained: $Met_{0·8}Glu_{0·9}His_{0·7}Phe_{1·0}Arg_{1·0}$-$Gly_{1·1}$. Digestion of the synthetic heptapeptide with leucine aminopeptidase[15] gave rise to the expected constituent amino-acids as determined by quantitative analysis[16]: $Met_{0·9}Glu_{0·9}His_{0·9}Phe_{1·0}$-$Arg_{1·0}Try_{1·0}Gly_{1·0}$.

On the basis of the frog skin assay procedure[17], the heptapeptide possesses an MSH potency of 1·4 × 10^6 units per gm.; a single dose of 0·0005 mgm. caused a change in melanophore index from 1+ to 3+ within 1 hr. in hypophysectomized *Rana pipiens*, as determined by the *in vivo* assay method of Hogben and Slome[18]. When 0·1 mgm. of the synthetic product was assayed by the *in vitro* adrenal method[19], it did not exhibit ACTH activity, but 0·001 mgm. was found to cause the release of ACTH from the rat anterior pituitary, in accordance with the results of the *in vitro* procedure of Saffran and Schally[20].

It is of interest that the MSH potency of the heptapeptide is considerably higher than that reported for the glutamine analogue[8]. The question of whether or not differences in corticotropin-releasing activity exist between the heptapeptide and its glutamine analogue cannot be answered satisfactorily at the present time, since there are no standard preparations or standardized assay procedures for comparing corticotropin-releasing substances.

Biosynthesis of ^{14}C-Sclareol and β-Sitosterol from 2-^{14}C-Mevalonic Acid

Salvia sclarea, a member of the family Labiatae, contains the bicyclic diterpene sclareol[1] and at least two acidic pentacyclic triterpenes[2]. From the non-saponifiable fraction, β-sitosterol has recently been isolated[3]; the plant thus provides a means of studying simultaneously the biosynthesis of diterpene, sterol and pentacyclic triterpene.

Several flowering sections of *S. sclarea* were cut 10–15 cm. above the root and the cut ends were immersed in an aqueous solution of 2-^{14}C-sodium mevalonate. (The 2-^{14}C-mevalonic acid was purchased from Isotopes Specialties, Inc., Burbank, California, and had a specific activity of 0·66 mc./m*M*. All carbon-14 determinations were carried out with a windowless gas-flow counter on infinitely thin samples plated and dried on nickel planchets 2·5 cm. in diameter.) A total of 60 μc. was absorbed. After standing over-night with continuous absorption of distilled water provided, the sections were divided into the various parts indicated in Table 1 and allowed to dry in air for one week. Each part (respectively) was exhaustively extracted with hot 95 per cent ethanol, which was afterwards distilled almost to dryness *in vacuo*. The residue was steam-distilled and the portion left, after drying *in vacuo*, was extracted with hot ligroin (boiling point 90–100°). The latter was washed with 1 per cent potassium hydroxide and water, then distilled to dryness. The residue contained sclareol and β-sitosterol. These were separated on active alumina, the sterol being removed with benzene, and the diterpene afterwards being removed with 2 per cent ethanol in benzene. From the benzene residue after distillation, sterol was precipitated by Sperry and Webb's method[4]. The crude sclareol fraction was sublimed twice at 10–30μ mercury pressure, at which stage sclareol melting at 99–102° was obtained. Table 1 shows the yield and carbon-14 content of sclareol and sterol expressed on a common weight basis, at what was considered a comparable stage of purification.

Table 1. INCORPORATION OF 2-^{14}C-MEVALONIC ACID INTO SCLAREOL AND β-SITOSTEROL OF *Salvia sclarea*

Plant part	Sclareol Yield (mgm./gm. dried plant)	Sclareol Carbon-14 (c./m./gm. dried plant)	Sterol Yield (mgm./gm. dried plant)	Sterol Carbon-14 (c./m./gm. dried plant)
Flowers	39·19	23,196	3·09	124,520
Flower stems	26 81	22,735	1 21	187,421
Leaves	2·75	7,276	1·36	11,238
Main stem	4 18	5,938	0·58	34,341
Stipules	23 81	35,198	1·45	96,498

On several additional sublimations and recrystallizations from aqueous methanol and ligroin, the specific activity of the sclareol (melting point 104–106°) continued to drop. On five-fold dilution with non-radioactive sclareol, hydrogenation under pressure in the presence of platinum catalyst, and two recrystallizations of the product from ligroin, dihydrosclareol (melting point 114–116°) with the following specific activities was obtained: flowers, 14 c./m. per mgm., flower stems, 9 c./m. per mgm., leaves, 12 c./m. per mgm., main stem, 7 c./m. per mgm., stipules, 14 c./m. per mgm. These figures indicate a very low order of incorporation of carbon-14 from mevalonic acid into the sclareol molecule. The sterol fractions, on the other hand, retained their high specific activity on an additional precipitation with digitonin. It is tempting to assume that, under these experimental conditions, the mevalonic acid was preferentially incorporated into the sterol molecule rather than into the diterpene. However, it is equally plausible that the turnover of the sclareol molecule may exceed that of the sterol, and other interpretations may become necessary as our information on the biosynthesis of terpenoids in higher plants is expanded. Efforts are in progress to determine in more detail the extent of incorporation of carbon-14 into the sterol (β-sitosterol) and acidic triterpene fractions.

This investigation was supported by a research grant from the National Institutes of Health, U.S. Public Health Service.

Utilization of the Stereoisomers of *iso*leucine by *Lactobacillus arabinosus* 17–5

IT has been reported by several authors[1-3] that *Lactobacillus arabinosus* is capable of utilizing L-allo*iso*leucine as well as L-*iso*leucine in the presence of vitamin B_6 but unable to utilize D-allo*iso*leucine, there has been only one report[4] that D-*iso*leucine was partially utilizable.

We have studied the utilization of the four stereoisomers of *iso*leucine by lactic acid bacteria such as *Streptococcus fœcalis R*, *Leuconostoc mesenteroides P*–60 and *Lactobacillus arabinosus* 17–5, which are widely used for the microbioassay of amino-acids. As a result, in contrast with the previous reports, *Lact. arabinosus* was found to be able to utilize all four stereoisomers of *iso*leucine in the presence of vitamin B_6, but not in its absence.

The medium used in the present experiment was essentially the same as described by Henderson and Snell[5], except that 0·6γ of pyridoxamine, 0·6γ of pyridoxal and 2γ of pyridoxine per 2 ml. of culture medium were used as vitamin B_6 compounds and L-isomers of amino-acids were used except for alanine, phenylalanine and serine. Incubation was carried out at 37° in test-tubes which were read at suitable intervals with a spectrophotometer at 660 mμ.

The growth-responses of the three micro-organisms to the *iso*leucine isomers in the presence or absence of vitamin B_6 are summarized in Table 1.

Table 1. GROWTH RESPONSE OF LACTIC ACID BACTERIA TO *iso*LEUCINE ISOMERS

*iso*Leucine isomers	*Lact. arabinosus*		*Str. faecalis*		*Leuc. mesenteroides*	
	$B_6(+)$	$B_6(-)$	$B_6(+)$	$B_6(-)$	$B_6(+)$	$B_6(-)$
L-*iso*Leucine	+	+	+	+	+	+
L-Allo*iso*leucine	+	−	−	−	−	−
D-*iso*Leucine	+	−	−	−	−	−
D-Allo*iso*-leucine	+	−	−	−	−	−

The concentration of *iso*leucine isomers was 2 ~ 100γ per 2 ml. tube. Incubation was carried out for 96 hr.

It is of interest that D-*iso*leucine and D-allo*iso*leucine were also utilized in the presence of vitamin B_6 by *Lact. arabinosus*. This utilization of *iso*leucine isomers by *Lact. arabinosus* was further studied in detail. Approximately the same final level of growth was attained with L-allo*iso*leucine, D-*iso*leucine and D-allo*iso*leucine as that with L-*iso*leucine at higher concentrations (Fig. 1,*A*). However, it was observed that maximum growth with L-allo*iso*leucine and D-allo*iso*leucine was attained respectively in about 24 hr. and 48 hr. longer than the time required with L-*iso*leucine. Response to D-*iso*leucine was lowest among the stereoisomers tested, and maximum growth

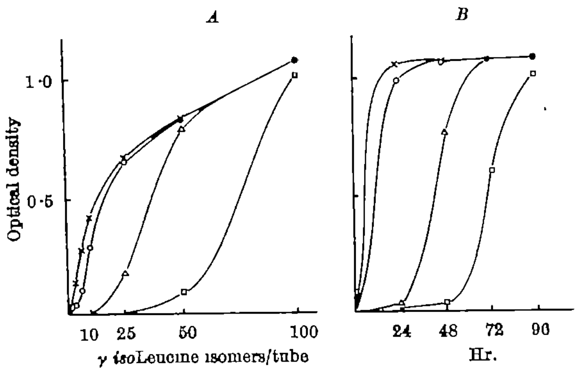

Fig. 1. Growth responses of *Lact. arabinosus* to *iso*leucine isomers. Incubation was carried out in the medium of initial pH 6 0. *A*, contained 100γ stereoisomers per tube; *B*, incubated for 96 hr. ×, L-*iso*leucine; ○, L-allo*iso*leucine; □, D-*iso*leucine; △, D-allo*iso*leucine

was reached 72 hr. later than with L-*iso*leucine (Fig. 1,*B*).

The adjustment of the initial pH of the medium to 6·0 or 5 3 resulted in more rapid growth with the stereoisomers than that of pH 6·8, as previously noted by Meister[3] in the case of L-*iso*leucine and L-allo*iso*leucine. Employment of the medium reported by Steele *et al.*[6] and the medium of Henderson and Snell[5] using mainly the DL-forms of amino-acids with modified vitamin supplement, which conformed with that of the former, resulted in slower growth response with D-*iso*leucine and D-allo*iso*leucine than that of the medium employed by us, which contained mainly L-form of amino-acids. Further work on the influence of the components of the medium revealed that the presence of excessive amounts of valine and leucine, especially the latter, inhibited the utilization of *iso*leucine isomers. This difference of the components of the media seems to account for the discrepancy between the reports on the utilization of *iso*leucine isomers. Of the vitamin B_6 compounds, pyridoxamine was most effective for the utilization of *iso*leucine isomers and pyridoxal followed. Activity of pyridoxine was lowest and was only effective for the utilization of L-allo*iso*leucine under the conditions employed by us.

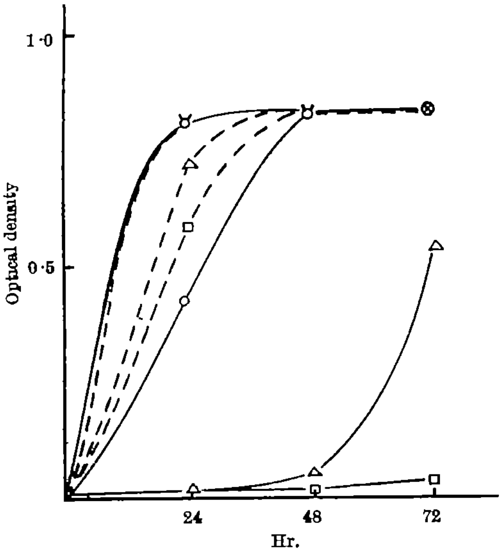

Fig. 2. Growth responses of *Lact. arabinosus* adapted for D-*iso*leucine medium and of ordinary strain to 50γ *iso*leucine isomers. ×, L-*iso*leucine; ○, L-allo*iso*leucine; □, D-*iso*leucine; △, D-allo*iso*leucine. ——, Ordinary strain; – – –, adapted strain

We also found that the strain cultured successively in the medium containing one of the other *iso*leucine isomers in place of L-*iso*leucine was able to utilize *iso*leucine isomers more rapidly than the ordinary strain cultured in the medium containing L-*iso*leucine. For example, growth responses of the strain cultured five times in succession in the medium containing D-*iso*leucine and of ordinary strain are shown in Fig. 2.

Compared with the ordinary strain, the strain adapted to D-*iso*leucine medium showed marked acceleration in response not only specifically to D-*iso*leucine but also to L-allo*iso*leucine and D-allo*iso*leucine. By employing these findings, it is possible to determine microbiologically the total amounts of synthetic *iso*leucine and allo*iso*leucine in mixtures.

A Simple Paper Chromatographic Method for Determination of Amino-Acid Activation Profiles in Tissue Preparations

THE capacity of an enzyme preparation to activate amino-acids is usually measured by means of the amino-acid dependent isotope exchange reaction between pyrophosphate labelled with phosphorus-32 and adenosine triphosphate[1]. According to the procedure usually adopted, the labelled adenosine triphosphate is separated from the other components of the incubation mixture by treatment with charcoal. The pyrophosphate of the adsorbed adenosine triphosphate is eluted by hydrolysis with hot hydrochloric acid. The radioactivity is determined and calculated per μmole adenosine triphosphate. For measurement of whole series of individual amino-acid activating enzyme activities in tissue preparations there was a need of a simple procedure which also could be used on a semi-micro scale. A scanning method was therefore developed involving paper chromatography combined with radioautography of the papergrams.

The incubation mixture contained, in a final volume of 0·25 ml.: adenosine triphosphate–magnesium chloride (1·2 μmoles), pyrophosphate labelled with phosphorus-32 (0·8 μmole), potassium fluoride (12 μmoles), *tris*(hydroxymethyl)aminomethane buffer, pH 7·8 (30 μmoles), and the enzyme preparation (0·13 ml.). Each tube also contained 0·6 μmole of the L-amino-acid to be tested. Usually, 18 separate amino-acids were assayed. The period of incubation (35° C.) varied with the activity of the enzyme preparation from 10 to 60 min. After the incubation, 0·05 ml. of the chromatography solvent (see below) was added, giving the solution a total volume of 0·30 ml. The tubes were centrifuged, and 10 µl. of the clear supernatant was applied to Whatman No. 1 chromatographic paper. The papergrams were developed in *iso*butyric acid/ammonia/water (50 : 1 : 20) for 72 hr. at 18° C. by the descending technique. The labelled adenosine triphosphate was localized by radioautography (Gevaert, X-ray film), as well as the inorganic phosphate, which was present in the labelled pyrophosphate solution used, and which to some extent was formed during incubation. Adenosine triphosphate also was outlined by use of a 'Mineralight' lamp. For quantitative determination of specific activity, radioactivity of adenosine triphosphate was measured by a thin mica window counter (Tracerlab) on a 2·4-cm. diameter circle cut from the centre of the adenosine triphosphate spot. The radioactivity of 10 µl. of the labelled pyrophosphate solution used in the experiment, but at a concentration of 0·8 µmole in 0·30 ml., was measured in the same way. The percentage exchange values were calculated by the method of Davie *et al.*[2].

A typical radioautograph is illustrated in Fig. 1. The experiment was performed with the *p*H 5 enzyme fraction of rat liver. It is obvious from the radioautograph that the intensity of the adenosine triphosphate spots already gave a fairly good indication of the activity of activating enzymes for the different amino-acids. The general information obtained in this way may be supplemented by a more exact determination of the percentage exchange values as is shown in Table 1 using purified ribonucleoprotein particles from rat liver[3,4] and S_{50}-protein. S_{50}-protein is an enzyme preparation obtained from the *p*H-5 soluble fraction of rat liver by fractionation with ethanol and ammonium sulphate[5,6]. As is shown in Table 1, there was a slight but significant stimulation of the isotope exchange between labelled pyrophosphate and adenosine triphosphate by most of the amino-acids in the system with purified ribonucleoprotein particles. As has been shown previously[6], the capacity of amino-acid activation was rather low in the S_{50}-protein preparation, except in the cases of L-proline, L-cysteine and L-tyrosine.

Table 1. ACTIVATION OF AMINO-ACIDS BY ENZYME PREPARATIONS OF RAT LIVER, MEASURED BY ISOTOPE EXCHANGE BETWEEN PYROPHOSPHATE LABELLED WITH PHOSPHORUS-32 AND ADENOSINE TRIPHOSPHATE

Amino-acid	Percentage exchange per mgm. protein: Purified ribonucleoprotein particles	Percentage exchange per mgm. protein: S_{50}-protein
Alanine	0·4	1·3
Arginine	0 1	0·1
Aspartic acid	1·1	1 7
Cysteine	0·2	7 2
Glutamic acid	0 9	0 0
Glycine	0 5	1·2
Histidine	0 6	3 3
*iso*Leucine	0 6	1 4
Leucine	2 3	0 6
Lysine	0·9	0·4
Methionine	0·5	1·5
Phenylalanine	0·1	1 2
Proline	0 0	9·0
Serine	0 4	3 0
Threonine	0·1	3·3
Tryptophan	0·6	0·8
Tyrosine	0 8	6·0
Valine	0·2	1 7

Incubation system: adenosine triphosphate–magnesium chloride (1·2 µmoles), labelled pyrophosphate (0·8 µmole), potassium fluoride (12 µmoles), *tris*(hydroxymethyl)aminomethane buffer, *p*H 7·8 (30 µmoles), and about 2 mgm. of the enzyme protein. Each tube contained, in addition, 0·6 µmole of the L-amino-acid indicated. Final volume: 0·25 ml. Incubation for 60 min. at 35° C.

Ribonucleoprotein particles of rat liver were prepared by the method of Rendi and Hultin (ref. 3) and purified (ref. 4). Before being added to the incubation tubes they were resuspended in a medium of 0·25 *M* sucrose, 0·035 *M tris*(hydroxymethyl)aminomethane buffer, *p*H 7 8, 0·025 *M* potassium chloride and 0·01 *M* magnesium chloride. S_{50}-protein was a purified preparation of the *S*-protein of Sachs (ref. 5) obtained from the *p*H-5 soluble rat liver fraction (ref. 3).

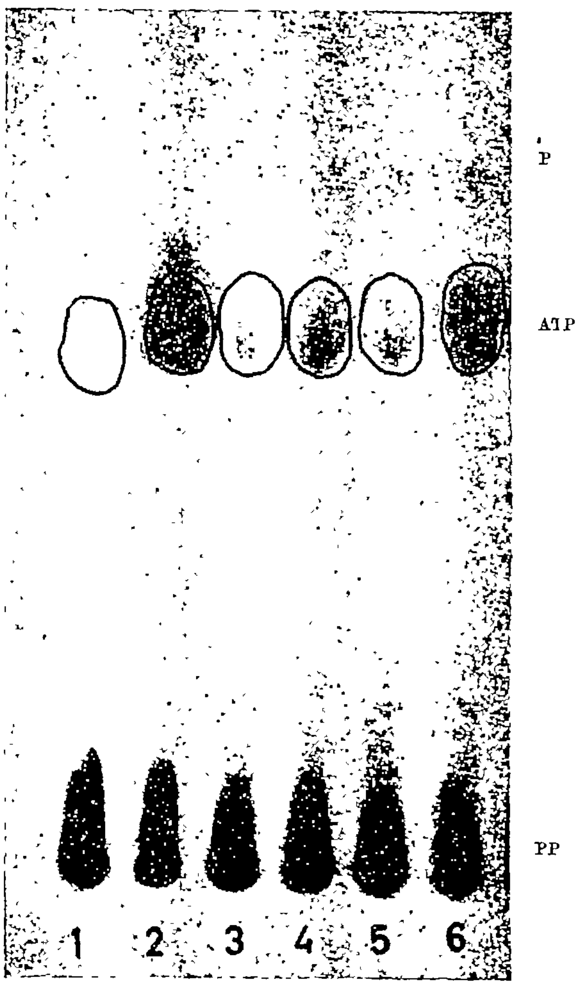

Fig. 1. Radioautograph, illustrating activation of amino-acids by the *p*H-5 enzyme fraction (ref. 2) of rat liver (0·8 mgm. protein), measured as isotope exchange between pyrophosphate-^{32}P (PP) and adenosine triphosphate (ATP). Incubation for 30 min. at 35° C. Incubation system as in Table 1. Separation of adenosine triphosphate, pyrophosphate-^{32}P and phosphate on Whatman No. 1 paper. Development for 72 hr. at 18° C., descending. Encircled areas indicate ultra-violet absorption. Samples of incubation mixtures applied on base-line contained: 1, no amino-acids; 2, amino-acid mixture of 12 amino-acids (ref. 1); 3, histidine; 4, alanine; 5, serine; 6, threonine

I wish to thank Dr. T. Hultin for his helpful advice and criticism, and Mrs. G. Beskow for technical assistance. The work was supported by a grant from the Swedish Cancer Society.

PHYSIOLOGY

Anticomplementary Action of Aspirin

THE role of complement (C') in allergy[1,2], anaphylaxis[3,4], and the possible role of antigen–antibody reactions, and thus also of C'[5] in rheumatism and general fever phenomena, induced us to determine whether classical antidotes against these diseases, like aspirin (acetyl-salicylic acid)[6], salicylic acid, quinine and cortisone, have any anticomplementary action.

For this purpose the influence was studied of solutions of these agents on the hæmolysis normally provoked by the action of guinea pig's serum (C') on sheep erythrocytes (E) sensitized with rabbit anti-sheep erythrocytes serum (A) : $EAC' \to E^*$. Standard hæmolysis tubes were filled with 0·5 ml. C', diluted 1/100; 0·1 ml. E, diluted 1/50, and 0·1 ml. A, diluted 1/100, and incubated at 37° C. during 30 min. With the standard C', A and E reagents obtained from the Pasteur Institute, Paris, complete hæmolysis was always obtained in these circumstances. The dilutions were made in Michaelis's barbital buffer, $pH = 7 \cdot 4$, $\mu = 0 \cdot 15$, containing $1 \cdot 5 \times 10^{-4}$ M Ca^{++} and 5×10^{-4} M Mg^{++}. The different dilutions of aspirin, etc., tested were also made in this buffer, and the solutions thus obtained then served to dilute the C'. In this way the total volume of the reagents was kept constant, and the material to be tested for its action on C' was brought into contact with C' before any other reagent. The results are presented in Table 1.

Table 1. THE ANTICOMPLEMENTARY EFFECT OF ASPIRIN, SALICYLATE, QUININE AND CORTISONE

	Concentration (weight/volume) giving 50 per cent hæmolysis in 30 min.	Smallest concentration completely inhibiting hæmolysis in 30 min.
Aspirin	4×10^{-4}	5×10^{-4}
Sodium salicylate	no inhibition	
Quinine	$> 5 \times 10^{-4}$	slight delay of hæmolysis
Cortisone acetate	$2 \cdot 5 \times 10^{-4}$	$3 \cdot 3 \times 10^{-4}$

It is clear from Table 1 that aspirin is the only compound tested which has a strong anticomplementary action within the normal therapeutical doses, at least so far as guinea pig serum is concerned (which contains more C' than human serum). Sodium salicylate seems to have no action at all, which seems strange, as it is still much in use in many countries, instead of aspirin. Its beneficent action (if any[7]) may perhaps be explained by an acetylation during its metabolism. Quinine, which has only a slightly retarding action on C' hæmolysis, probably owes its beneficent action to a different mechanism altogether. Cortisone acetate is only anticomplementary in rather stronger than therapeutical doses : the mechanism of its action must be complex.

We have also determined which of the C' factors is inhibited by aspirin. We suspected that the inhibited factor is C_3', because of the work of Osler *et al.*[3], and we were supported in this suspicion when $EA + (C' +$ aspirin$)$, after centrifuging three times and washing with buffer (to remove the aspirin), gave rise to hæmolysis when fresh $C' +$ ethylenediamine disodium acetate (EDTA) was added[8]. This hypothesis was confirmed by using C_4' (prepared by heating the serum at 56° C. for 20 min. and then treating it with ammonium[9]), instead of C' + EDTA, because this C_3' also caused the $[EA + (C' +$ aspirin$)]$, washed three times, to hæmolyse.

We have not up to now determined whether the inhibition of C_3' by aspirin is irreversible or reversible[10]. We have been unable to determine which C' factor cortisone acetate inhibits, for, although we have chosen this form of cortisone for its relatively good water solubility, it could not be satisfactorily removed from the sheep erythrocytes by centrifuging and washing. But we have assured ourselves that the hæmolysis-preventing action of cortisone acetate is due to its action on C', and is not an aspecific protection against hæmolysis (as is the case with cholesterol[11]). Cortisone acetate, aspirin, sodium salicylate and quinine do not protect sheep erythrocytes against hæmolysis by saponin, digitonin, or dodecyl sulphate.

Work on the action of aspirin and other substances on human C' *in vitro* and *in vivo*, and on guinea pig C' *in vivo*, is still in progress ; but it can already be concluded, in the light of the results mentioned, and in view of the work of Osler *et al.*[3], that the action of aspirin on C' can quite satisfactorily explain its multiple therapeutical benefits in various pathological states such as allergy, rheumatism and fever. Thus, quantitative estimations of this type of therapeutical activity of a great many existing and new compounds may quite easily be obtained through simple complement-hæmolysis reactions.

We are indebted to the frequent and fruitful discussions we had with Dr. A. Eyquem of the Pasteur Institute, Paris.

Note added in proof. 4×10^{-4} aspirin has since proved active against much higher C' concentrations *in vitro*. This anti-complementary action, and the lack of it in the case of salicylate, has been confirmed *in vivo*.

Possible Sources of Tartronate Deficiency in Man

SINCE exogenous tartronate (hydroxymalonate) is probably essential for the nutrition of rats[1], it has been suggested[2] that prolonged deficiency of available tartronate might result also in metabolic disturbances in man. Tartronate, which is produced only by plants[3], has chemical and physiological properties which could result in its becoming deficient in human diets. These properties are : (*a*) easy decarboxylation in hot, slightly acid solution ; (*b*) complete solubility in water; and (c) a relatively rapid rate of excretion. In the present work these sources of loss have been examined.

The loss of tartronate caused by decarboxylation may be attributed to the heating of acid foods during their preparation for consumption. To measure this effect, the homogenized samples were heated 1 hr. at 100° C., while the controls were alkalinized to *p*H 9 before the heating to prevent decarboxylation. The samples were cooled to room temperature, and the *p*H of the controls was brought back to the original value. Each was then analysed[4] for tartronic acid (Table 1). Losses were about 20 per cent for acid foods and insignificant for neutral and alkaline foods.

Table 1. LOSS OF TARTRONATE (TA) RESULTING FROM 1-HR. HEATING WITH WATER AT 100° C. OF A NUMBER OF ANIMAL AND VEGETABLE TISSUES

Tissue	Sample *p*H	Unalkalinized (mgm. TA/gm.)	Alkalinized (mgm. TA/gm.)	Loss TA (per cent)
Apple	4·0	2·78	3·27	15
Rolled oats	5·7	0·07	0·09	22
Potato	5·8	0·21	0·46	33
Corn meal	5·9	0·14	0·18	22
Tartronate	6·0	0·82	0·93	14
Rice, brown	6·3	0·25	0·30	17
Haddock	6·6	0·03	0·04	25
Milk, raw	6·7	0·25	0·27	7
Beefsteak	6·9	0·15	0·16	6
Egg yolk	9·1	0·04	0·04	0
Egg white	9·1	0·11	0·12	6

Oxidation by air during heating was eliminated as a factor, since no differences were found between evacuated and non-evacuated samples.

Discarding the water in which vegetables have been boiled results in the loss of considerable tartronate. For example, a peeled half (72 gm.) of a medium-sized potato, without further cutting, was boiled 30 min. in a covered beaker with 125 ml. of water. At the end of that time the total weight of tartronate in the potato was 5·0 mgm., while that in the water was 5·7 mgm. Thus, half the tartronate remaining after decarboxylation would have been discarded.

Volatilization with steam is relatively slight (approximately 0·06 mgm./100 gm.).

Urinary tartronate excretion was measured in serial 2-hr. samples for 12 hr. following meals containing: (*a*) about 20 mgm. and (*b*) about 650 mgm. of tartronic acid. Each meal was eaten following a 12-hr. fast. The urine samples were alkalinized to *p*H 9, evaporated to about 15 ml. and analysed for tartronic acid[4] (Table 2). The excretion-rate in this work, about 10 mgm. per 12-hr. period, was essentially the same for both meals, but represented a large fraction of the tartronate in the low-tartronate meal.

Tartronate in a stool sample was found to be about five times as concentrated as in the urine (0·028 mgm. versus 0·005 mgm. per gm.).

Table 2. URINARY EXCRETION OF TARTRONIC ACID (TA) FOLLOWING A MEAL CONTAINING: (*a*) ABOUT 20 MGM. AND (*b*) ABOUT 650 MGM. TA

Period (2 hr.)	(*a*) (mgm. TA/2 hr.)	(*b*) (mgm. TA/2 hr.)
First	1·80	3·06
Second	2·27	2·02
Third	1·44	1·80
Fourth	2·03	0·71
Fifth	0·63	1·46
Sixth	1·57	1·73
Total	9·74	10·98

Clear metabolic abnormalities are produced within two months in young rats on a tartronate-free diet, indicating that in this species, at least, exogenous tartronate may be essential to normal nutrition[1]. The first effect noted is the gradual rise in the carbohydrate-assimilatory respiratory quotients to values significantly greater than 1·00 (refs. 1, 5), accompanied by increasing obesity[1]. Minimal amounts of tartronate reduced these quotients to less than 1·00 (ref. 1). After about twelve months on the tartronate-free diet, the carbohydrate-assimilatory respiratory quotients were appreciably below 1·00 and fat formation no longer occurred[5], presumably because insulin was no longer as available for the early stages of carbohydrate catabolism. At this late stage no evident effect follows tartronate feeding. If, however, insulin is injected at the time of the test meal, high respiratory quotients are again found. A few days feeding of small amounts of tartronate can suppress this insulin effect[2]. These results and a number of low glucose tolerances suggest that at this stage an absolute or relative deficiency of insulin has supervened[2].

On the basis of results obtained with calf heart muscle, the following hypothesis has been suggested to interpret the above observations: tartronate may be a coenzyme of oxalosuccinic carboxylase in the citric acid cycle[3]; thus its deficiency in the body could result in a tendency to accumulate acetyl coenzyme *A*; much of this intermediate would be converted to fatty acids and cholesterol, requiring an abnormal amount of reduced triphosphopyridine nucleotide[6]; to supply this reduced triphosphopyridine nucleotide, an abnormal amount of glucose would have to be catabolized by the pentose phosphate route, which would require an excessive amount of insulin[7] and simulate in this respect the metabolic consequences of over-eating. If this accretion is sufficiently prolonged, disorders of the endocrine control of carbohydrate metabolism may be induced.

Whether tartronate is essential to human nutrition and, if so, whether it is possible for deficiencies to occur, are unknown, although the analogy of the obese, tartronate-deficient rat to human metabolic conditions may be significant. That losses of tartronate consistent with a mild to moderate deficiency can occur in man has been shown in this communication.

A New Green-Leaf Growth-stimulating Factor, Phyllococosine, from Coconut Milk

KINETIN[1,2] and gibberellin[3] are known to accelerate the growth of green leaf disks floated on a medium containing one of these substances. A growth factor that stimulates leaf growth has now been discovered in coconut milk.

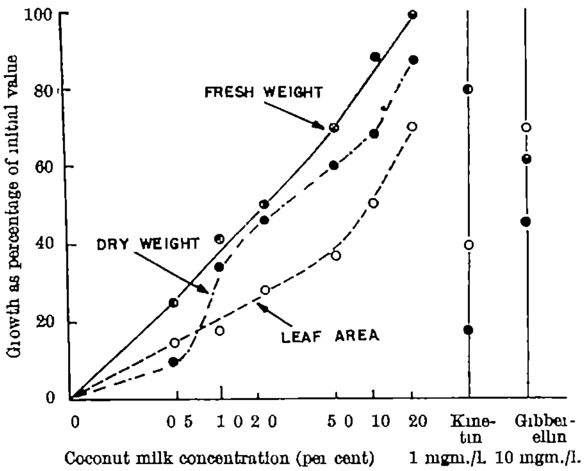

Fig. 1. Effect of coconut milk on the growth of green leaf disks. Leaf disks were incubated at 25° C. for 12 hr. under illumination of 1,000 lux. The two lines on the right show the optimum growth produced by kinetin (refs. 1 and 2) or gibberellin (ref. 3)

Raphanus sativus L. var. *acantiformis* Makino was cultured in pots in the field[1,2]. When the first foliage leaves became about 0·4–0·5 cm.^{2} in size, the pots were transferred to the dark room to increase the sensitivity of the tests, and kept there for about 24 hr. After this period, disks were punched out from the middle of the leaves with a cork borer (0·5 cm. in diameter), and each lot of fifteen disks was floated on 10 ml. of the culture solution[1,2] in Petri dishes (5 cm. diameter) and then incubated at 25° C. for 12 hr. under 1,000 lux of illumination from fluorescent tubes. The fresh weight, dry weight and leaf area of the leaf disks incubated with coconut milk were greater than those of kinetin- or gibberellin-treated disks (Fig. 1).

Growth comparisons between the media containing various concentrations of coconut milk in the presence of optimum concentrations of kinetin (1·0 mgm./l.) (ref. 1) or gibberellin (10·0 mgm./l.) (ref. 3) indicated that both gibberellin and kinetin have a synergistic effect with coconut milk (Fig. 2). When coconut milk was mixed with an equal volume of 0·1 *N* acetic acid, 0·1 *N* hydrochloric acid or 0·1 *N* sulphuric acid, and kept in the cold for 12 hr. in the dark, a considerable loss in activity resulted. The leaf-growth factor in coconut milk did not dissolve in ethyl ether, petroleum ether, benzene, chloroform or anhydrous acetone. All these facts indicate that this leaf-growth factor is different from kinetin or gibberellin.

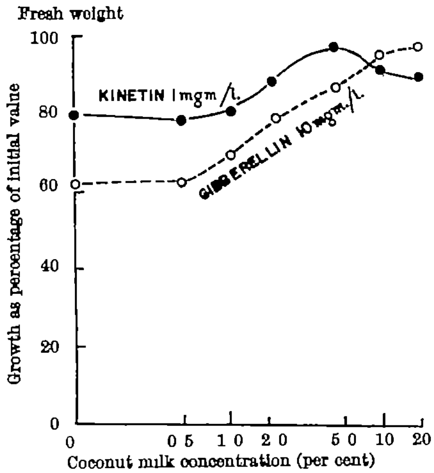

Fig. 2. Synergistic effect of coconut milk and kinetin or gibberellin Leaf disks were incubated at 25° C. for 12 hr. under illumination of 1,000 lux

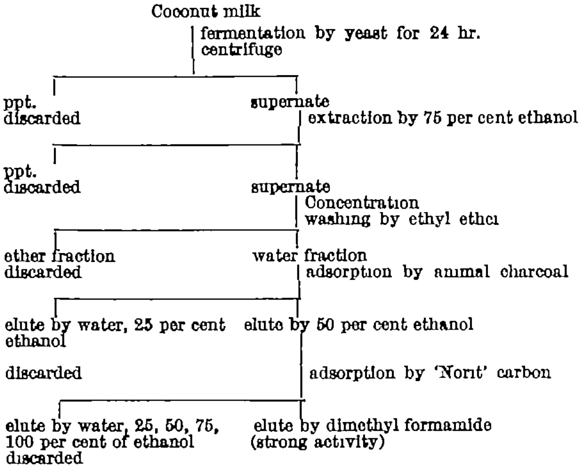
The leaf-growth factor was purified according to the scheme shown in Fig. 3, and a preparation about 2,000 times more active on a dry-weight basis than the starting material was obtained.



Coconut milk
fermentation by yeast for 24 hr.
centrifuge
ppt. discarded
supernate
extraction by 75 per cent ethanol
ppt. discarded
supernate
Concentration
washing by ethyl ether
ether fraction discarded
water fraction
adsorption by animal charcoal
elute by water, 25 per cent ethanol
elute by 50 per cent ethanol
discarded
adsorption by 'Norit' carbon
elute by water, 25, 50, 75, 100 per cent of ethanol discarded
elute by dimethyl formamide (strong activity)

Fig. 3. Purification of coconut milk factor

The cell-division factor from coconut milk has been extensively purified[4] and the activity has been reported to be precipitated with mercuric or lead acetate. The leaf-growth promoting factor lost its activity on treatment with these compounds (hydrogen sulphide was added to remove the excess mercuric or lead ion).

We conclude that this leaf-growth factor in coconut milk is a new growth factor and propose to name it 'phyllococosine'.

We thank Prof. T. Yamaki, of the University of Tokyo, for his criticisms.

Differential Sublimation Rates of Light and Tritium-labelled Water

WATER is an important component of the body, and the only one that can be measured directly. Body water is also useful, however, to obtain an estimate of body fat. Body water plus body density information enables one to estimate body fat with a precision of approximately 2–4 per cent when the following equation is used:

$$\text{Percentage fat} = (2{\cdot}118\,D - 0{\cdot}780\,TBW - 1{\cdot}354) \times 100$$

where D is the density of the body, and TBW is the total body water, as a proportion of body weight[1].

A valid and reliable method for measurement of total body water with a liquid scintillation spectrometer was sought in order to evaluate changes in body composition in man which occur as the result of restriction of calories and other experimental regimens. Others[1,2] have reported that tritium may be used successfully as a solute to determine total body water. The method depends on vacuum sublimation of tritium-labelled plasma to obtain suitable samples of plasma water for liquid scintillation radioassay. Since sublimation to virtual dryness requires one or more hours, it was felt that time might be saved if a shorter collection period would give the same specific activity as complete sublimation. Credence was attached to this approach because it has been observed that distillation of urine containing tritium in specially shaped vessels failed to produce a significant difference in isotope concentration in serial distillation samples[3]. When the procedure for vacuum distillation[2] was sequentially interrupted and fractional collections were obtained, it became apparent that progressive tracer enrichment of the sublimate occurred. Further, the geometry of the glassware used for sublimation altered the rate of enrichment. Although the phenomenon of tracer enrichment has long been known and has been effectively used for isotopic separation by fractionation[4], it seems important to direct attention now to this significant source of error in incomplete sublimation in view of increasing interest in determinations of body composition.

A sample of tritium-labelled water of known concentration was placed inside a Florence flask (first apparatus), which was then rotated in a dry ice and ethanol bath to freeze the sample in the shape of a thin spherical shell. The flask was connected to a vacuum system in which vapour released from the sample was collected by a trap immersed in dry ice and ethanol. The vapour trap was frequently replaced by a new one, and whatever ice had collected in each vapour trap was melted, removed, mixed, and radioassayed with a liquid scintillation spectrometer. The total procedure was repeated twice, and the normalized average results are given in Table 1*A*.

The sublimation procedure was also repeated in a second apparatus, the sample vessel of which was tubular rather than spherical. The sample was frozen in this vessel in the shape of a solid cylinder rather than a hollow sphere. With this second apparatus, the ratio of exposed area to sample volume was such that the sample melted before sublimation was completed. Later fractions were therefore condensates of the evaporated vapour from the liquid sample. The sublimation was repeated twice, and the normalized average results are given in Table 1*B*.

Table 1*A* indicates that on the average as the sublimation proceeded, each sublimate fraction contained an increasing concentration of tritium. The sample taken at the beginning of the sublimation had the lowest specific radioactivity, and the sample taken at the end of the sublimation showed the highest specific radioactivity (arbitrarily designated 100 per cent). The mean percentage difference between the first and last collection was 8 per cent.

Table 1. Results of Three Separate Sublimations (*a*, *b*, *c*) with Each of Two Apparatus Models

A, First apparatus (spherical flask)

Sublimation fraction→	1		2		3		4	
	C mμc./gm.	*N* %	*C*	*N*	*C*	*N*	*C*	*N*
Sublimation mixture *a*	9·09	93	9 20	94	9·54	98	9 73	100
b	50 2	92	52 4	96	50·0	91	54·8	100
c	50 2	91	50 5	92	—	—	55 0	100
Mean percentage		92		94		95		100
Time (min.)		10		34		51		92

B, Second apparatus (tubular flask)

Process →	Sublimation			Melting	Evaporation		
Sublimation fraction→	1	2	3	4	5	6	7
Sublimation mixture *a*	95%	95%	100%	92%	90%	95%	100%
b	86	91	100	97	93	97	95
c	96	96	95	—	96	99	100
Mean percentage	92	96	98	95	93	97	98
Time (min.)	16	32	52	68	83	107	Residue

Each value represents the mean radioassay of five aliquots of each sublimation fraction. Values are in percentages of the most radioactive sample (rounded to two significant figures). *C*, mean concentration of tritium found, in mμc. per gm. of sample; *N*, normalized mean concentration of tritium (per cent); time, mean time elapsed from the beginning of the sublimation to the termination of collection of each fraction, in minutes.

Thus, the maximum variation from the mean concentration for the entire collection was 4 per cent. Estimated total body water would therefore vary by 4 per cent if only the results from the first collection were used for the estimation.

Table 1*B* also indicates that on the average the concentration of tracer in the sublimed fractions increased with time of collection, for the first three fractions. During the collection of fraction 4, the sample melted and the liquid sample bubbled, so that the sample was physically re-mixed. The majority of the trapped specific activity from fractions five to seven was condensed from the vapour of the liquid sample, and again showed a progressive increase with time. Comparison of Tables 1*A* and *B* reveals that the variation of specific activity with time depended on the geometry of the system. Results were highly variable with the second apparatus.

In summary, one cannot predict in advance from the shape of the sample flask what the concentration of tracer in a particular fraction of the sublimate might be; but it is apparent that the concentration of tracer in a single fraction is not likely to be representative of the concentration in the total volume recovered from the sample. Errors in the sublimation are minimized by removing as much water as possible from the sample of biological fluid subjected to the sublimation procedure. Alternatively, in order to save time, a correction curve might be determined for a specific sublimation procedure, if it should be desirable to obtain only a partial sublimate for radioassay. To simplify interpretation of such a correction curve, the ratio of surface to volume of the frozen sample should be relatively large, as in a spherical flask, in order to secure reproducible results. The difference between the value of mean specific activity obtained from a correction curve and from total sublimation should be no more than 2 per cent, whereas using only the first collection from the spherical flask the variation was 4 per cent. Although it might have been predicted that an enrichment effect would have been observed both because of (1) the difference in vapour pressure of tritium-labelled water and light water at given temperature and pressure[5], (2) Graham's law, in practice this enrichment effect may or may not[3] be found, depending on the apparatus and conditions for sublimation or evaporation.

RADIOBIOLOGY

Dose–Response Relationship in Radiation Carcinogenesis

The question whether the dose–response relationship for neoplasia induced by ionizing radiations is linear or non-linear, and with or without a threshold dose, is one of the most important problems in both basic and applied radiobiology[1].

From the experimental knowledge now available[2], and especially from the results of chromosome work of the past few years, more and more evidence indicates that in all forms of neoplasia the key step is an irreversible change in the genetic apparatus of the somatic cells, that is, a somatic mutation, consisting in cytogenetical loss caused by interference with the synthesis and functions of the deoxyribonucleic acid of the chromosomes, leading, presumably, to the deletion of growth-controlling and/or regulatory proteins as well as to the loss of tissue-specific antigens.

It has generally been tacitly assumed that this somatic mutation hypothesis for induced carcinogenesis implies a linear dose–response relationship for small doses. However, it has been pointed out (see, for example, refs. 3 and 4) that this is not correct, but that the somatic mutation hypothesis may lead to non-linear dose–response relationships when the effects are taken into account of such phenomena as indirect free-radical energy transfers, the toxicity of the carcinogenic agents which kill certain of the cells, the various adaptive mechanisms of the cells whereby they defend themselves against the carcinogenic potency of the agents, such as reunion of broken chromosomes, production of antibodies, physiological recovery factors, inter- and intra-molecular transfers of ionization-electrons and excitation energies, and so forth[5].

Thus, from a direct one-hit form of the somatic mutation hypothesis previously worked out[3,6], it follows that for radiation carcinogenesis the response R (fraction of animals showing at least one tumour among a test sample) is a function of the applied dose D (in arbitrary units) given theoretically by:

$$R = 1 - \exp\left[-\frac{k\exp[-\mu D]D}{\alpha}\right], \quad \alpha = \alpha_e + \alpha_a \quad (1)$$

Here k is the specific carcinogenicity constant measuring the carcinogenic potency of the agent for given species of test animal, genotype, phenotype, tissue and type of tumour; μ is the toxicity constant measuring the degree of toxicity of the agent; α_e is the elimination constant measuring, in the case of radiation from internally applied radioisotopes, the physical decay and metabolic elimination of the agent; α_a is the adaptation constant measuring the degree of adaptive power of the cells.

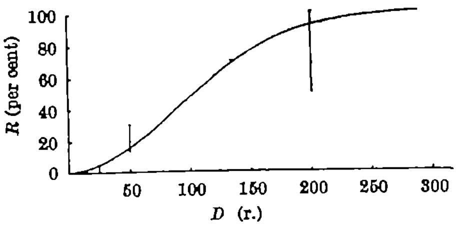

Fig. 1

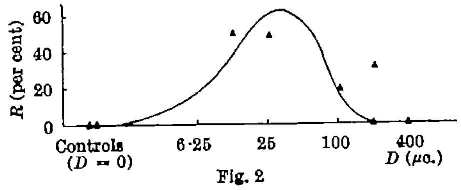

Fig. 2

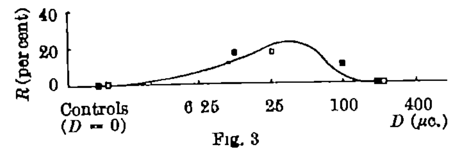

Fig. 3

Whether a threshold dose exists or not in radiation carcinogenesis cannot be decided experimentally but only on theoretical grounds, as pointed out by Mole[4]. We see from equation (1) that no threshold is required in the direct one-hit form of the somatic mutation hypothesis. However, as shown below and in Figs. 1–3, the existence of such a threshold may be simulated in certain cases by the fact that the form of equation (1) may lead to such small values of R for small doses that they are unobservable in the small samples of test animals generally used in experimental carcinogenesis.

For increasing radiation doses, the defence mechanisms of the cells may be expected to be interfered with and weakened, and thus the adaptation constant α_a will, presumably, decrease with increasing doses. If, tentatively, we make the simple assumption about this variation that α_a is inversely proportional to the dose D:

$$\alpha_a = \beta/D \quad (2)$$

we get dose–response curves which, for $\alpha_e \ll \alpha_a$, show sigmoid form, varying for small doses as D^2, and for $\alpha_e \gg \alpha_a$ are linear for small doses. Inserting (2) into (1), we can calculate the theoretical dose–response curve and compare it with experimental values by graphical fitting of the three parameters α_e/k, β/k, and μ. (The value of the parameter k can be obtained when the induction-time versus dose curve is fitted.) In Fig. 1 we show as an example $R = R(D)$ with $\alpha_e = 0$, $\mu = 0$, and $k/\beta = 6{\cdot}4 \times 10^{-5}$ fitted to the experimental values of Deringer *et al.* discussed by Mole[4]. In Figs. 2 and 3 we show as two other examples $R = R(D)$ with $\alpha_e = 0$, $\mu = 0{\cdot}06$, and $k/\beta = 6{\cdot}4 \times 10^{-3}$ and $\frac{1}{4} \times 6{\cdot}4 \times 10^{-3}$, respectively, fitted to the experimental values of Lindsay *et al.* discussed by Mole[4].

We see from Figs. 1–3 that the direct one-hit form of the somatic mutation hypothesis actually leads to a sufficiently flexible dose–response curve—without, but in some cases simulating, a threshold—which can be fitted with qualitative agreement to experimental values showing not only a linear form, but also a sigmoid form, and a form with a maximum. Thus radiation carcinogenesis does not even theoretically show one and the same form of the dose–response curve common to all cases, but the form varies from case to case, depending on the experimental conditions and the relative importance of the effects of toxicity, elimination and adaptation in each specific case.

More detailed experimental knowledge elucidating directly the toxicity effect, the elimination effect, and the adaptation effect is, therefore, necessary in each case before reliable conclusions can be drawn regarding the form of the dose–response relationship and its further application, such as for estimations of radiation hazards.

Action of Neurohypophyseal Hormones on the Sodium Fluxes of a Freshwater Teleost

THE presence of hormones showing oxytocic and vasopressic activities in the neurohypophysis of teleosteans has been known for some time[1]. The intervention of the hypothalamo-hypophyseal complex in the regulation of the hydro-mineral balance in teleosteans has been recently proposed as a result of histological studies on neurosecretion[2]. The biological role of the hormones secreted by this complex, however, remains unknown: no antidiuretic or water-balance effect has been shown in these animals[3]. On the other hand, teleostean neurohypophyseal extracts are known to be active in certain Amphibia not only on the water metabolism[4], but also on the active sodium transport exhibited by the skin[5]. The object of the present work was to study whether, failing a clear-cut effect on water metabolism, the role of these hormones in fish is in fact concerned with sodium exchange across the gills.

The experiments were carried out on the freshwater teleost *Carassius auratus* L. The net flux, influx and outflux of sodium in a freshwater fish can be calculated by a quantitative analysis of the changes in the external medium over a period of time of the concentrations of sodium-23 and -24 added as a tracer[6]. These determinations were made over a short range of time (8 hr.) so that the radioactive outflux of the fish could be considered as negligible in the calculations. The experiments were carried out on four groups, each of six fishes (average weight of a fish, 80 gm.), placed in aerated aquaria containing 4 l. of running tap-water. The determinations of the sodium fluxes were carried out simultaneously in the four aquaria over a period of one month (March–April 1960). Each week, one of the groups acted as a control, the fishes receiving injections of a 0·9 per cent aqueous solution of sodium chloride, while the other groups received hormonal extracts. On successive weeks, different groups of fish were chosen as controls. Of the groups of fish receiving hormonal extracts, at least one was injected with acetic extract of acetonic powder of *Carassius* hypophysis (equivalent to 1 mgm. of dry powder containing 60 mU. oxytocic activity[7] per animal), or with a similar extract of *Carassius* neurohypophysis (0·1 or 0·2 mgm. powder containing 45 or 90 mU. oxytocic activity per animal). The remaining groups received either synthetic oxytocin ('Syntocinon', Sandoz) at doses of 150 mU. or 1 U. per animal, or vasopressin ('Pitressin', Parke-Davis) at doses of 400 mU. per animal.

Fishes show a marked 'shock-effect' at any disturbance, which results in an upset of their mineral balance[6,8,9], to avoid which certain precautions had to be adopted in all experiments. The fish had had 15 days adaptation in the experimental aquaria before the beginning of the measurements, and the aquaria were isolated from laboratory disturbances by a screen. The addition of radiosodium (after stopping the water circulation) and the removal of water samples every 2 hr. were carried out by remote control. Finally, the intra-muscular injections were made 17 hr. before the flux determinations.

The results are shown in Fig. 1 and Table 1. In Fig. 1, the changes with time in the external radiosodium concentration are shown on the left, and those of the external sodium-23, measured by flame-photometry, on the right. In all the experiments, these relationships were linear functions. A comparison of the regression lines corresponding to the four groups when acting as controls (black circles) with those when the groups had been treated with *Caras-*

Table 1. ACTION OF *Carassius* HYPOPHYSEAL EXTRACTS AND OF MAMMALIAN HORMONES ON THE SODIUM FLUXES OF *Carassius auratus*

	Doses	No. of determinations	Influx (μgm./hr.)	Net flux	Outflux
Controls	—	4	149 ± 33*	−13 ± 27	162 ± 27
Carassius extracts	45–90 mU. (oxytocic)	4	325 ± 7	+181 ± 19	144 ± 13
Oxytocin	150 mU.	2	290	+5	285
	1 U.	1	372	+162	210
Vasopressin	400 mU.	1	231	+87	268

* *S.E.*

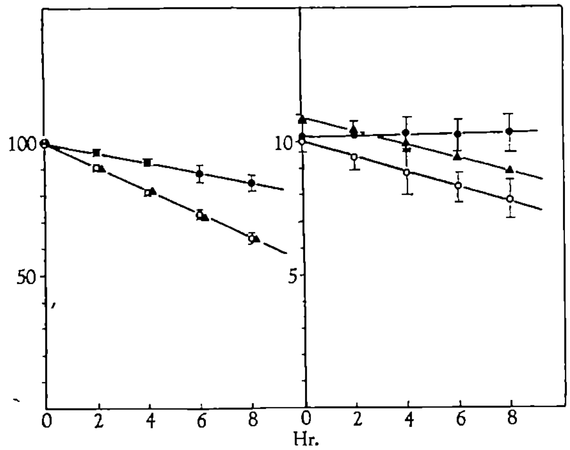

Fig. 1. Changes with time in the external media of fishes injected with neuro-hormonal extracts. Left, changes in the sodium-24 concentration (in per cent of the initial radioactivity); right, changes in the concentration of sodium-23 (μgm./ml.). Black circles, controls; white circles, after injection with *Carassius* hypophyseal extracts: black triangles, after injection with 1 U. oxytocin. The standard error of the measurements is indicated

sius extracts (white circles) shows that the slopes are significantly different for both sodium-23 and -24. In the controls, the net flux per animal is around zero: $f_{\text{net}} = -13 \pm 27$ (*S.E.*) μgm./hr., while the influx is 149 ± 33 μgm./hr. After injection with the *Carassius* extracts, the concentration of external sodium-23 falls in all the groups, indicating a positive net flux: $+181 \pm 19$ μgm./hr., while the average influx becomes 325 ± 7 μgm./hr. These increased fluxes are significantly different from the control values ($t = 5{\cdot}9$ and $P < 0{\cdot}001$ for f_{net}; $t = 5{\cdot}35$ and $P = 0{\cdot}001$ for the influx). The sodium outflux, that is $f_{\text{in}} - f_{\text{net}}$, on the other hand, remains unchanged: $f_{\text{out}} = 144 \pm 13$ in the treated fish, compared with 162 ± 27 μgm./hr. in the controls ($t = 0{\cdot}55$ and $P = 0{\cdot}6$).

The injection of oxytocin (1 U. per animal) results in an effect comparable with that obtained after injections with *Carassius* extracts. The change in external radiosodium concentration (black triangles) is identical and the slope of the linear regression line, indicating the change in concentration of external sodium-23, is similar to that obtained after hypophyseal extract injections.

Thus both *Carassius* hypophyseal and neurohypophyseal extracts and oxytocin stimulate the influx of sodium and, the outflux remaining unchanged, the result is a net uptake of sodium. The action of these hormones on the gills of teleosts is thus identical with their action on the skin of Amphibia: that is, the hormones stimulate the active influx of sodium against the concentration gradient, while the passive outflux remains unaffected.

The results given in Table 1 show that only *Carassius* extracts and oxytocin produce a clear-cut increase in sodium uptake, and that the extracts are much more active than would be expected from their actual oxytocic activity. On the other hand, vasopressin has very little activity. It would seem probable, therefore, that the neurohypophyseal principles of the fish, which are active in the mineral metabolism, are different from the mammalian neurohypophyseal hormones. The same conclusion has already been advanced by Maetz *et al.*[5] from a comparison of the activities of the hypophyseal extracts of various teleosteans with those of mammalian hormones on the active transport of sodium across frog skin ('natriferic activity'). From various investigations on the 'water-balance effect' in the frog, Heller[4], and more recently Pickering and Heller[10], Sawyer *et al.*[11], Sawyer[12], conclude that in amphibians and teleosts a 'water-balance principle' occurs, which is different from any of the mammalian hormones. Nevertheless, the biological role of the new hormone(s) would appear to be related, in any event in the teleosts, much more to the sodium than to the water exchange.

CYTOLOGY

Implication of Chromosome Structure and Replication on Hazard of Tritiated Thymidine and the Interpretation of Data on Cell Proliferation

LABELLING of chromosomal deoxyribonucleic acid (DNA) with tritium-labelled thymidine (H^3TDR) demands consideration of the probabilities of long-term retention of the label and damage to somatic and genetic cells. These are important for the interpretation of results and for consideration of hazards associated with the use of tritiated thymidine in human beings. The model proposed by Taylor, Woods and Hughes[1] permits prediction of the persistence of the label, an implication which has not been adequately explored in previous publications by ourselves and others[2–4]. The model is based on autoradiographic observations on plant chromosomes labelled with H^3TDR during replication. In this model each chromosome is considered to consist of two halves (chromatids), both of which replicate. If H^3TDR is available during DNA synthesis for a finite period, both half-chromosomes will be labelled in their newly formed replicas. On division, all chromosomes of the daughter cells will contain the label in the newly replicated chromatid. Subsequent DNA synthesis proceeds without further availability of H^3TDR, and newly formed replicas of both labelled and unlabelled chromatids will be unlabelled.

In the daughter cells of the second division, on the average half the chromosomes will be labelled, each composed of one labelled and one unlabelled chromatid. After each subsequent division the number of labelled chromosomes per cell will be halved as the originally labelled chromatids become distributed among twice the number of cells. When the synchronously dividing progeny of a labelled cell first exceeds the chromosomal number, the fraction of labelled cells will begin to diminish, since an increasing number of cells will contain a single labelled chromatid which cannot subdivide, but must go to one daughter cell, leaving the other totally unlabelled. The expected decrease has been computed on the basis of equal distribution among daughter cells and studied experimentally in a transplantable mouse tumour by Mendelsohn[5]. The only assumption made is the non-exchangeability of DNA. This is true at the molecular level. However, exchange of part of a labelled chromatid with the corresponding portion of its unlabelled replica has been demonstrated autoradiographically in plant cells[1]. This results in redistribution of the label among a larger number of chromosomes. The extent of crossing-over in somatic and genetic cells of man is not known, but it is unlikely to approach a random distribution, as would be expected of exchangeability on a molecular level.

If one accepts this model, disregarding crossing-over for the purpose of this discussion, it may be expected that the labelled chromosomes will be randomly distributed among the daughter cells at each mitosis. Assuming that the movement of each labelled chromosome to one or the other pole of the spindle is equally likely and independent of the movement of any other chromosome, the probability of occurrence $f_k(x)$ of cells with x labelled chromosomes after k generations can be shown to follow a binomial distribution :

$$f_k(x) = \binom{n}{x}\left(\frac{1}{2^{k-1}}\right)^x\left(1 - \frac{1}{2^{k-1}}\right)^{n-x}$$

or

$$f_k(x) = \binom{n}{x}\frac{(2^{k-1} - 1)^{n-x}}{2^{(k-1)n}}$$

where n is the chromosome number. These discrete distributions have been computed for the human chromosome number 46 and are represented in Fig. 1 for the second to fifth division. In Fig. 1 the individual points $f(x)$ for each generation are joined for easier visualization. The most frequent number of labelled chromosomes per cell in successive generations is 23, 11, 5 and 2, the expected means being 23, 11·5, 5·75 and 2·87.

As can be seen from Fig. 1, about 5 per cent of cells have 0 labelled chromosomes after the fifth division. After the sixth division (not shown here), the most frequent number of labelled chromosomes is 1, and about 23 per cent of the progeny can be expected to be unlabelled. Without the influence of the random distribution of chromosomes, unlabelled cells would not appear until the seventh division. Thus, as the modal number of labelled chromosomes per cell approaches zero, the random distribution of chromosomes will favour an earlier appearance of unlabelled cells than the aforementioned decrease in the fraction of labelled cells due to the indivisibility of the originally labelled chromatids.

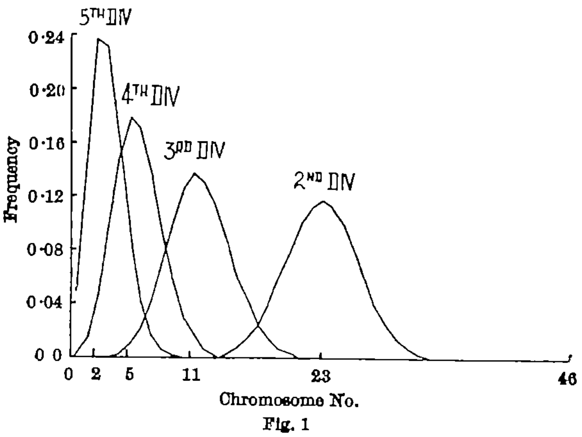

Fig. 1

Another feature of somatic cell proliferation is that a substantial portion of the progeny mature into non-proliferating cells which differentiate and die or are lost from the body, thus removing the labelled DNA.

The number of cells carrying the radioactive label in the DNA is thus continuously reduced in somatic proliferating systems such as marrow, lymphoid tissue and gastro-intestinal mucosa in three ways. There is continued loss of labelled material through death or loss of the non-dividing progeny of labelled cells ; without consideration of random distribution of chromosomes, the percentage of labelled cells is reduced continuously in an exponential manner, once the progeny exceeds the chromosomal number, because the label is not homogeneously re-mixed with all the DNA during each doubling period ; and the random distribution of labelled chromosomes among daughter cells favours an even earlier appearance of unlabelled cells among the progeny.

It has not been established that the model proposed by Taylor, Woods and Hughes pertains to mammalian chromosomes. It is now under study in tissue culture systems of human cells. If the expected agreement with the Taylor–Woods–Hughes model is confirmed, it will have a direct bearing on the interpretation of data in the study of cell proliferation, and the somatic and genetic hazard of H^3TDR in long-term work.

Chromosome Anomaly in Two Cases of Cerebral Palsy, a Brother and a Sister

THE unsolved question of the source of many human congenital anomalies has recently received great impetus from the cytological aspect. This is largely due to an improved chromosome spreading technique which led to the establishment of the correct chromosome number in man[1]. Further evidence that a change in chromosome number was responsible for the phenotypic expression of certain clinical entities[2] stimulated the application of this

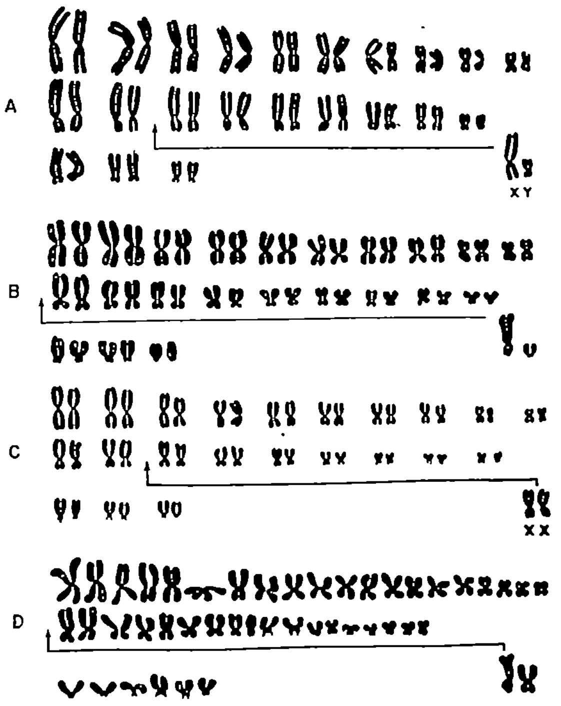

Fig. 1. *A*, Normal male; *B*, affected male; *C*, normal female; *D*, affected female. The arrows indicate the position of the *X*-chromosome in order of size and shape in relation to the centromere. The position is sixth or seventh in the ideograms of the normal children and third or fourth in the ideograms of the affected children

approach to cases of cerebral palsy of unknown or so-called developmental etiology.

In the course of our investigation of the hereditary aspect of cerebral palsy a brother and a sister came to our notice. In addition to an unusual aspastic spastic type of cerebral palsy, these children also had congenital cataract of the nuclear and posterior capsular type. After intensive investigation of this family, a rare recessive autosomal type of inheritance was reported[3]. However, recent work on metaphase plates obtained from peripheral leucocytes grown in tissue culture by a modification of the Hungerford *et al.*[4] technique showed uniform counts of 46 chromosomes in both children. Ideogram arrangements (Fig. 1) of chromosomes according to position of centromere consistently demonstrated an abnormal morphological configuration of one of the larger chromosomes with a subterminal centromere. No apparent homologous chromosome could be established for this abnormal-looking chromosome in either the boy or the girl.

Ideograms of both cases were carefully analysed and compared with those obtained from normal children of the same sex and age. Inspection of these ideograms (Fig. 1) seems to place the long unpaired subterminal chromosome in the position of the *X*-chromosome in relation to the other autosomes. Of course, the difficulty of differentiating the *X*-chromosome from some of the other elements in the complement is well recognized by cytologists.

Since both parents are phenotypically normal, a translocation on the *X*-chromosome in the mother was considered as a possible mechanism responsible for the condition in the children. The *X*-chromosome in the boy must have come from the mother, and obviously the girl also received this particular *X*-chromosome from the mother. If this theory is correct, it must be assumed that this abnormality occurred in the mother in early embryological gonadal development.

The slightly greater degree of involvement demonstrable in the boy might be due to the heterozygous sex chromosome in the male. Presumably the girl received a normal *X*-chromosome from the father and conceivably this may make a slight difference in phenotypic expression. The fact remains that there is a striking similarity in the children as to their general physical and facial appearance, their motor and cataract involvement, their mental performance, as well as the presence of the same 'abnormal' chromosome.

BIOLOGY

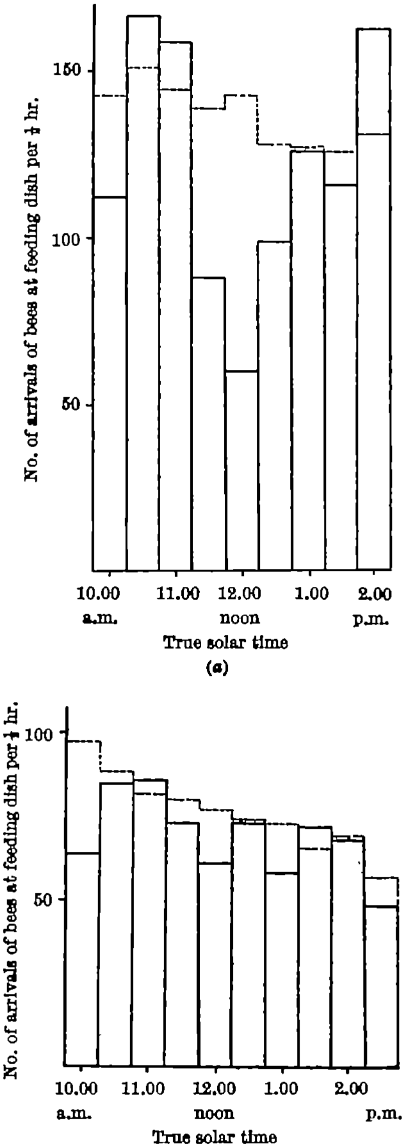
Honeybee Communication when the Sun is Close to the Zenith

THE work of von Frisch[1] and others has shown the ability of honeybees to communicate the direction of a food source by indicating the angle between the azimuths (compass direction) of the source of food and the Sun. In northern or southern latitudes, the Sun is always low enough in the sky for its azimuth to be clearly determined by the bees; but in the tropics the Sun at one or two seasons of the year passes through the zenith (that is, directly overhead), or very close to the zenith, at midday. What effect does this have on honeybee communication ?

Using facilities provided by the Zoology Department of the University College of the West Indies (lat. 18° N.), experiments to answer this question were carried out in August 1959. Bees were trained to visit a feeding dish about 200 yd. from their hive. These trained bees were marked and allowed to fly back and forth between hive and dish throughout the day. Any unmarked bees that arrived at the dish were killed. The times of arrival at the dish of marked and unmarked bees were recorded.

The combined results of six days observations (August 1, 2, 3, 10, 11, 12) are shown in Fig. 1*a*. On these days the Sun at noon was always less than 3° from the zenith. These results show a pronounced fall around midday in the frequency of arrival of unmarked bees.

The combined results of observations on August 17, 18 and 19 are shown in Fig. 1*b*. On these days the noon zenith distance of the Sun was 4·5–5·0°. There



(a)

(b)

Fig. 1. Frequency of arrival of bees at different times of day. Continuous lines indicate unmarked bees. Broken lines indicate number of visits, divided by 2, of marked (trained) bees. Combined results of days (a) when Sun at noon less than 3° from zenith; (b) when Sun at noon 4·5–5 0° from zenith

is no suggestion here of a midday fall in frequency of arrival of unmarked bees.

Bad flying conditions around midday could of course account for the fall in numbers of unmarked bees shown in Fig. 1a. But detailed weather records failed to provide evidence for such bad conditions. In any event the number of visits of marked bees does not decline at midday. Most other possible explanations, such as a daily rhythm of hive activity, or a daily rhythm in dancing behaviour of the foragers, are ruled out by the steady arrival of unmarked bees throughout the day shown in Fig. 1b.

The evidence, therefore, seems strong that honeybee communication is hindered at small zenith distances of the Sun.

Fig. 2 shows the frequency of arrival of unmarked bees calculated for different zenith distances of the Sun. For zenith distances of less than 5° the frequency was about half that at large zenith distances. Rather surprisingly, bees were still arriving steadily even when the zenith distance was less than 1°. Control experiments have ruled out the possibility that the bees arriving at small zenith distances are scout bees, and have made it very unlikely that they are bees delayed as a result of inaccurate information[2]. There seem to remain two possible explanations. Either the perception by some of the bees of the relative positions of Sun and zenith is extraordinarily acute, so that they are still able to determine accurately the azimuth of the Sun when its zenith distance is less than one or two degrees; or some method of communication is involved which is independent of the position of the Sun. Experiments are being carried out at present to examine these possibilities.

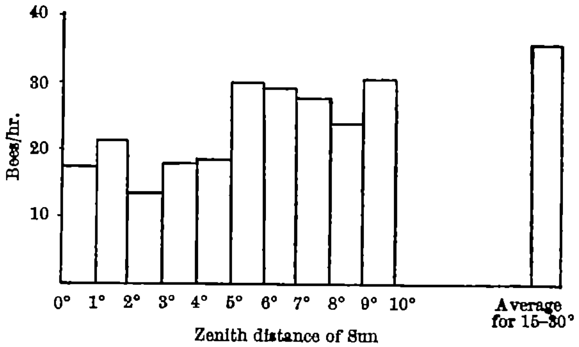


Fig. 2. Frequency of arrival of bees at different zenith distances of the Sun. Calculated from combined results of August 1, 2, 3, 10, 11, 12, 17, 18 and 19

Morphogenetic Effects of Lipoic Acid on Amphibian Embryos

We have recently[1,2] studied the effects of mercaptoethanol (HS·CH$_2$ – CH$_2$OH) and its oxidized counterpart, dithiodiglycol, on morphogenesis in a number of different systems (amphibian eggs, regenerating tadpoles and planarians, fragments of *Acetabularia*): it was always found that mercaptoethanol inhibits morphogenesis, while dithiodiglycol has no effect or is even slightly stimulatory.

It has been recently reported by Henderson and Eakin[3] that lipoic acid (5 μgm./ml.) inhibits regeneration of the head in planarians: it therefore has the same effect as mercaptoethanol in this material. It has been suggested by Henderson and Eakin[3] that lipoic acid might act by modifying the thiol-disulphide equilibrium. It was therefore decided to compare the effects of lipoic acid and mercaptoethanol on amphibian eggs, in order to find out whether, as in planarians, the two substances act in the same way.

It was found that lipoic acid (5 μgm./ml.) and mercaptoethanol at low concentrations (*M*/300–*M*/1,000), contrary to this expectation, act in completely opposite manner on *Rana temporaria* and

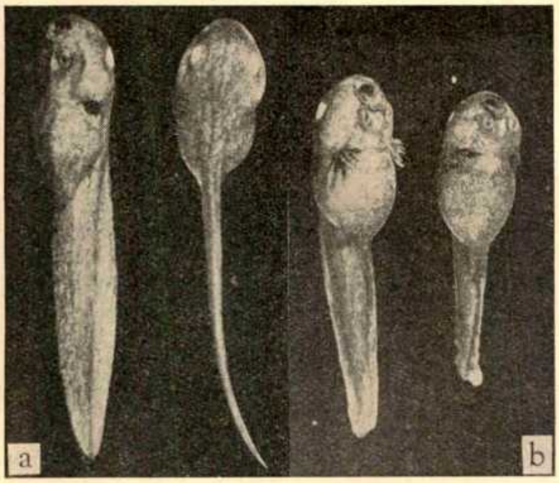

Fig. 1. (*a*) Control tadpoles of *Rana temporaria*; (*b*) embryos of *Rana temporaria* after treatment with lipoic acid (5 μgm./ml.) during 3 days

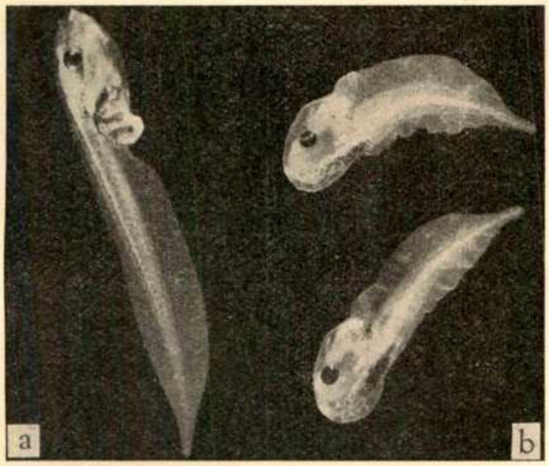

Fig. 2. (*a*) Control tadpole of *Xenopus laevis*; (*b*) embryos of *Xenopus laevis* treated during 5 days with lipoic acid (5 μgm./ml.)

Xenopus laevis embryos (gastrulæ or neurulæ): there is no delay in development, no inhibition of morphogenetic movements, and no microcephaly when these embryonic stages are treated with lipoic acid. On the other hand, this substance produces a marked inhibition of tail elongation, whereas the head and the size of the fin are essentially normal. This effect, which seems to be fairly specific of lipoid acid, is found in the frog (Fig. 1) as well as in *Xenopus* embryos (Fig. 2).

Extensive measurements of the length of the tail with an ocular micrometer showed that the tail undergoes a 25 per cent reduction in *Rana* and a 35 per cent reduction in *Xenopus* in tadpoles treated with lipoic acid.

In *Pleurodeles*, the effects of lipoic acid are very different; but, again, they are quite distinct from those observed in the case of mercaptoethanol. In this case, lipoic acid is so active in producing cell dissociation that concentrations as low as 0·3 μgm./ml. are still toxic. At still lower concentrations of lipoic acid, no consistent effect on the size of the tail can be detected. But another effect is visible, namely, an increase in pigmentation. Again, this effect is exactly the opposite to that observed for mercaptoethanol. The latter produces albinism and, in the case of *Xenopus*, the appearance of tadpoles with blue eyes and chromatophores[2]. This inhibition of pigmentation by mercaptoethanol is probably due, as shown by Roston[4], to the combination of thiols with an oxidation product of dioxyphenylalanine during pigment formation under the action of tyrosinase.

Since dithiodiglycol at low concentrations ($M/10,000$–$M/100,000$) exerts effects which are exactly the opposite to those of mercaptoethanol[1,2], it is obvious that it must act like lipoic acid; in fact, it has been repeatedly found that dithiodiglycol produces tadpoles with large heads and short bodies. It also produces rapid cell dissociation and lysis in *Pleurodeles*; an increase in pigmentation can often be noticed in this species after treatment with low concentrations of dithiodiglycol. However, tail reduction is rather exceptional in embryos treated with dithiodiglycol; it is thus possible that lipoic acid exerts a specific effect possibly related to its coenzyme activities, in the case of this morphogenetic process.

Finally, preliminary experiments have been made on the effects of lipoic acid (5 μgm./ml.) on regeneration in anucleate fragments of *Acetabularia*: a slight inhibition of cap formation, but much smaller than in the case of mercaptoethanol or cysteine, has been observed.

The present results, taken together with those of Henderson and Eakin[3], show that lipoic acid acts, according to the cell system under study, like mercaptoethanol or dithiodiglycol. This finding is in agreement with the view expressed by Henderson and Eakin that lipoic acid might play an important part in shifting or maintaining the intracellular thiol-disulphide equilibrium. Biochemical work is obviously required in order to test this hypothesis.

Localization of the Cells of Origin of the Ventral Spino-Cerebellar Tract

The location of the cells of origin of the ventral spino-cerebellar tract has never been determined conclusively by anatomical investigations[1]. We have now systematically searched for these cells in the lumbar segments of the cat spinal cord. Cells were identified as ventral spino-cerebellar tract neurones if they were monosynaptically excited by Golgi tendon organ (I*b*) afferents and antidromically activated on stimulation of fibres in the dissected spinal half (at *Th* 13 or *L*1), contralateral to the nerve supplying I*b* excitation[2]. The position of cells encountered was derived from the co-ordinates shown by the stereotactic instrument used for insertion of the microelectrode, and histologically controlled. Fig. 1 shows the position of the 39 ventral spino-cerebellar tract neurones (five experiments) from which successful intra-cellular recordings were obtained. All these cells were activated from ipsilateral nerves and antidromically invaded from

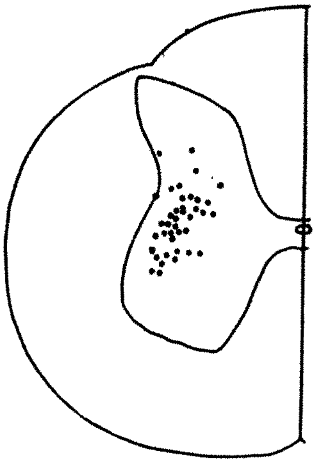

Fig. 1. Position of 39 intracellularly recorded ventral spino-cerebellar tract neurones in lumbar segments four to five

the contralateral side. Almost all units activated from the hamstring nerve were found in the upper part of the L_5 or lower part of the L_4 segment.

The present investigation has demonstrated that the ventral spino-cerebellar tract cells constitute a column of cells in the lateral part of the intermediate zone and dorso-lateral part of the ventral horn. Some cells also occur in the adjacent part of the dorsal horn. Clearly the ventral spino-cerebellar tract cells are to be distinguished from the border cells described by Cooper and Sherrington[3]. The location is, however, similar to that described by Sprague[4] for certain cells with contralaterally ascending axons, though many ventral spino-cerebellar tract cells are found more dorsally.

A Chitin Medium for Isolation, Growth and Maintenance of Actinomycetes

SEVERAL different media have been suggested for isolation of Actinomycetes from soil[1]. Most of these contain carbon and nitrogen sources which are utilized by bacteria and moulds as well as by Actinomycetes, and therefore are not selective for the latter. Bacteriostatic and fungistatic chemicals such as phenol[2] and sodium propionate[3] have been incorporated into isolation media to suppress growth of bacteria and moulds and thus favour Actinomycetes. But such amendments at permissible concentrations frequently allow growth of contaminants and at higher levels may also suppress Actinomycetes. The report by Jeuniaux[4] that the polysaccharide chitin is widely utilized by members of the genus *Streptomyces* was confirmed in our laboratory in tests showing that all of 38 isolates of *Streptomyces* spp. utilized chitin as the sole carbon and nitrogen source, when supplied in an agar medium. In preliminary work, soil suspensions plated on this medium gave a predominance of Actinomycete colonies and very few bacterial and fungal colonies. These results suggested that a medium with chitin as the sole carbon and nitrogen source might be selective for isolation of Actinomycetes.

The medium used was similar to that of Reynolds[5] and consisted of colloidal chitin, 2·5 gm. (dry weight); dipotassium hydrogen phosphate, 0·7 gm.; potassium dihydrogen phosphate, 0·3 gm.; crystalline magnesium sulphate, 0·5 gm.; crystalline ferrous sulphate, 0·01 gm.; zinc sulphate, 0·001 gm.; agar, 20 gm. The *p*H of the medium was 7·0. Colloidal chitin was prepared by treating crude chitin alternately with *N* sodium hydroxide and *N* hydrochloric acid several times, then with ethyl alcohol until foreign matter was removed. This purified chitin was dissolved in cold concentrated hydrochloric acid, filtered through glass wool, precipitated in distilled water, and alternately sedimented and washed until neutral. Chitin-mineral agar was poured into Petri dishes over a 10-ml. base layer of water agar. A diluted soil suspension was applied to the chitin-mineral agar layer in either of two ways: (*a*) by mixing 0·2 ml. of soil suspension with 9·8 ml. of melted, cooled (42° C.) chitin-mineral agar before pouring; or (*b*) by spraying[6] 0·2 ml. of soil suspension on 10 ml. of the hardened medium in Petri dishes. Plates were incubated at 28° C. for 8 days.

Results in Table 1 show that Actinomycetes developed abundantly on chitin-mineral agar whereas bacteria and moulds were suppressed. Conspicuous zones cleared of chitin surrounded most of the Actinomycete colonies. By contrast, glucose-asparagine agar, egg albumin agar, and Czapek's agar, three commonly used media[1] which contain non-selective carbon sources, gave fewer Actinomycete colonies, more bacteria than Actinomycetes, and numerous moulds. At a lower dilution of soil (10^{-4}), the selectivity of chitin-mineral agar was still more evident. Conventional media were overgrown with bacteria and moulds which obliterated the Actinomycete colonies, whereas on chitin-mineral agar numerous Actinomycete colonies predominated. These results were verified using different soils.

Table 1. NUMBER OF ACTINOMYCETE, BACTERIAL AND MOULD COLONIES ISOLATED WHEN 0·2 ML. OF A SOIL SUSPENSION (10^{-5} DILUTION) WAS SPRAYED ON VARIOUS AGAR MEDIA

Medium	Average (5 plates) colonies per plate		
	Actinomycetes	Bacteria	Moulds
Chitin-mineral	30	0·4	0·2
Glucose-asparagine	8	14	5
Egg albumin	19	35	14
Czapek's	14	36	9

Streptomyces lavendulae and two unidentified isolates of *Streptomyces* gave more growth when cultured in chitin-mineral liquid medium (6 gm. chitin per litre) than in glucose-asparagine, egg albumin, or Czapek's broths. Chitin-mineral agar slants also supported excellent growth and sporulation of Actinomycetes.

Thus, chitin-mineral media were excellent substrates for isolation and estimation of total numbers of Actinomycetes from soil, and for growth and maintenance of cultures as well.

Injury by Soaking of *Populus alba* Seeds

AIR-DRIED seeds of *Populus alba*, stored in closed vessels at + 5° C., are injured when submerged in distilled or tap water (see Table 1).

Table 1

Duration of soaking in distilled water	Germinated Normally (per cent)	Germinated Abnormally (per cent)	Not germinated (per cent)
0 (Control)	64·9 ± 1·95	11·8 ± 0·92	23·4 ± 1·90
15 min.	26·2 ± 0·50	40·2 ± 2·41	34·2 ± 2·41
35 min.	27·0 ± 1·20	40·0 ± 0·53	33·7 ± 1·62
60 min.	24·0 ± 0·63	45·9 ± 1·45	30·0 ± 1·33

The soaking medium was suddenly removed by suction on a Nutsch filter so that the seed-coats became almost dry. Any excess moisture of the germinating medium (filter-paper in Petri dishes) was carefully avoided. Seedlings having well-developed hypocotyl hairs showing regular growth and geotropic responses were considered as normal. (Unlike other seeds, the germination of *Populus* (and *Salix*) seeds begins with the extension of the hypocotyl, which shows negative geotropism. Soon around the end of the hypocotyl there appear 'hypocotyl hairs', very like the ordinary root hairs of other plants. These attach the plant very firmly to the substrate and play a great part in the geotropic stretching upright of the seedling. The first normal root emerges only later from the middle of the hypocotyl end. Though germination is very rapid, definitive counting was carried out on the third day after sowing, in order to recognize abnormal seedlings without doubt. Errors are indicated according to the formula:

$$\sigma = \pm\sqrt{\frac{S(x-\bar{x})^2}{n(n-1)}}$$

where x denotes the results of singular germination experiments, $\bar{x}$ their average, n the number of parallel experiments (in our case, four). Because of the small number of experiments, differences exceeding $\pm 3\sigma$ should be taken as criteria of significance.

As can be seen, soaking for 15, 35 or 60 min. equally increases the percentage of abnormal seedlings, while the decrease in germinating power is slightly significant.

Two types of abnormalities were found. Most of the abnormal seedlings show poor development of the hypocotyl hairs, absence of firm attachment to the substrate and imperfect geotropism, that is, they are leaning. On touching, they easily overturn. A few of the abnormal plants germinate inversely, that is, the cotyledons appear first. The elongation of these plants is much reduced; geotropism is completely lacking. Unfortunately, it is not possible to state quantitatively the precise proportions of these abnormalities to one another.

Table 2 provides evidence that the injuries result immediately when the seeds come into contact with water. This conclusion is not affected by the apparently poor biological value of the seeds.

Table 2

Duration of soaking in water	Germinated Normally (per cent)	Germinated Abnormally (per cent)	Not germinated (per cent)
0 (Control)	57·9 ± 2·20	14·7 ± 0·65	27·3 ± 1·81
1 min.	25·9 ± 2·32	43·6 ± 0·91	30·5 ± 2·59
30 min.	25·0 ± 1·00	41·4 ± 2·78	33·6 ± 2·10

It is certain from Table 2 that anaerobiosis cannot be the cause of this striking injury. This view is confirmed by the observation that aeration in the course of soaking or previous saturation of the water with oxygen neither prevents nor increases the injury, in contrast to the experiments of Barton[1] with beans, where the presence of oxygen was very harmful.

The injury is restricted by treatments decreasing the diffusion pressure deficit of the seeds. For example, it is entirely or partially prevented by presoaking the seeds in a 2-*M* solution of sucrose for ½ hr., and then washing it out with distilled or tap water. Moreover, the damage depends largely on the humidity of the seed, as was shown also in Yamamoto's experiments with beans[2]. At a water content of 8 per cent (on dry weight basis) the damage is very severe, but it is also evident, though slight, with seeds containing 12·6 per cent of water.

The latter facts as well as the rapidity of the effect support the view that the injury is of mechanical nature, according to Iljin's theory[3] on damage due to desiccation and rehydration: the sudden distension of the cell membrane tears the protoplasm incapable of quick swelling. This interpretation is made more convincing by the observation of Sitnikova[4] that in rapidly deteriorating seeds of Salicaceae protoplasm and membrane are connected permanently by means of plasmodesms, while in other seeds a separation takes place. This is probably in connexion with the prompt germination of most *Populus* and *Salix* species; the hypocotyl hairs most susceptible to soaking injury show a particularly high growth-rate.

The practical significance of these findings is not yet clear. I suppose that soaking injury may play a certain part in the deterioration of *Populus* seeds both in Nature and forestry, particularly if propagation is by sowing stored dry seeds. In practice, it is probably important that such damage occurs

Table 3

	Water content (dry wt. basis) (per cent)	Germinated Normally (per cent)	Germinated Abnormally (per cent)	Not germinated (per cent)
Control (sown on filter-paper withour aeration)	8·2	46·7 ± 1·2	25·0 ± 0·9	28·2 ± 0·5
Aerated with humid air for 4 hr. before sowing	14·3	64·9 ± 2·1	15·5 ± 0·5	19·5 ± 1·3

even if dry seeds are germinated on moderately moist filter paper. Aeration with humid air can 'restore' the viability of the seeds, that is, it can prevent soaking injury (Table 3)

High Polyploidy in a New Zealand *Poa*

The basic chromosome number of *Poa* is 7. Of the New Zealand species so far examined, the majority are tetraploid ($4x = 28$) and one species is 12-ploid ($12x = 84$). A much higher number has now been found in plants of *Poa litorosa* Cheesem., collected in the Auckland Islands. Preparations of mitosis show 263–265 chromosomes (Fig. 1) and the species is therefore approximately 38-ploid. So far as we are aware, this is the highest chromosome number yet recorded in the Gramineae or in the Monocotyledons as a whole. Studies of meiosis and of the breeding system have yet to be undertaken.

BACTERIOLOGY

Absence of the Glucose Effect on the Frequency of Lysogenization in *Salmonella typhimurium*

When a sensitive bacterial cell is exposed to a temperate bacteriophage it may undergo lysis, become lysogenized, or remain uninfected. The relative frequency with which these responses occur depends on the genetic structure of the phage and the conditions of the infection. The outcome may be influenced by temperature[1], multiplicity of infection[2], and the addition of various chemicals[3,4]. In a recent paper[5], it was reported that glucose added to a nutrient agar medium affected a 100 per cent lysogenic response with *Salmonella typhimurium* strain *LT*2 ($C^{+}dg^{s}$)[6] and phage *PLT*22, while a glucose diauxie-resistant variant of this strain ($C^{+}dg^{r-1}$)[6] was found to be immune to this apparent glucose effect. These conclusions were based on observations of 'turbid' or 'less turbid' plaques as the criteria for lysogenization or lysis, respectively, of the initially infected cell. Recent attempts to duplicate these experiments were not successful, nor could any glucose effect on the frequency of lysogenization be detected using a more direct and reliable method developed by Luria and Fraser (ref. 4). (We wish to thank E. Bertani for details of the method and the indicator strain.)

This latter method involves plating cells infected with phage *PLT*22 on *EMB* galactose medium in a soft agar layer with a galactose non-fermenting (Gal^{-}) indicator strain of *LT*2. The infected cells that undergo lysis form plaques in 18 hr., infected cells that are lysogenized form dark colonies surrounded by clear halos in 48 hr., and uninfected cells form dark colonies without halos in 48 hr.

The maintenance of strains, *Salmonella typhimurium LT*2 ($C^{+}dg^{s}$), the glucose-resistant variant ($C^{+}dg^{r-1}$), and the Gal^{-} variant indicator (which was also methionine-negative and histidine-negative), and the production and maintenance of phage were as previously described[6].

In the first two experiments the infection procedure was essentially as described by Bertani[4]. An aerated overnight culture of strain *LT*2 ($C^{+}dg^{s}$), grown in nutrient broth, was diluted into fresh nutrient broth and aerated at 37° C. to about 5×10^{7} cells/ml. The

Table 1. Frequency of Lysogenization with Glucose present during the Early Phase of the Latent Period

Media during first 10 min. of latent period	Lytic centres*	Lysogenic cells*	Uninfected cells*	Frequency of lysogenization (per cent)
Nutrient broth	35	34	36	49
Nutrient broth plus 0·2 per cent glucose	51	38	27	43
Nutrient broth plus 2·0 per cent glucose	50	41	34	45

* Figures represent average of three plates (0·1 ml. per plate)

Nutrient broth	30	40	30	57
Nutrient broth plus 0·2 per cent glucose	45	33	20	44

* Figures represent average of three plates (0·1 ml. per plate).

Table 3. FREQUENCY OF LYSOGENIZATION WITH GLUCOSE PRESENT DURING ADSORPTION AND DURING THE ENTIRE LATENT PERIOD

Media during adsorption and entire latent period	No. of tubes plated	Average No. of cells per tube	Total lytic centres	Total lysogenic cells	Total uninfected cells	Frequency of lysogenization (per cent)
Nutrient broth	30	2·5	25	26	24	51
Nutrient broth	30	2·0	20	16	24	44
Nutrient broth plus 1·0 per cent glucose	30	1·7	19	14	17	42
Nutrient broth plus 1·0 per cent glucose	30	1·7	22	16	15	42

cells were centrifuged, washed in buffered saline, recentrifuged, and re-suspended in buffered saline to about $2·3 \times 10^{8}$ cells/ml. Phage *PLT*22 was then added at a multiplicity of 1 and adsorption was allowed to take place for 10 min. at 37° C. in either non-nutrient media or nutrient media, with or without glucose as indicated. The infected culture was then diluted 10^{-3} into nutrient broth or nutrient broth plus glucose, and aerated at 37° C. for 10 min. At this time they were diluted again into homologous media to about 1×10^{3} cells/ml., and plated in triplicate on *EMB* galactose plates. Plating was done before the first bursts, which occurred about 35–40 min. after infection. Assays for free phage showed that after 10 min. more than 95 per cent of the phage had been adsorbed to the bacteria.

When cells of *LT*2 were infected with phage *PLT*22, either in non-nutrient media or in nutrient broth, and afterwards incubated in nutrient broth, about 50 per cent of the cells became lysogenic. When the infected culture ($C^{+}dg^{s}$) was exposed to 0·2 per cent or 2·0 per cent glucose for 10 min. after the 10 min. adsorption in non-nutrient media without glucose, no increase was observed in the frequency of lysogenization (Table 1). In a similar experiment the cells were infected as above, except that adsorption was allowed to take place in either nutrient broth or nutrient broth plus 2·0 per cent glucose. As before, glucose did not increase the frequency of lysogenization (Table 2).

The following experiment was performed to determine the frequency of lysogenization in cells exposed to glucose during adsorption and for the entire latent period. Log phase cultures ($C^{+}dg^{s}$) with about 1×10^{8} cells/ml. were infected in nutrient broth or in nutrient broth plus 1·0 per cent glucose with phage at a multiplicity of 1 and adsorption allowed to take place for 10 min. with aeration at 37° C. The cultures were then diluted to about 15–20 cells/ml. and 0·1 ml. samples were distributed to 30 small test-tubes and kept in a 37° C. water-bath for the entire latent period. (The latent period in nutrient broth plus 1·0 per cent glucose was found in a single-step growth experiment[7] to end in 70 min.) The dilution was made in order to prevent re-infection from early bursts, since the cells were not plated until they had been incubated for 70 min., and also to allow the detection of haloed colonies in the presence of plaques. The contents of the tubes were then plated with the *Gal*$^{-}$ indicator strain on *EMB* galactose plates as previously described. Tubes were scored according to which of the following appeared on the indicator plate: plaques (lytic response), dark colonies with halos (lysogenic response), or dark colonies without halos (sensitive response). In this experiment as well, there was no increase in the frequency of lysogenization due to the presence of glucose (Table 3).

Glucose has been shown to inhibit inducible enzymes concerned 'primarily with catabolism' by somehow augmenting repression of enzyme formation in the presence of the inducer[8]. The absence of the glucose effect on the decision between the lytic and lysogenic response by temperate phage *PLT*22 indicates that such inducible enzyme formation is probably not a factor in phage development under the conditions employed in these experiments. However, since glucose has no apparent effect on the synthesis of enzymes concerned with biosynthetic processes, enzymes the syntheses of which are no doubt controlled by repressor effects[9,10], the lack of effect of glucose on the frequency of lysogenization should not be interpreted to mean that the protein synthesis required for the lytic response[4] is not under repressor control.

This investigation was supported in part by a contract from the Office of Naval Research and the University of Pittsburgh, and by research grants from the National Science Foundation and the National Institute of Allergy and Infectious Diseases, United States Public Health Service.

Isolation and Some Properties of the Phages of *B. cereus* NRRL 569

So far not enough is known about the isolation and virulent phages of *B. cereus*. Kellenberger[1] studied the morphology of the temperate phages of a lysogenic *cereus* strain. McCloy's phages isolated from the lysogenic *B. cereus W* strain[2] showed anthrax specificity. The phages of Pollock's *B. cereus* 569 strain was not known until recently[3].

Isolation of the phages of *B. cereus* 569 was attempted from five samples of soil, in each case successfully. The selective enrichment was performed as follows. The vegetative cells of the streptomycin-resistant *B. cereus* 569 were added to the samples of soil suspended in *YP* (ref. 4) liquid media with 25 γ/ml. streptomycin. This culture was incubated for 4 hr. with vigorous shaking. Streptomycin suppressed the growth of other contaminating bacteria. The enriched phage suspension was propagated further by the usual methods.

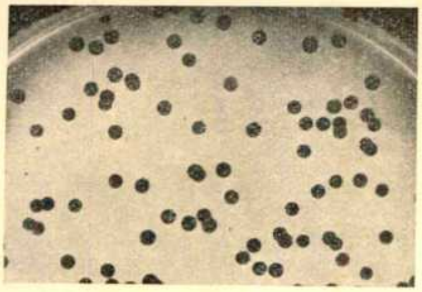

Fig. 1. Large, clear plaques of the virulent phages of *B. cereus* 569

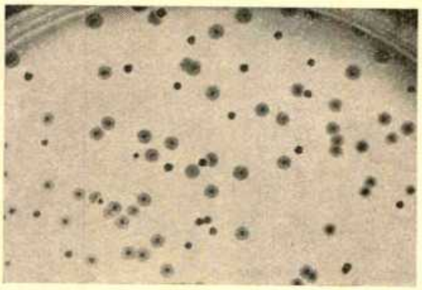

Fig. 2. Irregular clear and target-like plaques of the virulent phages of *B. cereus* 569

The propagation of the phages of *B. cereus* 569 was successful only in the *YP* (ref. 4) media. The common meat extract and Pollock's widely used media[5] were not useful for this purpose. However, with these media after being completed with Ca^{2+} (M/600) or Mn^{2+}, our phages caused the lysis of the cells of *B. cereus* 569.

On the basis of plaque morphology, our phages could be separated into three different groups: (1) clear; (2) target-like; (3) turbid plaques. According to the shape and form of the plaques we succeeded in differentiating some types in each group. The turbid plaques did not give a pure line in the subcultures; the clear and target-like mutants appeared in 10 per cent.

The above-mentioned basic types are represented in Figs. 1 and 2.

The results of the host-range experiments may be summarized as follows. The isolated phages are species specific. They do not lyse anthrax and other Gram-positive bacilli (*megaterium*, *subtilis*) and cocci. The results of the investigations on many different *cereus* strains show that a group of the *cereus* bacilli is not sensitive to the phages isolated on the strain 569. The strains did not lyse nor did they absorb the phages the autolysate of which[6] produced precipitation with the anthrax polysaccharide antibody. The *B. cereus* strains the autolysate of which did not precipitate the above-mentioned antibody were sensitive to phage. On the basis of the phage sensitivity the group of the *cereus* bacteria, considered as a uniform one, may be divided into two groups: (1) sensitive to the phages of *B. cereus* 569; (2) resistant to them.

There is an interesting correlation between the phage sensitivity and structure of the cell wall. The results of earlier experiments[6] showed that the *cereus* cell wall polysaccharide which precipitates the anthrax antibody consists of galactose and glucosamine; the non-precipitating one is made up of glucose and glucosamine with another unknown hexosamine. The present experiments suggest that the isolated phages affect those *cereus* bacilli the cell-wall structure of which agrees with those of *B. cereus* 569, showing that the polysaccharide of the cell wall consists of glucose, glucosamine and another hexosamine.

Further detailed characterization of our phages and the other experiments will be published elsewhere.

GENETICS

Diurnal Temperature Fluctuation and Genetic Variance in *Drosophila* Populations

Four populations of *Drosophila pseudo-obscura* were started from a common founder stock in November 1956, by Dr. L. Levine and me. Since that time, two of them, K 1 and K 2, have been maintained under conditions of temperature which, while slightly differing from year to year, have always been constant diurnally. Concurrently, the populations V 1 and V 2 have been kept in diurnally fluctuating conditions with again slight difference of mean from year to year, but always: (1) with the same mean temperature as the K populations and (2) undergoing a regular 10° C. oscillation of temperature during each period of 24 hr. A more detailed account of this type of environment will be found in a recent publication[1]. All populations were initially polymorphic for the two gene-arrangements Arrowhead and Chiricahua ($q_0 = 0·5$), of the third chromosome, and all populations are now largely, if not completely, monomorphic[2]. The changes in the polymorphic system which appear to be similar in both K and V populations will be discussed elsewhere (Beardmore, J. A., and Levine, L., in preparation).

Additive genetic variance in each of the four populations was estimated in the following way. Virgin flies were collected and mated assortatively for the number of chætæ on the fifth sternite. Two samples of five flies of each sex were drawn from each culture and the chætæ on the fifth sternite of each fly were counted. These counts permitted the regression for chæta number of offspring on mid-parent to be calculated for each sex in each population. The slope of the best-fitting regression for the V populations ($b = 0·342$) is considerably steeper than that calculated for the K populations ($b = 0·215$) and the significance of this difference closely approaches the 1 per cent level. Table 1 gives the analysis of variance.

The estimates of the regression coefficients are also estimates of h^2, the heritability of the character and indirectly, therefore, of the additive genetic variance (σ_g^2) of the populations for this character since $h^2 = \sigma^2_g/\sigma^2_p$. The variance of parental chæta number

Table 1. ANALYSIS OF VARIANCE OF REGRESSION OF FIFTH STERNITE CHÆTA NUMBER OF OFFSPRING ON MID-PARENT

Source	Mean square	d.f.	t	P
Differences between means	1·63	7		
Overall regression	121·60	1	11·17	very small
Differences between regression slopes				
(i) between K and V	6·48	1	2·574	$\simeq 0·01$
(ii) within K and within V	1·01	6		
Residual	0·978	624		
		639		

(σ^2_p) in the K populations is not significantly different from that of the V populations ($F = 1·09$, $P > 0·2$). The ratio of the heritabilities of K and V populations may, therefore, fairly be taken to represent the ratio of the additive genetic variance present in the populations.

Thoday[3,4] has considered the way in which living organisms may accommodate themselves to environmental fluctuation. His thesis is that long-term oscillations of the environment will be met by genetic flexibility of populations. Such variation is thought of as having a period several or many times the generation length of the organism. Oscillations of a short-term nature (or less than the generation time of the organism) will be accommodated by developmental flexibility. The results reported here show that a regular environmental fluctuation with a period of oscillation equal to about 5 per cent of the generation time of the organism is highly effective in promoting the maintenance of additive genetic variance by populations.

It is true that what applies to genetic variance for bristle number may not apply to other characters, and it is also true that there may be reasons peculiar to *Drosophila* which render a result of this kind less surprising than it would be in some other organisms. Nevertheless, it is quite clear that the greater genetic variance in the V populations is a direct result of the diurnal environmental variation. Two conclusions follow: (1) that the greater developmental flexibility[3] or homeostasis[5] shown by the V populations for which we have additional evidence (Beardmore, J. A., and Levine, L., in preparation) may be dependent on greater heterozygosity; (2) the probability of evolutionary survival of V-type populations is greater than that of K-type populations.

FOREST PRODUCTS

A Method of obtaining Uniform Distribution of Wood Preservatives in Toxicity Test Blocks

THE standard method[1] of measuring the toxicity of wood preservatives consists of exposing small wood blocks, containing a range of loadings of the preservative, to attack by a specific wood-destroying fungus or insect and noting the loading required to inhibit attack. The blocks are prepared by impregnating them completely with different strength solutions of the preservative in an appropriate volatile solvent which is afterwards allowed to evaporate off. The average concentration of preservative substance left in each block is obtained from the weight of solution absorbed.

Some time ago we showed that during evaporation of the solvent the preservative tends to concentrate near the surface so that its final distribution in the block is uneven[2]. This happens with all types of preservative substances, whether in aqueous or organic solvent solution, and probably the only exceptions are certain water-borne formulations which are designed to react and become insoluble soon after impregnation. The outward movement of solutions during the drying of porous media and the resultant migration of the solute to the surface are quite well known, and have been observed with a number of other materials such as paper, textiles and soil.

Because of this uneven distribution the concentration of preservative to which the test organism is exposed is not precisely known, and this introduces some uncertainty about the accuracy of the toxic limits found. This has been recognized for some time[3,4], but no practicable method of ensuring a more even distribution has so far been available.

Recently we have found that a comparatively uniform distribution of various types of preservative can be obtained by cooling the blocks below the

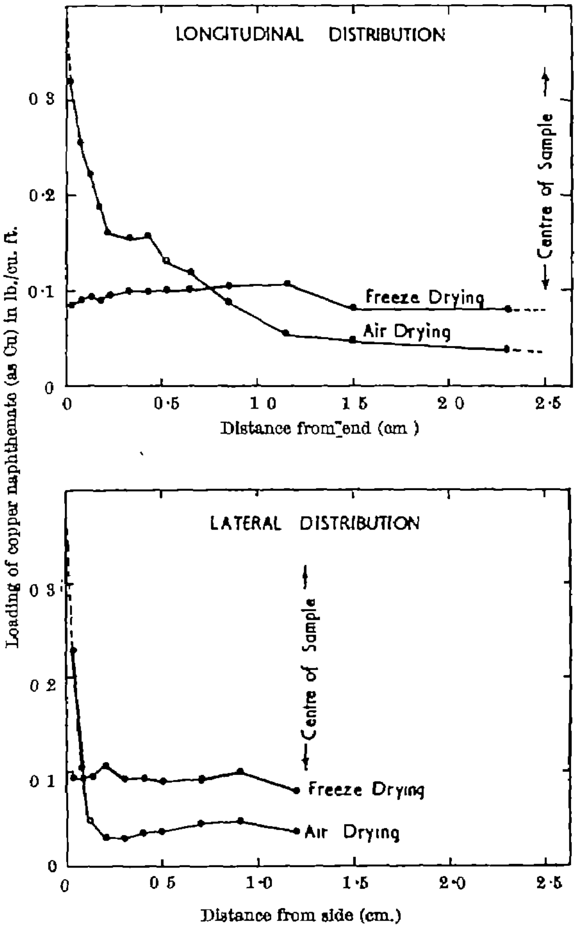

Fig. 1

freezing point of the solution directly after impregnation and subliming off the solvent under vacuum.

Fig. 1 shows the distribution in a standard-size beech block 5 × 2·5 × 1·5 cm., impregnated with a 5 per cent solution of copper naphthenate in benzene, after removal of the solvent by this method, compared with that in a similarly impregnated block dried under atmospheric conditions in the normal way.

Work on this method is still in progress, including its use in the preparation of uniformly loaded samples of the larger size used in field service tests on preservatives, for which purpose this investigation was initially undertaken, and a more detailed report will be published later.

SOIL SCIENCE

Soil Phosphate Solubility

The inorganic phosphate content of agricultural soils is very low (about 0·02 per cent phosphorus), and attempts to determine the nature of the phosphate compounds are beset with many difficulties. X-ray and optical methods cannot be used without first concentrating the phosphate fractions, and the process of concentration generally brings about changes of phosphate form. Methods based on chemical extractants effect a more or less complete redistribution of the soil phosphate compounds during the actual extraction and, in any event, do not act specifically on single phosphate components. Recent approaches to the problems have used solubility methods, in which attempts have been made to relate soil phosphate solubility of intact soil to the solubilities of known pure phosphate compounds. Based on experimental figures for the solubility products of pure phosphates, criteria have been proposed for assessing the existence of basic calcium phosphates, and iron and aluminium phosphates in soils[1]. However, the application of these criteria to experimental determinations of soil phosphate solubility[2] has not been wholly successful[3]. Thus, while the results for some soils obey the relationships for pure compounds, others do not[3], and the proposition that these can be attributed to substances of intermediate composition is not wholly satisfactory.

In the case of basic calcium phosphates, which are generally assumed to be the main phosphate forms in non-acid soils, the solubility relationships are conveniently described in terms of the 'phosphate potentials' and 'lime potentials' of aqueous solutions in equilibrium with the solid phosphates. The potentials are defined by the equations:

$$\text{Phosphate potential} = \tfrac{1}{2}p\text{Ca} + p\text{H}_2\text{PO}_4$$
$$\text{Lime potential} = p\text{H} - \tfrac{1}{2}p\text{Ca}$$
$$\text{where } pX = -\log_{10}(\text{activity of the ion } X)$$

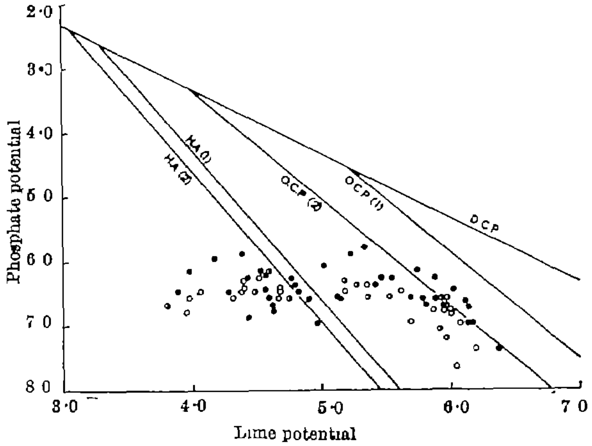

Fig. 1. Plot of phosphate and lime potentials of soils in relation to those of pure calcium phosphates. ●, Field application of 1,000 lb. phosphate (P_2O_5) per acre; ◑, of 500 lb. per acre, ○, of 0 lb. per acre. *D.C.P.*, dicalcium phosphate; *O.C.P.*, octocalcium phosphate from supersaturation (1), from undersaturation (2); *H.A.*, hydroxyapatite from supersaturation (1), from undersaturation (2)

For a pure calcium phosphate there is a linear relationship between the phosphate potential and the lime potential, the slope of which is governed by the chemical composition of the compound and the intercept of which is found from the experimentally determined solubility product. The linear relationships shown in Fig. 1 for dicalcium phosphate, hydroxyapatite and octocalcium phosphate are those used by Aslyng[2], based on the solubility products of Bjerrum[4]. The pairs of lines for hydroxyapatite and octocalcium phosphate are based on the solubility products determined by approaching equilibrium from undersaturation and supersaturation. If, then, one of these compounds exists in a soil, the experimentally determined phosphate and lime potentials of the soil should fall on the line for that particular compound.

To test this, the phosphate and lime potentials of soils enriched in the field with 0, 500, 1,000 lb. phosphate (P_2O_5) per acre as superphosphate at twenty-three sites in Britain were measured by a method similar to that described by Aslyng[2]. The soils, at soil/solution ratios of 1 : 10, 1 : 5, 2 : 5, and 4 : 5, were shaken for 16 hr. with 0·01 *M* calcium chloride solution. Each soil/solution ratio was replicated three times. The *p*H values of the suspensions were measured with a glass electrode, and, after centrifuging, the phosphate concentrations of the extracts were determined by the method of Lucena-Conde and Prat[5]. The activities of the Ca^{++} and $H_2PO_4^-$ ions were calculated from the analytical figures using the known dissociation constants of phosphoric acid[2] and the first approximation to the Debye–Huckel theory. The potentials for the soil/solution ratio of 2 : 5 were calculated and plotted in Fig. 1.

Although some of the points fall near the lines for the pure compounds, the overall distribution suggests either that no definite forms of calcium phosphate can be inferred to exist in soils or that the apparent solubility relationships are being influenced by other factors. That the latter is likely is seen from the fact that all soils of low *p*H (low lime potential) have solubilities lower than that of hydroxyapatite, whereas soils of high *p*H have solubilities greater than that of hydroxyapatite. This is shown more strikingly by

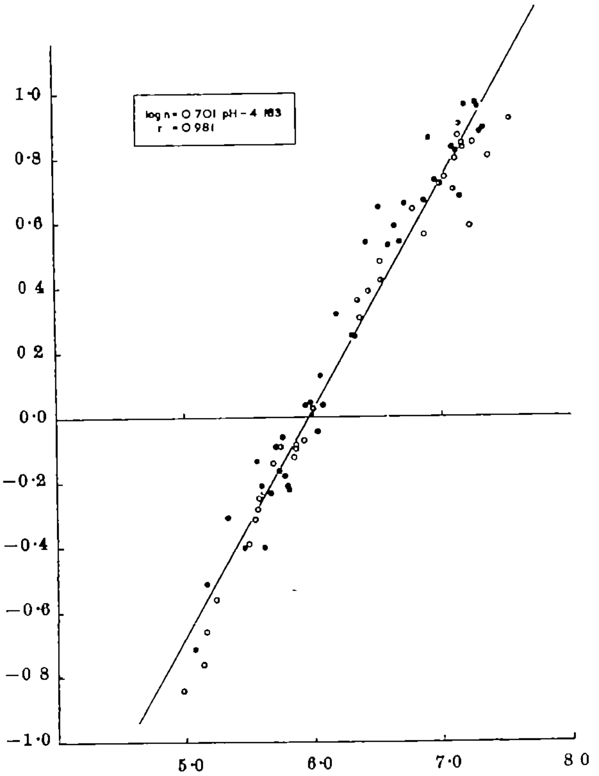

Fig. 2. Plot of logarithm of saturation index of hydroxyapatite for the soils as a function of soil pH. Symbols as for Fig. 1

calculating the apparent ionic product (I) of hydroxyapatite in the soil suspensions and relating this to the true solubility product (L) in pure systems. A 'saturation index' n can be defined (Bjerrum, quoted by Schmidt-Nielsen[6]) as:

$$n = (I/L)^{1/9}$$
$$\text{or } \log n = (pL - pI)/9$$

The factor 1/9 appears because the solubility product of hydroxyapatite, $Ca_5(PO_4)_3OH$, is a product of nine ion activities. Values of log n for the soil systems are plotted as a function of pH in Fig. 2. There is a consistent linear relationship with the regression equation:

$$\log n = 0{\cdot}701\, p\text{H} - 4{\cdot}183$$

and a correlation coefficient of 0·981 ($P < 0{\cdot}001$).

All soils with pH values above 6·0 have a phosphate solubility greater than that of hydroxyapatite, and, since hydroxyapatite is stable in this pH range, it should theoretically be precipitated. Why it does not has yet to be elucidated, but the results for soils resemble closely an effect observed by Greenwald[7] and Ericsson[8] for pure hydroxyapatite in the presence of calcium carbonate and for dental apatite which always contains a little calcium carbonate. These authors found that, in absence of carbonate ions, the solubility of hydroxyapatite obeyed the solubility product principle but that, in presence of carbonate ions, the principle was apparently disobeyed. Ericsson found that, in the presence of carbonate ions, the saturation index n varied with pH according to the equation:

$$\log n = 0{\cdot}44\, p\text{H} - 2{\cdot}23$$

Greenwald attributed the increase of solubility in the presence of carbonate ions at high pH to the formation of complex ions in solution, but it is difficult on this basis to account for the decrease in solubility found by Ericsson at low pH. Ericsson's regression equation differs from that found for soils of which carbonate ions are also normal constituents. Other anions, such as silicate, present in soils could have an effect on apatite solubility similar to that of carbonate, and this may account for the difference in the two regression equations. Nevertheless, that similar relationships seem to hold is both interesting and important.

Direct Methods of Estimation in the Spectrographic Analysis of Cobalt in Soil Concentrates

THE relationship which forms the basis of the internal standard method of spectrographic analysis may be written:

$$\log I_T/I_S = n_T \log C_T + \log a_T/a_S C_S^{n_S}$$

where I_T, I_S are the respective intensities of the analysis and internal standard lines; C_T, C_S are the respective concentrations of the analysis and internal standard elements; and a, n are constants dependent on the general conditions of excitation. In its application to the determination of trace constituents in biological concentrates[1], the internal standard, which is iron, varies in content, and the calibration involves three steps: (*a*) obtaining plots of log I_T/I_S (background-corrected) against log C_T for sets of standard mixtures K, L, M, N, . . . containing increments of the internal standard element from one set to the next; (*b*) selecting one of these as the standard working curve, for example, the plot from the M set; and (*c*) deriving a correction graph for the C_S value of the sample. The calibration curves for cobalt, namely, log I_T/I_S versus log C_T (10–1,000 p.p.m.) and log $I_S/I_{S(M)}$ versus log C_S (2·0–50·0 per cent Fe_2O_3), are obtained as straight lines of unit gradient.

In soil analysis the concentration procedure adopted[2] is to precipitate the trace constituents on a carrier precipitate of aluminium and iron oxinates, which on ignition yields essentially a residue of aluminium oxide in admixture with iron oxide (Fe_2O_3) and the trace elements. In the treatment of an acetic acid soil extract[3], a solution of iron in hydrochloric acid (equivalent to 2·0 mgm. Fe_2O_3) is added prior to the concentration, since with the quantities involved, acetic acid extracts only traces of iron (c. 0·1–0·5 mgm., ref. 3), although occasionally amounts up to the order of 1 4 mgm. (equivalent to 2·0 mgm. Fe_2O_3) may be extracted. The final computation of results therefore requires (i) photometric evaluation of the sample spectrum for log I_T/I_S, (ii) analysis of the concentrate for C_S, (iii) correction of log I_T/I_S for the C_S value of the sample, (iv) determination of C_T for the corrected log I_T/I_S value via the standard working curve, and (v) evaluation of the concentration in the original material on dividing C_T by the appropriate factor.

A modification of the above procedure involves adding to the residue, after weighing (w_1 mgm.) but prior to mixing, 30 mgm. purified Fe_2O_3. The whole is then mixed in an agate mortar and proceeded with in the usual manner. The percentage internal standard may be estimated directly as $100 \times \left[\frac{32}{w_1 + 30}\right]$, that is, $100 \times 32/w$, where w is weight of final concentrate. The error contained in this assumption may be computed as ['residual' soil Fe_2O_3 (say, 2·0 mgm.) + error in concentrating and analysing[4] 4·0 mgm. Fe_2O_3]. Since the error of a normal iron determination has been found to be 6·5 per cent ($P = 0{\cdot}95$), the above error at the most is [2·0 + 0·26 ($P = 0{\cdot}95$)] mgm. = 2·26 mgm. Fe_2O_3, which reckoned on 32 mgm. is of the order of 7 per cent. This figure compares favourably with the normal analytical error, and small differences can be ignored when field-sampling errors are taken into account[5]. Further, from the nature of the calibration curves[1,6], we may write for values of $C_T \leqslant 1{,}000$ p.p.m. :

$$\log C_T = \log(C_t/C_S)_M + \log C_S + \log I_T/I_S$$

where C_t is the value of C_T when $\log I_T/I_S = 0$. If for $\log C_S$ we substitute $\log[100 \times 32/w]$ and subtract from it the log concentration factor = $\log[2 \times 10^4/w]$ (for 20-gm. aliquots of soil), we derive an expression for the C_T value in the soil, namely:

$$\log C_{T(\text{soil})} = \log\,(C_t/C_S)_M + \log \frac{32 \times 10^2/w}{2 \times 10^4/w} + \log I_T/I_S = \log 0{\cdot}16(C_t/C_S)_M + \log I_T/I_S$$

or

$$\log C_{T(\text{soil})} = \log k + \log I_T/I_S$$

where k is a constant determined by the calibration and experimental arrangement.

Regarding the proposed modification: (i) it neither interferes with the method of analysis nor does it introduce extra work, apart from the addition of Fe_2O_3; (ii) it renders unnecessary the analysis of internal standard content; since these analyses are usually performed in batches of six, each batch requiring about 2 hr. for complete assay, there is a substantial saving in operational time; (iii) it does not increase unduly the final weight of concentrate which is normally about 40–60 mgm.; and (iv) it avoids graphical calculation, thereby permitting concentrations for acetic acid-soluble cobalt to be computed directly from the photometric evaluation in the ranges 0·04–3·50 p.p.m. ('normal' 40 mgm. concentrate) and 0 03–3·00 p.p.m. ('normal' 60 mgm. concentrate). Since most extractable cobalt contents fall well within the above limits, the scheme may be applied with advantage in the routine analysis of available cobalt in soils: its general application would depend on (a) the amounts of acetic acid-soluble iron in the run of samples being analysed, and (b) the magnitude of w_1 and the subsequent dilution with Fe_2O_3 to within the limits imposed by the straight-line portion of the correction graph[1].

ARCHÆOLOGY

An Extinct Giant Pangolin and Associated Mammals from Niah Cave, Sarawak

EXAMINATION of the mammalian remains excavated from the west mouth of Niah Cave, Sarawak[1], in 1954–58 down to a depth of 72 in., which corresponds to a carbon-14 date of about 32,000 years B.P. (ref. 2), established a fauna containing only the lowland evergreen rain forest species of modern south-east Asia[3]; of those identified, only the Malay tapir[4] and the tiger (an unerupted canine from Neolithic levels ($E/G1$, 6–12 in.)) are to-day unknown from the wild in Borneo.

Extension of the dig to lower levels has now produced three bones attributable to *Manis palaeojavanica* Dubois—an extinct giant pangolin formerly known only from Middle Pleistocene deposits in Java—from depths at Niah ($H/17$, 104–110 in.) corresponding to carbon-14 dates of about 42–47,000 years B.P. (ref. 5). Besides man (represented by skeletal remains as well as artefacts of stone and bone) the associated mammalian fauna includes only extant species. Represented are: pig (*Sus* cf. *barbatus*), orang utan (*Pongo pygmaeus*), monkeys (certainly *Presbytis* species, others indeterminate), a wild cat (*Felis* cf. *bengalensis*), a large bovine (*Bubalus* c.q. *Bibos* species), the larger mouse-deer (*Tragulus napu*), a number of rats (including *Rattus* cf. *sabanus*, cf. *mulleri* and cf. *rattus*), a shrew (*Crocidura* species), and several bats (identified by the Earl of Cranbrook) (including *Rousettus* cf. *amplexicaudatus*, *Hipposideros* cf. *diadema*[6], cf. *galeritus*[6], and two indeterminate species of intermediate size, *Chaerephon* species, *Cheiromeles* cf. *torquatus*[6] and *Myotiss* pecies[6]), as well as the common recent Malaysian pangolin (*Manis javanica*); the last has never before been found in the fossil or sub-fossil state. The Niah finds prove the co-existence of the two species of *Manis* in the Upper Pleistocene of Borneo.

Fuller reports will be published in forthcoming issues of the *Sarawak Museum Journal*.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, January 16

Royal Geographical Society (at 1 Kensington Gore, London, S.W.7), at 5 p.m.—Mr. J. E. Thorpe and others: "A University Expedition to British Honduras".

British Society for the Philosophy of Science (in the Joint Staff Common Room, University College, Gower Street, London, W.C.1), at 5.30 p.m.—Prof. K. R. Popper: "The Growth of Knowledge" (President's Address).

Society of Chemical Industry, Pesticides Group (at 14 Belgrave Square, London, S.W.1), at 5.30 p.m.—Dr. Hubert Martin: "Pesticides and the Public".

University of London (in the Physiology Theatre, University College, Gower Street, London, W.C.1), at 5.30 p.m.—Prof. F. Bergel, F.R.S.: "Biochemistry and Biology of Enzymes in Cancer".*

Monday, January 16—Friday, January 20

Institute of Physics and the Physical Society (at the Royal Horticultural Society's Halls, Westminster, London, S.W.1)—45th Annual Exhibition.

Wednesday, January 18

British Institution of Radio Engineers, Computer Group (at University College, Gower Street, London, W.C.1), at 2–5 p.m. and 6–8 p.m.—Symposium on "Alpha Numeric Displays".

Institute of Physics and Physical Society, Acoustics Group (at the Royal Horticultural Society (New Hall), Vincent Square, London, S.W.1), at 2 p.m.—Symposium on "Traffic Noise". Speakers: Dr. D. W. Robinson, Mr. C. H. G. Mills and Miss S. W. Forgarty.

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Mr. Oliver N. Millar: "The Restoration Portrait" (Fred Cook Memorial Lecture).

Institute of Physics and Physical Society, Low Temperature Group (at 47 Belgrave Square, London, S.W.1), at 4 p.m.—Annual General Meeting. 4.30 p.m.—Dr. R. W. Hill. "The Thermodynamic Properties of Fluid Helium".

Bone and Tooth Society (at the Institute of Orthopædics, 234 Great Portland Street, London, W.1), at 4.30 p.m.—Symposium on "The Temporo-Mandibular Joint".

Royal Meteorological Society (at 49 Cromwell Road, London, S.W.7), at 5 p.m.—Mr. J. S. A. Green: "A Problem in Baroclinic Stability"; Mr. F. Knighting: "Some Computations of the Variation of Vertical Velocity with Pressure on a Synoptic Scale".

Institution of Electrical Engineers, Supply Section (at Savoy Place, London, W.C.2), at 5.30 p.m.—Mr. M. N. John: "A General Method of Digital Network Analysis particularly suitable for use with Low-Speed Computers"; Dr. P. P. Gupta and Prof. M. W. Humphrey Davies: "Digital Computers in Power System Analysis".

Society of Chemical Industry, Corrosion Group (at 14 Belgrave Square, London, S.W.1), at 6 p.m.—Mr. R. L. Samuel: "Metallic Diffusion Coatings".

Royal Institute of Chemistry (at King's College, Strand, London, W.C.2), at 6.30 p.m.—Prof. Sir C. N. Hinshelwood, O.M., F.R.S.: "Aspects of the Chemistry of Living Cells".

Wednesday, January 18—Thursday, January 19

Institution of Mechanical Engineers (at 1 Birdcage Walk, Westminster, London, S.W.1), at 2.30 p.m. on Wednesday and 10 a.m. on Thursday—Symposium on "Pressure Vessel Research Towards Better Design".

Thursday, January 19

Northampton College of Advanced Technology (at St. John Street, London, E.C.1), at 3 p.m.—Prof. Dimitri Riabouchinsky (l'Académie des Sciences de l'Institut de France): "Some Special Problems in Fluid Mechanics".

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W.1), at 5 p.m.—Dr. E. C. Zeeman: "Geometric Topology".

University of London (in the Physiology Theatre, University College, Gower Street, London, W.C.1), at 5 p.m.—Dr. A. N. Michelson: "Nucleotide Anhydrides and Oligonucleotides".* (Further lecture on January 26.)

Society of Chemical Industry, Road and Building Materials Group (at 14 Belgrave Square, London, S.W.1), at 6 p.m.—Mr. J. R. P. Jordan: "Problems Associated with Research on Aggregates".

Pharmaceutical Society of Great Britain (at 17 Bloomsbury Square, London, W.C.1), at 7.30 p.m.—Mr. K. A. Lees: "Fermentation Processes in Preparing Pharmaceutical Materials".

Royal Society of Tropical Medicine and Hygiene (at Manson House, 26 Portland Place, London, W.1), at 7.30 p.m.—Dr. T. Wilson: "Filariasis in Malaya".

Society for Visiting Scientists (at 5 Old Burlington Street, London, W.1), at 7.30 p.m.—Discussion Meeting on "Atmospheric Pollution". Chairman: Dr. R. Lessing, O.B.E. Speakers: Dr. S. R. Craxford, Dr. P. J. Lawther and Dr. E. A. J. Mahler.

British Institute of Radiology (at 32 Welbeck Street, London, W.1), at 8 p.m.—Mr. P. E. Thompson Hancock, Mr. J. D. N. Nabarro and Mr. P. B. Kunkler: "Treatment of the Reticuloses by Chemotherapy and Radiotherapy".

Friday, January 20

Association of Applied Biologists (in the British Museum (Natural History), Cromwell Road, London, S.W.7), at 10.40 a.m.—Symposium on "Recent Developments in Plant Nematology".

Institute of Navigation (at the Royal Geographical Society, 1 Kensington Gore, London, S.W.7), at 5.15 p.m.—Mr. A. Stratton and Mr. K. R. Honick: "Presentation of Height Information in Aircraft".

Institution of Electrical Engineers, Education Discussion Circle (at Savoy Place, London, W.C.2), at 6 p.m.—Discussion on "Management Studies for Junior Engineers", opened by Mr. G. S. C. Lucas.

Society of Chemical Industry, Fine Chemicals Group (at 14 Belgrave Square, London, S.W.1), at 6.30 p.m.—Dr. M. C. Whiting: "The Chemistry of some Macrocyclic Antibiotics".

Royal Aeronautical Society (in the Lecture Theatre, 4 Hamilton Place, London, W.1), at 7 p.m.—Mr. Lorne Welch: "Gliding and Man-Powered Flight".

Saturday, January 21

London County Council (at the Horniman Museum, London Road, Forest Hill, London, S.E.23), at 3.30 p.m.—Miss R. Osborn: "High Life Among Gorillas".*

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Scientific Officer (with a good honours degree in chemistry or botany, preferably with some postgraduate experience) in the Weeds Section, to work on problems associated with the absorption, mobility and persistence of herbicides in soils—The Secretary, National Vegetable Research Station, Wellesbourne, Warwick (January 28).

Head of the Department of Science of the Jamaica College of Arts, Science and Technology, Kingston—The Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W.C.2 (January 31).

Lecturer (honours graduate in science) in the Department of Building Science—The Registrar, The University, Liverpool, quoting Ref. CV/N (January 31).

Lecturer in the History of Science—The Secretary, The University, 38 North Bailey, Durham (January 31).

Lecturer or Assistant Lecturer in the Department of Applied Mathematics—The Registrar, The University, Liverpool (January 31).

Research Assistant (with an honours degree in physics) in the Department of Mathematics, to continue and develop a fundamental investigation of the rheological properties of concentrated polymer solutions—The Registrar, The Manchester College of Science and Technology, Sackville Street, Manchester 1 (January 31).

Senior Lecturer (preferably active in magneto-fluid dynamics or plasma physics and able to initiate research in one of these fields) in Mathematics—The Secretary, Royal College of Science and Technology, George Street, Glasgow, C.1 (January 31).

Lecturer (with a degree in science, preferably in chemistry) in the Department of Education—The Registrar (Room 22, O.R.B), The University, Reading (February 1).

Chair of Logic—The Secretary of University Court, The University, Glasgow (February 3).

Assistant, Assistant Experimental Officer grade (with a pass degree or equivalent qualification), in the Department of Potato Genetics, to help in biochemical investigations in potatoes—The Secretary, John Innes Institute, Bayfordbury, Hertford, Herts (February 7).

Lecturer or Assistant Lecturer in Pure Mathematics—The Registrar, The University, Leeds 2 (February 7).

Lecturer or Assistant Lecturer in Pure Mathematics; and a Lecturer or Assistant Lecturer in Applied Mathematics—The Secretary and Registrar, The University, Southampton (February 10).

Senior Lecturer (preferably with some experience in physical anthropology and comparative anatomy) in Anatomy at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, February 10).

Lecturer (with an honours degree in psychology and interests in experimental psychology) in Psychology at the University of Canterbury, Christchurch, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand and London, February 14).

Senior Technician (with training in histological techniques and the preparation of teaching material) in the Zoology Department, University of Canterbury, Christchurch, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand and London, February 15).

Senior Lecturer or Lecturer (with special qualifications, teaching and research experience in either biogeography and climatology, or cultural (especially economic) geography) in Geography at the University of Auckland, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand and London, February 17).

Chair of Applied Mechanics tenable in the Newcastle Division of the University—The Registrar, University Office, 46 North Bailey, Durham (February 18).

Chair of Physics tenable in the Newcastle Division—The Registrar, University Office, 46 North Bailey, Durham (February 18)

JOHNSON AND JOHNSON RESEARCH FELLOW (with previous experience in tissue transplantation or related fields), to investigate problems of tissue transplantation—The Secretary, East Grinstead Research Trust, Queen Victoria Hospital, East Grinstead, Sussex (February 24).

CHAIR OF INORGANIC CHEMISTRY tenable in the NEWCASTLE DIVISION of the University—The Registrar, University Office, 46 North Bailey, Durham (February 25).

LECTURER or ASSISTANT LECTURER IN ELECTRONICS—The Secretary and Registrar, The University, Southampton (February 28).

DEMONSTRATOR IN INORGANIC CHEMISTRY—Dr. Lee's Professor of Chemistry, Physical Chemistry Laboratory, The University, South Parks Road, Oxford (March 1).

CHAIR OF METALLURGY within the Faculty of Engineering, University of Sydney, Australia—The Secretary Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia and London, March 15).

JUNIOR MYCOLOGIST (with a good honours degree in botany, postgraduate training in systematic mycology, a working knowledge of Latin and German, with Russian an added qualification) at the Commonwealth Mycological Institute, Kew—The Secretary, Commonwealth Agricultural Bureaux, Farnham House, Farnham Royal, Bucks (March 31).

LECTURER IN RADIATION BIOLOGY—The Secretary, Department of Biology as Applied to Medicine, Middlesex Hospital Medical School, London, W.1 (April 1).

ASSISTANT, Grade B (with an honours degree in physics, research or industrial experience in some branch of applied physics, and preferably teaching experience) IN THE DEPARTMENT OF PHYSICS—The Registrar, Bristol College of Science and Technology, Ashley Down, Bristol 7.

ASSISTANT LECTURER (graduate in chemistry, and preferably with experience in the food industry)—The Principal, National College of Food Technology, St. George's Avenue, Weybridge, Surrey.

ASSISTANT (young research worker interested in the electron microscopic structure of cells) IN THE CANCER RESEARCH UNIT—Prof. G. Causey, Department of Anatomy, Royal College of Surgeons, Lincoln's Inn Fields, London, W.C.2.

GEOLOGISTS (preferably under 35, a first- or good second-class honours degree in geology with emphasis on metamorphic and igneous rocks and/or structural geology, and preferably previous experience) in Tanganyika, for regional geological survey of metamorphic and igneous rock terrains, and preliminary investigation of mineral deposits—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.114/7/06.

GEOLOGIST (with a first- or upper second-class honours degree in geology) in the Bechuanaland Protectorate, to undertake general geological surveys, including the examination of mineral deposits, water supply problems and geological mapping—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.105/76/03.

OFFICER (with a degree in science, or diploma in horticulture or agriculture), to assist in field experimental work—The Secretary, National Vegetable Research Station, Wellesbourne, Warwick.

PHYSICISTS (with a second-class honours degree or equivalent in mathematics or physics, and for the more senior posts, at least three years postgraduate research experience), to join a team engaged on an experimental programme on the Fast Reactor—The Personnel Manager, U.K.A.E.A., Dounreay Experimental Reactor Establishment, Thurso, Caithness, quoting Ref. 163/34.

BROADCASTING AND TELEVISION IN EDUCATION

THE presidential address entitled "Science Broadcasting in Sound and Television" delivered by Mr. A. B. Oldfield Davies to the Assembly of Corresponding Societies at the Cardiff meeting of the British Association was certainly realistic, if not also somewhat pessimistic, as to the contribution of television or sound broadcasting to the effective diffusion of real scientific knowledge. Sound broadcasting, he thought, with its greater flexibility and variety of programme services, has some substantial advantages at present over television; but he seemed very doubtful whether even the most outstanding programmes do any more than help to create an atmosphere of respect for knowledge as something good in itself. That opinion is not lightly to be dismissed and is one to be kept in mind when the expansion of educational broadcasting is being so widely discussed. The British Broadcasting Corporation is, of course, placing on a permanent basis its school television service and doubling its output; it is also continuing its school broadcasting in sound, and also the Network Three service for programmes devoted specifically to the aims of further education. The development of transistor receivers, cheap and easy to run, has in recent years opened up immense possibilities for expanding the audiences for medium-wave transmissions in the less-developed areas, particularly in Asia and Africa, though in many parts of the world short-wave broadcasting is still the main means of communication.

These new possibilities were duly noted by the Ashby Commission on Post-School Certificate and Higher Education in Nigeria. Its report, "Investment in Education"*, contains a note on new educational techniques in which they are briefly discussed. Although it is recognized that teaching through television is in its infancy and much has yet to be learned in both the use and improvement of the medium, it is recommended that, while it is still problematic when Nigeria will be able to embark on television on a large scale, channels for educational television should be reserved now, in order to ensure that, when educational television becomes practicable, the opportunity will not have been lost because the channels have been appropriated for commercial television. This, of course, is a large part of the case for allotting a second channel to the British Broadcasting Corporation, as is emphasized in the Corporation's recent annual report† and in the important speech on the future of broadcasting in Britain which the director-general, Mr. H. C. Greene, delivered to the Manchester Luncheon Club on November 9 and which has since been substantially reproduced in *The Listener* (64, 875; 1960).

Other recommendations on the new educational techniques made by the Ashby Commission include experiments with the use of the record player and magnetic tape recordings in language teaching; the organization and maintenance of a central film library for distributing to schools on a loan basis; a determined effort to use radio for English broadcasts in primary schools for at least five grades; and establishment by the Federal Minister of Education of a committee to study advances in these fields and to make recommendations for experiments in Nigerian schools. These recommendations were in fact duly noted by Lord Newton in replying for the Government on an important debate on modern aids in education in the House of Lords on November 29; and it is obviously desirable that the significance and potentialities of all such developments should receive full consideration by the Pilkington Committee on the Future of Sound and Television Broadcasting, which already has before it conflicting views as to the allocation of a third television channel. Meanwhile, it should be noted that the Minister of Education, Sir David Eccles, in opening the annual conference of the National Institute of Adult Education at Swansea, suggested the screening of television programmes of adult education. The Organization for European Economic Co-operation has already advocated the use of school television broadcasts as a contribution towards overcoming difficulties arising out of the shortage of science teachers, and, although the debate in the House of Lords brought out some misgivings on the part of school teachers, it is clear that there is wide opportunity for experiment and indeed research into the use of both sound and television broadcasting for educational purposes. Indeed, a report published last May by the University of Leeds advocated entrusting any third television channel to a Universities Television Corporation rather than to the British Broadcasting Corporation or to the Independent Television Authority.

Such a network, it was suggested, should be dedicated to education and the dissemination of knowledge, speculation and the arts, and the suggestion arose out of an examination of teaching methods. It was intended to make lectures by leading specialists available to large numbers of students at the same time, and the proposal was also concerned with the maintenance of the closest possible link between a university and its town or region. Calling for the exploitation, not the resistance, of television, it visualized spreading far more widely the activities and influence of the extra-mural departments of the university. Also the network would have at its disposal the best academic minds of the country. It would be able to provide a series of courses directed at different levels of intelligence, but possessing more depth than those now attempted; and the proposal also contemplates facilitating contact of the universities with secondary school children through its television programmes instead of merely through examinations.

---

* Investment in Education: The Report of the Commission on Post-School Certificate and Higher Education in Nigeria. Pp. v+140. (Lagos: Federal Government Printer; London: Crown Agents for Oversea Governments and Administrations, 1960.) 5s. net.

† Annual Report and Accounts of the British Broadcasting Corporation, 1959–60. Pp. 175+8 plates. (Cmnd. 1174.) (London: H.M. Stationery Office, 1960.) 9s. net.

This project was briefly noticed in the debate in the House of Lords, but not in Mr. Greene's speech in Manchester on November 9. Apart from a strong plea for public service broadcasting in the sense in which it had been defined by Sir Ian Jacob—as a compound of a system of control, an attitude of mind and an aim which, if successfully achieved, resulted in a service which could not be given by any other means—Mr. Greene was concerned more especially with local broadcasting and the possibility of serving minority interests, which, in a particular and limited sense, a university television network might also be said to do. He quoted Sir Ian Jacob's conception of the system of control, as full independence, or the maximum degree of independence that Parliament would accord; of the attitude of mind as an intelligent one capable of attracting to the service the highest quality of character and intellect; and the aim to give the best and most comprehensive service of broadcasting to the public that is possible. He then stressed the vital factor of the underlying motive, which must not be vitiated by political and commercial considerations. The support which was given to Lord James of Rusholme's remark in the House of Lords debate in reference to the peak viewing hours, that we have sold our broadcasting system to advertising, indicates how much agreement there is here with Mr. Greene's argument.

Mr. Greene sought to show how, precisely because of this situation with regard to the peak hours, only a public service system could ensure for the local audience a genuinely local and independent programme. In support of the British Broadcasting Corporation's claim, he adduced its experience in resisting political and commercial pressures, which could be intense at the local level, in collaborating with universities, technical colleges and schools in providing educational programmes, and in the impartial reflexion of all kinds of controversies. He also mentioned the support of the Corporation's nationally based service in collecting items for the local audience and the existence of its three national networks as sources of programmes at times when the local station is not putting out its own programmes. He is convinced that there is plenty of good material for local broadcasting and that such broadcasting has an essential contribution to make to the life of the community, though he maintained that this can only be made within the framework of public service broadcasting, and doubted whether a universities television network could prove effective enough to resist pressure or be efficient enough in making use of the channels available.

Mr. Greene was concerned rather with low-powered transmitters operating over a radius of no more than four or five miles; in such a network of local stations, sound radio could well provide a service beyond the reach of television and tap the neglected wealth of resources in the universities and elsewhere as well as assist in promoting a more vigorous local culture. Mr. Greene has been criticized for his omission of any reference to religious broadcasting in this connexion, and there is clearly something to be said for any local VHF stations including local councils of churches with other local institutions with which they can work in harmony while maintaining standards of broadcasting. Apart from this, the fact that a Cambridge firm of television and radio equipment manufacturers has already outlined a scheme for establishing a hundred local VHF radio stations in Britain, run, not as part of a big organization, but by individual owners as local affairs, and with the transmitter available to the education authorities for schools broadcasting during the day when it is not in use for the main transmission, confirms that local sound broadcasting is already practicable. Apart from the scheme outlined in this pamphlet issued by Pye, Ltd., about a hundred companies have in fact been registered with the object of running such local stations if and when it becomes possible.

In opening the debate in the House of Lords, Lord Bessborough suggested that the very success of sound radio in education is one potent reason why no more than 2,500 out of some 30,000 schools in Britain take the educational television programmes of the British Broadcasting Corporation and of Associated Rediffusion. He agreed with Mr. R. Hickman, of the National Union of Teachers, that many more programmes are needed, but that it is essential to ensure the utmost co-ordination and co-operation among initiating companies, who must build up and maintain units able both to become expert in teaching methods and techniques, and also to maintain the closest possible contact with schools. Lord Bessborough urged also that full advantage should be taken of special opportunities in universities, and particularly that universities should be enabled to start pilot schemes; and although Lord Newton took up this point in his reply, he suggested that the initiative should come mainly from the universities themselves, and that the Pilkington Committee might express opinions on the merits of university broadcasting and television.

Much the weightiest speech in the debate was that of Lord James of Rusholme. He acknowledged the very great contribution which television—and still more sound broadcasting—has made to education in Britain, and paid tribute to the work of the British Broadcasting Corporation, particularly in research and development, and to that of the Schools Broadcasting Council, through which the Corporation has worked. There is still need, Lord James thought, for much research in the use of broadcasting, and we might be on the threshold of fundamental developments. There are also the limitations imposed by finance, and he strongly supported not only the plea put forward by the Corporation in its current report for the retention of the whole of the licence fee but also increasing the fee to an economic figure. The effective use of television, however, depends ultimately on the imagination and skill of the class-room teacher, and he thought it futile to over-emphasize the value of television in the schools when these programmes have to contend with the 'diseducation' effect of those broadcast at the peak hours for child-viewers—between 6 and 9 p.m.

Other speakers in the debate, like Lord Aberdare, Lord Strang and the Baroness Swanborough, stressed the importance of research and of the influence of the teachers, which, it was emphasized, are not replaced either by sound or by television programmes, and Lord Newton readily responded. There is no question, he said, of attempting to meet the present shortage of teachers by trying to use broadcasts as a substitute for teachers, and he suggested that the main function of broadcasting in Britain, both on sound and on television, is enrichment of teaching, as opposed to the direct teaching method of the kind used in the United States. As Lord Newton understood it, this meant that broadcasts could reinforce a teacher, extend the range of teaching and provide fresh help in the classroom, and he thought that among teachers there is much serious thought and goodwill and the recognition that this new medium is something to be taken seriously and of great potential importance. Speaking about equipment, he merely observed that the Minister of Education has no direct financial control over the purchase of equipment for the purpose; this is entirely a matter for the local education authorities. He agreed as to the need for more research, but referred to the work of the National Committee for Visual Aids in Education, and stated that the report of the Organization for European Economic Co-operation, "Teaching through Television", is being studied by the Minister of Education. It is the policy of the Colonial Office to encourage development of sound and television broadcasting on local lines and with the use of local talent. Sympathetic consideration is also being given to financial aid for a further period to the Overseas Visual Aids Centre in Tavistock Square.

Lord Newton's hope that this debate would stimulate constructive thought in educational circles about the possibilities of school broadcasts and television should certainly be fulfilled, and his view that the great trusts and foundations could give a most useful lead in research in this field should be duly noted. Lord Newton thought, too, that the teachers' attitude would be a main determining factor, and that this might be particularly influenced by the results of research. As yet, however, as was almost universally acknowledged in the debate, sound broadcasting is by far the more important, and a prime task accordingly is to see that the resources and techniques available are adequate and appropriate. Nevertheless, although the British Broadcasting Corporation's views on local broadcasting, as set forth both by the Director-General himself and in the Corporation's current annual report, embrace full and free association and co-operation with universities, local authorities, newspapers and other important institutions within the local communities, there is an influential volume of opinion, not reflected in the debate in the House of Lords, which is strongly opposed to any extension of the British Broadcasting Corporation's power in this field. That the British Broadcasting Corporation is seriously misrepresented in this connexion may be of relatively little importance: some of the misrepresentations have been decisively refuted by Mr. Greene. It is more serious, however, that the picture of local broadcasting in other countries should also be distorted in this same connexion, and more debates, free from party political bias and commercial misrepresentation, are undoubtedly needed if a sound judgment is to be reached as to the manner in which educational broadcasting, whether in sound or television, should be approached. Further consideration is required of the way in which the universities and schools might co-operate, and how in the development of local broadcasting and television the conception of public service could best be preserved and to ensure that there is no sacrifice of the public interest—educational or cultural—to sectional or purely financial advantage.

THE CORRESPONDENCE OF ISAAC NEWTON

The Correspondence of Isaac Newton, Vol. 2
1676–1687. Edited by Prof. H. W. Turnbull. Pp. xiii + 552 + 6 plates. (Cambridge: At the University Press, 1960. Published for the Royal Society.) 147*s*. net.

THE decade (1676–87) spanned by the present volume was an eventful one in Newton's life. While he was harassed by a rather nasty controversy with the Liège Jesuits about the theory of colours, he had to face, in friendly rivalry, Leibniz's first claim to the independent discovery of the infinitesimal calculus (1676–78). Then (1679–80) came the fateful discussion with Hooke about the fall of a body to the centre of the Earth, which led Newton's thoughts to the more general problem of finding the trajectory of a gravitating body. He soon received a further incentive to pursue this line of investigation from Flamsteed's controversial interpretation of comet observations at the end of the year 1680 (Old Style). Finally, prompted by Halley's famous visit in 1684, he was induced to write down his decisive results and to elaborate them during the ensuing years (1684–87) in the form of the *Principia*.

This succession of dramatic incidents fills the pages of this fascinating volume, in which are assembled not only the well-known documents which form the basis of existing biographies but also a large number of hitherto unpublished letters and manuscripts which throw much new light on the events and on Newton's complex personality. The very excellence of the editor's work elicits in but one respect an expression of regret: one would wish that he had been somewhat more generous in the inclusion of auxiliary documents not strictly of epistolary character; for example, from the important accounts of the work done in Great Britain on infinite series, drawn up by Collins for the information of Leibniz, we are only given those passages which refer directly to Newton; this documentation, however, is too fragmentary to be of any use to the serious student, and one may question very much the wisdom of such an effort at economy. It is true that these documents, as well as others equally essential, like the treatise *De Motu*, exist in print; but the books in which they are published have practically vanished from the market and are even not common in public libraries; a reprint in the context of the *Correspondence*, which would not have sensibly increased the bulk of the volume, would therefore have been most welcome. Perhaps an earnest plea for a somewhat broader conception of the selection of material may still have some influence on the preparation of future volumes.

One hitherto quite unknown episode, revealed by the present publication, is the prolongation of the futile controversy about Newton's theory of colours started by the English Jesuits of Liège: one assumed that it was closed by the last answer from Newton published in the *Philosophical Transactions* in 1676 (Letter 173 in this volume), but we now learn that the exchange of letters between the Jesuit Lucas and Newton went on at intervals during two more years, the former becoming more and more venomous and the latter increasingly rude. Obviously, the mixture of cunning casuistics and pedantic irrelevancy displayed by his opponent was too much for Newton's robust common sense and sound logic, but he had also a deeper motive for so insistently pursuing a pointless and sordid quarrel: Lucas had found for the elongation of the solar spectrum a smaller value than Newton, and this sufficed to rouse the morbid suspiciousness which the latter manifested whenever he thought his accuracy and veracity impugned. Lucas's attempts at belittling the discrepancy only increased Newton's exasperation, and unfortunately made him blind to the true explanation—the difference in dispersive power of the glasses, although this was actually suggested (Letter 200) (amid a number of irrelevances) by Lucas himself! Hooke (Letter 223) wondered at Newton's "patience"—unaware of this tragi-comic aspect of the situation.

At the same time, through the intermediary of Oldenburg, a thorough confrontation was taking place of the respective achievements of Newton and Leibniz and their respective followers in the treatment of various algebraical and geometrical problems by a method of series expansion, involving a limiting process of derivation or differentiation as well as the inverse process of integration. To this correspondence Newton contributed, somewhat reluctantly, two remarkable Letters (165 and 188), of which especially the second ("epistola posterior") is a document of capital interest, retracing as it does in great detail the successive steps through which Newton arrived at the full realization of his method. The whole material pertaining to this momentous development (unfortunately with some curtailment, as mentioned above) is here fully elucidated by the editor's especially careful and elaborate annotation.

We then pass to the no less remarkable circumstances which led to the genesis of the *Principia*. The first act is well known already by the accounts given by Rigaud and Rouse Ball, and, quite recently, by J. Lohne in *Centaurus* (vol. 7, pp. 6–52; 1960). Challenged by Hooke's acute criticism, Newton is forced to rectify his views concerning the path by which a falling body would eventually reach the centre of the Earth; and from this academic problem he is further led (as we know from the later correspondence with Halley) to study the dynamical behaviour of bodies acted on by gravitation. It appears that the crux of this problem was neither the formulation of the inverse square law (which had been inferred from Kepler's laws by Hooke, Halley and Wren as well as by Newton), nor the conception (inspired by Galilei's treatment of projectiles) of the planetary motion as a uniform rectilinear one modified by an attraction from the Sun; the difficulty was to determine the shape of the resulting trajectory. This was the decisive step which Newton then (1680) took; but, as usual, after solving the problem, he "threw the calculation by, being upon other studies".

It was not long, however, before his attention was again turned to the same question, this time by a concrete case of astronomical observation. In the last months of the year 1680 (Old Style) two comets had been successively observed, the first moving towards the Sun, the second away from it. Flamsteed, who had himself contributed to these observations, suggested that the two objects were the same comet, first attracted, then repelled by some magnetic action of the Sun; and he solicited Newton's opinion. The ensuing correspondence is now for the first time published in full, and it enables us to form a picture of this incident rather different from the somewhat misleading account of it given by Brewster. Flamsteed's magnetic theory, as one imagines, did not resist Newton's remarkably sound criticism, based on the empirical knowledge of magnetic phenomena; but at the same time, Newton accurately described the orbit which a single comet could have followed under the action of gravity: at first, he hesitated to accept the proposed identification of the two objects on the ground that there was no precedent for such a form of cometary orbit, all the known ones being practically rectilinear. However, as better observations became available, it became clear that they did fit a single orbit of the type indicated by Newton.

It is not surprising, therefore, that when Halley, in August 1684, asked him what would be the trajectory of a gravitating body under the inverse square law, Newton had the answer ready. (Lohne's surmise, expressed in the aforementioned article, that Newton did not then have the proof, but only worked it out after Halley's visit, is not in harmony with Newton's own declaration, nor with other circumstantial evidence.) The story of how Halley succeeded in persuading Newton to write the *Principia*, how Hooke's not unjustified reclamation of priority nearly wrecked the enterprise, how Halley's tact and devotion rescued it and carried it to a good ending, is too well known to need repetition. But it is a delight to read it again, in the protagonists' own words, so faithfully recorded and beautifully printed.

L. ROSENFELD

ATOMS AND MOLECULES

Basic Physics of Atoms and Molecules

By Dr. U. Fano and L. Fano. Pp. xv+414. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1959.) 80*s*. net.

THE book is divided into two parts and ten appendixes. The first part presents the basic facts concerning the structure of matter and introduces the new concepts required to correlate them. The second part deals with aggregates of particles, being chiefly concerned with chemical bonding. Mathematical background is provided in the appendixes.

At an early stage most text-books introduce experimental evidence concerning the wave aspects of particle beams, and, from a comparison with beams of light, the Schroedinger wave-equation quickly follows. This book arouses interest because the authors prefer to discuss the analogy between polarization of light beams and of molecular beams. They consider that discussion of a system having a small number of eigen-states is more instructive, and, in addition, polarization in the classical treatment of radiation has much in common with ideas of quantum mechanics. The analogy brings out clearly the principle of superposition, but their picture is somewhat clouded by a premature introduction of rotational matrices, the mathematics of which has fortunately been relegated to an appendix.

The second part will appeal more to the chemist than the physicist, who would prefer an account of metals and semi-conductors and a more detailed description of the simple molecules. Indeed, the chemist may find the whole of this part too brief and qualitative.

Finally, it is difficult to decide for whom the book is intended. The authors state in their preface that it is directed primarily to research workers in the natural sciences (and undergraduates) and presupposes only a general knowledge of physics and mathematics. This view is supported when, in two footnotes, they find it necessary to explain what is meant by the exponential function, and in the first few appendixes when among other subjects they describe the relative motion of two particles and introduce the concept of complex numbers. The next appendix gives the geometrical calculation of rotational matrices and is followed by an equally difficult one on the mathematical formulation of quantum laws. A mathematical derivation of the Uncertainty Principle is given, whereas the qualitative treatment involving the 'gamma-ray microscope' may have been more consistent with the aims of the preface.

On the whole, the average student will find this book particularly heavy going. G. A. Jones

RACIAL PREJUDICE AND MENTAL HEALTH

Race Relations and Mental Health

By Marie Jahoda. Pp. 48. (Paris: Unesco; London: H. M. Stationery Office, 1960.) 1.75 NF.; 2*s*. 6*d*.; 0.50 dollars.

THE virulence with which racial prejudice has made its appearance in the present century is one of the strangest and most disturbing phenomena of present times. Race hatred and conflict thrive on scientifically false ideas and are encouraged by ignorance. To illuminate errors in fact and reasoning and to make known conclusions reached in various branches of science and to combat racial propaganda, the Director-General of Unesco was asked to study and collect scientific material concerning questions of race; to give wide diffusion to the scientific information collected; and to prepare an educational campaign based on this information.

Before this programme could be carried out, it was necessary for Unesco to have the relevant facts at its disposal. Accordingly, a number of prominent scientists were asked to summarize the main results in the field of their specialization. Some of them have already presented the results of their investigations in booklet form, and, now, Marie Jahoda examines in *Race Relations and Mental Health* the psychogenetic bases of prejudice and the relationship between prejudice and mental health. The work is commendable for the objective way in which it is presented and, where the author presents her own views, makes it clear that they represent her opinions.

Whether racial antagonism is based on fact or fancy becomes a question of the adequacy of inference; there is a growing body of empirical evidence to show that inadequate reality-testing is characteristic of many who feel hostile to racial outgroups This is well brought out by Jahoda who shows that the same qualities which are given as reasons for disliking another racial group are often highly appreciated when found in a member of a favoured group. Another cause of prejudice is that the human propensity to make generalizations—and prejudgments—often results in some economy of mental effort. Such pre-judgments can harden into rigidly stereotyped thinking which eschews reality-testing even when facts are available.

After a psycho-analytical study of the deeper causes of prejudice, Jahoda discusses whether or not prejudice is inevitable. Here she refuses to be spuriously optimistic. Racial antagonism, according to her psycho-analytically oriented interpretation, is a deeply meaningful support to the individual of low mental health. The psychological need which leads to racial antagonism is universal and will continue to exist during the foreseeable future. Few will disagree with this conclusion or with her personal belief that "to deprive one's sense of identity from work or from stamp collecting or from mountain climbing may be psychologically as precarious as to deprive it from prejudice against underprivileged groups; but it may help one to live without hating either oneself or one's neighbours".

T. H. Hawkins

CHRISTIANITY AND SCIENTIFIC PROGRESS

Science, Technology and the Christian

By Prof. C. A. Coulson. (The Beckly Social Service Lecture, 1960.) Pp. 111. (London: The Epworth Press, 1960.) 8*s*. 6*d*. net.

PROF. COULSON'S Beckly Social Service Lecture is addressed primarily to those who share his Christian faith, for, in accordance with the purpose for which the Lecture was instituted, he seeks to show why the Christian, as such, should be concerned with technology as well as with science, the nature of the issues that are involved, and the manner in which Christians could contribute to the solution of some of the problems that arise, for example, in the control of nuclear power, the application of automation, or in food and population policies. With Archbishop William Temple, he regards Christianity as the most materialistic of religions, and in the same sense. Much in this Lecture accordingly should be welcomed by the scientist or technologist who shares that sense of the ethical values which Smuts and others since, like Hinshelwood, Appleton and Ashby, have expounded, whether or not Prof. Coulson's own faith is fully accepted. This attempt to stir Christian people to constructive thinking and the facing of change leads, for example, to an eloquent plea for an educational system which allows no child to pass through it without some acquaintance with both science and technology.

In a way, the Lecture could be described as an attempt to interpret in a specific Christian context the essential message of the Duke of Edinburgh's Study Conference at Oxford in 1956. The challenge of change is presented just as clearly, and Prof. Coulson brings out the social and human issues involved, to the solution of which he is convinced that Christian principles of conduct have an essential contribution to make. Here, however, the emphasis on the pace of change and the decay of tradition recalls a fine passage in A. N. Whitehead's *Adventures of Ideas*, which discusses routine, tradition and change and their implications in the modern world.

Prof. Coulson is never trivial and writes with a sincerity, dignity and restraint that should enlist the support even of those inclined to take umbrage at his claim that some of his principles are specifically Christian, in the immense task to which he calls us of seeking to use creatively and imaginatively all the vast powers now at the disposal of mankind, with the sensitive insight into human needs, the profound respect for human personality and the confidence that the world has learned particularly from the life of Christ. Prof. Coulson's scholarship and wide reading characterize this short book as profoundly as his human sympathy and his Christian faith, and although it is unfair to expect too much in such matters of a published lecture, regret may be entertained that the book loses something of its full value as a stimulus to further study through the absence of an index and all but a handful of references.

R. BRIGHTMAN

FROM ARTS AND CRAFTS TO TECHNOLOGY

A Short History of Technology from the Earliest Times to A.D. 1900

By T. K. Derry and Trevor I. Williams. Pp. xviii + 782. (Oxford: Clarendon Press; London: Oxford University Press, 1960.) 38s. net.

AS the large five-volume *History of Technology* was being written by Prof. Charles Singer and his colleagues, an abridged edition was planned to meet both the needs of a wider readership (the larger handbook unfortunately being beyond the means of the average reader) and the desirability of establishing more firmly in the minds of both historians and engineers the relation between the history of technology and history in general. Imperial Chemical Industries have again generously supported this venture. The fortunate fact that one of the authors, Dr. Trevor I. Williams, is not only well known as the editor of *Endeavour* but was also for several years engaged in assisting Prof. Singer in producing his pioneer handbook has made it possible to use the evidence and manuscripts collected in compiling the five-volume work. This is also the source of most of the 353 figures used in the text of this new book.

However, the authors have by no means produced merely an abridgment of Singer's handbook. They have planned their own "technological history and history of technology", in which the essential trends and developments are presented in a concise and very readable form. A good bibliography, designed for the English reader, points the way for further detailed work on the subjects broached in the various chapters.

The book consists of two sections, each of which is preceded by a "General Historical Survey" of the period covered. The first section "From the Earliest Times to A.D. 1750" takes up about one-third of this 700-page text-book. In nine thirty-page chapters we are introduced to the crafts necessary for producing food and satisfying other domestic needs, mining and metallurgy, transport, recording and communications, sources of power and the earliest forms of the chemical industry, and their history is carried up to the Industrial Revolution.

The remaining two-thirds of the book and more than 220 illustrations cover "The Industrial Revolution to A.D. 1900". This upper limit has been quite rightly chosen by the authors, as "by 1900 the most advanced societies were beginning to register a change in the aims, as distinct from the methods, of technology. For man was no longer pitting his wits against Nature merely for the easier satisfaction of long-felt wants. . . . With the entry upon a new period, in which necessity ceases to be the mother of invention", the inventor began to create new wants, and technology is embedded firmer than ever in the general history of civilization.

The last section deals with many tools, methods and machines, with which most of us are still familiar, even if some forms of technology are now slowly disappearing. Here we are confronted with the history of the steam engine and turbines, machine tools and the development of interchangeable machine parts. New materials such as wrought and cast iron, steel and concrete begin to play a prominent part. Transport is transformed by the coming of the steamer, railways, bicycles, motor-cars and aeroplanes. Coal-mining grows and fosters the cheap production of iron and steel and initiates the coal-gas and coal-tar industries. Pure synthetic chemicals such as soda, sulphuric acid, nitric acid and ammonia are basic products for a new chemical industry. Rubber and petroleum create the 'motor age', and there is the new electrical industry which provides better communications, lighting and power. Finally, there is modern mechanized farming and the processing and preservation of farm-products by canning and refrigeration.

These and many more subjects are here presented in a form which will prove to be most valuable to the historian without technical training, who, in his turn, will be confronted with the gaps in our knowledge for which he will be called on to provide the clues for further research, together with the engineer and the technologist. Seven tables relating political and economic historical data to those of technology are given at the end of this book, which is without doubt a most valuable introductory manual to a historical discipline still in its pioneering age.

R. J. FORBES

Algebraic Curves

By Prof. J. G. Semple and G. T. Kneebone. Pp. xiii + 361. (Oxford: Clarendon Press; London: Oxford University Press, 1959.) 45*s*. net.

RECENT work on algebraic geometry has been much concerned with placing the subject on foundations which should be genuinely algebraic; a programme set on foot by van der Waerden some twenty-five years ago. The theory of algebraic curves is a very important section of algebraic geometry, and while R. J. Walker's excellent treatise, based on methods of modern algebra, has been available for ten years, an account on similar lines, but tailored to suit the student in his final undergraduate or first postgraduate year, has been needed. This need has now been fully met. Semple and Kneebone start from the beginnings, and take the general theory as far as the Riemann–Roch theorem; the exposition is always clear and precise, and each chapter begins with a survey of what is to be found therein and concludes with valuable exercises and notes. No very extensive algebraic equipment is required in the early stages, and to make the work self-contained an appendix summarizes practically all the needed work on rings, fields, polynomials and elimination theory. Two chapters initiate special studies: that on "Coordinates of a Curve" is a most helpful introduction to the Cayley form for algebraic varieties, while that on "Local Geometry in S_2" deals with a logical algebraic basis for what used to be called 'indefinitely near points'. It should be added that references to the older methods involving algebraic functions and Riemann surfaces are not absolutely excluded. An older generation might ask what Salmon would have made of all this, but, remembering that according to his contemporaries Salmon was "never a calculus man", perhaps he would have come to appreciate this new close convolution of geometry with algebra.

T. A. A. Broadbent

Chemical Analysis of Resin-based Coating Materials

Edited by C. P. A. Kappelmeier. Pp. xxvii + 630. (New York: Interscience Publishers Inc.; London: Interscience Publishers, Ltd., 1959.) 147*s*.

THIS collection of papers on the analysis of coating compositions was edited by an expert in this particular field, the late Dr. C. P. A. Kappelmeier, who studied under Baeyer and Wieland.

The book contains practical contributions from twenty-six senior chemists of many leading chemical firms situated in all parts of the world. It constitutes a unique and welcome compilation of tested classical and modern methods for the analysis of resins, plastics, paints, solvents, etc.

C. Schwarzenback and W. Schneider present an excellent chapter on the complexometric analyses of metallic additives: A. Z. Conner describes the techniques of paper and columnar chromatography, but gas-liquid chromatography receives only brief mention. Infra-red and ultra-violet absorption methods receive detailed treatment, and even the applications of mass spectrometry are succinctly discussed in the 'rosin' section.

Specialized chapters are devoted to alkyd and synthetic thermoplastic resins, latex paints, cellulose lacquers, drying oils, etc., and much helpful laboratory detail is provided. This volume will undoubtedly prove a most valuable reference work for industrial analysts who are concerned with the quantitative and qualitative examination of the wide range of coating compositions now being manufactured by the chemical industries. It is, unfortunately, rather highly priced for a book of 630 pages, but it is most legible and printed on excellent paper.

D. T. Lewis

Microbiology

Historical Contributions from 1776 to 1908 by Spallanzani, Schwann, Pasteur, Cohn, Tyndall, Koch, Lister, Schloesing, Burrill, Ehrlich, Winogradsky, Warington, Beijerinck, Smith, Orla-Jensen. Edited by Raymond N. Doetsch. Pp. xii + 233. (New Brunswick, N.J.: Rutgers University Press, 1960.) 5 dollars.

THIS book follows a commendable trend in American scientific publishing during recent years of presenting, in abridged form, excerpts from the works of the great scientists of the past. For those of us—the majority—who will never have an opportunity of reading many of the original papers, such syntheses provide an admirable substitute. As the editor wisely points out, the selection of papers is necessarily arbitrary, and there is bound to be difference of opinion regarding inclusions and omissions. Nevertheless, few will quarrel with the majority of the works included here, each of which is prefaced with a brief biographical introduction and a picture of the author.

The collection will be of value to anyone interested in the history of science, and would be a useful adjunct to any course covering this period of scientific history. It should prove particularly valuable in schools where the historical aspects of scientific discovery tend to be overlooked. The diversity of subjects covered provides a fascinating insight into the manifold applications of the so-called scientific method.

W. H. Dowdeswell

Transactions of the International Astronomical Union

Vol. 10: Tenth General Assembly held at Moscow, 12–20 August, 1958. Edited by D. H. Sadler. (International Council of Scientific Unions: International Astronomical Union.) Pp. ix + 774. (Cambridge: At the University Press, 1960.) 90*s*. net.

THIS volume contains the Proceedings of the meeting of the International Astronomical Union held in Moscow (1958). It contains the resolutions adopted at that meeting and the reports and proceedings of the various Commissions within the Union. The reports of the Commissions provide valuable summaries of the state of the subject and provide extensive bibliographies of original research done, in the preceding three years, in those fields which come within the scope of the Commissions. Four joint discussions (solar flares and corpuscular streams, nucleogenesis in stars, the luminosity of cepheids and astronomical observations with artificial satellites, rockets and balloons) which took place during the meeting are reported. A list of members of the Union and their addresses, correct to October 1959, together with the membership of the Commissions, is also appended.

It is noted that the General Secretary is contemplating action to expedite the publication of the *Transactions*. The rapid publication of the *Transactions* in smaller volumes would certainly enhance their usefulness as a reference work.

D. McNally

EFFECT OF ALPHA- AND BETA-MELANOCYTE STIMULATING HORMONES ON THE SKIN COLOUR OF MAN

By PROF. AARON B. LERNER and DR. JOSEPH S. McGUIRE

Section of Dermatology, Department of Medicine, Yale University School of Medicine, New Haven, Conn.

SIX years ago it was shown that intramuscular injection into man of a relatively crude alkali-treated extract from hog pituitary glands produced darkening of skin and nevi[1]. This darkening was similar to that observed in patients with adrenocortical insufficiency and some types of pituitary tumour. The pituitary fraction used at that time had a moderate amount of melanocyte stimulating hormone activity, but almost no other measurable hormonal effect. Later, two types of melanocyte stimulating hormones, α- and β-, were isolated from the pituitary glands of hogs, cows, sheep, horses, monkeys and human beings[2-4]. The structure of α-melanocyte stimulating hormone in all species is the same, although it has not been completely established for man. On carboxymethyl-cellulose columns, α-melanocyte stimulating hormone from man behaves the same as that from other species[5]. On the other hand, there are at least five varieties of β-melanocyte stimulating hormone; and it appears that in some species two forms may exist (Fig. 1)[7]. Since the pituitary material used in the original experiments in man was crude and because alkali treatment prolonged the melanocyte stimulating hormone activity as tested with frog skin *in vitro*, it was desirable to repeat the experiments with pure α- and β-melanocyte stimulating hormones. In addition it was possible to refine the techniques for measuring changes in skin colour.

Traces of vasopressin in our best preparation of α-melanocyte stimulating hormone prevented us from using this material in human beings. Fortunately, we were able to use synthetic α-melanocyte stimulating hormone generously provided by Dr. Klaus Hofmann and his colleagues, who accomplished its synthesis in 1959[8]. Although the synthetic α-melanocyte stimulating hormone, unlike the naturally occurring hormone, had a formyl group on the epsilon amino-group of lysine, and glutamine in place of glutamic acid, its activity on frog skin was the same as that of the natural hormone. 100 mgm. of β-melanocyte stimulating hormone was prepared in our laboratories from hog pituitary glands by Dr. Teh Lee and Mrs. Vina Buettner-Janusch, and another 100 mgm. was supplied by Drs. R. Guillemin and A. V. Schally.

Fig. 1. Structure of α- and β-melanocyte stimulating hormones showing the common sequence of amino-acids in both peptides. α-Melanocyte stimulating hormone from hogs, cows, sheep, horses and monkeys is the same. The sequence of hog β-melanocyte stimulating hormone is given, and the sites of variation in different species are shown. Thus in cows and sheep serine replaces glutamic acid; in monkeys arginine replaces lysine (refs. 5, 6); in horses arginine replaces proline (ref. 6); and in human beings the tetrapeptide Ala·Glu Lys Lys is added to the N-terminal aspartic acid, and arginine replaces lysine (ref. 4). In some species, for example, sheep and monkeys, both glutamyl and seryl β-melanocyte stimulating hormone are present (ref. 7)

Four Negroes took part in the work. From the early experiments we found that, within limits, the darker the individual the greater his response to melanocyte stimulating hormone. Short supplies of both α- and β-melanocyte stimulating hormones necessitated short-term experiments with darkly pigmented subjects. Throughout the experiment changes in colour of the skin were recorded with two kinds of reflectance measurements and two kinds of colour photography. Photographs before and after each experiment were taken on the same roll of film so that the problem of variability in processing the colour film would not occur. Professional 'Ektachrome *E*-3' was used. Illumination was provided by three electronic flash units, and an Eastman 81*A* colour correction filter was used. All exposures were f.8. Also, 16-mm. 'movies' with colour film were taken of the face for 2–5 sec. daily. Reflectance measurements of the centre of the forehead and of the back of the forearm were made with a Cary model 14 recording reflectance spectrophotometer using light of 3500–7000 Å. Measurements of the forehead, cheek and arm also were made with a Photovolt model 610 photoelectric reflexion meter without filters and with red, blue and green filters as described earlier[1]. The injections, each 1·0 ml. in volume, were administered intramuscularly into the deltoid muscle. The melanocyte stimulating hormone was first dissolved in saline and then diluted with an equal volume of 16 per cent gelatin solution. The final concentration of melanocyte stimulating hormone usually was 4·0 mgm. per ml. This preparation was used in all subjects except J. R., who received the hormone in saline alone. Three of the subjects were employed at indoor jobs during the day. The fourth (R. R.) was unemployed for the duration of the experiment. All subjects avoided exposure to sunlight so far as it was practical and wore caps and shirts with long sleeves whenever they were out of doors.

Subject 1. J. R. was a 32-year-old college student. On the first day the following results of blood studies were obtained: fasting blood sugar, 75 mgm. per cent; blood urea nitrogen, 17 mgm. per cent; carbon dioxide, 26 7 m.equiv./l.; chloride, 107 m.equiv./l.;

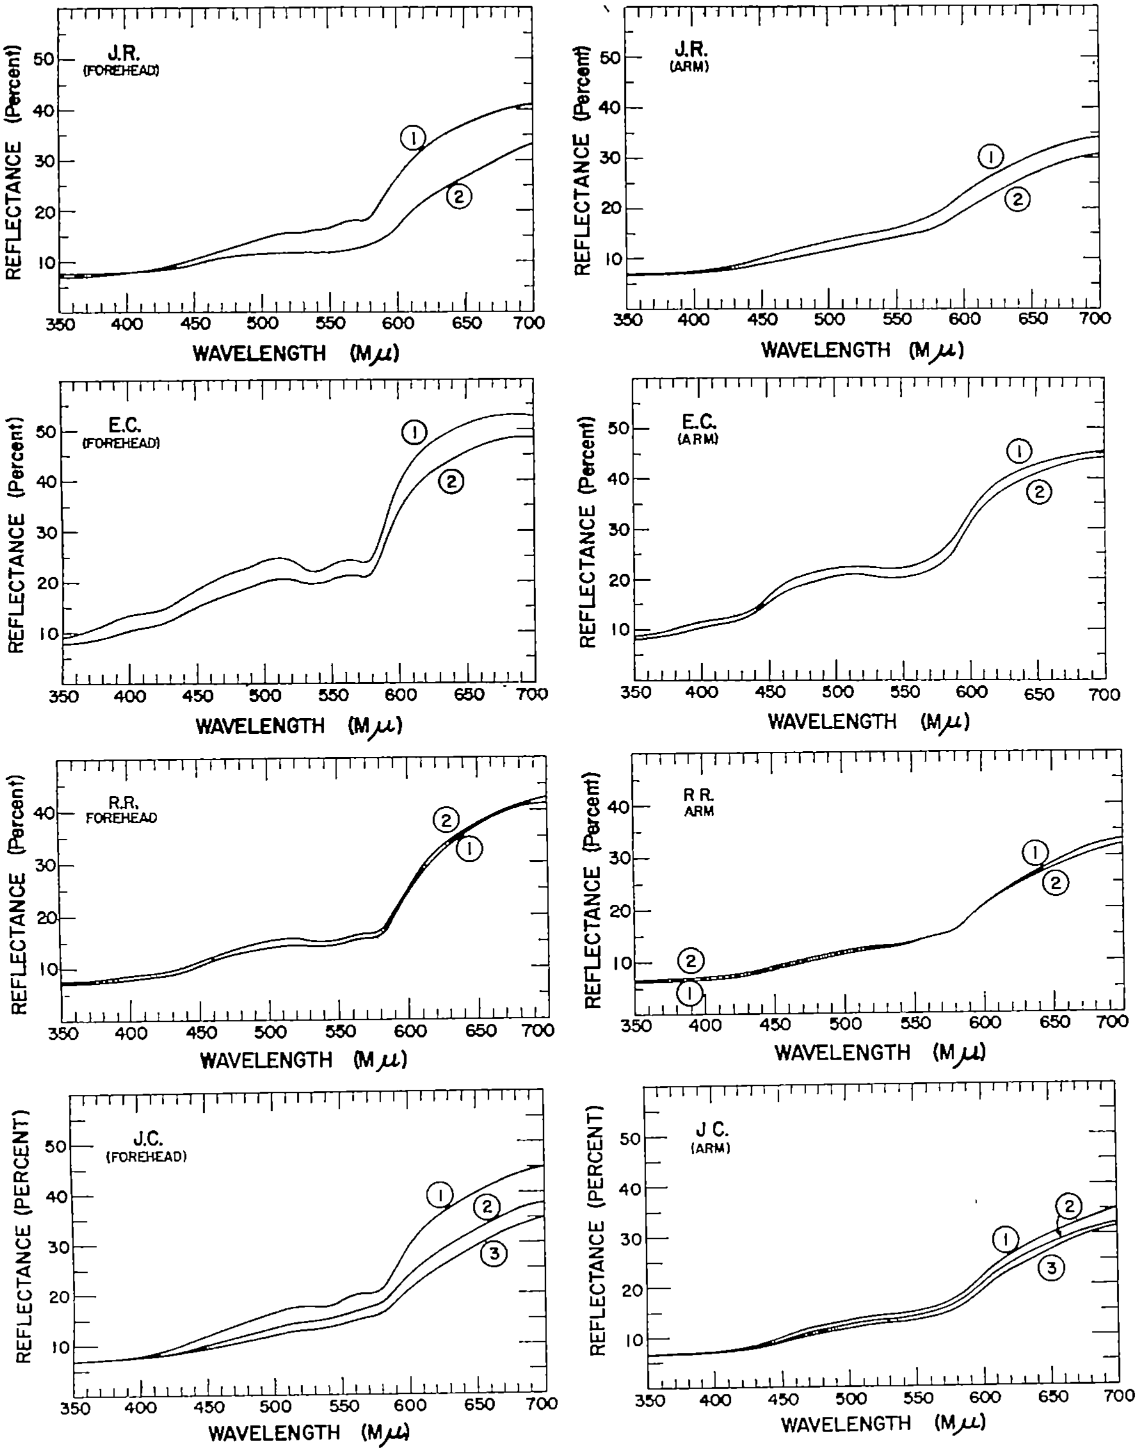

Fig. 2. Effect of melanocyte stimulating hormone on the reflectance of skin. The subject was seated beside a Cary model 14 reflectance spectrophotometer, and reflectance recordings were made of the extensor surface of the forearm and the mid-forehead, just above the glabella. The wave-length of incident light was varied from 700 mμ to 350 mμ. Duplicate tracings were made for each site
Subject J. R. Curve 1 was obtained before α-melanocyte stimulating hormone injections were given and curve 2 on the eleventh day of the experiment. The patient received on the first day, 3·1 mgm.; second day, 6 mgm.; third day, 9 mgm.; and up to the tenth day, 8 mgm. of α-melanocyte stimulating hormone a day. Note the decrease in reflectance throughout the spectrum
Subject E. C. received 8 mgm. of α-melanocyte stimulating hormone a day for ten days. Curve 1 was obtained on the first day and curve 2 on the thirteenth day. Note again the decrease in reflectance following administration of α-melanocyte stimulating hormone
Subject R. R. received 8 mgm. of α-melanocyte stimulating hormone a day for ten days. Curve 1 was obtained on the first day, curve 2 on the eleventh day. There was no change in reflectance during this period
Subject J. C. received 8 mgm. of β-melanocyte stimulating hormone a day for six days. Curves 1 and 2 were obtained on the first and seventh days. He then received 4 mgm. of α-melanocyte stimulating hormone for four days and 2 mgm. for one day. Curve 3 was obtained on the thirteenth day. There was definite darkening in this subject during administration of β-melanocyte stimulating hormone

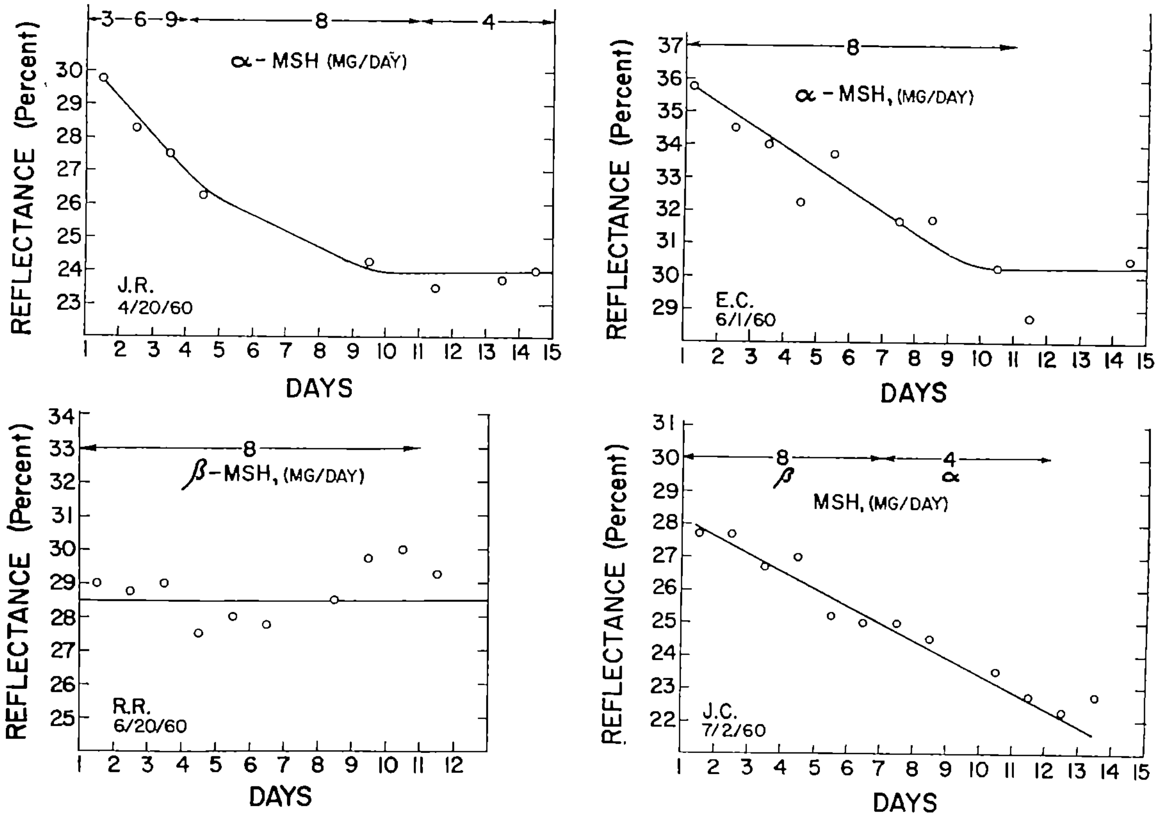

Fig. 3. Photovolt reflectance measurements during administration of melanocyte stimulating hormone. Reflectance of light from the skin was measured with a Photovolt model 610 photoelectric reflexion meter. The values used are arithmetic averages of separate readings made with red, blue, green and no filters. The forehead was measured in all patients except J. C., whose cheek was used. Here again it is seen that administration of α-melanocyte stimulating hormone to J. R. and E. C. resulted in a decrease in reflectance. Hog β-melanocyte stimulating hormone had no effect on R. R., but did cause a decrease in reflectance in subject J. C.

sodium, 141 m.equiv./l.; potassium, 4·7 m.equiv./l.; total protein, 8·5 gm. per cent; albumin, 3·2 gm. per cent; globulin, 5·3 gm. per cent; calcium, 12·1 mgm. per cent; phosphorus, 2·9 mgm. per cent; protein-bound iodine 7·8 μgm. per cent. On the fourteenth day these tests were repeated and found to be essentially unchanged: fasting blood sugar, 92 mgm. per cent; blood urea nitrogen, 12 mgm. per cent; carbon dioxide, 23·2 m.equiv./l.; chloride, 101 m.equiv./l.; sodium, 139 m.equiv./l.; potassium, 4·7 m.equiv./l.; total protein, 8 gm. per cent; albumin, 3·7 gm. per cent; globulin, 4·3 gm. per cent; calcium, 10·8 mgm. per cent; phosphorus, 3·4 mgm. per cent; protein-bound iodine, 7 μgm. per cent; erythrocyte sedimentation-rate, 7 mm./hr. The elevated globulin and calcium in the first group of studies suggested that the subject had sarcoidosis. However, X-ray examination of the chest was normal, and there were no symptoms or other signs of this disease. The activity of the synthetic α-melanocyte stimulating hormone was 3·3 × 10^{9} units/gm. On the first day 0·1 mgm. of melanocyte stimulating hormone was given intravenously over a period of 5 hr. in a litre of 5 per cent glucose in water. There were no changes in blood pressure or pulse, and three additional injections of 1 mgm. each were given that day. Six injections of 1 mgm. each were given on the second day. On the third day the patient and his wife noticed darkening of his face which they described as grey. On this day he received a total of 9 mgm. in seven injections. On the fourth day there were four injections of 2 mgm. each. This dose of 8 mgm./day was continued through the tenth day with two injections daily. Then 4 mgm./day was given in two daily injections of 2 mgm. each for four days. No melanocyte stimulating hormone was given after the fourteenth day.

The first increase in pigmentation appeared bilaterally in roughly circular areas just above the zygoma. The pigmentation was not even initially; but after an additional four or five days blended into the surrounding skin colour. Six weeks after the termination of the injections the subject had returned to his original colour.

Subject 2. E. C., a 24-year-old hospital employee, was lighter than the first subject. His hyperpig-

Plate (facing page). Appearance before and after administration of melanocyte stimulating hormone. These photographs were made on Professional Ektachrome *E*-3, using an Eastman 81*A* colour correction filter. The lighting, shutter speed and diaphragm opening were not varied. The pictures of each subject were made on a separate roll of film. This helped eliminate variations due to developing. The photographs in all cases were made within 1 or 2 hr. of the Cary reflectance measurements in Fig. 2. The first picture was obtained just before treatment, the second picture just after treatment. The second picture of J. C. was made after β-melanocyte stimulating hormone and just before α-melanocyte stimulating hormone was given. There was darkening of both J. R. and E. C. following administration of synthetic α-melanocyte stimulating hormone R. R. did not darken after he received hog β-melanocyte stimulating hormone, but J. C. did darken

mentation following the administration of melanocyte stimulating hormone was not so pronounced to the eye. He received 8 mgm./day of synthetic α-melanocyte stimulating hormone for ten days in two daily injections of 1·0 ml. of gel. The activity of the melanocyte stimulating hormone was $3\cdot3 \times 10^9$ units/gm. The melanocyte stimulating hormone used from the sixth to the tenth day had an activity of $2\cdot0 \times 10^9$ units/gm.

Subject 3. R. R., age 25, received, in two daily injections, 8 mgm. per day of β-melanocyte stimulating hormone with an activity of $1\cdot4 \times 10^9$ units/gm. for ten days. Routine analyses including blood count, urinalysis, blood urea nitrogen, fasting blood sugar, carbon dioxide, chloride, sodium, potassium, calcium, phosphorus and protein-bound iodine were normal on the first and last mornings of the test period. There was no observable or measurable darkening during the experiment.

Subject 4. J. C., age 23, received β-melanocyte stimulating hormone 8 mgm./day for six days in two divided doses daily. He darkened on this treatment. The β-melanocyte stimulating hormone had an activity of $1\cdot3 \times 10^9$ units/gm. To test the effectiveness in this subject of α-melanocyte stimulating hormone ($2\cdot0 \times 10^9$ units/gm.) which was more active than β-melanocyte stimulating hormone with regard to frog skin darkening, a smaller amount, 2 mgm./day of α-melanocyte stimulating hormone, was given for five days. There was some further darkening during this period.

It is interesting that the patients who darkened could detect the darkening at least as soon as we could measure it. This was attributed to the ability of the eye to integrate small changes in reflected light over a wide spectrum. The darkened skin had a decreased reflexion from 4000 to 7000 Å. Thus, melanin through its ability to absorb light of a large part of the spectrum is ideally suited for a light-protective role.

All subjects darkened more on the forehead than on the arm, and one (J. R.) showed quite striking darkening anterior to the ear above the zygoma. All hyperpigmentation had completely regressed within 6 weeks. The localization of the hyperpigmentation may result in part from the increased number of melanocytes present in the skin of the face[9].

From these experiments it is clear that systemically administered α-melanocyte stimulating hormone is an effective agent for darkening the skin of man. The relationship between melanin granule dispersion and new melanin formation in mammalian melanocytes is not known However, since darkening begins almost within 24 hr., it is possible that dispersion of melanin granules occurs within the melanocyte similar to that seen in the pigment cells of frogs and fish following exposure to melanocyte stimulating hormone. Newly synthesized melanin, however, may account for the prolonged hyperpigmentation.

β-Melanocyte stimulating hormone from hogs was not effective in the first subject, but was effective in the second one. Each subject received β-melanocyte stimulating hormone that had been prepared in different laboratories. Both preparations of β-melanocyte stimulating hormone had almost the same activity on frog skin. It is not known whether the difference in darkening of human skin was due to some unknown variation in the two β-melanocyte stimulating hormones or to a difference in response of the two subjects. Human β-melanocyte stimulating hormone was not available for testing. Neither α- nor β-melanocyte stimulating hormones had any effect on numerous metabolic tests carried out.

There is still doubt whether adrenocorticotrophic hormone can darken human skin. When this hormone was first introduced to clinical medicine approximately ten years ago, it was not uncommon to see patients develop pronounced hyperpigmentation following its use. These older preparations of adrenocorticotrophic hormone contained large amounts of melanocyte stimulating hormone[1]. More recently, commercial adrenocorticotrophic hormone has had much less melanocyte stimulating hormone, and the hyperpigmentation that occurs is less frequent and less pronounced. It would be possible to give 100–200 units of adrenocorticotrophic hormone free of melanocyte stimulating hormone to an experimental subject in order to test the effect of homogeneous adrenocorticotrophic hormone on skin darkening. With regard to darkening frog skin, this amount of adrenocorticotrophic hormone would be very small compared with the melanocyte stimulating hormone given the four subjects described in this report. On frog skin adrenocorticotrophic hormone has only one-thirtieth the activity of α-melanocyte stimulating hormone. Thus the amount of melanocyte stimulating hormone used daily in the present studies would equal more than 25,000 units of adrenocorticotrophic hormone in frog skin darkening activity. Perhaps some day it will be possible to give α-melanocyte stimulating hormone from which the N-terminal acetyl group is removed. The darkening action of this peptide might be like that of adrenocorticotrophic hormone which also has a free N-terminal serine.

One can ask whether the 4–8 mgm. of α-melanocyte stimulating hormone which was injected daily is a physiological amount of this hormone. Without knowing the amount of the injected material that is destroyed or sequestered by muscle and the amount normally produced by the human pituitary, this question cannot be resolved. All work carried out thus far has given results consistent with the view that the hyperpigmentation seen in patients with adrenocortical insufficiency and in some patients with pituitary tumours could be due to an increased release of α- or β-melanocyte stimulating hormone or both from the pituitary gland into the general circulation.

This work was supported by a grant from the U.S. Public Health Service, and during the tenure of a special fellowship from the National Institute of Arthritis and Metabolic Diseases, U.S. Public Health Service held by one of us (J. S. McG.).

We wish to thank Dr. M. Ruth Wright, who carried out the bioassay for α- and β-melanocyte stimulating hormones.

POSSIBLE BIOLOGICAL EFFECTS OF ELECTRICALLY CHARGED PARTICLES IN TOBACCO SMOKE

By DR. K. H. KINGDON

General Electric Research Laboratory, Schenectady, New York

THE idea that inhaled atmospheric ionization may have some effect on humans has been current for about thirty years. Recent experiments by Krueger and Smith[1] have demonstrated that air ions incident on the mammalian trachea will increase or decrease the vibration frequency of the cilia according as the ions are negative or positive. I have pointed out[2] that 'glow discharge electrolysis' experiments[3,4] indicate that the ordinary 'small ions' of atmospheric electricity carry appreciable quantities of chemical and electrostatic energy (about 6 eV./ion), and I have found that 5×10^{-4} coulomb/sq. cm. of such ions incident on *Escherichia coli* will kill them to $1/e$. This amounts to 3×10^{8} ergs/gm. and is about eight times the amount of ultra-violet energy or 700 times the amount of X-ray energy required to kill *E. coli*.

With the establishment of definite biological effects of atmospheric small ions such as those referred to above, it becomes of interest to inquire whether the ions which are well known to be present in tobacco smoke are of such a kind, or are present in sufficient numbers, as to produce significant biological effects when inhaled.

Ions in Smoke from Tip of Cigarette

Ions from the cigarette were analysed by drawing them in a current of air through the standard mobility equipment of atmospheric electricity, the particular apparatus being operated so as to collect small ions of mobility greater than 0·4 cm.^{2}/sec. volt and to reject slower ions. The sum of large and small ions was measured, without analysis, by other equipment. Air was drawn through the cigarette as needed with equipment giving a 'standard draught' of 35 c.c. in 2 sec. The ambient air currents at the cigarette tip were gentle enough so that after initial ignition a 'king-size' cigarette required 14 min. to burn up, without further 'standard draughts'. The ions are presumably generated by thermal ionization of potassium, which is always present in substantial amounts.

The first attempts to observe small-ion currents from a burning cigarette showed that small ions were indeed generated, but in numbers which increased greatly with application of a few hundred volts, or more, to the mouth end of the cigarette. The applied voltage creates a field at the burning tip which separates the positive and negative ions generated there and prevents their rapid recombination. Simple measurements show that a smoker's ordinary movements will raise his body to potentials of hundreds of volts, so that an adequate voltage is often applied automatically to the cigarette.

Fig. 1 shows the small-ion current as a function of voltage applied to the mouth end of a burning cigarette. At a few hundred volts the current is of the order of 10^{-10} to 10^{-9} amp. The current increases systematically with voltage, but shows a marked saturation trend above 1,000 V.

In addition to the emission of small ions, there is an emission of large ions which is about an order of magnitude greater than the small-ion current. The currents of both large ions and small ions increase sharply when the temperature of the cigarette is raised by giving it a standard draught. Both currents also increase sharply when ash is removed so as to expose the burning area.

The saturation behaviour of the small-ion current is due to the high electrical resistance of the cigarette. It was found that the resistances of a number of unlighted cigarettes were of the order 10^{10}–10^{11} ohms, and that although the resistance of the cigarette was lowered temporarily by taking a standard draught, the resistance returned to a high value between draughts.

Fig. 2 shows the variation with time of the emission of small ions from a cigarette charged to 1,000 V. after one standard draught only. The emission fluctuates down and up as ash accumulates or is removed by natural fall and by tapping. It is clear that the cigarette is a continuous source of small ions of the order 3×10^{-10} amp.

Ions are present in the smoke drawn through the cigarette and increase in number as the electric field

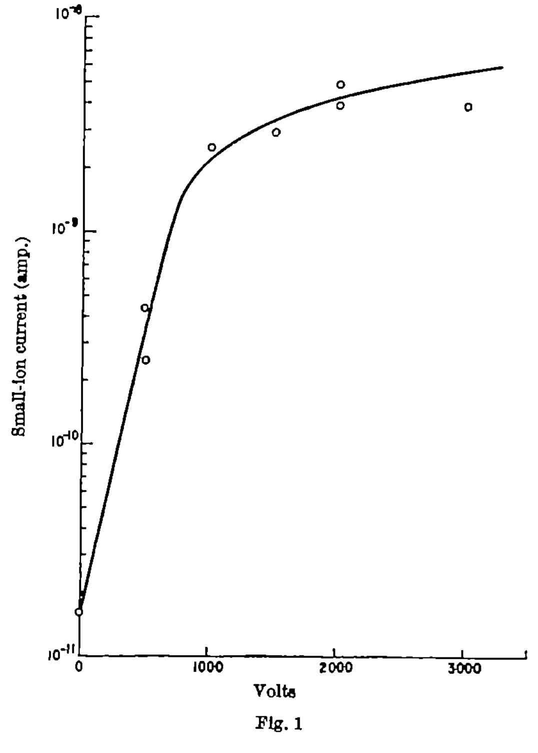

Fig. 1

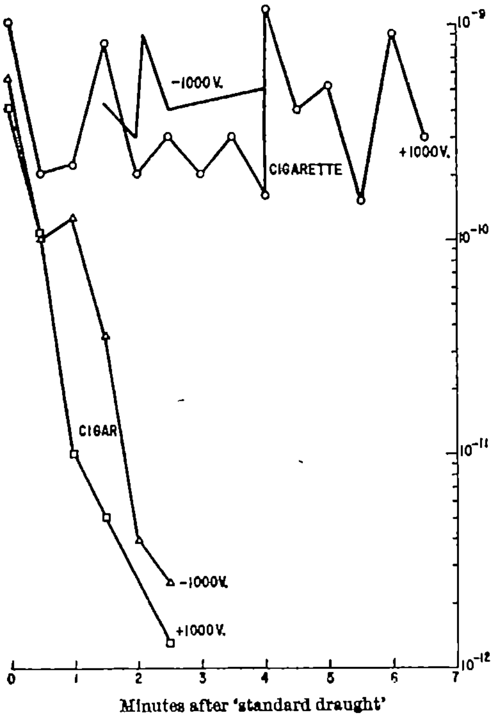

Fig. 2

at the burning tip is increased. No small ions could be detected in this smoke stream. In a more rigorous test of this sort, small ions generated by electrical corona were used. It was found that passing this ion stream through a 1-cm. length of cigarette reduced the small-ion content to 1/3,400, and passing it through 0·7 cm. of filter tip reduced the small-ion content to 1/8,500. The conclusion from these tests is that any small ions generated at the burning tip are removed (to about 1/10,000) by Brownian movement and electrical forces on their way through the cigarette and do not enter the mouth. The large ions, formed by coalescence of small ions with smoke particles, are thought not to have any specialized biological effect ascribable to their charge[3].

Unipolar small ions leaving the tip of a charged cigarette are spread throughout a substantial volume by thermal or air current convection, by motion of the cigarette, and by their mutual repulsion. The repulsion limits the concentration of unipolar ions which can be built up in the vicinity of the cigarette. Thus if N positive ions of charge e are within a sphere of radius 25 cm., the electric field Ne/r^2 at the surface of the sphere for $N = 1 \cdot 8 \times 10^{10}$ will be 4 V./cm. The ions at the surface of the sphere will move outwards with a velocity of 4 cm./sec., about twice that given to them by the ordinary atmospheric electric field. The average concentration in the sphere of radius 25 cm. is $2 \cdot 8 \times 10^5$ ions/c.c. It appears that the generation of small ions by the cigarette can maintain a concentration of this order, but it also appears that repulsive forces will prevent the concentration from being much higher.

It seems likely, therefore, that a smoker inhales small ions at a concentration of approximately 2×10^5 ions/c.c. all the time that he is smoking a cigarette. This concentration is about one thousand times that found in an ordinary city bedroom with no smoking going on.

Similarities between Experimental Small-Ion Effects and Alleged Correlations of Smoking with Lung Cancer

The discussion so far has dealt with the physical characteristics of the emission of small ions from a burning cigarette. The remainder of this article will be devoted to an exploration of the possible relation between continued inhalation of super-normal quantities of small ions and the development of lung cancer. This hypothesis is envisaged as an alternative to the concept that lung cancer may be caused by carcinogenic chemicals in tobacco smoke. The carcinogenic chemical concept is not universally accepted[5,6] as a major cause of lung cancer, so it seems worth while to explore an alternative. Explanations offered by this alternative hypothesis for three areas of observation in smoking and lung cancer will be compared first.

Comparison of cigarette, cigar and pipe smoking. Evidence has been presented in the literature which is alleged to show that lung cancer is much less frequent among cigar and pipe smokers than it is among cigarette smokers. Data have been presented in the present article to show that a charged, burning cigarette is a relatively strong and continuous source of small ions. Similar tests with a cigar showed that although a vigorously smoked, charged cigar (two successive standard draughts) gave transient small-ion currents comparable with those from a cigarette (see Fig. 2), the current decreased rapidly with time, so that a cigar is a much weaker continuous source of small ions than a cigarette. Similar tests with a charged pipe showed it to be an even weaker source.

Alleged differences between the behaviour of cigarettes, cigars and pipes in producing lung cancer may thus be correlated very simply with observed differences in the numbers of small ions produced.

Site of lung cancer as observed in diagnosis. The type of lung cancer which is alleged to be connected with smoking is observed first in the lower parts of the bronchi. Particles capable of rapid diffusion, such as the small ions, are much more likely to be deposited in the bronchi than are the slow, 0·5 micron droplets, carrying the alleged carcinogenic chemicals.

Failure to give mice lung cancer by inhalation of smoke from a smoking machine. Several attempts have been made to develop lung cancer in mice by exposure to smoke from a smoking machine[7], but in such experiments the development of cancer has not exceeded the normal expectancy. It has been pointed out above that by passage through the cigarette small ions are completely removed from the smoke of even a strongly electrically charged cigarette, so that the mice, although possibly exposed to inhalation of carcinogenic chemicals in the smoke, were not exposed to the effects of any small ions which may have been created initially in the smoke.

Possibility of Biological Damage from Inhalation of Small Ions

Data are not available to permit a convincing calculation of the possibility of lung damage resulting from inhalation of small ions in cigarette smoke. However, it is worth noting that the biological effect of small ions is closely similar[3] in most details to the familiar indirect X-ray process of radiation biology. Both processes involve the initial formation of a positive ion and a free electron, which afterwards give rise to active chemical species. The chemical energy of these secondary products causes the final biological effect. In view of the major similarity between the two processes, it seems reasonable to put forward as a hypothesis that if prolonged exposure to a low intensity of X-rays or other ionizing radiation can cause lung cancer, prolonged exposure to small ions at an intensity about one hundred times normal may also cause lung cancer.

It should be emphasized, however, that as yet there is no experimental demonstration of this, and the small-ion hypothesis is simply advanced as an alternative approach which appears to merit further exploration.

The emission of small ions from a charged, burning cigarette can be completely suppressed by smoking the cigarette within a screen which always encloses the burning tip and maintains zero field there. Suppression of emission of small ions is complete even when cigarette and shield are charged to 3,000 V. If further experimentation confirms the hypothesis of the production of lung cancer by small ions, it would be very satisfactory to have available such a simple and effective means of suppressing the effect.

Since potassium, or some other element of low ionization potential, is probably intimately connected with the formation of the small ions by thermal ionization, elimination of this element from tobacco presumably would reduce greatly the generation of small ions from an unshielded cigarette.

I am indebted to the General Electric Research Laboratory for making laboratory facilities and equipment available for carrying out the work just after my retirement. I wish also to express my appreciation to C. M. Bishop for continued help with the experiments, and to H. Hurwitz, jun., J. L. Lawson and J. K. Bragg for constructive criticism.

CENTENARIES

By JOAN M. EYLES

Samuel Clegg, 1781–1861

SAMUEL CLEGG the elder, a pioneer gas engineer, died at Haverstock Hill, Middlesex, on January 8, 1861, within two months of his eightieth birthday. Clegg was born in Manchester and received some of his education from John Dalton, who was teaching in Manchester from 1793 onwards. About this time William Murdock was carrying out his first experiments in gas-lighting while he was employed by the Birmingham firm of Boulton, Watt and Co. When young Clegg later became apprenticed to this firm, they were developing their first gas-making plants. It is not surprising, therefore, that his interests turned in that direction.

He left the firm in 1805 to set up in business himself, and soon after installed gas-lighting in the cotton mill of Henry Lodge at Sowerby Bridge, near Halifax. In 1808 he was awarded a silver medal by the Society for the Encouragement of the Arts for his apparatus for making gas from pit coal and lighting factories therewith. Later on he moved to London, and in 1812 installed gas-lighting in both the dwelling-house and business establishment of Rudolph Ackermann, the well-known art publisher, at 101 Strand.

In 1812 the Gas, Light and Coke Company obtained a charter to operate in the metropolis, and a few months later Clegg became its chief engineer. He was with the Company for nearly five years, and undoubtedly its success owed much to his ability. Clegg was responsible for the lighting of Westminster Bridge in 1813 (even lighting the lamps himself when the lamplighters refused to risk it) and also for the installation of gas mains along many of the streets of Westminster and the City. A notable achievement was the lighting of Guildhall in the City, inaugurated on November 9, 1815. During this period he introduced many improvements, including the first gas-meter and a gas governor; he also designed a horizontal rotary retort, which was incorporated in the plant installed at the Royal Mint by F. Accum, in 1817, the year in which Clegg left the Gas, Light and Coke Company.

Clegg afterwards suffered financial reverses. He worked for a time as engineer to the Portuguese Government, and also became involved with a project for a so-called atmospheric railway, in which a vehicle attached to a piston in a continuous pipe is made to move by maintaining a low pressure on one side of the piston. Later, however, he received a Government appointment as a gas surveyor, and also assisted his son, Samuel Clegg the younger, with the preparation of a treatise on the manufacture of coal gas.

Sir James Hall (1761–1832)

SIR JAMES HALL of Dunglass, fourth baronet, was born on January 17, 1761. He succeeded to the title when only fifteen, on the death of his father, Sir John Hall. In 1784 he was elected a member of the recently founded Royal Society of Edinburgh, a society with which he was closely connected for the rest of his life, publishing his scientific and literary papers in its *Transactions*, and holding office as president during 1812–20.

When Hutton's famous paper on a "Theory of the Earth" was read to the Society in 1785, Hall was abroad, studying among other matters the lavas of Vesuvius. At that time he was not attached to any system of geology, but later was won over to the Huttonian system and then became one of its most ardent supporters. He saw the possibility of testing the validity of some of Hutton's ideas by laboratory experiment, but this suggestion was not welcomed by Hutton himself; and it was only after the latter's death in 1797 that Hall began to carry out experiments seriously and systematically.

In 1798 he showed that glassy material obtained by heating strongly different lavas and whinstones would revert to a crystalline material if cooling was sufficiently slow. He followed these experiments with others designed to show the "Effects of Compression in modifying the Action of Heat", in which his aim was to demonstrate that when powdered limestone was strongly heated it would, if heated in a confined space, fuse and re-crystallize instead of decomposing. Using gun-barrels and other apparatus of his own design, he succeeded in his objective, obtaining results on which subsequent experimenters were unable to improve substantially for nearly a century, and which clearly show his skill and perseverance at a time when pyrometry and furnace control were in their infancy. Indeed, he opened up an entirely new field of research in chemistry and geology.

Hall's interest in experimental geology continued through his lifetime, and he investigated the effect of lateral compression on bedded strata, and the causes of consolidation of strata. After his death in 1832 some of his apparatus and a number of specimens were presented to the Geological Society of London by his son, Captain Basil Hall, and they are now in the collections of the Geological Museum.

OBITUARIES

Prof. G. W. O. Howe

The initials G.W.O.H., familiar to radio engineers throughout the world, passed from currency on November 7 with the death of Prof. George Walter Osborne Howe.

Howe, who was born on December 4, 1875, at Charlton, Kent, and educated at the Roan School, Greenwich, took pride in the long association of his family with riverside London. His forebears were, he used to say, Thames watermen.

After an engineering apprenticeship with Siemens Brothers in Woolwich, Howe became an undergraduate at Armstrong College, Newcastle on Tyne. He graduated with honours from the University of Durham in 1900 and he had the distinction of being the senior Whitworth Scholar in that year.

During 1900–02 he obtained experience in the design of electrical machines at the Siemens-Schuckert works in Berlin, this incidentally being a period in which the German designers of electrical machines were pre-eminent in Europe.

On his return to England, he took up his first teaching appointment in the Hull Technical College, and apart from a brief interlude in 1920–21 at the National Physical Laboratory, where he was head of the Department of Electrical Standards and Measurements, the whole of his long career was devoted to academic work.

It was in 1905 that he was appointed to a lectureship in the City and Guilds College, and there he began to make his major contributions to electrical science. His most notable original work was on radio propagation, the behaviour of radio aerials and on the penetration of high-frequency currents into conductors. His earliest papers show that distinctive quality of mind which was to characterize all his publications and to bring to him in later years a reputation which was truly world wide. His intellectual armoury comprised a superb knowledge of classical electromagnetism, exceptional powers of physical visualization, and the capacity to devise new methods of approach to complex phenomena whereby familiar concepts and relatively simple mathematical methods could be applied.

During 1910–20 he contributed to *The Electrician* a series of papers dealing in the main with high-frequency phenomena, and he made communications on the same subject to the *Proceedings of the Royal Society* and to the *Journal of the Institution of Electrical Engineers*.

In 1921 he was appointed to the newly created James Watt chair of electrical engineering in the University of Glasgow. At about the same time the monthly journal *Experimental Wireless*, now *Electronic Technology*, invited Prof. Howe to become its technical editor. This editorship, which lasted for more than twenty-five years, must be one of the most remarkable in the history of scientific publishing. Every month an editorial appeared over the initials G. W. O. H. Just occasionally the editorial would be of conventional form, commenting in a general way on some development or perhaps on an international conference. The regular pattern was, however, a closely reasoned exposition of some piece of electrical theory relating to a topic of current interest. The article might expose a fallacy, might derive by a brilliant simplification a result obtained in some recently published paper by a recondite method, or might treat a difficulty which had arisen in the course of discussion with his colleagues. Many of the problems which he tackled involved conceptual difficulties of a high order and he would admit to many hours of anxious thought over some of them and, on one or two occasions, to momentary misgivings after he had gone to press. In these editorials, not only was his capacity for clarity of exposition displayed at its best, but also his genius for the apt simile and for witty and sometimes caustic comment had free play. Muddled thinking or obfuscation would sometimes provoke him to a sharpness of witty sarcasm which could give a false impression of him.

Quite early in his career he began attending meetings of the British Association. He became, in due course, secretary and afterwards recorder of Section G (Engineering), and in 1924 president of that Section. He attended three of the meetings which the British Association held overseas—Adelaide in 1914, Toronto in 1924 and Johannesburg in 1929. In January 1938 he went as a member of the official delegation of the British Association to the jubilee meeting of the Indian Science Congress which was held in Calcutta.

During the later part of his life he maintained a direct association with the radio-manufacturing industry as a director of the Mullard Radio Valve Company.

Prof. Howe was elected to associate membership of the Institution of Electrical Engineers in 1905. He took a prominent part in the formation of the Wireless Section of the Institution in 1919 and he was elected chairman of the Section in 1921. In 1956 the Institution awarded to Prof. Howe the Faraday Medal in recognition of his pioneering work in the study and analysis of high-frequency oscillations and of the theory of radio propagation and for his outstanding contributions to engineering education. The Institute of Radio Engineers of New York in 1955 also conferred on him the high honour of election to fellowship of the Institute.

His scientific work apart, Howe experienced his greatest enjoyment in his music. He was an accomplished violinist. He had been taught, he said, when very young on a miniature violin specially made for him, and he could not remember a time when he did not play the instrument. Until a year or two before his death he was an active member of the Glasgow University Orchestral Society.

Only those who had the good fortune to study under him knew the quality of his teaching. He was one of the greatest teachers of his generation. It is hard to escape the conclusion that the main driving force in his scientific work was the urge first to understand, in Clerk Maxwell's boyish phrase, "the go of the thing" and then to expound it. His mind was essentially scholarly, and yet one got the impression that he was intrigued by the unexpected practical implication, the apparent anomaly or the amusingly odd concept rather than by the deeper philosophical implications.

A lively and entertaining companion, a delightful host and an equally delightful guest, Prof. Howe had a wide circle of friends. It was only rarely that the brilliant mind, which in its day-to-day contacts with the world gave the impression of being quietly but confidently self-contained, revealed for a moment that depth of human feeling of which it was capable.

Prof. Howe married in 1901 Sarah Alice Maunder. Mrs. Howe died in 1930. J. GREIG

Dr. Norman Bauer

NOT often is exceptional scientific ability and a deep concern for the welfare of his fellow man combined in one individual. Such an individual was Dr. Norman Bauer.

Dr. Bauer began his studies at the University of California at Berkeley, graduating with a B.S. in chemistry in 1937. He then entered the University of Michigan, receiving his M.S. in 1939 and his Ph.D. in 1941, under the direction of Prof. K. Fajans. He held a scholarship during 1936–37 at the University of California and was Eastman Kodak Fellow at the University of Michigan during 1940–41, and a Post-doctoral Fellow at that institution during 1941–42.

Desiring to teach, he joined the faculty of the University of New Hampshire in 1942 and remained there until 1945. During this period he was co-author with Prof. Fajans of the sections on the determination of density and refractometry in Weissberger's *Technique of Organic Chemistry*, having done much important research in these fields. Due to personal obligations, he returned to California in 1945, where he was employed by the California Research Corporation. Here he became interested in mass spectrometry, publishing articles in this field. In 1949 he founded an independent research laboratory under the name Physical Science Associates at Berkeley. Later, with his personal obligations changed, he returned to academic life, accepting a position at Utah State University in 1953, where he was most recently professor of chemistry.

Here he carried on an excellent programme of teaching and basic research in physical chemistry. His knowledge and enthusiasm encouraged research in several fields, and many new methods of approaching problems in soil and plant nutrition and in the thermodynamics of the water relations of soils and plants were developed by him. He became interested in the problem of biological nitrogen fixation and made substantial progress in this difficult field, studying the physical chemistry of legoglobins (the proteins involved in nitrogen fixation), establishing a reputation for his laboratory in this topic. Recently, he made significant discoveries that may lead to a major advance in the solution of this problem. Working with electron spin resonance equipment at Varian Laboratories during the summer of 1960, he detected the presence of free radicals that could be key intermediates in nitrogen fixation. This was especially gratifying to him, since he had predicted theoretically the existence of such radicals in a study of possible pathways for the process. His death on September 9 prevented him from following up this important possibility.

Dr. Bauer was concerned about many problems involving man's welfare. He was opposed to further testing of atomic bombs and personally paid for advertising space to register his protest. He published articles questioning the reasoning of the U.S. Atomic Energy Commission on the hazards of radioactive fall-out. He was particularly concerned with the dangers of nuclear war and spoke out strongly for the cause of peace. He was a champion of the cause of academic freedom, taking an active part in upholding the right of free inquiry. A dedicated scientist, a gifted teacher, he was, in every sense, a man of unquestioned integrity and morals who brought honour to his profession, and a man of good will. JACK T. SPENCE

Mr. Jaques Cattell

JAQUES CATTELL, editor of *American Men of Science*, publisher of the *American Naturalist*, and president of the Jaques Cattell Press, Inc., died after a long illness at New York Hospital on December 18: he was fifty-six years old.

In 1923 Mr. Jaques Cattell became associate editor of *American Men of Science* with his father, the late Dr. James McKeen Cattell, and editor following the death of his father. He was also editor of *Leaders in Education*, founded by his father. The *Directory of American Scholars* was established by him in 1942, under the sponsorship of the American Council of Learned Societies.

Mr. Jaques Cattell was interested in scientific publishing and the graphic arts. He was president of Science Press Printing Company, and later was a pioneer in the use of cold type composition in scientific publishing. In 1959 he moved to Arizona, and, at the invitation of the President of Arizona State University, continued the publication of his biographical directories from the University campus in Tempe.

He is survived by his widow, the former Elizabeth Walsh, and his son, James Cattell.

The Jaques Cattell Press, Inc., has announced the appointment of Garrison Cattell and Dorothy Hancock as acting editors of *American Men of Science*. Mr. Cattell and Mrs. Hancock have worked closely with Mr. Jaques Cattell in editing and publishing this directory.

NEWS and VIEWS

Mathematics at Canberra:

Dr. B. H. Neumann, F.R.S.

Dr. B. H. Neumann has been appointed to the newly established chair of mathematics at the National University of Australia, Canberra. Bernhard H. Neumann was born in Berlin in 1909. He received his early academic training at the Universities of Freiburg and Berlin, where he obtained the degree of Dr. phil. in 1932. Soon afterwards he left Hitler's Germany and continued his research work at Cambridge, where he graduated Ph.D. in 1935. His first teaching appointment was at University College, Cardiff (1937–40). This was followed by war service from 1940 until 1945. After the War he joined the staff at University College, Hull (1946–48). Since 1948, Dr. Neumann has been a member of the Mathematics Department at Manchester, first as a senior lecturer and later as a reader. Neumann's published work is almost exclusively devoted to the theory of groups. He has enriched this important branch of modern algebra by outstanding contributions published in numerous articles, in which he lucidly expounds his results, solves old problems and poses new ones. His achievements have been recognized by academic distinctions which include the Adams Prize (1951–52), the D.Sc. degree at the University of Manchester (1954) and the election to the Royal Society (1959). Besides his creative powers, Dr. Neumann possesses a remarkable talent to inspire young mathematicians and to guide them through all the stages of their career as research workers. He will no doubt attract to Canberra a team of enthusiastic collaborators. Chief among these will be his wife, Dr. Hanna Neumann, who is well known for her own work on group theory.

Engineering Science at Oxford:

Prof. A. Thom

Prof. A. Thom is to retire from the chair of engineering science at the University of Oxford, which he has held since 1945. Prof. Thom is an engineer with an aeronautical bias, who worked in the Royal Aircraft Establishment, Farnborough, during the whole of the Second World War, after a long period as a lecturer at the University of Glasgow. He is best known for his skill and inventiveness in the field of numerical analysis by desk computers. In particular, he has obtained a large number of useful results in theoretical fluid dynamics and other subjects by his 'squares' method, an alternative to Southwell's 'relaxation' approach. He is also well known for a number of important wind-tunnel investigations.

Prof. D. W. Holder

Dr. D. W. Holder, who is to succeed Prof. Thom in the chair of engineering science at the University of Oxford, is like him in that he is an aeronautical engineer, who has built up since the War a remarkable research team in high-speed aerodynamics at the National Physical Laboratory. This team has been responsible for a large proportion of the fundamental advances in transonic, supersonic and hypersonic gas dynamics in Britain since 1945. The research facilities which he has built up have been truly impressive, but his contributions towards interpretation of the results have been equally important, notably in the field of shock-wave boundary-layer interaction.

Current Research and Development in Scientific Documentation

A recent issue of *Current Research and Development in Scientific Documentation*, issued by the National Science Foundation, lists 159 research projects in 99 organizations, compared with 61 in 39 organizations a year ago (No. 7. Pp. viii+153. Washington, D.C.: Government Printing Office, 1960. 65 cents). Of these 17 are listed under information requirements and uses; 45 under information storage and retrieval; 26 under mechanical translation; 17 under equipment; and 54 under potentially related research which is not directly connected with scientific documentation, but which may influence such work in the future. The present issue is provided with a detailed subject index and an introductory statement to each section directing attention to new work and to closely related projects reported in other sections. In the first section may be noted the study by the International Federation of Documentation of the availability and value of scientific conference papers and proceedings; a study of the availability and publication of scientific information contained in unclassified Government research reports; studies of the use of photocomposition and of microform publication, of the information needs of scientists in the field of psychopharmacology and of the need for an abstracting service in soil and water technology. In information storage and retrieval most of the effort is concentrated on systems design, but there is growing interest in evaluation and comparison of the newer systems, in more theoretical work on systems design and in mechanized processing of complete texts. Mechanical translation research up to the present has been mainly concentrated on the problems of lexicon and the passing of the source languages, principally Russian and English, with relatively little attention to the synthesis of the output language. The most noticeable trends are the increasing number of languages under study and the increasing breadth and generality of the theoretical work. Under equipment, particular emphasis is being placed on the development of storage devices and of output components.

Education and Industry

In an article that appeared in a recent issue of *ESSO Magazine* (9, No. 4, Autumn, 1960), Sir Hugh Beaver suggests that people in Great Britain can no longer afford to argue about education for management, and that it is no longer realistic to call on "industry to exercise the greatest care in recruiting graduates", in order to allow the schools to have a proportion of the 'good people' for advanced studies. He argues that to many, what matters are the financial attractions, and says that no one should question or deplore such an attitude in any individual, now that it has been shown that industry offers as great an opportunity of real service to the community and to the country as any of the professions. There are many thousands of companies in industry and commerce who want an educated intake but who are harassed by the deficit due to a shortage of teachers. Such difficulties could be solved, he suggests, by a system of senior part-time appointments or temporary secondments, or by alleviating the problem of the shortage of teachers itself. However, he directs attention to the fact that it cannot be claimed that we are deploying Britain's full resources so long as women play such a small part in our industrial, scientific, technological and high-management activities. Sir Hugh also touches on the increasing specialization which now occurs right through industry. These specializations are now acceptable, and the formal ladder of promotion and success must be by one or other specialization. The great task that confronts all who are training managers is to produce people who, while initially master of one or other specialization, can at the same time understand how the other parallel and complementary specializations all build the one body, whether it is their own company or the industry of which their company is a unit. Only by such means will they be capable of becoming managers with wide responsibilities.

Mental Health

DURING 1959–60 the major concern of the National Association for Mental Health has been with the promotion of World Mental Health Year in the United Kingdom and with preparations for the coming of the Mental Health Act. These are described in the fourteenth annual report (Pp. 55. London: National Association for Mental Health, 1960). Before the Mental Health Act received the Royal Assent on July 29, 1959, the Ministry of Health had issued circulars in anticipation of its coming. The most noticeable was that issued during January 1958, authorizing the informal admission of patients to mental deficiency hospitals. Following the passing of the Mental Health Act, the Minister of Health issued a direction to local authorities asking them to submit details of their proposals for community care. These are now being studied at the Ministry. Another development of considerable importance to the Association is the initiative of the Royal College of Nursing in petitioning the Privy Council for an alteration in its Charter to enable all registered nurses to become members of the College. If the petition is granted, mental nurses, male and female, may, for the first time, become members of the Royal College of Nursing. Information about the work of the Association can be obtained from Maurice Craig House, 39 Queen Anne Street, London, W.1.

Polish Scientific Publications

THE *Quarterly Review of Publications*, published since 1955, describes publications of the Polish Academy of Sciences and of such scientific societies as are supported by the Academy. For the convenience of readers interested in particular disciplines, the *Review* has appeared since 1958 in three series: Series *A*, Social Sciences; Series *B*, Biological Sciences; and Series *C*, Pure and Technical Sciences. To give the reader a more complete picture of current Polish scientific literature, the editors have decided to include in the *Review* the more important scientific publications of institutions other than the Polish Academy of Sciences and the affiliated societies. Each entry published in the *Review* is supplemented by a brief summary. Titles are quoted in the language used by the author and, except in the case of Latin and Greek titles, an English translation is given. Copies of the *Review* can be obtained from the Distribution Centre, Warszawa, Palac Kultury, 1, Nauki.

Peabody Museum of Yale University

THE annual report of the Peabody Museum of Yale University for 1960 is unusual in that it is the first to be issued by the Museum and is also the first by the present director, Mr. S. Dillon Ripley (Pp. 31. New Haven, Conn.: Peabody Museum of Natural History, Yale University, 1960). It also coincides with the re-activation of the Museum Trustees and the Advisory Committee. The report records the opening of the new wing on October 30, 1959, which event marked the culmination of nearly 15 years planning. The director rightly states that the health of a museum depends not only on the development of exhibits, or the active progress of school services, but also on the calibre of the research by the staff and those associated with it. An impressive list of publications is a measure of the research carried out by this Museum. It is intended that reports should include semi-popular articles on natural history subjects—the first one being on the wren.

The Australian Museum

THE first part (two stories) of the new six-storey wing of the Australian Museum was officially opened by the Premier of New South Wales, Mr. R. J. Heffron, on August 11. The completion of this first part is one of the outstanding events in the history of the Museum, for it is the first major building addition for half a century. The new work is faced with handsome sandstone and contains curatorial offices, laboratories and space for reserve collections. The contract for the erection of the other four floors has already been signed and these will enable further collections to be displayed and also provide for a public cafeteria on the roof.

Impact of *Lunik* 2 on the Moon

AT about the time when *Lunik* 2 struck the Moon, 21h. 02m. 24s. U.T. on September 13, 1959, optical observers in several parts of Europe noted small disturbances on the Moon's surface. Their observations, none of which could be certainly linked with *Lunik* 2, were reviewed by G. Fielder (see *Nature*, 185, 11; 1960). One group of observations, from Hungary, has now been described in more detail by L. Detre, in a publication entitled "Bericht über Optische Beobachtungen Anlässlich der Landung der Sowjetischen Mondrakete Lunik II" (Mitteilungen der Sternwarte der Ungarischen Akademie der Wissenschaften. Nr. 45: Pp. 10. Budapest: Sternwarte der Ungarischen Akademie der Wissenschaften, 1960). On the night of September 13, which was exceptionally clear in Hungary, an expanding dark spot was observed on the moon, near the crater Autolycus, by several astronomers at two independent observatories, Szabadsághegy and Baja, between the times 21h. 02m. 30s. U.T. and 21h. 07m., when it became too diffuse to observe. Traces of a similar phenomenon were found on photographs taken at the same time at Uppsala, Sweden. The co-ordinates of the dark spot (+ 0·03, + 0 45) agree well with those given for the impact point of *Lunik* 2.

Seventeenth-Century Bronze Finds in Eastern Nigeria

An interim report of excavations undertaken at Igbo-Ukwu, Eastern Nigeria, by Thurstan Shaw, appears in the November issue of *Man*. About twenty years ago some interesting finds, including bronze vessels, were unearthed by an African called Isaiah Anozie when digging out an underground cistern. Some of these objects are now in the museums at Jos and Lagos, and the facts of the find were duly reported in *Man*. Thurstan Shaw has now undertaken systematic investigations at the site and many more objects have been recovered from this and another nearby compound. They include pots, bowls, a swordhilt and scabbard, ornaments, rings, and a coiled snake on a spike, all in bronze. Of the two sites the first seems to have been a vessel or regalia store-place, and the second a burial. It is suggested that they were both connected with the former *Eze Nri*—the priest King of Umueri, who brought from the region of Idah an intrusive culture into Iboland. A seventeenth-century date and African workmanship are here tentatively postulated.

Indians of the Western Prairies

The Department of Northern Affairs and National Resources, Canada, has recently issued a bulletin in its Anthropological Series entitled *Indian Days on the Western Prairies*, which has been prepared by Marius Barbeau (Bulletin No. 163. Anthropological Series, No. 46. Pp. vi+234 and 165 plates. Ottawa: Queen's Printer, 1960. 4 dollars). The Bulletin is full of Indian tales and is well illustrated, sometimes in colour. But the work, of course, is a serious contribution to the study of the old inhabitants of the western prairies. There is a long introduction, where a general account of the tribes and their problems is given and the difficulties facing them are discussed. Most of the volume, however, is devoted to stories told by the Indians themselves, which give a vivid idea of the outlook on life of these people at the time of the coming of the white man, and of how they reacted to his arrival. There are a great number of illustrations of scenes and designs, mostly taken from paintings on skins. There are also portraits drawn in characteristic style by Langdon Kihn. The volume is of great value to anyone wishing to learn something of the civilization of these interesting peoples.

Diagnosis of Yaws

As increasing progress is made in the eradication of yaws in many countries, it becomes increasingly important to differentiate as clearly as possible between skin and other lesions not caused by yaws and those yaws lesions which they may closely resemble. At all stages of a mass campaign for the eradication of yaws, the clinical diagnosis should be as accurate as circumstances permit. However, in view of the limited time available in the initial treatment surveys and of the simple training given to many of the field staff, a certain proportion of diagnoses—probably about 10 per cent—may be expected to be erroneous. Such errors are all the easier to make as the skin has a limited number of reaction patterns, so that similar lesions may result from different causes. In the later stages of an eradication campaign, the manifestations of yaws have largely disappeared as a result of mass treatment with penicillin. It is then that many lesions not due to yaws become prominent, and at this stage accuracy of diagnosis assumes particular importance. The lesions of yaws were fully illustrated in C. J. Hackett's *An International Nomenclature of Yaws Lesions*, published by the World Health Organization in 1957. A new monograph, written by the same author in collaboration with Dr. L. J. A. Loewenthal, is intended as a companion volume to the earlier publication, and was prepared in response to requests for an illustrated handbook which would assist field workers in making accurate diagnoses (World Health Organization. Monograph Series No. 45: *Differential Diagnosis of Yaws*. Pp. 88 (52 figures). (Geneva: World Health Organization; London: H.M. Stationery Office, 1960.) 10 Swiss francs; 17*s*. 6*d*.; 3.25 dollars.

Hearing in Cetaceans

The skull of the Cetacea differs widely from the usual mammalian pattern; the relative sizes and positions of the bones forming it are much modified, and in many species they show a high degree of asymmetry. A complicated system of air sinuses connected with the Eustachian tube is associated with extensive venous plexuses in the basicranial region, the tympano-periotic bones are dissociated from the skull, and the bones of the middle ear with the tympanic membrane are also highly modified. Such peculiar conditions have long attracted the attention of comparative anatomists, whose observations are scattered through the literature of cetology. A recent paper (Fraser, F. C., and Purves, P. E., "Hearing in Cetaceans", *Bull. Brit. Mus.* (*Nat. Hist.*), 7, No. 1; 1960) reviews the history of the subject, and gives detailed comparative descriptions of the anatomy of the cetacean head based on original dissections, injected preparations, and radiographs. The authors had access to a large amount of unique material and have brilliantly illuminated much that was previously obscure. They have not, however, confined themselves to descriptive anatomy, for they have devised and carried out numerous elegant experiments to ascertain the functions of the various anatomical structures in the physiology of hearing. They have been able to show that the generally accepted theory which claims the Cetacea hear by bone conduction is not only erroneous but also impossible, and that in all the cetaceans the sense of hearing is the most important of the special senses. These points and many others are lucidly described and discussed in this scholarly and well-written paper, which is illustrated with numerous excellent plates. It is by far the most important work on the anatomy and physiology of the Cetacea to appear since Scholander's classic paper of 1940.

Effects of Maleic Hydrazide on Rust Fungi

Some interesting differential effects of maleic hydrazide on the growth of leaf and stem rusts of wheat are reported by D. J. Samborski *et al.* (*Canad. J. Bot.*, 38, 1; 1960). The effect of this substance was investigated, using intact plants supplied with maleic hydrazide through the roots, detached leaves floated on solutions of maleic hydrazide, and spores germinated on maleic hydrazide solutions in agar. In each instance the growth of leaf rust was inhibited at concentrations of maleic hydrazide which had no effect on the growth of stem rust. Some resistant wheat varieties became susceptible to rust after treatments with levels of maleic hydrazide which were not inhibitory to rust development. In some experiments, leaf rust races reacted differentially to maleic hydrazide. The authors consider that both nutritional and inhibitory factors may be involved in resistance and host–pathogen specificity.

Tenth Pacific Science Congress

THE tenth Pacific Science Congress is to be held at the University of Hawaii, Honolulu, during August 21–September 6, 1961. The Congress will be divided into nine Sections: Agricultural Sciences; Anthropology and Social Sciences; Biological Sciences; Conservation; Forestry; Geography; Geophysical Sciences; Public Health and Medical Sciences; Scientific Information. Each Section will include a number of divisions. Three special symposia are being organized: "Man's Place in the Island Ecosystem"; "Science Museums in the Pacific Area"; "Galapagos Islands: a Unique Area for Scientific Investigations". Further information can be obtained from the secretary-general, Mr. Harold J. Coolidge, Tenth Pacific Science Congress, Bishop Museum, Honolulu 17, Hawaii.

University News: London

APPOINTMENTS are announced as follows: Dr. D. R. Cox, reader in statistics at Birkbeck College, to the University chair of statistics tenable at that College; Dr. E. F. Scowen, reader in medicine at St. Bartholomew's Hospital Medical College, to the University chair of medicine tenable at that College; Mr. Arthur Summerfield, lecturer in psychology at University College, to the chair of psychology tenable at Birkbeck College; Dr. Donald Rogers, senior lecturer in physics at University College, Cardiff, to the University readership in chemical crystallography tenable at the Imperial College of Science and Technology from October 1. Titles within the University of London have been conferred as follows: professor of mathematics, on Dr. K. F. Roth, in respect of his post at University College; reader in medicine, on Mr. P. H. Sanderson, in respect of his post at St. Mary's Hospital Medical School; professor emeritus of biochemistry, on Prof. W. Robson, on his retirement from the professorship of biochemistry at King's College; reader in mathematics, on Dr. F. A. E. Pirani, in respect of his post at King's College; reader in mathematics, on Dr. S. Raimes, in respect of his post at the Imperial College of Science and Technology. Dr. F. A. Goldsworthy was appointed to the readership in applied mathematics at Queen Mary College (see *Nature*, 189, 22; 1961), but was unable to accept the appointment.

Announcements

THE following awards have been made by the president and council of the Royal Astronomical Society: *Gold Medal*: Prof. Herman Zanstra, until recently professor of astronomy in the University of Amsterdam, for his work on gaseous nebulæ; *Eddington Medal*: Prof. Hans A. Bethe, professor of nuclear physics at Cornell University, for his outstanding identification of energy-generating processes in stars.

MR. J. A. CHALDECOTT, deputy keeper in the Department of Physics, Science Museum, South Kensington, has been appointed keeper of the Science Library in succession to the late Mr. H. T. Pledge. Mr. G. W. B. Lacey, assistant keeper, has been appointed deputy keeper in the Department of Aeronautics.

MR. M. A. L. BANKS, a managing director of the British Petroleum Co., Ltd., has been appointed a member of the Advisory Council on Research and Development to the Ministry of Power. The Council, which advises the Minister on the scientific aspects of his statutory duties, was recently reconstituted and its terms of reference amended so as to emphasize that its advisory functions cover all aspects of research and development concerned with fuel and power from the laboratory to industrial application.

THE Industrial Science Achievement Award of the American Association for the Advancement of Science has been awarded to the Bell Telephone Laboratories, Inc., for its achievements in the field of universal communication during the year 1960. Among the work mentioned was: long-distance communication by reflecting radio-signals from *Echo* 1, the world's first electronic telephone switching system, the optical maser and solid state materials.
